5.2 activemq::cmsutil Namespace Reference

Data Structures

- class **CachedConsumer**

  A cached message consumer contained within a pooled session.

- class **CachedProducer**

  A cached message producer contained within a pooled session.

- class **CmsAccessor**

  Base class for ***activemq.cmsutil.CmsTemplate*** *(p. 992) and other CMS-accessing gateway helpers, defining common properties such as the CMS* ***cms.ConnectionFactory*** *(p. 1114) to operate on.*

- class **CmsDestinationAccessor**

  Extends the `CmsAccessor` *(p. 971) to add support for resolving destination names.*

- class **CmsTemplate**

  `CmsTemplate` *(p. 992) simplifies performing synchronous CMS operations.*

- class **DestinationResolver**

  Resolves a CMS destination name to a `Destination`*.*

- class **DynamicDestinationResolver**

  Resolves a CMS destination name to a `Destination`*.*

- class **MessageCreator**

  Creates the user-defined message to be sent by the `CmsTemplate` *(p. 992).*

- class **PooledSession**

  A pooled session object that wraps around a delegate session.

- class **ProducerCallback**

  Callback for sending a message to a CMS destination.

- class **ResourceLifecycleManager**

  Manages the lifecycle of a set of CMS resources.

- class **SessionCallback**

  Callback for executing any number of operations on a provided CMS Session.

- class **SessionPool**

  A pool of CMS sessions from the same connection and with the same acknowledge mode.

5.3 activemq::commands Namespace Reference

Data Structures

- class **ActiveMQBlobMessage**
- class **ActiveMQBytesMessage**
- class **ActiveMQDestination**
- class **ActiveMQMapMessage**
- class **ActiveMQMessage**
- class **ActiveMQMessageTemplate**
- class **ActiveMQObjectMessage**
- class **ActiveMQQueue**
- class **ActiveMQStreamMessage**
- class **ActiveMQTempDestination**
- class **ActiveMQTempQueue**
- class **ActiveMQTempTopic**
- class **ActiveMQTextMessage**
- class **ActiveMQTopic**
- class **BaseCommand**
- class **BaseDataStructure**
- class **BooleanExpression**
- class **BrokerError**

  This class represents an Exception sent from the Broker.

- class **BrokerId**
- class **BrokerInfo**
- class **Command**
- class **ConnectionControl**
- class **ConnectionError**
- class **ConnectionId**
- class **ConnectionInfo**
- class **ConsumerControl**
- class **ConsumerId**
- class **ConsumerInfo**
- class **ControlCommand**
- class **DataArrayResponse**
- class **DataResponse**
- class **DataStructure**
- class **DestinationInfo**
- class **DiscoveryEvent**
- class **ExceptionResponse**
- class **FlushCommand**
- class **IntegerResponse**
- class **JournalQueueAck**
- class **JournalTopicAck**
- class **JournalTrace**
- class **JournalTransaction**
- class **KeepAliveInfo**
- class **LastPartialCommand**
- class **LocalTransactionId**

- class **Message**
- class **MessageAck**
- class **MessageDispatch**
- class **MessageDispatchNotification**
- class **MessageId**
- class **MessagePull**
- class **NetworkBridgeFilter**
- class **PartialCommand**
- class **ProducerAck**
- class **ProducerId**
- class **ProducerInfo**
- class **RemoveInfo**
- class **RemoveSubscriptionInfo**
- class **ReplayCommand**
- class **Response**
- class **SessionId**
- class **SessionInfo**
- class **ShutdownInfo**
- class **SubscriptionInfo**
- class **TransactionId**
- class **TransactionInfo**
- class **WireFormatInfo**
- class **XATransactionId**

5.4 activemq::core Namespace Reference

Namespaces

- namespace **kernels**
- namespace **policies**

Data Structures

- class **ActiveMQAckHandler**

  Interface class that is used to give CMS Messages an interface to Ack themselves with.

- class **ActiveMQConnection**

  Concrete connection used for all connectors to the ActiveMQ broker.

- class **ActiveMQConnectionFactory**
- class **ActiveMQConnectionMetaData**

  This class houses all the various settings and information that is used by an instance of an ***ActiveMQConnection*** *(p. 232) class.*

- class **ActiveMQConstants**

  Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back an forth between string and enum values.

- class **ActiveMQConsumer**
- class **ActiveMQDestinationEvent**
- class **ActiveMQDestinationSource**
- class **ActiveMQMessageAudit**
- class **ActiveMQProducer**
- class **ActiveMQQueueBrowser**
- class **ActiveMQSession**
- class **ActiveMQSessionExecutor**

  Delegate dispatcher for a single session.

- class **ActiveMQTransactionContext**

  Transaction Management class, hold messages that are to be redelivered upon a request to rollback.

- class **ActiveMQXAConnection**
- class **ActiveMQXAConnectionFactory**
- class **ActiveMQXASession**
- class **AdvisoryConsumer**
- class **ConnectionAudit**

  Provides the Auditing functionality used by Connections to attempt to filter out duplicate Messages.

- class **DispatchData**

  Simple POCO that contains the information necessary to route a message to a specified consumer.

- class **Dispatcher**

Interface for an object responsible for dispatching messages to consumers.

- class **FifoMessageDispatchChannel**
- class **MessageDispatchChannel**
- class **PrefetchPolicy**

  Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

- class **RedeliveryPolicy**

  *Interface for a **RedeliveryPolicy** (p. 2542) object that controls how message Redelivery is handled in ActiveMQ-CPP when a transaction is rolled back.*

- class **SimplePriorityMessageDispatchChannel**
- class **Synchronization**

  *Transacted Object **Synchronization** (p. 2968), used to sync the events of a Transaction with the items in the Transaction.*

5.5 activemq::core::kernels Namespace Reference

Data Structures

- class **ActiveMQConsumerKernel**
- class **ActiveMQProducerKernel**
- class **ActiveMQSessionKernel**
- class **ActiveMQXASessionKernel**

5.6 activemq::core::policies Namespace Reference

Data Structures

- class **DefaultPrefetchPolicy**
- class **DefaultRedeliveryPolicy**

5.7 activemq::exceptions Namespace Reference

Data Structures

- class **ActiveMQException**
- class **BrokerException**
- class **ConnectionFailedException**

5.8 activemq::io Namespace Reference

Data Structures

- class **LoggingInputStream**
- class **LoggingOutputStream**

  OutputStream filter that just logs the data being written.

5.9 activemq::library Namespace Reference

Data Structures

- class **ActiveMQCPP**

5.10 activemq::state Namespace Reference

Data Structures

- class **CommandVisitor**

  Interface for an Object that can visit the various Command Objects that are sent from and to this client.

- class **CommandVisitorAdapter**

  Default Implementation of a ***CommandVisitor*** *(p. 1026) that returns NULL for all calls.*

- class **ConnectionState**
- class **ConnectionStateTracker**
- class **ConsumerState**
- class **ProducerState**
- class **SessionState**
- class **Tracked**
- class **TransactionState**

5.11 activemq::threads Namespace Reference

Data Structures

- class **CompositeTask**

  Represents a single task that can be part of a set of Tasks that are contained in a ***CompositeTaskRunner*** *(p. 1046).*

- class **CompositeTaskRunner**

  A ***Task*** *(p. 2989) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.*

- class **DedicatedTaskRunner**
- class **Scheduler**

  Scheduler *(p. 2630) class for use in executing Runnable Tasks either periodically or one time only with optional delay.*

- class **SchedulerTimerTask**

  Extension of the Decaf TimerTask that adds a Runnable instance which is the target of this task.

- class **Task**

  Represents a unit of work that requires one or more iterations to complete.

- class **TaskRunner**

5.12 activemq::transport Namespace Reference

Namespaces

- namespace **correlator**
- namespace **failover**
- namespace **inactivity**
- namespace **logging**
- namespace **mock**
- namespace **tcp**

Data Structures

- class **AbstractTransportFactory**

  *Abstract implementation of the **TransportFactory** (p. 3133) interface, providing the base functionality that's common to most of the **TransportFactory** (p. 3133) instances.*

- class **CompositeTransport**

  *A Composite **Transport** (p. 3125) is a **Transport** (p. 3125) implementation that is composed of several Transports.*

- class **DefaultTransportListener**

  *A Utility class that create empty implementations for the **TransportListener** (p. 3146) interface so that a subclass only needs to override the one's its interested.*

- class **FutureResponse**

  A container that holds a response object.

- class **IOTransport**

  *Implementation of the **Transport** (p. 3125) interface that performs marshaling of **commands** (p. 61) to IO streams.*

- class **ResponseCallback**

  Allows an async send to complete at a later time via a Response event.

- class **Transport**

  *Interface for a **transport** (p. 72) layer for command objects.*

- class **TransportFactory**

  Defines the interface for Factories that create Transports or TransportFilters.

- class **TransportFilter**

  *A filter on the **transport** (p. 72) layer.*

- class **TransportListener**

  *A listener of asynchronous **exceptions** (p. 67) from a command **transport** (p. 72) object.*

- class **TransportRegistry**

  *Registry of all **Transport** (p. 3125) Factories that are available to the client at runtime.*

5.13 activemq::transport::correlator Namespace Reference

Data Structures

- class **ResponseCorrelator**

  *This type of **transport** (p. 72) filter is responsible for correlating asynchronous responses with requests.*

5.14 activemq::transport::failover Namespace Reference

Data Structures

- class **BackupTransport**
- class **BackupTransportPool**
- class **CloseTransportsTask**
- class **FailoverTransport**
- class **FailoverTransportFactory**

  *Creates an instance of a **FailoverTransport** (p. 1490).*

- class **FailoverTransportListener**

  *Utility class used by the **Transport** (p. 3125) to perform the work of responding to events from the active **Transport** (p. 3125).*

- class **URIPool**

5.15 activemq::transport::inactivity Namespace Reference

Data Structures

- class **InactivityMonitor**
- class **ReadChecker**

  Runnable class that is used by the {.

- class **WriteChecker**

  Runnable class used by the {.

5.16 activemq::transport::logging Namespace Reference

Data Structures

- class **LoggingTransport**

  *A **transport** (p. 72) filter that logs **commands** (p. 61) as they are sent/received.*

5.17 activemq::transport::mock Namespace Reference

Data Structures

- class **InternalCommandListener**

  Listens for Commands sent from the ***MockTransport*** (p. *2221*).

- class **MockTransport**

  The ***MockTransport*** (p. *2221*) *defines a base level* ***Transport*** (p. *3125*) *class that is intended to be used in place of an a regular protocol* ***Transport*** (p. *3125*) *suck as TCP.*

- class **MockTransportFactory**

  Manufactures MockTransports, which are objects that read from input streams and write to output streams.

- class **ResponseBuilder**

  Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

5.18 activemq::transport::tcp Namespace Reference

Data Structures

- class **SslTransport**

  Transport *(p. 3125) for connecting to a Broker using an SSL Socket.*

- class **SslTransportFactory**
- class **TcpTransport**

  Implements a TCP/IP based ***transport*** *(p. 72) filter, this* ***transport*** *(p. 72) is meant to wrap an instance of an* ***IOTransport*** *(p. 1790).*

- class **TcpTransportFactory**

  Factory Responsible for creating the ***TcpTransport*** *(p. 3005).*

5.19 activemq::util Namespace Reference

Data Structures

- class **ActiveMQMessageTransformation**
- class **ActiveMQProperties**

  Implementation of the CMSProperties interface that delegates to a ***decaf::util::Properties*** *(p. 2486) object.*

- class **AdvisorySupport**

  Support class that provides various static constants for use in constructing Destination names for the ActiveMQ advisory destinations.

- class **CMSExceptionSupport**
- class **CompositeData**

  Represents a Composite URI.

- class **IdGenerator**
- class **LongSequenceGenerator**

  This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

- class **MarshallingSupport**
- class **MemoryUsage**
- class **PrimitiveList**

  List of primitives.

- class **PrimitiveMap**

  Map of named primitives.

- class **PrimitiveValueConverter**

  Class controls the conversion of data contained in a ***PrimitiveValueNode*** *(p. 2430) from one type to another.*

- class **PrimitiveValueNode**

  Class that wraps around a single value of one of the many types.

- class **Service**

  Base interface for all classes that run as a ***Service*** *(p. 2672) inside the application.*

- class **ServiceListener**

  Listener interface for observers of ***Service*** *(p. 2672) related events.*

- class **ServiceStopper**
- class **ServiceSupport**

  Provides a base class for ***Service*** *(p. 2672) implementations.*

- class **URISupport**
- class **Usage**

Functions

- template<>
  std::string **PrimitiveValueConverter::convert< std::string >** (const **PrimitiveValueNode** &value) const
- template<>
  std::vector< unsigned char > **PrimitiveValueConverter::convert< std::vector< unsigned char > >** (const **PrimitiveValueNode** &value) const

5.19.1 Function Documentation

5.19.1.1 template<> std::string activemq::util::PrimitiveValueConverter::convert< std::string > (const PrimitiveValueNode & *value*) const [inline]

5.19.1.2 template<> std::vector<unsigned char> activemq::util::PrimitiveValueConverter::convert< std::vector< unsigned char > > (const PrimitiveValueNode & *value*) const [inline]

5.20 activemq::wireformat Namespace Reference

Namespaces

- namespace **openwire**
- namespace **stomp**

Data Structures

- class **MarshalAware**
- class **WireFormat**

  *Provides a mechanism to marshal **commands** (p. 61) into and out of packets or into and out of streams, Channels and Datagrams.*

- class **WireFormatFactory**

  *The **WireFormatFactory** (p. 3231) is the interface that all **WireFormatFactory** (p. 3231) classes must extend.*

- class **WireFormatNegotiator**

  *Defines a **WireFormatNegotiator** (p. 3247) which allows a **WireFormat** (p. 3227) to.*

- class **WireFormatRegistry**

  *Registry of all **WireFormat** (p. 3227) Factories that are available to the client at runtime.*

5.21 activemq::wireformat::openwire Namespace Reference

Namespaces

- namespace **marshal**
- namespace **utils**

Data Structures

- class **OpenWireFormat**
- class **OpenWireFormatFactory**
- class **OpenWireFormatNegotiator**
- class **OpenWireResponseBuilder**

  *Used to allow a MockTransport to generate response **commands** (p. 61) to OpenWire Commands.*

5.22 activemq::wireformat::openwire::marshal Namespace Reference

Namespaces

- namespace **generated**

Data Structures

- class **BaseDataStreamMarshaller**

  *Base class for all Marshallers that **marshal** (p. 83) DataStructures to and from the wire using the OpenWire protocol.*

- class **DataStreamMarshaller**

  *Base class for all classes that **marshal** (p. 83) **commands** (p. 61) for Openwire.*

- class **PrimitiveTypesMarshaller**

  *This class wraps the functionality needed to **marshal** (p. 83) a primitive map to the Openwire Format's expectation of what the map looks like on the wire.*

5.23 activemq::wireformat::openwire::marshal::generated Namespace Reference

Data Structures

- class **ActiveMQBlobMessageMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQBlobMessageMarshaller*** *(p. 209).*

- class **ActiveMQBytesMessageMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQBytesMessageMarshaller*** *(p. 228).*

- class **ActiveMQDestinationMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQDestinationMarshaller*** *(p. 333).*

- class **ActiveMQMapMessageMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQMapMessageMarshaller*** *(p. 361).*

- class **ActiveMQMessageMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQMessageMarshaller*** *(p. 372).*

- class **ActiveMQObjectMessageMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQObjectMessageMarshaller*** *(p. 389).*

- class **ActiveMQQueueMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQQueueMarshaller*** *(p. 429).*

- class **ActiveMQStreamMessageMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQStreamMessageMarshaller*** *(p. 489).*

- class **ActiveMQTempDestinationMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQTempDestinationMarshaller*** *(p. 498).*

- class **ActiveMQTempQueueMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQTempQueueMarshaller*** *(p. 506).*

- class **ActiveMQTempTopicMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQTempTopicMarshaller*** *(p. 514).*

- class **ActiveMQTextMessageMarshaller**

  Marshaling ***code*** *(p. 1005) for Open Wire Format for* ***ActiveMQTextMessageMarshaller*** *(p. 523).*

- class **ActiveMQTopicMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQTopicMarshaller** (p. 531).*

- class **BaseCommandMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **BaseCommandMarshaller** (p. 642).*

- class **BrokerIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **BrokerIdMarshaller** (p. 719).*

- class **BrokerInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **BrokerInfoMarshaller** (p. 731).*

- class **ConnectionControlMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ConnectionControlMarshaller** (p. 1102).*

- class **ConnectionErrorMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ConnectionErrorMarshaller** (p. 1110).*

- class **ConnectionIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ConnectionIdMarshaller** (p. 1125).*

- class **ConnectionInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ConnectionInfoMarshaller** (p. 1136).*

- class **ConsumerControlMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ConsumerControlMarshaller** (p. 1169).*

- class **ConsumerIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ConsumerIdMarshaller** (p. 1178).*

- class **ConsumerInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ConsumerInfoMarshaller** (p. 1191).*

- class **ControlCommandMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ControlCommandMarshaller** (p. 1199).*

- class **DataArrayResponseMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **DataArrayResponseMarshaller** (p. 1241).*

- class **DataResponseMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **DataResponseMarshaller** (p. 1283).*

- class **DestinationInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **DestinationInfoMarshaller** (p. 1388).*

- class **DiscoveryEventMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **DiscoveryEventMarshaller** (p. 1407).*

- class **ExceptionResponseMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ExceptionResponseMarshaller** (p. 1469).*

- class **FlushCommandMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **FlushCommandMarshaller** (p. 1565).*

- class **IntegerResponseMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **IntegerResponseMarshaller** (p. 1756).*

- class **JournalQueueAckMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **JournalQueueAckMarshaller** (p. 1807).*

- class **JournalTopicAckMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **JournalTopicAckMarshaller** (p. 1816).*

- class **JournalTraceMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **JournalTraceMarshaller** (p. 1823).*

- class **JournalTransactionMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **JournalTransactionMarshaller** (p. 1830).*

- class **KeepAliveInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **KeepAliveInfoMarshaller** (p. 1837).*

- class **LastPartialCommandMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **LastPartialCommandMarshaller** (p. 1851).*

- class **LocalTransactionIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **LocalTransactionIdMarshaller** (p. 1920).*

- class **MarshallerFactory**

  Used to create marshallers for a specific version of the wire protocol.

- class **MessageAckMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **MessageAckMarshaller** (p. 2122).*

- class **MessageDispatchMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **MessageDispatchMarshaller** (p. 2155).*

- class **MessageDispatchNotificationMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **MessageDispatchNotificationMarshaller** (p. 2164).*

- class **MessageIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **MessageIdMarshaller** (p. 2179).*

- class **MessageMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **MessageMarshaller** (p. 2184).*

- class **MessagePullMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **MessagePullMarshaller** (p. 2215).*

- class **NetworkBridgeFilterMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 2250).*

- class **PartialCommandMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **PartialCommandMarshaller** (p. 2360).*

- class **ProducerAckMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ProducerAckMarshaller** (p. 2460).*

- class **ProducerIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ProducerIdMarshaller** (p. 2472).*

- class **ProducerInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ProducerInfoMarshaller** (p. 2481).*

- class **RemoveInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **RemoveInfoMarshaller** (p. 2576).*

- class **RemoveSubscriptionInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 2585).*

- class **ReplayCommandMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ReplayCommandMarshaller** (p. 2593).*

- class **ResponseMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ResponseMarshaller** (p. 2617).*

- class **SessionIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **SessionIdMarshaller** (p. 2699).*

- class **SessionInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **SessionInfoMarshaller** (p. 2707).*

- class **ShutdownInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **ShutdownInfoMarshaller** (p. 2752).*

- class **SubscriptionInfoMarshaller**

*Marshaling **code** (p. 1005) for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2950).*

- class **TransactionIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **TransactionIdMarshaller** (p. 3102).*

- class **TransactionInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **TransactionInfoMarshaller** (p. 3110).*

- class **WireFormatInfoMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **WireFormatInfoMarshaller** (p. 3243).*

- class **XATransactionIdMarshaller**

  *Marshaling **code** (p. 1005) for Open Wire Format for **XATransactionIdMarshaller** (p. 3286).*

5.24 activemq::wireformat::openwire::utils Namespace Reference

Data Structures

- class **BooleanStream**

  Manages the writing and reading of boolean data streams to and from a data source such as a DataInputStream or DataOutputStream.

- class **HexTable**

  *The **HexTable** (p. 1645) class maps hexidecimal strings to the value of an index into the table, i.e.*

- class **MessagePropertyInterceptor**

  Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

5.25 activemq::wireformat::stomp Namespace Reference

Data Structures

- class **StompCommandConstants**
- class **StompFrame**

  A Stomp-level message frame that encloses all messages to and from the broker.

- class **StompHelper**

  Utility Methods used when marshaling to and from StompFrame's.

- class **StompWireFormat**
- class **StompWireFormatFactory**

  Factory used to create the Stomp Wire Format instance.

5.26 cms Namespace Reference

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

Data Structures

- class **AsyncCallback**

  Asynchronous event interface for CMS asynchronous operations.

- class **BytesMessage**

  *A **BytesMessage** (p. 857) object is used to send a message containing a stream of unsigned bytes.*

- class **Closeable**

  Interface for a class that implements the close method.

- class **CMSException**

  CMS API Exception that is the base for all exceptions thrown from CMS classes.

- class **CMSProperties**

  Interface for a Java-like properties object.

- class **CMSSecurityException**

  This exception must be thrown when a provider rejects a user name/password submitted by a client.

- class **Connection**

  The client's connection to its provider.

- class **ConnectionFactory**

  *Defines the interface for a factory that creates connection objects, the **Connection** (p. 1089) objects returned implement the CMS **Connection** (p. 1089) interface and hide the CMS Provider specific implementation details behind that interface.*

- class **ConnectionMetaData**

  *A **ConnectionMetaData** (p. 1140) object provides information describing the **Connection** (p. 1089) object.*

- class **DeliveryMode**

  This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

- class **Destination**

  *A **Destination** (p. 1377) object encapsulates a provider-specific address.*

- class **DestinationEvent**

  *An event class that is used to wrap information related to **Destination** (p. 1377) add and remove events from the CMS Provider.*

- class **DestinationListener**

  A listener class that the client can implement to receive events related to ***Destination*** *(p. 1377) addition or removal on the CMS Provider.*

- class **DestinationSource**

  Provides an object that will provide a snapshot view of Destinations that exist on the ***Message*** *(p. 2090) provider.*

- class **EnhancedConnection**

  An enhanced CMS ***Connection*** *(p. 1089) instance that provides additional features above the default required features of a CMS* ***Connection*** *(p. 1089) instance.*

- class **ExceptionListener**

  If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener` *(p. 1465) that is registered with the* `Connection` *(p. 1089).*

- class **IllegalStateException**

  This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

- class **InvalidClientIdException**

  This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

- class **InvalidDestinationException**

  This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

- class **InvalidSelectorException**

  This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

- class **MapMessage**

  A ***MapMessage*** *(p. 2024) object is used to send a set of name-value pairs.*

- class **Message**

  Root of all messages.

- class **MessageAvailableListener**

  A listener interface similar to the ***MessageListener*** *(p. 2183) interface.*

- class **MessageConsumer**

  A client uses a `MessageConsumer` *(p. 2127) to received messages from a destination.*

- class **MessageEnumeration**

  Defines an object that enumerates a collection of Messages.

- class **MessageEOFException**

  This exception must be thrown when an unexpected end of stream has been reached when a ***StreamMessage*** *(p. 2923) or* ***BytesMessage*** *(p. 857) is being read.*

- class **MessageFormatException**

  This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

- class **MessageListener**

  A `MessageListener` (p. 2183) object is used to receive asynchronously delivered messages.

- class **MessageNotReadableException**

  This exception must be thrown when a CMS client attempts to read a write-only message.

- class **MessageNotWriteableException**

  This exception must be thrown when a CMS client attempts to write to a read-only message.

- class **MessageProducer**

  *A client uses a `MessageProducer` (p. 2192) object to send messages to a **Destination** (p. 1377).*

- class **MessageTransformer**

  *Provides an interface for clients to transform **cms::Message** (p. 2090) objects inside the CMS **MessageProducer** (p. 2192) and **MessageConsumer** (p. 2127) objects before the message's are sent or received.*

- class **ObjectMessage**

  Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

- class **Queue**

  An interface encapsulating a provider-specific queue name.

- class **QueueBrowser**

  *This class implements in interface for browsing the messages in a **Queue** (p. 2514) without removing them.*

- class **ResourceAllocationException**

  This exception is thrown when an operation is invalid because a transaction is in progress.

- class **Session**

  *A **Session** (p. 2680) object is a single-threaded context for producing and consuming messages.*

- class **Startable**

  Interface for a class that implements the start method.

- class **Stoppable**

  Interface for a class that implements the stop method.

- class **StreamMessage**

  *Interface for a **StreamMessage** (p. 2923).*

- class **TemporaryQueue**

  *Defines a Temporary **Queue** (p. 2514) based **Destination** (p. 1377).*

- class **TemporaryTopic**

Defines a Temporary ***Topic*** *(p. 3096) based* ***Destination*** *(p. 1377).*

- class **TextMessage**

  Interface for a text message.

- class **Topic**

  An interface encapsulating a provider-specific topic name.

- class **TransactionInProgressException**

  This exception is thrown when an operation is invalid because a transaction is in progress.

- class **TransactionRolledBackException**

  This exception must be thrown when a call to ***Session.commit*** *(p. 2684) results in a rollback of the current transaction.*

- class **UnsupportedOperationException**

  This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

- class **XAConnection**

  The ***XAConnection*** *(p. 3261) interface defines an extended* ***Connection*** *(p. 1089) type that is used to create* ***XASession*** *(p. 3278) objects.*

- class **XAConnectionFactory**

  The ***XAConnectionFactory*** *(p. 3262) interface is specialized interface that defines an* ***ConnectionFactory*** *(p. 1114) that creates* ***Connection*** *(p. 1089) instance that will participate in XA Transactions.*

- class **XAException**

  The ***XAException*** *(p. 3265) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.*

- class **XAResource**

  The ***XAResource*** *(p. 3271) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).*

- class **XASession**

  The ***XASession*** *(p. 3278) interface extends the capability of* ***Session*** *(p. 2680) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).*

- class **Xid**

  An interface which provides a mapping for the X/Open XID transaction identifier structure.

Namespaces

- namespace **io**
- namespace **net**
- namespace **nio**
- namespace **security**
- namespace **util**

Data Structures

- class **AprPool**

  *Wraps an APR pool object so that classes in **decaf** (p. 96) can create a static member for use in static methods where apr function calls that need a pool are made.*

- class **DecafRuntime**

  Handles APR initialization and termination.

5.29 decaf::internal::io Namespace Reference

Data Structures

- class **StandardErrorOutputStream**

  Wrapper Around the Standard error Output facility on the current platform.

- class **StandardInputStream**
- class **StandardOutputStream**

5.30 decaf::internal::net Namespace Reference

Namespaces

- namespace **ssl**
- namespace **tcp**

Data Structures

- class **DefaultServerSocketFactory**

  Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.

- class **DefaultSocketFactory**

  SocketFactory implementation that is used to create Sockets.

- class **Network**

  Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.

- class **SocketFileDescriptor**

  File Descriptor type used internally by Decaf Socket objects.

- class **URIEncoderDecoder**
- class **URIHelper**

  Helper class used by the URI classes in encoding and decoding of URI's.

- class **URIType**

  Basic type object that holds data that composes a given URI.

5.31 decaf::internal::net::ssl Namespace Reference

Namespaces

- namespace **openssl**

Data Structures

- class **DefaultSSLContext**

  Default SSLContext manager for the Decaf library.

- class **DefaultSSLServerSocketFactory**

  Default implementation of the SSLServerSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

- class **DefaultSSLSocketFactory**

  Default implementation of the SSLSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

5.32 decaf::internal::net::ssl::openssl Namespace Reference

Data Structures

- class **OpenSSLContextSpi**

  Provides an SSLContext that wraps the OpenSSL API.

- class **OpenSSLParameters**

  Container class for parameters that are Common to OpenSSL socket classes.

- class **OpenSSLServerSocket**

  SSLServerSocket based on OpenSSL library ***code*** (p. *1005*).

- class **OpenSSLServerSocketFactory**

  SSLServerSocketFactory that creates Server Sockets that use OpenSSL.

- class **OpenSSLSocket**

  Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

- class **OpenSSLSocketException**

  Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.

- class **OpenSSLSocketFactory**

  Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

- class **OpenSSLSocketInputStream**

  An output stream for reading data from an OpenSSL Socket instance.

- class **OpenSSLSocketOutputStream**

  OutputStream implementation used to write data to an ***OpenSSLSocket*** (p. *2294*) *instance.*

5.33 decaf::internal::net::tcp Namespace Reference

Data Structures

- class **TcpSocket**

  Platform-independent implementation of the socket interface.

- class **TcpSocketInputStream**

  Input stream for performing reads on a socket.

- class **TcpSocketOutputStream**

  Output stream for performing write operations on a socket.

5.34 decaf::internal::nio Namespace Reference

Data Structures

- class **BufferFactory**

  Factory class used by static methods in the ***decaf::nio*** *(p. 120) package to create the various default version of the NIO interfaces.*

- class **ByteArrayBuffer**

  This class defines six categories of operations upon byte buffers:.

- class **CharArrayBuffer**
- class **DoubleArrayBuffer**
- class **FloatArrayBuffer**
- class **IntArrayBuffer**
- class **LongArrayBuffer**
- class **ShortArrayBuffer**

5.35 decaf::internal::security Namespace Reference

Namespaces

- namespace **provider**

Data Structures

- class **Engine**

  *The **Engine** (p. 1449) class serves as a convenience class for classes in the Decaf Security package.*

- class **SecurityRuntime**

  Internal class used to manage Security related resources and hide platform dependent calls from the higher level API.

- class **ServiceRegistry**

  Serves as a registry for all the Providers for services using the naming format of "Service-Name.Algorithm".

- class **SecureRandomImpl**

  Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources.

5.36 decaf::internal::security::provider Namespace Reference

Namespaces

- namespace **crypto**

Data Structures

- class **DefaultMessageDigestProviderService**

  *Decaf's Default Message Digest Security **provider** (p. 105) used to create instances of the built-in Message Digest algorithm SPI classes.*

- class **DefaultProvider**

  Implements the Security Provider interface for the Decaf library.

- class **DefaultSecureRandomProviderService**

  *Decaf's Default Secure Random Security **provider** (p. 105) used to create instances of the built-in Secure Random algorithm SPI classes.*

5.37 decaf::internal::security::provider::crypto Namespace Reference

Data Structures

- class **MD4MessageDigestSpi**
  MD4 MessageDigestSpi.
- class **MD5MessageDigestSpi**
  MD5 MessageDigestSpi.
- class **SHA1MessageDigestSpi**
  SHA1 MessageDigestSpi.

5.38 decaf::internal::util Namespace Reference

Namespaces

- namespace **concurrent**

Data Structures

- class **ByteArrayAdapter**

  This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

- class **GenericResource**

  A Generic ***Resource*** *(p. 2599) wraps some type and will delete it when the* ***Resource*** *(p. 2599) itself is deleted.*

- class **HexStringParser**
- class **Resource**

  Interface for all Managed Resources in Decaf, these objects are added to the Runtime System and are destroyed at shutdown.

- class **ResourceLifecycleManager**
- class **StringUtils**
- class **TimerTaskHeap**

  A Binary Heap implemented specifically for the Timer class in Decaf Util.

5.39 decaf::internal::util::concurrent Namespace Reference

Data Structures

- class **Atomics**
- class **ExecutorsSupport**

  Various support methods for use in Executors and surrounding classes.

- class **PlatformThread**
- class **SynchronizableImpl**

  A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

- class **Threading**
- struct **ThreadHandle**
- struct **MonitorHandle**
- class **CompletionCondition**
- class **ThreadLocalImpl**
- class **Transferer**

  *Shared **internal** (p. 97) API for dual stacks and queues.*

- class **TransferQueue**

  This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers.

- class **TransferStack**
- struct **RWLOCK**

Typedefs

- typedef PLATFORM_THREAD_CALLBACK_TYPE(PLATFORM_CALLING_CONV * **threadMainMethod**)(**PLATFORM_THREAD_ENTRY_ARG**)

  *This is the main method for thread instances, this value is valid on any platform, the **PlatformThread** (p. 2364) methods will handle calling this method and providing it with its assigned arg.*

- typedef void(* **threadingTask**)(void *)

  *The **ThreadHandle** (p. 3030) contains one of these and it should be the method that does the actual work for the thread.*

- typedef void * **PLATFORM_THREAD_ENTRY_ARG**
- typedef pthread_t **decaf_thread_t**
- typedef pthread_key_t **decaf_tls_key**
- typedef pthread_cond_t * **decaf_condition_t**
- typedef pthread_mutex_t * **decaf_mutex_t**
- typedef pthread_rwlock_t * **decaf_rwmutex_t**

5.39.1 Typedef Documentation

5.39.1.1 typedef HANDLE decaf::internal::util::concurrent::decaf_condition_t

5.39.1.2 typedef LPCRITICAL_SECTION decaf::internal::util::concurrent::decaf_mutex_t

5.39.1.3 typedef RWLOCK * decaf::internal::util::concurrent::decaf_rwmutex_t

5.39.1.4 typedef HANDLE decaf::internal::util::concurrent::decaf_thread_t

5.39.1.5 typedef DWORD decaf::internal::util::concurrent::decaf_tls_key

5.39.1.6 typedef void * decaf::internal::util::concurrent::PLATFORM_THREAD_ENTRY_ARG

5.39.1.7 typedef void(* decaf::internal::util::concurrent::threadingTask)(void *)

The **ThreadHandle** (p. 3030) contains one of these and it should be the method that does the actual work for the thread.

5.39.1.8 typedef PLATFORM_THREAD_CALLBACK_TYPE(PLATFORM_CALLING_CONV * decaf::internal::util::concurrent::threadMainMethod)(PLATFORM_THREAD_ENTRY_ARG)

This is the main method for thread instances, this value is valid on any platform, the **PlatformThread** (p. 2364) methods will handle calling this method and providing it with its assigned arg.

Parameters:

arg A void* that was given when the thread was started.

5.40 decaf::io Namespace Reference

Data Structures

- class **BlockingByteArrayInputStream**

  This is a blocking version of a byte buffer stream.

- class **BufferedInputStream**

  A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of ***io*** *(p. 110) operations on the input stream.*

- class **BufferedOutputStream**

  Wrapper around another output stream that buffers output before writing to the target output stream.

- class **ByteArrayInputStream**

  A ***ByteArrayInputStream*** *(p. 823) contains an* ***internal*** *(p. 97) buffer that contains bytes that may be read from the stream.*

- class **ByteArrayOutputStream**
- class **Closeable**

  Interface for a class that implements the close method.

- class **DataInput**

  The ***DataInput*** *(p. 1255) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.*

- class **DataInputStream**

  A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

- class **DataOutput**

  The ***DataOutput*** *(p. 1271) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.*

- class **DataOutputStream**

  A data output stream lets an application write primitive Java data types to an output stream in a portable way.

- class **EOFException**
- class **FileDescriptor**

  This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.

- class **FilterInputStream**

  A ***FilterInputStream*** *(p. 1521) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.*

- class **FilterOutputStream**

  This class is the superclass of all classes that filter output streams.

- class **Flushable**

  *A **Flushable** (p. 1561) is a destination of data that can be flushed.*

- class **InputStream**

  A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.

- class **InputStreamReader**

  *An **InputStreamReader** (p. 1717) is a bridge from byte streams to character streams.*

- class **InterruptedIOException**
- class **IOException**
- class **OutputStream**

  Base interface for any class that wants to represent an output stream of bytes.

- class **OutputStreamWriter**

  A class for turning a character stream into a byte stream.

- class **PushbackInputStream**

  *A **PushbackInputStream** (p. 2508) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.*

- class **Reader**
- class **UnsupportedEncodingException**

  Thrown when the the Character Encoding is not supported.

- class **UTFDataFormatException**

  Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

- class **Writer**

5.41 decaf::lang Namespace Reference

Namespaces

- namespace **exceptions**

Data Structures

- class **Appendable**

  An object to which char sequences and values can be appended.

- class **ArrayPointer**

  Decaf's implementation of a Smart ***Pointer*** *(p. 2370) that is a template on a Type and is* ***Thread*** *(p. 3016) Safe if the default Reference Counter is used.*

- class **ArrayPointerComparator**

  This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this ***ArrayPointer*** *(p. 599).*

- class **Boolean**
- class **Byte**
- class **Character**
- class **CharSequence**

  A ***CharSequence*** *(p. 949) is a readable sequence of char values.*

- class **Comparable**

  This interface imposes a total ordering on the objects of each class that implements it.

- class **Double**
- class **Exception**
- class **Float**
- class **Integer**
- class **Iterable**

  Implementing this interface allows an object to be cast to an ***Iterable*** *(p. 1799) type for generic collections API calls.*

- class **Long**
- class **Math**

  The class `Math` *(p. 2043) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.*

- class **Number**

  The abstract class ***Number*** *(p. 2269) is the superclass of classes* ***Byte*** *(p. 766),* ***Double*** *(p. 1414),* ***Float*** *(p. 1531),* ***Integer*** *(p. 1738),* ***Long*** *(p. 1967), and* ***Short*** *(p. 2721).*

- struct **STATIC_CAST_TOKEN**
- struct **DYNAMIC_CAST_TOKEN**
- class **Pointer**

  Decaf's implementation of a Smart ***Pointer*** *(p. 2370) that is a template on a Type and is* ***Thread*** *(p. 3016) Safe if the default Reference Counter is used.*

- class **PointerComparator**

  This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the ***Pointer*** *(p. 2370) instance.*

- class **Readable**

  A ***Readable*** *(p. 2526) is a source of characters.*

- class **Runnable**

  Interface for a runnable object - defines a task that can be run by a thread.

- class **Runtime**
- class **Short**
- class **String**

  The ***String*** *(p. 2935) class represents an immutable sequence of chars.*

- class **System**

  The ***System*** *(p. 2979) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.*

- class **Thread**

  A ***Thread*** *(p. 3016) is a concurrent unit of execution.*

- class **ThreadGroup**
- class **ThreadLocal**

  This class provides thread-local variables.

- class **Throwable**

  This class represents an error that has occurred.

- class **Types**

Functions

Namespaces

- namespace **ssl**

Data Structures

- class **BindException**
- class **ConnectException**
- class **DatagramPacket**

  Class that represents a single datagram packet.

- class **HttpRetryException**
- class **Inet4Address**
- class **Inet6Address**
- class **InetAddress**

  Represents an IP address.

- class **InetSocketAddress**
- class **MalformedURLException**
- class **NoRouteToHostException**
- class **PortUnreachableException**
- class **ProtocolException**
- class **ServerSocket**

  This class implements server sockets.

- class **ServerSocketFactory**

  Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

- class **Socket**
- class **SocketAddress**

  Base class for protocol specific ***Socket*** *(p. 2770) addresses.*

- class **SocketError**

  Static utility class to simplify handling of error codes for socket operations.

- class **SocketException**

  Exception for errors when manipulating sockets.

- class **SocketFactory**

  The ***SocketFactory*** *(p. 2789) is used to create* ***Socket*** *(p. 2770) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.*

- class **SocketImpl**

  Acts as a base class for all physical ***Socket*** *(p. 2770) implementations.*

- class **SocketImplFactory**

  Factory class interface for a Factory that creates ScoketImpl objects.

- class **SocketOptions**
- class **SocketTimeoutException**
- class **UnknownHostException**
- class **UnknownServiceException**
- class **URI**

  *This class represents an instance of a **URI** (p. 3168) as defined by RFC 2396.*

- class **URISyntaxException**
- class **URL**

  *Class **URL** (p. 3210) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.*

- class **URLDecoder**
- class **URLEncoder**

5.44 decaf::net::ssl Namespace Reference

Data Structures

- class **SSLContext**

  Represents on implementation of the Secure ***Socket*** *(p. 2770) Layer for streaming based sockets.*

- class **SSLContextSpi**

  Defines the interface that should be provided by an ***SSLContext*** *(p. 2810) provider.*

- class **SSLParameters**
- class **SSLServerSocket**

  Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol.

- class **SSLServerSocketFactory**

  Factory class interface that provides methods to create SSL Server Sockets.

- class **SSLSocket**
- class **SSLSocketFactory**

  Factory class interface for a ***SocketFactory*** *(p. 2789) that can create* ***SSLSocket*** *(p. 2829) objects.*

5.45 decaf::nio Namespace Reference

Data Structures

- class **Buffer**

  A container for data of a specific primitive type.

- class **BufferOverflowException**
- class **BufferUnderflowException**
- class **ByteBuffer**

  This class defines six categories of operations upon byte buffers:.

- class **CharBuffer**

  This class defines four categories of operations upon character buffers:.

- class **DoubleBuffer**

  This class defines four categories of operations upon double buffers:.

- class **FloatBuffer**

  This class defines four categories of operations upon float buffers:.

- class **IntBuffer**

  This class defines four categories of operations upon int buffers:.

- class **InvalidMarkException**
- class **LongBuffer**

  This class defines four categories of operations upon long long buffers:.

- class **ReadOnlyBufferException**
- class **ShortBuffer**

  This class defines four categories of operations upon short buffers:.

- class **GeneralSecurityException**
- class **InvalidKeyException**
- class **Key**

  *The **Key** (p. 1841) interface is the top-level interface for all keys.*

- class **KeyException**
- class **KeyManagementException**
- class **MessageDigest**

  *This **MessageDigest** (p. 2134) class provides applications the functionality of a message digest algorithm, such as MD5 or SHA.*

- class **MessageDigestSpi**

  *This class defines the Service **Provider** (p. 2500) Interface (SPI) for the **MessageDigest** (p. 2134) class, which provides the functionality of a message digest algorithm, such as MD5 or SHA.*

- class **NoSuchAlgorithmException**
- class **NoSuchProviderException**
- class **Principal**

  Base interface for a principal, which can represent an individual or organization.

- class **Provider**

  *This class represents a "provider" for the Decaf **Security** (p. 2643) API, where a provider implements some or all parts of Decaf **Security** (p. 2643).*

- class **ProviderException**
- class **ProviderService**
- class **PublicKey**

  A public key.

- class **SecureRandom**
- class **SecureRandomSpi**

  *Interface class used by **Security** (p. 2643) Service Providers to implement a source of secure random bytes.*

- class **Security**
- class **SecuritySpi**

  *Base class used as a Marker for all **Security** (p. 2643) **Provider** (p. 2500) Interface classes in the Decaf **Security** (p. 2643) API.*

- class **SignatureException**

Data Structures

- class **AbstractCollection**

  *This class provides a skeletal implementation of the **Collection** (p. 1006) interface, to minimize the effort required to implement this interface.*

- class **AbstractList**

  *This class provides a skeletal implementation of the **List** (p. 1902) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array).*

- class **AbstractMap**

  *This class provides a skeletal implementation of the **Map** (p. 2008) interface, to minimize the effort required to implement this interface.*

- class **AbstractQueue**

  *This class provides skeletal implementations of some **Queue** (p. 2515) operations.*

- class **AbstractSequentialList**

  *This class provides a skeletal implementation of the **List** (p. 1902) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list).*

- class **AbstractSet**

  *This class provides a skeletal implementation of the **Set** (p. 2715) interface to minimize the effort required to implement this interface.*

- class **ArrayList**
- class **Arrays**
- class **BitSet**

  This class implements a vector of bits that grows as needed.

- class **Collection**

  The root interface in the collection hierarchy.

- class **Collections**
- class **Comparator**

  A comparison function, which imposes a total ordering on some collection of objects.

- class **ConcurrentModificationException**
- class **Date**

Wrapper class around a time value in milliseconds.

- class **Deque**

  Defines a 'Double ended Queue' interface that allows for insertion and removal of elements from both ends.

- struct **HashCodeUnaryBase**
- struct **HashCode**

  *Base **HashCode** (p. 1594) template, specializations are created from this to account for the various native types.*

- struct **HashCode< const T >**
- struct **HashCode< T * >**
- struct **HashCode< const T * >**
- struct **HashCode< bool >**
- struct **HashCode< char >**
- struct **HashCode< wchar_t >**
- struct **HashCode< unsigned short >**
- struct **HashCode< short >**
- struct **HashCode< unsigned int >**
- struct **HashCode< int >**
- struct **HashCode< unsigned long long >**
- struct **HashCode< long long >**
- struct **HashCode< float >**
- struct **HashCode< double >**
- struct **HashCode< std::string >**
- struct **HashCode< const std::string >**
- struct **HashCode< decaf::lang::Pointer< T > >**
- class **HashMap**

  *Hash table based implementation of the **Map** (p. 2008) interface.*

- class **HashSet**

  *This class implements the **Set** (p. 2715) interface, backed by a hash table (actually a **HashMap** (p. 1613) instance).*

- class **Iterator**

  Defines an object that can be used to iterate over the elements of a collection.

- class **LinkedHashMap**

  *Hashed and linked list implementation of the **Map** (p. 2008) interface, with predictable iteration order.*

- class **LinkedHashSet**

  *Hash table and linked list implementation of the **Set** (p. 2715) interface, with predictable iteration order.*

- class **LinkedList**

  *A complete implementation of the **List** (p. 1902) interface using a doubly linked list data structure.*

- class **List**

An ordered collection (also known as a sequence).

- class **ListIterator**

  An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.

- class **LRUCache**

  A Basic Least Recently Used (LRU) Cache ***Map*** (p. *2008).*

- class **Map**

  An object that maps keys to values.

- class **MapEntry**
- class **NoSuchElementException**
- class **PriorityQueueBase**
- class **PriorityQueue**

  An unbounded priority queue based on a binary heap algorithm.

- class **Properties**

  Java-like properties class for mapping string names to string values.

- class **Queue**

  A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

- class **Random**

  Random (p. *2521) Value Generator which is used to generate a stream of pseudorandom numbers.*

- class **Set**

  A collection that contains no duplicate elements.

- class **StlList**

  List (p. *1902) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.*

- class **StlMap**

  Map (p. *2008) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.*

- class **StlQueue**

  The ***Queue*** (p. *2515) class accepts messages with an psuh(m) command where m is the message to be queued.*

- class **StlSet**

  Set (p. *2715) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.*

- class **StringTokenizer**

  Class that allows for parsing of string based on Tokens.

- class **Timer**

  A facility for threads to schedule tasks for future execution in a background thread.

- class **TimerTask**

  A Base class for a task object that can be scheduled for one-time or repeated execution by a ***Timer*** *(p. 3071).*

- class **UUID**

  *A class that represents an immutable universally unique identifier (****UUID*** *(p. 3219)).*

5.51 decaf::util::comparators Namespace Reference

Data Structures

- class **Less**

  *Simple **Less*** (p. 1855) ***Comparator*** (p. 1040) *that compares to elements to determine if the first is less than the second.*

  *Provides a default implementation for the methods of the **ExecutorService** (p. 1484) interface.*

- class **BlockingQueue**

  *A **decaf::util::Queue** (p. 2515) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.*

- class **BrokenBarrierException**
- class **CallableType**

  *Base class of all **Callable<T>** (p. 888) objects, used to allow identification via type casting.*

- class **Callable**

  A task that returns a result and may throw an exception.

- class **CancellationException**
- class **ConcurrentHashMap**
- class **ConcurrentMap**

  *Interface for a **Map** (p. 2008) type that provides additional **atomic** (p. 133) putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 2008) interface.*

- class **ConcurrentStlMap**

  ***Map** (p. 2008) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.*

- class **CopyOnWriteArrayList**
- class **CopyOnWriteArraySet**

  *Since the **CopyOnWriteArraySet** (p. 1221) and the **CopyOnWriteArrayList** (p. 1203) share much of the same operational semantics this class uses the **CopyOnWriteArrayList** (p. 1203) for all its underlying operations.*

- class **CountDownLatch**
- class **Delayed**

  A mix-in style interface for marking objects that should be acted upon after a given delay.

- class **ExecutionException**
- class **Executor**

  *An object that executes submitted **decaf.lang.Runnable** (p. 2622) tasks.*

- class **Executors**

*Implements a set of utilities for use with **Executors** (p. 1479), **ExecutorService** (p. 1484), **ThreadFactory** (p. 3027), and **Callable** (p. 888) types, as well as providing factory methods for instance of these types configured for the most common use cases.*

- class **ExecutorService**

  *An **Executor** (p. 1476) that provides methods to manage termination and methods that can produce a **Future** (p. 1571) for tracking progress of one or more asynchronous tasks.*

- class **FutureType**
- class **Future**

  *A **Future** (p. 1571) represents the result of an asynchronous computation.*

- class **FutureTask**

  A cancellable asynchronous computation.

- class **LinkedBlockingQueue**

  *A **BlockingQueue** (p. 690) derivative that allows for a bound to be placed on the number of elements that can be enqueued at any one time.*

- class **Lock**

  A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

- class **Mutex**

  ***Mutex** (p. 2236) object that offers recursive support on all platforms as well as providing the ability to use the standard wait / notify pattern used in languages like Java.*

- class **RejectedExecutionException**
- class **RejectedExecutionHandler**

  *A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. 3047).*

- class **RunnableFuture**

  *A Runnable version of the **Future** (p. 1571) type.*

- class **Semaphore**

  A counting semaphore.

- class **Synchronizable**

  The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

- class **SynchronousQueue**

  *A **blocking queue** (p. 690) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa.*

- class **ThreadFactory**

  *public interface **ThreadFactory** (p. 3027)*

- class **ThreadPoolExecutor**

  Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

- class **TimeoutException**
- class **TimeUnit**

  *A **TimeUnit** (p. 3088) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.*

- class **LoggerHierarchy**
- class **LogManager**

  *There is a single global **LogManager** (p. 1954) object that is used to maintain a set of shared state about Loggers and log services.*

- class **LogRecord**

  ***LogRecord** (p. 1960) objects are used to pass **logging** (p. 135) requests between the **logging** (p. 135) framework and individual log Handlers.*

- class **LogWriter**
- class **MarkBlockLogger**

  Defines a class that can be used to mark the entry and exit from scoped blocks.

- class **PropertiesChangeListener**

  *Defines the interface that classes can use to listen for change events on **Properties** (p. 2486).*

- class **SimpleFormatter**

  *Print a brief summary of the **LogRecord** (p. 1960) in a human readable format.*

- class **SimpleLogger**
- class **StreamHandler**

  *Stream based **logging** (p. 135) **Handler** (p. 1590).*

- class **XMLFormatter**

  *Format a **LogRecord** (p. 1960) into a standard XML format.*

Enumerations

- enum **Levels** {
  Off, **Null**, **Markblock**, **Debug**,
  Info, **Warn**, **Error**, **Fatal**,
  Throwing }

  Defines an enumeration for logging levels.

5.55.1 Enumeration Type Documentation

5.55.1.1 enum decaf::util::logging::Levels

Defines an enumeration for **logging** (p. 135) levels.

Enumerator:

Off
Null
Markblock
Debug
Info
Warn
Error
Fatal
Throwing

5.56 decaf::util::zip Namespace Reference

Data Structures

- class **Adler32**

  Clas that can be used to compute an Adler-32 ***Checksum*** *(p. 956) for a data stream.*

- class **CheckedInputStream**

  An implementation of a FilterInputStream that will maintain a ***Checksum*** *(p. 956) of the bytes read, the* ***Checksum*** *(p. 956) can then be used to verify the integrity of the input stream.*

- class **CheckedOutputStream**

  An implementation of a FilterOutputStream that will maintain a ***Checksum*** *(p. 956) of the bytes written, the* ***Checksum*** *(p. 956) can then be used to verify the integrity of the output stream.*

- class **Checksum**

  An interface used to represent ***Checksum*** *(p. 956) values in the Zip package.*

- class **CRC32**

  Class that can be used to compute a CRC-32 checksum for a data stream.

- class **DataFormatException**
- class **Deflater**

  This class compresses data using the DEFLATE algorithm (see `specification`*).*

- class **DeflaterOutputStream**

  Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream.

- class **Inflater**

  This class uncompresses data that was compressed using the DEFLATE algorithm (see `specification`*).*

- class **InflaterInputStream**

  A FilterInputStream that decompresses data read from the wrapped InputStream instance.

- class **ZipException**

5.57 std Namespace Reference

Data Structures

- struct **less< decaf::lang::ArrayPointer< T > >**

  An override of the less function object so that the Pointer objects can be stored in STL Maps, etc.

- struct **less< decaf::lang::Pointer< T > >**

  An override of the less function object so that the Pointer objects can be stored in STL Maps, etc.

6.2 decaf::util::AbstractCollection< E > Class Template Reference

This class provides a skeletal implementation of the **Collection** (p. 1006) interface, to minimize the effort required to implement this interface.

`#include <src/main/decaf/util/AbstractCollection.h>`Inheritance diagram for decaf::util::AbstractCollection< E >:

Public Member Functions

- **AbstractCollection** ()
- virtual ~**AbstractCollection** ()
- **AbstractCollection**< E > & **operator**= (const **AbstractCollection**< E > &collection)

  Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).

- virtual bool **contains** (const E &value) const

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).
  Parameters:

  value *The value to check for presence in the collection.*
  Returns:

  true if there is at least one of the elements in the collection
  Exceptions:

  NullPointerException *if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).*

- virtual bool **containsAll** (const **Collection**< E > &collection) const

- virtual bool **equals** (const **Collection**< E > &collection) const

  *Answers true if this **Collection** (p. 1006) and the one given are the same size and if each element contained in the **Collection** (p. 1006) given is equal to an element contained in this collection.*

- virtual void **copy** (const **Collection**< E > &collection)

  *Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006).*

- virtual bool **isEmpty** () const

  Returns true if this collection contains no elements.

- virtual bool **add** (const E &value DECAF_UNUSED)

- virtual bool **addAll** (const **Collection**< E > &collection)

- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).
  Parameters:

  value *The reference to the element to remove from this* ***Collection*** *(*p. *1006).*
  Returns:

  true if the collection was changed, false otherwise.
  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(*p. *1006) is a container of pointers and does not allow NULL values.*

- virtual bool **removeAll** (const **Collection**< E > &collection)

- virtual bool **retainAll** (const **Collection**< E > &collection)

- virtual std::vector< E > **toArray** () const

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(*p. *1006).*

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

Protected Attributes

- **util::concurrent::Mutex mutex**

6.2.1 Detailed Description

template<typename E> class decaf::util::AbstractCollection< E >

This class provides a skeletal implementation of the **Collection** (p. 1006) interface, to minimize the effort required to implement this interface. To implement an unmodifiable collection, the programmer needs only to extend this class and provide implementations for the iterator and size methods. (The iterator returned by the iterator method must implement hasNext and next.)

To implement a modifiable collection, the programmer must additionally override this class's add method (which otherwise throws an UnsupportedOperationException), and the iterator returned by the iterator method must additionally implement its remove method.

The programmer should generally provide a void (no argument) and **Collection** (p. 1006) constructor, as per the recommendation in the **Collection** (p. 1006) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

Since:

1.0

6.2.2 Constructor & Destructor Documentation

6.2.2.1 template<typename E> decaf::util::AbstractCollection< E >::AbstractCollection () [inline]

6.2.2.2 template<typename E> virtual decaf::util::AbstractCollection< E >::~AbstractCollection () [inline, virtual]

6.2.3 Member Function Documentation

6.2.3.1 template<typename E> virtual bool decaf::util::AbstractCollection< E >::add (const E &value *DECAF_UNUSED*) [inline, virtual]

This implementation always throws an UnsupportedOperationException.

Referenced by decaf::util::AbstractCollection< K >::addAll(), decaf::util::AbstractCollection< K >::copy(), and decaf::util::AbstractCollection< K >::operator=().

6.2.3.2 template<typename E> virtual bool decaf::util::AbstractCollection< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented in **decaf::util::AbstractQueue< E >** (p. 177), **decaf::util::ArrayList< E >** (p. 589), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1224), **decaf::util::LinkedList< E >** (p. 1887), **decaf::util::StlList< E >** (p. 2861), **decaf::util::AbstractQueue< Pointer< Transport > >** (p. 177), **decaf::util::ArrayList< ServiceListener * >** (p. 589), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 589), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1887), **decaf::util::LinkedList< CompositeTask * >** (p. 1887), **decaf::util::LinkedList< URI >** (p. 1887), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1887), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1887), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1887), **decaf::util::LinkedList< decaf::net::URI >** (p. 1887), **decaf::util::LinkedList< Pointer< Command > >** (p. 1887), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1887), **decaf::util::LinkedList< cms::Destination * >** (p. 1887), **decaf::util::LinkedList< cms::Session * >** (p. 1887), and **decaf::util::LinkedList< cms::Connection * >** (p. 1887).

6.2.3.3 template<typename E> virtual void decaf::util::AbstractCollection< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Implements **decaf::util::Collection< E >** (p. 1009).

Reimplemented in **decaf::util::AbstractList< E >** (p. 160), **decaf::util::AbstractQueue< E >** (p. 177), **decaf::util::ArrayList< E >** (p. 589), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1224), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1867), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2971), **decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet** (p. 1631), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet** (p. 1155), **decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet** (p. 1635), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet** (p. 1159), **decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection** (p. 1639), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection** (p. 1162), **decaf::util::LinkedList< E >** (p. 1888), **decaf::util::PriorityQueue< E >** (p. 2450), **decaf::util::StlList< E >** (p. 2862), **decaf::util::StlSet< E >** (p. 2895), **decaf::util::AbstractList< ServiceListener * >** (p. 160), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 160), **decaf::util::AbstractList< CompositeTask * >** (p. 160), **decaf::util::AbstractList< URI >** (p. 160), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 160), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 160), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 160), **decaf::util::AbstractList< decaf::net::URI >** (p. 160), **decaf::util::AbstractList< Pointer< Command > >** (p. 160), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 160),

decaf::util::AbstractList< cms::Destination * > (p. 160), **decaf::util::AbstractList< cms::Session * >** (p. 160), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 160), **decaf::util::AbstractList< cms::Connection * >** (p. 160), **decaf::util::AbstractQueue< Pointer< Transport > >** (p. 177), **decaf::util::ArrayList< ServiceListener * >** (p. 589), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 589), **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1867), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1888), **decaf::util::LinkedList< CompositeTask * >** (p. 1888), **decaf::util::LinkedList< URI >** (p. 1888), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1888), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1888), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1888), **decaf::util::LinkedList< decaf::net::URI >** (p. 1888), **decaf::util::LinkedList< Pointer< Command > >** (p. 1888), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1888), **decaf::util::LinkedList< cms::Destination * >** (p. 1888), **decaf::util::LinkedList< cms::Session * >** (p. 1888), **decaf::util::LinkedList< cms::Connection * >** (p. 1888), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2895), and **decaf::util::StlSet< Resource * >** (p. 2895).

Referenced by decaf::util::AbstractCollection< K >::copy(), and decaf::util::AbstractCollection< K >::operator=().

6.2.3.4 template<typename E> virtual bool decaf::util::AbstractCollection< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Implements **decaf::util::Collection< E >** (p. 1010).

Reimplemented in **decaf::util::ArrayList< E >** (p. 590), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1225), **decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet** (p. 1635), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet** (p. 1159), **decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection** (p. 1639), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection** (p. 1162), **decaf::util::LinkedList< E >** (p. 1889), **decaf::util::StlList< E >** (p. 2862), **decaf::util::StlSet< E >** (p. 2896), **decaf::util::ArrayList< ServiceListener * >** (p. 590), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 590), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1889), **decaf::util::LinkedList< CompositeTask**

∗ > (p. 1889), **decaf::util::LinkedList< URI >** (p. 1889), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1889), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1889), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1889), **decaf::util::LinkedList< decaf::net::URI >** (p. 1889), **decaf::util::LinkedList< Pointer< Command > >** (p. 1889), **decaf::util::LinkedList< cms::MessageProducer ∗ >** (p. 1889), **decaf::util::LinkedList< cms::Destination ∗ >** (p. 1889), **decaf::util::LinkedList< cms::Session ∗ >** (p. 1889), **decaf::util::LinkedList< cms::Connection ∗ >** (p. 1889), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2896), and **decaf::util::StlSet< Resource ∗ >** (p. 2896).

Referenced by decaf::util::AbstractCollection< K >::containsAll().

6.2.3.5 template<typename E> virtual bool decaf::util::AbstractCollection< E >::containsAll (const Collection< E > & *collection*) const [inline, virtual]

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1225), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2972).

Referenced by decaf::util::AbstractCollection< K >::equals().

6.2.3.6 template<typename E> virtual void decaf::util::AbstractCollection< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006). The default implementation iterates over the contents of the given collection adding each to this collection after first calling this Collection's clear method.

Parameters:

collection The collection to mirror.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

IllegalStateException if the elements cannot be added at this time due to insertion restrictions.

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1226), **decaf::util::LinkedList< E >** (p. 1889), **decaf::util::StlList< E >** (p. 2862), **decaf::util::StlSet< E >** (p. 2896), **decaf::util::LinkedList< cms::MessageConsumer ∗ >** (p. 1889), **decaf::util::LinkedList< CompositeTask ∗ >** (p. 1889), **decaf::util::LinkedList< URI >** (p. 1889), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1889), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1889), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1889), **decaf::util::LinkedList< decaf::net::URI >** (p. 1889), **decaf::util::LinkedList< Pointer< Command > >** (p. 1889), **decaf::util::LinkedList< cms::MessageProducer ∗ >** (p. 1889), **decaf::util::LinkedList< cms::Destination ∗ >** (p. 1889), **decaf::util::LinkedList< cms::Session ∗ >** (p. 1889), **decaf::util::LinkedList< cms::Connection ∗ >** (p. 1889), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2896), and **decaf::util::StlSet< Resource ∗ >** (p. 2896).

6.2.3.7 template<typename E> virtual bool decaf::util::AbstractCollection< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 1006) and the one given are the same size and if each element contained in the **Collection** (p. 1006) given is equal to an element contained in this collection.

Parameters:

collection - The **Collection** (p. 1006) to be compared to this one.

Returns:

true if this **Collection** (p. 1006) is equal to the one given.

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1226), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2973), **decaf::util::StlList< E >** (p. 2863), **decaf::util::StlSet< E >** (p. 2897), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2897), and **decaf::util::StlSet< Resource * >** (p. 2897).

Referenced by decaf::util::LinkedList< cms::Connection * >::operator!=(), decaf::util::ArrayList< Pointer< ActiveMQDestination > >::operator!=(), decaf::util::LinkedList< cms::Connection * >::operator==(), and decaf::util::ArrayList< Pointer< ActiveMQDestination > >::operator==().

6.2.3.8 template<typename E> virtual bool decaf::util::AbstractCollection< E >::isEmpty () const [inline, virtual]

Returns true if this collection contains no elements. This implementation returns **size()** (p. 1015) == 0.

Returns:

true if the size method return 0.

Implements **decaf::util::Collection< E >** (p. 1012).

Reimplemented in **decaf::util::ArrayList< E >** (p. 591), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1226), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2973), **decaf::util::LinkedList< E >** (p. 1892), **decaf::util::StlList< E >** (p. 2864), **decaf::util::StlSet< E >** (p. 2897), **decaf::util::ArrayList< ServiceListener * >** (p. 591), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 591), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1892), **decaf::util::LinkedList< CompositeTask * >** (p. 1892), **decaf::util::LinkedList< URI >** (p. 1892), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1892), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1892), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1892), **decaf::util::LinkedList< decaf::net::URI >** (p. 1892), **decaf::util::LinkedList< Pointer< Command > >** (p. 1892), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1892), **decaf::util::LinkedList< cms::Destination * >** (p. 1892), **decaf::util::LinkedList< cms::Session * >** (p. 1892), **decaf::util::LinkedList< cms::Connection * >** (p. 1892), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2897), and **decaf::util::StlSet< Resource * >** (p. 2897).

Referenced by decaf::util::AbstractQueue< Pointer< Transport > >::clear(), decaf::util::PriorityQueue< E >::peek(), decaf::util::PriorityQueue< E >::poll(), and decaf::util::PriorityQueue< E >::remove().

6.2.3.9 template<typename E> virtual void decaf::util::AbstractCollection< E >::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::clear(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::remove(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::toArray().

6.2.3.10 template<typename E> virtual void decaf::util::AbstractCollection< E >::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.2.3.11 template<typename E> virtual void decaf::util::AbstractCollection< E >::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.2.3.12 template<typename E> AbstractCollection<E>& decaf::util::AbstractCollection< E >::operator= (const AbstractCollection< E > & *collection*) [inline]

Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

Parameters:

collection - the collection to copy

Returns:

a reference to this collection

Reimplemented in **decaf::util::ArrayList< E >** (p. 592), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1870), **decaf::util::LinkedList< E >** (p. 1894), **decaf::util::PriorityQueue< E >** (p. 2451), **decaf::util::ArrayList< ServiceListener * >** (p. 592), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 592), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1894), **decaf::util::LinkedList< CompositeTask * >** (p. 1894), **decaf::util::LinkedList< URI >** (p. 1894), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1894), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1894), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1894), **decaf::util::LinkedList< decaf::net::URI >** (p. 1894), **decaf::util::LinkedList< Pointer< Command > >** (p. 1894), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1894), **decaf::util::LinkedList< cms::Destination * >** (p. 1894), **decaf::util::LinkedList< cms::Session * >** (p. 1894), and **decaf::util::LinkedList< cms::Connection * >** (p. 1894).

6.2.3.13 template<typename E> virtual bool decaf::util::AbstractCollection< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Implements **decaf::util::Collection< E >** (p. 1013).

Reimplemented in **decaf::util::ArrayList< E >** (p. 592), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1227), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1872), **decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet** (p. 1632), **decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet** (p. 1636), **decaf::util::LinkedList< E >** (p. 1897), **decaf::util::PriorityQueue< E >** (p. 2452), **decaf::util::StlList< E >**

(p. 2866), **decaf::util::StlSet< E >** (p. 2897), **decaf::util::ArrayList< ServiceListener * >** (p. 592), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 592), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1897), **decaf::util::LinkedList< CompositeTask * >** (p. 1897), **decaf::util::LinkedList< URI >** (p. 1897), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1897), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1897), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1897), **decaf::util::LinkedList< decaf::net::URI >** (p. 1897), **decaf::util::LinkedList< Pointer< Command > >** (p. 1897), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1897), **decaf::util::LinkedList< cms::Destination * >** (p. 1897), **decaf::util::LinkedList< cms::Session * >** (p. 1897), **decaf::util::LinkedList< cms::Connection * >** (p. 1897), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2897), and **decaf::util::StlSet< Resource * >** (p. 2897).

6.2.3.14 template<typename E> virtual bool decaf::util::AbstractCollection< E >::removeAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

Reimplemented in **decaf::util::AbstractSet< E >** (p. 199), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1228), **decaf::util::AbstractSet< Pointer< Synchronization > >** (p. 199), **decaf::util::AbstractSet< Resource * >** (p. 199), **decaf::util::AbstractSet< MapEntry< K, V > >** (p. 199), and **decaf::util::AbstractSet< K >** (p. 199).

6.2.3.15 template<typename E> virtual bool decaf::util::AbstractCollection< E >::retainAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1228).

6.2.3.16 template<typename E> virtual std::vector<E> decaf::util::AbstractCollection< E >::toArray () const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1006). All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns:

an vector of copies of all the elements from this **Collection** (p. 1006)

Implements **decaf::util::Collection< E >** (p. 1016).

Reimplemented in **decaf::util::ArrayList< E >** (p. 594), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1229), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1874), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2977), **decaf::util::LinkedList< E >** (p. 1900), **decaf::util::ArrayList< ServiceListener * >** (p. 594), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 594), **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1874), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1900), **decaf::util::LinkedList< CompositeTask * >** (p. 1900), **decaf::util::LinkedList< URI >** (p. 1900), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1900), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1900), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1900), **decaf::util::LinkedList< decaf::net::URI >** (p. 1900), **decaf::util::LinkedList< Pointer< Command > >** (p. 1900), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1900), **decaf::util::LinkedList< cms::Destination * >** (p. 1900), **decaf::util::LinkedList< cms::Session * >** (p. 1900), and **decaf::util::LinkedList< cms::Connection * >** (p. 1900).

6.2.3.17 template<typename E> virtual bool decaf::util::AbstractCollection< E >::tryLock () [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.2.3.18 template<typename E> virtual void decaf::util::AbstractCollection< E >::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.2.3.19 template<typename E> virtual void decaf::util::AbstractCollection< E >::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.2.3.20 template<typename E> virtual void decaf::util::AbstractCollection< E >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.2.3.21 template<typename E> virtual void decaf::util::AbstractCollection< E >::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

6.2.4 Field Documentation

6.2.4.1 template<typename E> util::concurrent::Mutex decaf::util::AbstractCollection< E >::mutex [mutable, protected]

Referenced by decaf::util::AbstractCollection< K >::lock(), decaf::util::AbstractCollection< K >::notify(), decaf::util::AbstractCollection< K >::notifyAll(), decaf::util::AbstractCollection< K >::tryLock(), decaf::util::AbstractCollection< K >::unlock(), and decaf::util::AbstractCollection< K >::wait().

6.3 decaf::util::concurrent::AbstractExecutorService Class Reference

Provides a default implementation for the methods of the **ExecutorService** (p. 1484) interface.

`#include <src/main/decaf/util/concurrent/AbstractExecutorService.h>`Inheritance diagram for decaf::util::concurrent::AbstractExecutorService:

Public Member Functions

- **AbstractExecutorService** ()
- virtual ~**AbstractExecutorService** ()

Protected Member Functions

- virtual void **doSubmit** (**FutureType** *future)

  *Perform the actual submit of a **FutureType** (p. 1581) instance, the caller is responsible for creating the properly typed Future<E> object and returning that to its caller.*

6.3.1 Detailed Description

Provides a default implementation for the methods of the **ExecutorService** (p. 1484) interface. Use this class as a starting point for implementations of custom executor service implementations.

Since:

1.0

6.3.2 Constructor & Destructor Documentation

6.3.2.1 decaf::util::concurrent::AbstractExecutorService::AbstractExecutorService ()

6.3.2.2 virtual decaf::util::concurrent::AbstractExecutorService::~AbstractExecutorService () `[virtual]`

6.3.3 Member Function Documentation

6.3.3.1 virtual void decaf::util::concurrent::AbstractExecutorService::doSubmit (FutureType * *future*) `[protected, virtual]`

Perform the actual submit of a **FutureType** (p. 1581) instance, the caller is responsible for creating the properly typed Future<E> object and returning that to its caller. The pointer provided is the property of this **Executor** (p. 1476) and must be deleted by this executor once its completed.

Parameters:

future Pointer to a base **FutureType** (p. 1581) instance that is to be submitted to the **Executor** (p. 1476).

Implements **decaf::util::concurrent::ExecutorService** (p. 1486).

6.4.1 Detailed Description

template<typename E> class decaf::util::AbstractList< E >

This class provides a skeletal implementation of the **List** (p. 1902) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array). For sequential access data (such as a linked list), **AbstractSequentialList** (p. 191) should be used in preference to this class.

To implement an unmodifiable list, the programmer needs only to extend this class and provide implementations for the get(int) and **size()** (p. 1015) methods.

To implement a modifiable list, the programmer must additionally override the set(int, E) method (which otherwise throws an UnsupportedOperationException). If the list is variable-size the programmer must additionally override the add(int, E) and remove(int) methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 1006) interface specification.

Unlike the other abstract collection implementations, the programmer does not have to provide an iterator implementation; the iterator and list iterator are implemented by this class, on top of the "random access" methods: get(int), set(int, E), add(int, E) and remove(int).

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

1.0

6.4.2 Constructor & Destructor Documentation

6.4.2.1 template<typename E> decaf::util::AbstractList< E >::AbstractList () [inline]

6.4.2.2 template<typename E> virtual decaf::util::AbstractList< E >::~AbstractList () [inline, virtual]

6.4.3 Member Function Documentation

6.4.3.1 template<typename E> virtual void decaf::util::AbstractList< E >::add (int index *DECAF_UNUSED*, const E &element *DECAF_UNUSED*) [inline, virtual]

6.4.3.2 template<typename E> virtual bool decaf::util::AbstractList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 1007).

Reimplemented in **decaf::util::ArrayList< E >** (p. 588), **decaf::util::LinkedList< E >** (p. 1886), **decaf::util::StlList< E >** (p. 2859), **decaf::util::ArrayList< ServiceListener * >** (p. 588), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 588), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1886), **decaf::util::LinkedList< CompositeTask * >** (p. 1886), **decaf::util::LinkedList< URI >** (p. 1886), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1886), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1886), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1886), **decaf::util::LinkedList< decaf::net::URI >** (p. 1886), **decaf::util::LinkedList< Pointer< Command > >** (p. 1886), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1886), **decaf::util::LinkedList< cms::Destination * >** (p. 1886), **decaf::util::LinkedList< cms::Session * >** (p. 1886), and **decaf::util::LinkedList< cms::Connection * >** (p. 1886).

Referenced by decaf::util::AbstractList< cms::Connection * >::add(), and decaf::util::AbstractList< cms::Connection * >::addAll().

6.4.3.3 template<typename E> virtual bool decaf::util::AbstractList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation). Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1006) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1904).

Reimplemented in **decaf::util::AbstractSequentialList< E >** (p. 194), **decaf::util::ArrayList< E >** (p. 588), **decaf::util::LinkedList< E >** (p. 1886), **decaf::util::StlList< E >** (p. 2861), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 194), **decaf::util::AbstractSequentialList<**

CompositeTask * > (p. 194), **decaf::util::AbstractSequentialList< URI** > (p. 194), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch** > > (p. 194), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo** > > (p. 194), **decaf::util::AbstractSequentialList< PrimitiveValueNode** > (p. 194), **decaf::util::AbstractSequentialList< decaf::net::URI** > (p. 194), **decaf::util::AbstractSequentialList< Pointer< Command** > > (p. 194), **decaf::util::AbstractSequentialList< cms::MessageProducer** * > (p. 194), **decaf::util::AbstractSequentialList< cms::Destination** * > (p. 194), **decaf::util::AbstractSequentialList< cms::Session** * > (p. 194), **decaf::util::AbstractSequentialList< cms::Connection** * > (p. 194), **decaf::util::ArrayList< ServiceListener** * > (p. 588), **decaf::util::ArrayList< Pointer< ActiveMQDestination** > > (p. 588), **decaf::util::LinkedList< cms::MessageConsumer** * > (p. 1886), **decaf::util::LinkedList< CompositeTask** * > (p. 1886), **decaf::util::LinkedList< URI** > (p. 1886), **decaf::util::LinkedList< Pointer< MessageDispatch** > > (p. 1886), **decaf::util::LinkedList< Pointer< DestinationInfo** > > (p. 1886), **decaf::util::LinkedList< PrimitiveValueNode** > (p. 1886), **decaf::util::LinkedList< decaf::net::URI** > (p. 1886), **decaf::util::LinkedList< Pointer< Command** > > (p. 1886), **decaf::util::LinkedList< cms::MessageProducer** * > (p. 1886), **decaf::util::LinkedList< cms::Destination** * > (p. 1886), **decaf::util::LinkedList< cms::Session** * > (p. 1886), and **decaf::util::LinkedList< cms::Connection** * > (p. 1886).

6.4.3.4 template<typename E> virtual void decaf::util::AbstractList< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 144).

Reimplemented in **decaf::util::ArrayList< E >** (p. 589), **decaf::util::LinkedList< E >** (p. 1888), **decaf::util::StlList< E >** (p. 2862), **decaf::util::ArrayList< ServiceListener** * > (p. 589), **decaf::util::ArrayList< Pointer< ActiveMQDestination** > > (p. 589), **decaf::util::LinkedList< cms::MessageConsumer** * > (p. 1888), **decaf::util::LinkedList< CompositeTask** * > (p. 1888), **decaf::util::LinkedList< URI** > (p. 1888), **decaf::util::LinkedList< Pointer< MessageDispatch** > > (p. 1888), **decaf::util::LinkedList< Pointer< DestinationInfo** > > (p. 1888), **decaf::util::LinkedList< PrimitiveValueNode** > (p. 1888), **decaf::util::LinkedList< decaf::net::URI** > (p. 1888), **decaf::util::LinkedList< Pointer< Command** > > (p. 1888), **decaf::util::LinkedList< cms::MessageProducer** * > (p. 1888), **decaf::util::LinkedList< cms::Destination** * > (p. 1888), **decaf::util::LinkedList< cms::Session** * > (p. 1888), and **decaf::util::LinkedList< cms::Connection** * > (p. 1888).

6.4.3.5 template<typename E> virtual int decaf::util::AbstractList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implements **decaf::util::List< E >** (p. 1906).

Reimplemented in **decaf::util::ArrayList< E >** (p. 591), **decaf::util::LinkedList< E >** (p. 1891), **decaf::util::StlList< E >** (p. 2864), **decaf::util::ArrayList< ServiceListener * >** (p. 591), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 591), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1891), **decaf::util::LinkedList< CompositeTask * >** (p. 1891), **decaf::util::LinkedList< URI >** (p. 1891), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1891), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1891), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1891), **decaf::util::LinkedList< decaf::net::URI >** (p. 1891), **decaf::util::LinkedList< Pointer< Command > >** (p. 1891), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1891), **decaf::util::LinkedList< cms::Destination * >** (p. 1891), **decaf::util::LinkedList< cms::Session * >** (p. 1891), and **decaf::util::LinkedList< cms::Connection * >** (p. 1891).

6.4.3.6 template<typename E> virtual Iterator<E>* decaf::util::AbstractList< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1799).

Reimplemented in **decaf::util::AbstractSequentialList< E >** (p. 195), **decaf::util::StlList< E >** (p. 2864), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 195), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 195), **decaf::util::AbstractSequentialList< URI >** (p. 195), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 195), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 195), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 195), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 195), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 195), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 195), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 195), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 195), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 195).

6.4.3.7 template<typename E> virtual Iterator<E>* decaf::util::AbstractList< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1800).

Reimplemented in **decaf::util::AbstractSequentialList< E >** (p. 196), **decaf::util::StlList< E >** (p. 2864), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 196), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 196), **decaf::util::AbstractSequentialList< URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 196), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 196), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 196), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 196), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 196).

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::ArrayList().

6.4.3.8 template<typename E> virtual int decaf::util::AbstractList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implements **decaf::util::List< E >** (p. 1907).

Reimplemented in **decaf::util::ArrayList< E >** (p. 591), **decaf::util::LinkedList< E >** (p. 1892), **decaf::util::StlList< E >** (p. 2864), **decaf::util::ArrayList< ServiceListener * >** (p. 591), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 591), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1892), **decaf::util::LinkedList< CompositeTask * >** (p. 1892), **decaf::util::LinkedList< URI >** (p. 1892), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1892), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1892), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1892), **decaf::util::LinkedList< decaf::net::URI >** (p. 1892), **decaf::util::LinkedList< Pointer< Command > >** (p. 1892),

decaf::util::LinkedList< cms::MessageProducer * > (p. 1892), **decaf::util::LinkedList< cms::Destination * >** (p. 1892), **decaf::util::LinkedList< cms::Session * >** (p. 1892), and **decaf::util::LinkedList< cms::Connection * >** (p. 1892).

6.4.3.9 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator (int index) const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1907).

Reimplemented in **decaf::util::AbstractSequentialList< E >** (p. 196), **decaf::util::LinkedList< E >** (p. 1892), **decaf::util::StlList< E >** (p. 2865), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 196), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 196), **decaf::util::AbstractSequentialList< URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 196), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 196), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 196), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 196), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1892), **decaf::util::LinkedList< CompositeTask * >** (p. 1892), **decaf::util::LinkedList< URI >** (p. 1892), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1892), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1892), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1892), **decaf::util::LinkedList< decaf::net::URI >** (p. 1892), **decaf::util::LinkedList< Pointer< Command > >** (p. 1892), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1892), **decaf::util::LinkedList< cms::Destination * >** (p. 1892), **decaf::util::LinkedList< cms::Session * >** (p. 1892), and **decaf::util::LinkedList< cms::Connection * >** (p. 1892).

6.4.3.10 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator (int *index*) [inline, virtual]

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (index < 0 || index > **size()** (p. 1015))

Implements **decaf::util::List< E >** (p. 1908).

Reimplemented in **decaf::util::AbstractSequentialList< E >** (p. 196), **decaf::util::LinkedList< E >** (p. 1893), **decaf::util::StlList< E >** (p. 2865), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 196), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 196), **decaf::util::AbstractSequentialList< URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 196), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 196), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 196), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 196), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1893), **decaf::util::LinkedList< CompositeTask * >** (p. 1893), **decaf::util::LinkedList< URI >** (p. 1893), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1893), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1893), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1893), **decaf::util::LinkedList< decaf::net::URI >** (p. 1893), **decaf::util::LinkedList< Pointer< Command > >** (p. 1893), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1893), **decaf::util::LinkedList< cms::Destination * >** (p. 1893), **decaf::util::LinkedList< cms::Session * >** (p. 1893), and **decaf::util::LinkedList< cms::Connection * >** (p. 1893).

6.4.3.11 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator () const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1909).

Reimplemented in **decaf::util::AbstractSequentialList< E >** (p. 197), **decaf::util::StlList< E >** (p. 2865), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 197), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 197), **decaf::util::AbstractSequentialList< URI >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 197), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 197), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 197), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 197), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 197).

6.4.3.12 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator () [inline, virtual]

Returns:

a list iterator over the elements in this list (in proper sequence).

Implements **decaf::util::List< E >** (p. 1910).

Reimplemented in **decaf::util::AbstractSequentialList< E >** (p. 197), **decaf::util::StlList< E >** (p. 2866), **decaf::util::AbstractSequentialList<**

cms::MessageConsumer * > (p. 197), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 197), **decaf::util::AbstractSequentialList< URI >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 197), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 197), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 197), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 197), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 197).

Referenced by decaf::util::AbstractList< cms::Connection * >::indexOf(), decaf::util::AbstractList< cms::Connection * >::lastIndexOf(), and decaf::util::AbstractList< cms::Connection * >::removeRange().

6.4.3.13 template<typename E> virtual E decaf::util::AbstractList< E >::removeAt (int index *index*) [inline, virtual]

Removes the element at the specified position in this list. Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

Implements **decaf::util::List< E >** (p. 1910).

6.5.1 Detailed Description

template<typename K, typename V> class decaf::util::AbstractMap< K, V >

This class provides a skeletal implementation of the **Map** (p. 2008) interface, to minimize the effort required to implement this interface. To implement an unmodifiable map, the programmer needs only to extend this class and provide an implementation for the entrySet method, which returns a set-view of the map's mappings. Typically, the returned set will, in turn, be implemented atop **AbstractSet** (p. 199). This set should not support the add or remove methods, and its iterator should not support the remove method.

To implement a modifiable map, the programmer must additionally override this class's put method (which otherwise throws an UnsupportedOperationException), and the iterator returned by **entrySet()** (p. 2012).iterator() must additionally implement its remove method.

The programmer should generally provide a void (no argument) and map constructor, as per the recommendation in the **Map** (p. 2008) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the map being implemented admits a more efficient implementation.

Since:

1.0

6.5.2 Constructor & Destructor Documentation

6.5.2.1 template<typename K, typename V> decaf::util::AbstractMap< K, V >::AbstractMap () [inline]

6.5.2.2 template<typename K, typename V> decaf::util::AbstractMap< K, V >::AbstractMap (const Map< K, V > & *map*) [inline]

6.5.2.3 template<typename K, typename V> decaf::util::AbstractMap< K, V >::AbstractMap (const AbstractMap< K, V > & *map*) [inline]

6.5.2.4 template<typename K, typename V> virtual decaf::util::AbstractMap< K, V >::~AbstractMap () [inline, virtual]

6.5.3 Member Function Documentation

6.5.3.1 template<typename K, typename V> virtual void decaf::util::AbstractMap< K, V >::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

6.5.3.2 template<typename K, typename V> virtual void decaf::util::AbstractMap< K, V >::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.5.3.3 template<typename K, typename V> virtual void decaf::util::AbstractMap< K, V >::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.5.3.4 template<typename K, typename V> virtual bool decaf::util::AbstractMap< K, V >::tryLock () [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.5.3.5 template<typename K, typename V> virtual void decaf::util::AbstractMap< K, V >::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.5.3.6 template<typename K, typename V> virtual void decaf::util::AbstractMap< K, V >::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.5.3.7 template<typename K, typename V> virtual void decaf::util::AbstractMap< K, V >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.5.3.8 template<typename K, typename V> virtual void decaf::util::AbstractMap< K, V >::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

6.5.4 Field Documentation

6.6.3 Member Function Documentation

6.6.3.1 decaf::lang::Thread* decaf::util::concurrent::locks::AbstractOwnableSynchronizer::getExclusiveOwnerThread () const [protected]

Gets the Thread that was last set using the setExclusiveOwnerThread method, or NULL if no Thread has been made the exclusive owner.

Returns:

pointer to the owner Thread or NULL if not set.

6.6.3.2 void decaf::util::concurrent::locks::AbstractOwnableSynchronizer::setExclusiveOwnerThread (decaf::lang::Thread * *thread*) [protected]

Sets the Thread that has exclusive ownership of this Synchronizer, can be NULL to indicate that no Thread now owns this Synchronizer.

Parameters:

thread The Thread that now has ownership, or NULL if ownership is released.

6.7 decaf::util::AbstractQueue< E > Class Template Reference

This class provides skeletal implementations of some **Queue** (p. 2515) operations.

`#include <src/main/decaf/util/AbstractQueue.h>`Inheritance diagram for decaf::util::AbstractQueue< E >:

Public Member Functions

- **AbstractQueue** ()
- virtual ~**AbstractQueue** ()
- virtual bool **add** (const E &value)

  Returns true if this collection changed as a result of the call.
  (Returns false if this collection does not permit duplicates and already contains the specified element.)
  Collections *(p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added.* ***Collection*** *(p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.*
  If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.
  For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.
  Parameters:

  value *The reference to the element to add to this* ***Collection*** *(p. 1006).*

  Returns:

  true if the element was added to this ***Collection*** *(p. 1006).*

  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
  IllegalArgumentException *if some property of the element prevents it from being added to this collection.*
  IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

- virtual bool **addAll** (const **Collection**< E > &collection)

  This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
  Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual E **remove** ()

  Gets and removes the element in the head of the queue.
  Throws a ***NoSuchElementException*** *(p. 2260) if there is no element in the queue.*
  Returns:

  the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260) if there is no element in the queue.*

- virtual E **element** () const

Gets but not removes the element in the head of the queue.
Throws a ***NoSuchElementException*** *(p. 2260) if there is no element in the queue.*

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260) if there is no element in the queue.*

- virtual void **clear** ()

Removes all of the elements from this collection (optional operation).
The collection will be empty after this method returns.
This implementation iterates over this collection, removing each element using the ***Iterator.remove*** *(p. 1803) operation. Most implementations will probably choose to override this method for efficiency.*
Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException *if the clear operation is not supported by this collection*

6.7.1 Detailed Description

template<typename E> class decaf::util::AbstractQueue< E >

This class provides skeletal implementations of some **Queue** (p. 2515) operations. Methods add, remove, and element are based on offer, poll, and peek, respectively.

A **Queue** (p. 2515) implementation that extends this class must minimally define a method **Queue** (p. 2515). offer(E) which does not permit insertion of null elements, along with methods **Queue** (p. 2515). **peek()** (p. 2517), **Queue.poll()** (p. 2517), **Collection.size()** (p. 1015), and a **Collection.iterator()** (p. 1800) supporting **Iterator.remove()** (p. 1803). Typically, additional methods will be overridden as well. If these requirements cannot be met, consider instead subclassing **AbstractCollection** (p. 141).

Since:

1.0

6.7.2 Constructor & Destructor Documentation

6.7.2.1 template<typename E> decaf::util::AbstractQueue< E >::AbstractQueue () [inline]

6.7.2.2 template<typename E> virtual decaf::util::AbstractQueue< E >::~AbstractQueue () [inline, virtual]

6.7.3 Member Function Documentation

6.7.3.1 template<typename E> virtual bool decaf::util::AbstractQueue< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

This implementation returns true if offer succeeds, else throws an IllegalStateException.

Implements **decaf::util::Collection< E >** (p. 1007).

Reimplemented in **decaf::util::PriorityQueue< E >** (p. 2449).

6.7.3.2 template<typename E> virtual bool decaf::util::AbstractQueue< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty). This implementation checks to see if the **Queue** (p. 2515) is being added to itself and throws an IllegalArgumentException if so, otherwise it delegates the add to the AbstractCollection's addAll implementation.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 143).

Referenced by decaf::util::AbstractQueue< Pointer< Transport > >::addAll(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::operator=().

6.7.3.3 template<typename E> virtual void decaf::util::AbstractQueue< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 144).

Reimplemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1867), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2971), **decaf::util::PriorityQueue< E >** (p. 2450), and **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1867).

6.7.3.4 template<typename E> virtual E decaf::util::AbstractQueue< E >::element () const [inline, virtual]

Gets but not removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 2260) if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260)* if there is no element in the queue.

This implementation returns the result of peek unless the queue is empty otherwise it throws a **NoSuchElementException** (p. 2260).

Implements **decaf::util::Queue< E >** (p. 2516).

Referenced by decaf::util::concurrent::SynchronousQueue< E >::drainTo().

6.7.3.5 template<typename E> virtual E decaf::util::AbstractQueue< E >::remove () [inline, virtual]

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 2260) if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260)* if there is no element in the queue.

This implementation returns the result of poll unless the queue is empty.

Implements **decaf::util::Queue< E >** (p. 2518).

Reimplemented in **decaf::util::PriorityQueue< E >** (p. 2453).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**AbstractQueue.h**

6.8 decaf::util::concurrent::locks::AbstractQueuedSynchronizer Class Reference

`#include <src/main/decaf/util/concurrent/locks/AbstractQueuedSynchronizer.h>`Inheritance diagram for decaf::util::concurrent::locks::AbstractQueuedSynchronizer:

Data Structures

- class **ConditionObject**

  Condition *(p. 1077) object for this Synchronizer, which serves as the basis for other* ***Lock*** *(p. 1926) objects.*

Public Member Functions

- virtual ~**AbstractQueuedSynchronizer** ()
- void **acquire** (int arg)

  Acquire the lock exclusively, ignoring interrupts.

- void **acquireShared** (int arg)

  Acquire the lock in shared mode, ignoring interrupts.

- void **acquireInterruptibly** (int arg)

  Acquire the lock exclusively, allowing for interrupts.

- void **acquireSharedInterruptibly** (int arg)

  Acquire the lock in shared mode, allowing interruption.

- **Collection< decaf::lang::Thread * > * getExclusiveQueuedThreads** () const

  Creates and returns a new ***Collection*** *(p. 1006) object that contains only those threads that may be waiting to acquire this Synchronization in exclusive mode.*

- **Collection< decaf::lang::Thread * > * getSharedQueuedThreads** () const

  Creates and returns a new ***Collection*** *(p. 1006) object that contains only those threads that may be waiting to acquire this Synchronization in shared mode.*

- **decaf::lang::Thread * getFirstQueuedThread** () const

  Returns the first thread queue (the thread that's been waiting the longest) if there are currently no queued threads this method returns NULL.

- **Collection< decaf::lang::Thread * > * getQueuedThreads** () const

  Creates and returns a new ***Collection*** *(p. 1006) object that contains a best effort snapshot of the threads that are currently waiting to acquire.*

- int **getQueueLength** () const

  Gets an estimated count of the number of threads that are currently waiting to acquire, this value changes dynamically so the result of this method can be invalid immediately after it is called.

- **Collection< decaf::lang::Thread * > * getWaitingThreads** (const **AbstractQueuedSynchronizer::ConditionObject** *condition) const

  *Creates and returns a new **Collection** (p. 1006) object that contains all the threads that may be waiting on the given ConditionOject instance at the time this method is called.*

- int **getWaitQueueLength** (const **AbstractQueuedSynchronizer::ConditionObject** *condition) const

  *Gets an estimated count of the number of threads that are currently waiting on the given **ConditionObject** (p. 1083), this value changes dynamically so the result of this method can be invalid immediately after it is called.*

- bool **hasContended** () const
- bool **hasQueuedThreads** () const
- bool **hasWaiters** (const **AbstractQueuedSynchronizer::ConditionObject** *condition) const

  *Returns true if there are any threads that are currently waiting on the given **ConditionObject** (p. 1083), the condition must be associated with this synchronizer instance.*

- bool **isQueued** (**decaf::lang::Thread** *thread) const

  *Traverse the **Queue** (p. 2515) if waiting threads to see if the given thread is present.*

- bool **owns** (const **AbstractQueuedSynchronizer::ConditionObject** *condition) const

  *Checks whether the given **ConditionObject** (p. 1083) uses this Synchronizer as its lock object.*

- bool **release** (int arg)

  When held in exclusive mode this method releases the Synchronizer.

- bool **releaseShared** (int arg)

  When held in shared mode this method releases the Synchronizer.

- std::string **toString** () const

  Gets a string that identifies this Synchronizer along with its present state.

- bool **tryAcquireNanos** (int arg, long long nanos)

  *Acquires in exclusive mode if possible, first checking if the calling thread has already been interrupted or not, then calling **tryAcquire(int)** (p. 188) at least one time and possibly more up to the given timeout, or until the calling thread is interrupted.*

- bool **tryAcquireSharedNanos** (int arg, long long nanos)

  *Acquires in shared mode if possible, first checking if the calling thread has already been interrupted or not, then calling **tryAcquireShared(int)** (p. 188) at least one time and possibly more up to the given timeout, or until the calling thread is interrupted.*

Protected Member Functions

- **AbstractQueuedSynchronizer** ()
- virtual int **getState** () const

  Gets and returns the currently set value of this object Synchronization sate.

- virtual void **setState** (int value)

  Sets the synchronization state to the given value.

- virtual bool **compareAndSetState** (int expect, int update)

  Sets the synchronization state to the specified value if the current value is equal to the expected value given, otherwise no change is made.

- virtual bool **isHeldExclusively** () const

  If the calling thread hold an exclusive lock on this synchronization then this method returns true, false otherwise.

- virtual bool **tryAcquire** (int arg)

  Performs the actual work of attempting to acquire the lock in exclusive mode.

- virtual int **tryAcquireShared** (int arg)

  Performs the actual work of attempting to acquire the lock in shared mode.

- virtual bool **tryRelease** (int arg)

  Performs a release for the calling thread in exclusive mode.

- virtual bool **tryReleaseShared** (int arg)

  Performs a release for the calling thread in shared mode.

- virtual **ConditionObject** * **createDefaultConditionObject** ()

  *Provides a means for derived classes to create a **ConditionObject*** (p. *1083*) *implemented by the basic logic implemented inside this class.*

6.8.1 Constructor & Destructor Documentation

6.8.1.1 decaf::util::concurrent::locks::AbstractQueuedSynchronizer::AbstractQueuedSynchronizer () [protected]

6.8.1.2 virtual decaf::util::concurrent::locks::AbstractQueuedSynchronizer::~AbstractQueuedSynchronizer () [virtual]

6.8.2 Member Function Documentation

6.8.2.1 void decaf::util::concurrent::locks::AbstractQueuedSynchronizer::acquire (int *arg*)

Acquire the lock exclusively, ignoring interrupts. This method will call tryAcquire at least once and return if that succeeds, otherwise it can block and possibly spin until the lock is acquired. This method can serve as the basis for a **Lock.lock()** (p. 1927) implementation.

Parameters:

arg Argument passed to tryAcquire, value is not interpreted by this class.

6.8.2.2 void decaf::util::concurrent::locks::AbstractQueuedSynchronizer::acquireInterruptibly (int *arg*)

Acquire the lock exclusively, allowing for interrupts. If the interrupt state is not already set this method will call tryAcquire at least once and return if that succeeds, otherwise it can block and possibly spin until the lock is acquired or the Thread is interrupted. This method can serve as the basis for a **Lock.lockInterruptibly()** (p. 1928) implementation.

Parameters:

arg Argument passed to tryAcquire, value is not interpreted by this class.

Exceptions:

InterruptedException if the calling Thread is interrupted.

6.8.2.3 void decaf::util::concurrent::locks::AbstractQueuedSynchronizer::acquireShared (int *arg*)

Acquire the lock in shared mode, ignoring interrupts. This method will call tryAcquireShared at least once and return if that succeeds, otherwise it can block and possibly spin until the lock is acquired.

Parameters:

arg Argument passed to tryAcquireShared, value is not interpreted by this class.

6.8.2.4 void decaf::util::concurrent::locks::AbstractQueuedSynchronizer::acquireSharedInterruptibly (int *arg*)

Acquire the lock in shared mode, allowing interruption. If the interrupt state is not already set this method will call tryAcquireShared at least once and return if that succeeds, otherwise it can block and possibly spin until the lock is acquired or the Thread is interrupted.

Parameters:

arg Argument passed to tryAcquireShared, value is not interpreted by this class.

Exceptions:

InterruptedException if the calling Thread is interrupted.

6.8.2.5 virtual bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::compareAndSetState (int *expect*, int *update*) `[protected, virtual]`

Sets the synchronization state to the specified value if the current value is equal to the expected value given, otherwise no change is made. This method is Atomic.

Parameters:

expect The value that state must have if the update is made.

update The new value to assign the state if the current value matches the expected.

Returns:

true if a change is made, false otherwise.

6.8.2.6 virtual ConditionObject* decaf::util::concurrent::locks::AbstractQueuedSynchronizer::createDefaultConditionObject () [protected, virtual]

Provides a means for derived classes to create a **ConditionObject** (p. 1083) implemented by the basic logic implemented inside this class. Can be overridden by derived classes that wish to provide their own implementation of a **ConditionObject** (p. 1083).

Returns:

a new **ConditionObject** (p. 1083) that is owned by the caller.

6.8.2.7 Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::AbstractQueuedSynchronizer::getExclusiveQueuedThreads () const

Creates and returns a new **Collection** (p. 1006) object that contains only those threads that may be waiting to acquire this Synchronization in exclusive mode.

Returns:

a **Collection** (p. 1006) pointer that contains waiting threads for exclusive acquisition. The caller owns the returned pointer.

6.8.2.8 decaf::lang::Thread* decaf::util::concurrent::locks::AbstractQueuedSynchronizer::getFirstQueuedThread () const

Returns the first thread queue (the thread that's been waiting the longest) if there are currently no queued threads this method returns NULL.

Returns:

the first thread in the queue or NULL if none are currently waiting.

6.8.2.9 Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::AbstractQueuedSynchronizer::getQueuedThreads () const

Creates and returns a new **Collection** (p. 1006) object that contains a best effort snapshot of the threads that are currently waiting to acquire.

Returns:

a **Collection** (p. 1006) pointer that contains waiting threads for lock acquisition. The caller owns the returned pointer.

6.8.2.10 int decaf::util::concurrent::locks::AbstractQueuedSynchronizer::getQueueLength () const

Gets an estimated count of the number of threads that are currently waiting to acquire, this value changes dynamically so the result of this method can be invalid immediately after it is called.

Returns:

an estimate of the number of waiting threads.

6.8.2.11 Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::AbstractQueuedSynchronizer::getSharedQueuedThreads () const

Creates and returns a new **Collection** (p. 1006) object that contains only those threads that may be waiting to acquire this Synchronization in shared mode.

Returns:

a **Collection** (p. 1006) pointer that contains waiting threads for shared acquisition. The caller owns the returned pointer.

6.8.2.12 virtual int decaf::util::concurrent::locks::AbstractQueuedSynchronizer::getState () const [protected, virtual]

Gets and returns the currently set value of this object Synchronization sate.

Returns:

the value of the synchronization sate.

6.8.2.13 Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::AbstractQueuedSynchronizer::getWaitingThreads (const AbstractQueuedSynchronizer::ConditionObject * *condition*) const

Creates and returns a new **Collection** (p. 1006) object that contains all the threads that may be waiting on the given ConditionOject instance at the time this method is called.

Returns:

a **Collection** (p. 1006) pointer that contains waiting threads on given **ConditionObject** (p. 1083). The caller owns the returned pointer.

Exceptions:

NullPointerException if the **ConditionObject** (p. 1083) pointer is NULL.

IllegalArgumentException if the **ConditionObject** (p. 1083) is not associated with this Synchronizer.

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.8.2.14 int decaf::util::concurrent::locks::AbstractQueuedSynchronizer::getWaitQueueLength (const AbstractQueuedSynchronizer::ConditionObject * *condition*) const

Gets an estimated count of the number of threads that are currently waiting on the given **ConditionObject** (p. 1083), this value changes dynamically so the result of this method can be invalid immediately after it is called. The **ConditionObject** (p. 1083) must be associated with this **AbstractQueuedSynchronizer** (p. 179) or an exception will be thrown.

Returns:

an estimate of the number of waiting threads.

Exceptions:

NullPointerException if the **ConditionObject** (p. 1083) pointer is NULL.

IllegalArgumentException if the **ConditionObject** (p. 1083) is not associated with this Synchronizer.

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.8.2.15 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::hasContended () const

Returns:

true if there has ever been the need for the acquire method to block.

6.8.2.16 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::hasQueuedThreads () const

Returns:

true if there are threads that are currently waiting to acquire.

6.8.2.17 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::hasWaiters (const AbstractQueuedSynchronizer::ConditionObject * *condition*) const

Returns true if there are any threads that are currently waiting on the given **ConditionObject** (p. 1083), the condition must be associated with this synchronizer instance.

Returns:

true if the condition object has waiting threads.

Exceptions:

NullPointerException if the **ConditionObject** (p. 1083) pointer is NULL.

IllegalArgumentException if the **ConditionObject** (p. 1083) is not associated with this Synchronizer.

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.8.2.18 virtual bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::isHeldExclusively () const [protected, virtual]

If the calling thread hold an exclusive lock on this synchronization then this method returns true, false otherwise. The default behavior is to throw an UnsupportedOperation exception as this method is only needed when **ConditionObject** (p. 1083) is supported.

Returns:

true if this synchronization is held exclusively by the current thread.

Exceptions:

UnsupportedOperationException if **Condition** (p. 1077) objects are not supported.

6.8.2.19 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::isQueued (decaf::lang::Thread * *thread*) const

Traverse the **Queue** (p. 2515) if waiting threads to see if the given thread is present.

Returns:

true if the given thread is in the wait **Queue** (p. 2515).

Exceptions:

NullPointerException if the thread pointer is NULL.

6.8.2.20 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::owns (const AbstractQueuedSynchronizer::ConditionObject * *condition*) const

Checks whether the given **ConditionObject** (p. 1083) uses this Synchronizer as its lock object.

Returns:

true if the **ConditionObject** (p. 1083) uses this Synchronizer as its lock.

Exceptions:

NullPointerException if the condition pointer is NULL.

6.8.2.21 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::release (int *arg*)

When held in exclusive mode this method releases the Synchronizer. This method calls **tryRelease(int)** (p. 189) and if one or more threads is unblocked it returns true. This method forms the basis of **Lock.unlock** (p. 1931).

Parameters:

arg A value used to release, it is passed to tryRelease and not interpreted by this class.

Returns:

the result that is returned from a call to **tryRelease(int)** (p. 189).

6.8.2.22 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::releaseShared (int *arg*)

When held in shared mode this method releases the Synchronizer. This method calls **tryReleaseShared(int)** (p. 190) and if one or more threads is unblocked it returns true.

Parameters:

arg A value used to release, it is passed to tryReleaseShared and not interpreted by this class.

Returns:

the result that is returned from a call to **tryReleaseShared(int)** (p. 190).

6.8.2.23 virtual void decaf::util::concurrent::locks::AbstractQueuedSynchronizer::setState (int *value*) [protected, virtual]

Sets the synchronization state to the given value.

Parameters:

value The new value to assign to the synchronization state.

6.8.2.24 std::string decaf::util::concurrent::locks::AbstractQueuedSynchronizer::toString () const

Gets a string that identifies this Synchronizer along with its present state. The string contains the state in a bracketed form that contains "State =" and the result of **getState()** (p. 184) and also contains the indicators "nonempty" or "empty" based on whether the thread queue is empty or not.

Returns:

a string value that identifies this **AbstractQueuedSynchronizer** (p. 179).

6.8.2.25 virtual bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::tryAcquire (int *arg*) [protected, virtual]

Performs the actual work of attempting to acquire the lock in exclusive mode. The implementation should acquire the lock in exclusive mode based on its current state or the capabilities of the lock being implemented.

Whenever a thread calls acquire this method is invoked. If the method fails then the acquire method can decide to block the calling thread until signaled that another attempt to acquire should be made.

The default implementation always throws UnsupportedOperationException.

Parameters:

arg The value passed to the acquire method.

Returns:

true if the acquire succeeded, false otherwise.

Exceptions:

IllegalMonitorStateException if the acquire places the object in an invalid state.

UnsupportedOperationException if exclusive mode is not supported.

6.8.2.26 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::tryAcquireNanos (int *arg*, long long *nanos*)

Acquires in exclusive mode if possible, first checking if the calling thread has already been interrupted or not, then calling **tryAcquire(int)** (p. 188) at least one time and possibly more up to the given timeout, or until the calling thread is interrupted.

Parameters:

arg Value to be passed to **tryAcquire(int)** (p. 188) its meaning is uninterpreted here.

nanos Time in nanoseconds to wait before reporting the acquisition as failed.

Returns:

true if the acquire succeeded, false otherwise.

Exceptions:

InterruptedException if the calling thread is interrupted.

6.8.2.27 virtual int decaf::util::concurrent::locks::AbstractQueuedSynchronizer::tryAcquireShared (int *arg*) [protected, virtual]

Performs the actual work of attempting to acquire the lock in shared mode. The implementation should acquire the lock in exclusive mode based on its current state or the capabilities of the lock being implemented.

Whenever a thread calls acquire this method is invoked. If the method fails then the acquire method can decide to block the calling thread until signaled that another attempt to acquire should be made.

The default implementation always throws UnsupportedOperationException.

Parameters:

arg The value passed to the acquire method.

Returns:

a negative value if the acquire failed, zero if it did succeed but no additional shared mode acquires can, or a positive number if success and future calls amy also succeed.

Exceptions:

IllegalMonitorStateException if the acquire places the object in an invalid state.

UnsupportedOperationException if shared mode is not supported.

6.8.2.28 bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::tryAcquireSharedNanos (int *arg*, long long *nanos*)

Acquires in shared mode if possible, first checking if the calling thread has already been interrupted or not, then calling **tryAcquireShared(int)** (p. 188) at least one time and possibly more up to the given timeout, or until the calling thread is interrupted.

Parameters:

arg Value to be passed to **tryAcquireShared(int)** (p. 188) its meaning is uninterpreted here.

nanos Time in nanoseconds to wait before reporting the acquisition as failed.

Returns:

true if the acquire succeeded, false otherwise.

Exceptions:

InterruptedException if the calling thread is interrupted.

6.8.2.29 virtual bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::tryRelease (int *arg*) [protected, virtual]

Performs a release for the calling thread in exclusive mode. For any thread that performs a release this method will always be invoked.

The default implementation always throws UnsupportedOperationException.

Parameters:

arg The value that was passed to the release method.

Returns:

true if the synchronization is now fully released such that waiting threads can now attempt to acquire it, false if not fully released.

Exceptions:

IllegalMonitorStateException if the release places the object in an invalid state.

UnsupportedOperationException if exclusive mode is not supported.

6.8.2.30 virtual bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::tryReleaseShared (int *arg*) [protected, virtual]

Performs a release for the calling thread in shared mode. For any thread that performs a release this method will always be invoked.

The default implementation always throws UnsupportedOperationException.

Parameters:

arg The value that was passed to the release method.

Returns:

true if the synchronization is now fully released such that waiting threads can now attempt to acquire it, false if not fully released.

Exceptions:

IllegalMonitorStateException if the release places the object in an invalid state.

UnsupportedOperationException if shared mode is not supported.

The documentation for this class was generated from the following file:

  Gets the element contained at position passed.

  Parameters:

  index *The position to get.*

  Returns:

  value at index specified.

  Exceptions:

  IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*

- virtual E **set** (int index, const E &element)

  Replaces the element at the specified position in this list with the specified element.

  Parameters:

  index *The index of the element to replace.*
  element *The element to be stored at the specified position.*

  Returns:

  the element previously at the specified position.

  Exceptions:

  IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*
  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*

IllegalArgumentException *if some property of the element prevents it from being added to this collection*
IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

- virtual bool **addAll** (int index, const **Collection**< E > &source)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index *The index at which to insert the first element from the specified collection*
source *The* ***Collection*** *(p. 1006) containing elements to be added to this list*

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*
UnsupportedOperationExceptio *if this is an unmodifiable collection.*
NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
IllegalArgumentException *if some property of the element prevents it from being added to this collection*
IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

- virtual E **removeAt** (int index)

Removes the element at the specified position in this list.
Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index *- the index of the element to be removed.*

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*
UnsupportedOperationExceptio *if this is an unmodifiable collection.*

6.9.1 Detailed Description

template<typename E> class decaf::util::AbstractSequentialList< E >

This class provides a skeletal implementation of the **List** (p. 1902) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list). For random access data (such as an array), **AbstractList** (p. 156) should be used in preference to this class.

This class is the opposite of the **AbstractList** (p. 156) class in the sense that it implements the "random access" methods (get(int index), set(int index, E element), add(int index, E element) and remove(int index)) on top of the list's list iterator, instead of the other way around.

To implement a list the programmer needs only to extend this class and provide implementations for the listIterator and size methods. For an unmodifiable list, the programmer need only implement the list iterator's hasNext, next, hasPrevious, previous and index methods.

For a modifiable list the programmer should additionally implement the list iterator's set method. For a variable-size list the programmer should additionally implement the list iterator's remove and add methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 1006) interface specification.

Since:

1.0

6.9.2 Constructor & Destructor Documentation

6.9.2.1 template<typename E> virtual decaf::util::AbstractSequentialList< E >::~AbstractSequentialList () [inline, virtual]

6.9.3 Member Function Documentation

6.9.3.1 template<typename E> virtual void decaf::util::AbstractSequentialList< E >::add (int index, const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index The index at which the specified element is to be inserted.

element The element to be inserted in this **List** (p. 1902).

Exceptions:

IndexOutOfBoundsException if the index is greater than size of the **List** (p. 1902).

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it inserts the specified element with **ListIterator.add** (p. 1914).

Implements **decaf::util::List< E >** (p. 1903).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1885), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1885), **decaf::util::LinkedList< CompositeTask * >** (p. 1885), **decaf::util::LinkedList< URI >** (p. 1885), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1885), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1885), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1885), **decaf::util::LinkedList< decaf::net::URI >** (p. 1885), **decaf::util::LinkedList< Pointer< Command > >** (p. 1885), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1885), **decaf::util::LinkedList< cms::Destination * >** (p. 1885), **decaf::util::LinkedList< cms::Session * >** (p. 1885), and **decaf::util::LinkedList< cms::Connection * >** (p. 1885).

6.9.3.2 template<typename E> virtual bool decaf::util::AbstractSequentialList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1006) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with listIterator(index)). Then, it iterates over the specified

collection, inserting the elements obtained from the iterator into this list, one at a time, using **ListIterator.add** (p. 1914) (to skip over the added element).

Reimplemented from **decaf::util::AbstractList< E >** (p. 159).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1886), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1886), **decaf::util::LinkedList< CompositeTask * >** (p. 1886), **decaf::util::LinkedList< URI >** (p. 1886), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1886), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1886), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1886), **decaf::util::LinkedList< decaf::net::URI >** (p. 1886), **decaf::util::LinkedList< Pointer< Command > >** (p. 1886), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1886), **decaf::util::LinkedList< cms::Destination * >** (p. 1886), **decaf::util::LinkedList< cms::Session * >** (p. 1886), and **decaf::util::LinkedList< cms::Connection * >** (p. 1886).

6.9.3.3 template<typename E> virtual E decaf::util::AbstractSequentialList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters:

index The position to get.

Returns:

value at index specified.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the element using **ListIterator.next** (p. 1803) and returns it.

Implements **decaf::util::List< E >** (p. 1905).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1890), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1890), **decaf::util::LinkedList< CompositeTask * >** (p. 1890), **decaf::util::LinkedList< URI >** (p. 1890), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1890), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1890), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1890), **decaf::util::LinkedList< decaf::net::URI >** (p. 1890), **decaf::util::LinkedList< Pointer< Command > >** (p. 1890), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1890), **decaf::util::LinkedList< cms::Destination * >** (p. 1890), **decaf::util::LinkedList< cms::Session * >** (p. 1890), and **decaf::util::LinkedList< cms::Connection * >** (p. 1890).

6.9.3.4 template<typename E> virtual Iterator<E>* decaf::util::AbstractSequentialList< E >::iterator () const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 161).

6.9.3.5 template<typename E> virtual Iterator<E>* decaf::util::AbstractSequentialList< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Reimplemented from **decaf::util::AbstractList< E >** (p. 161).

Referenced by decaf::util::LinkedList< cms::Connection * >::removeFirstOccurrence().

6.9.3.6 template<typename E> virtual ListIterator<E>* decaf::util::AbstractSequentialList< E >::listIterator (int index *DECAF_UNUSED*) const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 162).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1892), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1892), **decaf::util::LinkedList< CompositeTask * >** (p. 1892), **decaf::util::LinkedList< URI >** (p. 1892), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1892), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1892), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1892), **decaf::util::LinkedList< decaf::net::URI >** (p. 1892), **decaf::util::LinkedList< Pointer< Command > >** (p. 1892), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1892), **decaf::util::LinkedList< cms::Destination * >** (p. 1892), **decaf::util::LinkedList< cms::Session * >** (p. 1892), and **decaf::util::LinkedList< cms::Connection * >** (p. 1892).

6.9.3.7 template<typename E> virtual ListIterator<E>* decaf::util::AbstractSequentialList< E >::listIterator (int index *index*) [inline, virtual]

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (index < 0 || index > **size()** (p. 1015))

Reimplemented from **decaf::util::AbstractList< E >** (p. 163).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1893), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1893), **decaf::util::LinkedList< CompositeTask * >** (p. 1893), **decaf::util::LinkedList< URI >** (p. 1893), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1893), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1893), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1893),

decaf::util::LinkedList< decaf::net::URI > (p. 1893), **decaf::util::LinkedList< Pointer< Command > >** (p. 1893), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1893), **decaf::util::LinkedList< cms::Destination * >** (p. 1893), **decaf::util::LinkedList< cms::Session * >** (p. 1893), and **decaf::util::LinkedList< cms::Connection * >** (p. 1893).

6.9.3.8 template<typename E> virtual ListIterator<E>* decaf::util::AbstractSequentialList< E >::listIterator () const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 164).

6.9.3.9 template<typename E> virtual ListIterator<E>* decaf::util::AbstractSequentialList< E >::listIterator () [inline, virtual]

Returns:

a list iterator over the elements in this list (in proper sequence).

Reimplemented from **decaf::util::AbstractList< E >** (p. 164).

Referenced by decaf::util::AbstractSequentialList< cms::Connection * >::add(), decaf::util::AbstractSequentialList< cms::Connection * >::addAll(), decaf::util::AbstractSequentialList< cms::Connection * >::get(), decaf::util::AbstractSequentialList< cms::Connection * >::iterator(), decaf::util::AbstractSequentialList< cms::Connection * >::listIterator(), decaf::util::AbstractSequentialList< cms::Connection * >::removeAt(), and decaf::util::AbstractSequentialList< cms::Connection * >::set().

6.9.3.10 template<typename E> virtual E decaf::util::AbstractSequentialList< E >::removeAt (int index) [inline, virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it removes the element with **ListIterator.remove** (p. 1803).

Reimplemented from **decaf::util::AbstractList< E >** (p. 165).

6.9.3.11 template<typename E> virtual E decaf::util::AbstractSequentialList< E >::set (int index, const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters:

index The index of the element to replace.

element The element to be stored at the specified position.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the current element using **ListIterator.next** (p. 1803) and replaces it with **ListIterator.set** (p. 1915).

Implements **decaf::util::List< E >** (p. 1911).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1899), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1899), **decaf::util::LinkedList< CompositeTask * >** (p. 1899), **decaf::util::LinkedList< URI >** (p. 1899), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1899), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1899), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1899), **decaf::util::LinkedList< decaf::net::URI >** (p. 1899), **decaf::util::LinkedList< Pointer< Command > >** (p. 1899), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1899), **decaf::util::LinkedList< cms::Destination * >** (p. 1899), **decaf::util::LinkedList< cms::Session * >** (p. 1899), and **decaf::util::LinkedList< cms::Connection * >** (p. 1899).

6.10 decaf::util::AbstractSet< E > Class Template Reference

This class provides a skeletal implementation of the **Set** (p. 2715) interface to minimize the effort required to implement this interface.

`#include <src/main/decaf/util/AbstractSet.h>`Inheritance diagram for decaf::util::AbstractSet< E >:

Public Member Functions

- virtual ~**AbstractSet** ()
- virtual bool **removeAll** (const **Collection**< E > &collection)

  This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

6.10.1 Detailed Description

template<typename E> class decaf::util::AbstractSet< E >

This class provides a skeletal implementation of the **Set** (p. 2715) interface to minimize the effort required to implement this interface. The process of implementing a set by extending this class is identical to that of implementing a **Collection** (p. 1006) by extending **AbstractCollection** (p. 141), except that all of the methods and constructors in subclasses of this class must obey the additional constraints imposed by the **Set** (p. 2715) interface (for instance, the add method must not permit addition of multiple instances of an object to a set).

Since:

1.0

6.10.2 Constructor & Destructor Documentation

6.10.2.1 template<typename E> virtual decaf::util::AbstractSet< E >::~AbstractSet () [inline, virtual]

6.10.3 Member Function Documentation

6.10.3.1 template<typename E> virtual bool decaf::util::AbstractSet< E >::removeAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains

one or more elements in common with the specified collection. This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 150).

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1228).

The documentation for this class was generated from the following file:

6.11.3 Member Function Documentation

6.11.3.1 virtual Pointer<wireformat::WireFormat> activemq::transport::AbstractTransportFactory::createWireFormat (const decaf::util::Properties & *properties*) `[protected, virtual]`

Creates the WireFormat that is configured for this **Transport** (p. 3125) and returns it. The default WireFormat is Openwire.

Parameters:

properties The properties that were configured on the URI.

Returns:

a pointer to a WireFormat instance that the caller then owns.

Exceptions:

NoSuchElementException if the configured WireFormat is not found.

The documentation for this class was generated from the following file:

6.12 activemq::core::ActiveMQAckHandler Class Reference

Interface class that is used to give CMS Messages an interface to Ack themselves with.

`#include <src/main/activemq/core/ActiveMQAckHandler.h>`

Public Member Functions

- virtual ~**ActiveMQAckHandler** ()
- virtual void **acknowledgeMessage** (const **commands::Message** *message)=0

  Method called to acknowledge the message once it has been received by a MessageConsumer.

6.12.1 Detailed Description

Interface class that is used to give CMS Messages an interface to Ack themselves with.

Since:

2.0

6.12.2 Constructor & Destructor Documentation

6.12.2.1 virtual activemq::core::ActiveMQAckHandler::~ActiveMQAckHandler () [virtual]

6.12.3 Member Function Documentation

6.12.3.1 virtual void activemq::core::ActiveMQAckHandler::acknowledgeMessage (const commands::Message * *message*) [pure virtual]

Method called to acknowledge the message once it has been received by a MessageConsumer.

Parameters:

message The Message to Acknowledge.

Exceptions:

CMSException if an error occurs while acknowledging the given Message.

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQAckHandler.h**

6.13 activemq::commands::ActiveMQBlobMessage Class Reference

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual **cms::Message** * **clone** () const

  Clone this message exactly, returns a new instance that the caller is required to delete.

- std::string **getRemoteBlobUrl** () const

  Get the Remote URL of the Blob.

- void **setRemoteBlobUrl** (const std::string &remoteURL)

  Set the Remote URL of the Blob.

- std::string **getMimeType** () const

  Get the Mime Type of the Blob.

- void **setMimeType** (const std::string &mimeType)

  Set the Mime Type of the Blob.

- std::string **getName** () const

  Gets the Name of the Blob.

- void **setName** (const std::string &name)

  Sets the Name of the Blob.

- bool **isDeletedByBroker** () const

Gets if this Blob is deleted by the Broker.

- void **setDeletedByBroker** (bool value)
  Sets the Deleted By Broker flag.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQBLOBMESSAGE** = 29
- static const std::string **BINARY_MIME_TYPE**

6.13.1 Constructor & Destructor Documentation

6.13.1.1 activemq::commands::ActiveMQBlobMessage::ActiveMQBlobMessage ()

6.13.1.2 virtual activemq::commands::ActiveMQBlobMessage::~ActiveMQBlobMessage () throw () [inline, virtual]

6.13.2 Member Function Documentation

6.13.2.1 virtual cms::Message* activemq::commands::ActiveMQBlobMessage::clone () const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p. 2096).

References activemq::commands::Message::setReadOnlyBody(), and activemq::commands::Message::setReadOnlyProperties().

6.13.2.2 virtual ActiveMQBlobMessage* activemq::commands::ActiveMQBlobMessage::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 2076).

6.13.2.3 virtual void activemq::commands::ActiveMQBlobMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Message** (p. 2077).

6.13.2.4 virtual bool activemq::commands::ActiveMQBlobMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 378).

6.13.2.5 virtual unsigned char activemq::commands::ActiveMQBlobMessage::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 2079).

6.13.2.6 std::string activemq::commands::ActiveMQBlobMessage::getMimeType () const [inline]

Get the Mime Type of the Blob.

Returns:

string holding the MIME Type.

6.13.2.7 std::string activemq::commands::ActiveMQBlobMessage::getName () const [inline]

Gets the Name of the Blob.

Returns:

string name of the Blob.

6.13.2.8 std::string activemq::commands::ActiveMQBlobMessage::getRemoteBlobUrl () const [inline]

Get the Remote URL of the Blob.

Returns:

string from of the Remote Blob URL.

6.13.2.9 bool activemq::commands::ActiveMQBlobMessage::isDeletedByBroker () const [inline]

Gets if this Blob is deleted by the Broker.

Returns:

true if the Blob is deleted by the Broker.

6.13.2.10 void activemq::commands::ActiveMQBlobMessage::setDeletedByBroker (bool *value*) [inline]

Sets the Deleted By Broker flag.

Parameters:

value - set the Delete by broker flag to value.

6.13.2.11 void activemq::commands::ActiveMQBlobMessage::setMimeType (const std::string & *mimeType*) [inline]

Set the Mime Type of the Blob.

Parameters:

mimeType - String holding the MIME Type.

6.13.2.12 void activemq::commands::ActiveMQBlobMessage::setName (const std::string & *name*) [inline]

Sets the Name of the Blob.

Parameters:

name - Name of the Blob.

6.13.2.13 void activemq::commands::ActiveMQBlobMessage::setRemoteBlobUrl (const std::string & *remoteURL*) [inline]

Set the Remote URL of the Blob.

Parameters:

remoteURL - String form of the Remote URL.

6.13.2.14 virtual std::string activemq::commands::ActiveMQBlobMessage::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 2086).

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.14.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p. 209). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.14.2 Constructor & Destructor Documentation

6.14.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::Ac () [inline]

6.14.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::~A () [inline, virtual]

6.14.3 Member Function Documentation

6.14.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::creat () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.14.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::getD () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.14.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::loose (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.14.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::loose (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.14.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.14.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.14.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2187).

- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **ActiveMQBytesMessage** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual **cms::BytesMessage** * **clone** () const

  Clones this message.

- virtual void **clearBody** ()

  Clears out the body of the message.

- virtual void **onSend** ()

  *Allows derived **Message** (p. 2072) classes to perform tasks before a message is sent.*

- virtual void **setBodyBytes** (const unsigned char *buffer, int numBytes)

  sets the bytes given to the message body.

- virtual unsigned char * **getBodyBytes** () const

  Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.

- virtual int **getBodyLength** () const

  Returns the number of bytes contained in the body of this message.

- virtual void **reset** ()

  Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

- virtual bool **readBoolean** () const

Reads a Boolean from the Bytes message stream.

- virtual void **writeBoolean** (bool value)

  Writes a boolean to the bytes message stream as a 1-byte value.

- virtual unsigned char **readByte** () const

  Reads a Byte from the Bytes message stream.

- virtual void **writeByte** (unsigned char value)

  Writes a byte to the bytes message stream as a 1-byte value.

- virtual int **readBytes** (std::vector< unsigned char > &value) const

  Reads a byte array from the bytes message stream.

- virtual void **writeBytes** (const std::vector< unsigned char > &value)

  Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

- virtual int **readBytes** (unsigned char *buffer, int length) const

  Reads a portion of the bytes message stream.

- virtual void **writeBytes** (const unsigned char *value, int offset, int length)

  Writes a portion of a byte array to the bytes message stream.

- virtual char **readChar** () const

  Reads a Char from the Bytes message stream.

- virtual void **writeChar** (char value)

  Writes a char to the bytes message stream as a 1-byte value.

- virtual float **readFloat** () const

  Reads a 32 bit float from the Bytes message stream.

- virtual void **writeFloat** (float value)

  Writes a float to the bytes message stream as a 4 byte value.

- virtual double **readDouble** () const

  Reads a 64 bit double from the Bytes message stream.

- virtual void **writeDouble** (double value)

  Writes a double to the bytes message stream as a 8 byte value.

- virtual short **readShort** () const

  Reads a 16 bit signed short from the Bytes message stream.

- virtual void **writeShort** (short value)

  Writes a signed short to the bytes message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const

  Reads a 16 bit unsigned short from the Bytes message stream.

- virtual void **writeUnsignedShort** (unsigned short value)
  Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual int **readInt** () const
  Reads a 32 bit signed integer from the Bytes message stream.
- virtual void **writeInt** (int value)
  Writes a signed int to the bytes message stream as a 4 byte value.
- virtual long long **readLong** () const
  Reads a 64 bit long from the Bytes message stream.
- virtual void **writeLong** (long long value)
  Writes a long long to the bytes message stream as a 8 byte value.
- virtual std::string **readString** () const
  Reads an ASCII String from the Bytes message stream.
- virtual void **writeString** (const std::string &value)
  Writes an ASCII String to the Bytes message stream.
- virtual std::string **readUTF** () const
  Reads an UTF String from the BytesMessage stream.
- virtual void **writeUTF** (const std::string &value)
  Writes an UTF String to the BytesMessage stream.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQBYTESMESSAGE** = 24

6.15.1 Constructor & Destructor Documentation

6.15.1.1 activemq::commands::ActiveMQBytesMessage::ActiveMQBytesMessage ()

6.15.1.2 virtual activemq::commands::ActiveMQBytesMessage::~ActiveMQBytesMessage () throw () [virtual]

6.15.2 Member Function Documentation

6.15.2.1 virtual void activemq::commands::ActiveMQBytesMessage::clearBody () [virtual]

Clears out the body of the message. This does not clear the headers or properties.

Exceptions:

CMSException - if an internal error occurs.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 377).

6.15.2.2 virtual cms::BytesMessage* activemq::commands::ActiveMQBytesMessage::clone () const [inline, virtual]

Clones this message.

Returns:

a deep copy of this message.

Exceptions:

CMSException - if an internal error occurs while cloning the **Message** (p. 2072).

Implements **cms::BytesMessage** (p. 859).

References activemq::commands::Message::setReadOnlyBody(), and activemq::commands::Message::setReadOnlyProperties().

6.15.2.3 virtual ActiveMQBytesMessage* activemq::commands::ActiveMQBytesMessage::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 2076).

6.15.2.4 virtual void activemq::commands::ActiveMQBytesMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Message** (p. 2077).

6.15.2.5 virtual bool activemq::commands::ActiveMQBytesMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 378).

6.15.2.6 virtual unsigned char* activemq::commands::ActiveMQBytesMessage::getBodyBytes () const [virtual]

Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller. This is a copy of the data contained in this message, changing the value contained in this array has no effect on the data contained in this message.

Returns:

pointer to a byte buffer that the call owns upon completion of this method.

Exceptions:

CMSException - If an internal error occurs.

MessageNotReadableException - If the message is in Write Only Mode.

Implements **cms::BytesMessage** (p. 860).

6.15.2.7 virtual int activemq::commands::ActiveMQBytesMessage::getBodyLength () const [virtual]

Returns the number of bytes contained in the body of this message.

Returns:

number of bytes.

Exceptions:

CMSException - If an internal error occurs.

MessageNotReadableException - If the message is in Write Only Mode.

Implements **cms::BytesMessage** (p. 860).

6.15.2.8 virtual unsigned char activemq::commands::ActiveMQBytesMessage::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 2079).

6.15.2.9 virtual void activemq::commands::ActiveMQBytesMessage::onSend () [virtual]

Allows derived **Message** (p. 2072) classes to perform tasks before a message is sent.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 379).

6.15.2.10 virtual bool activemq::commands::ActiveMQBytesMessage::readBoolean () const [virtual]

Reads a Boolean from the Bytes message stream.

Returns:

boolean value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 860).

6.15.2.11 virtual unsigned char activemq::commands::ActiveMQBytesMessage::readByte () const [virtual]

Reads a Byte from the Bytes message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 861).

6.15.2.12 virtual int activemq::commands::ActiveMQBytesMessage::readBytes (unsigned char * *buffer*, int *length*) const [virtual]

Reads a portion of the bytes message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an IndexOutOfBoundsException is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.
MessageEOFException - if unexpected end of bytes stream has been reached.
MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 861).

6.15.2.13 virtual int activemq::commands::ActiveMQBytesMessage::readBytes (std::vector< unsigned char > & *value*) const [virtual]

Reads a byte array from the bytes message stream. If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.
MessageEOFException - if unexpected end of bytes stream has been reached.
MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 862).

6.15.2.14 virtual char activemq::commands::ActiveMQBytesMessage::readChar () const [virtual]

Reads a Char from the Bytes message stream.

Returns:

char value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.
MessageEOFException - if unexpected end of bytes stream has been reached.
MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 862).

6.15.2.15 virtual double activemq::commands::ActiveMQBytesMessage::readDouble () const [virtual]

Reads a 64 bit double from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 862).

6.15.2.16 virtual float activemq::commands::ActiveMQBytesMessage::readFloat () const [virtual]

Reads a 32 bit float from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 863).

6.15.2.17 virtual int activemq::commands::ActiveMQBytesMessage::readInt () const [virtual]

Reads a 32 bit signed integer from the Bytes message stream.

Returns:

int value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 863).

6.15.2.18 virtual long long activemq::commands::ActiveMQBytesMessage::readLong () const [virtual]

Reads a 64 bit long from the Bytes message stream.

Returns:

long long value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 863).

6.15.2.19 virtual short activemq::commands::ActiveMQBytesMessage::readShort () const [virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns:

short value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 864).

6.15.2.20 virtual std::string activemq::commands::ActiveMQBytesMessage::readString () const [virtual]

Reads an ASCII String from the Bytes message stream.

Returns:

String from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 864).

6.15.2.21 virtual unsigned short activemq::commands::ActiveMQBytesMessage::readUnsignedShort () const [virtual]

Reads a 16 bit unsigned short from the Bytes message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 864).

6.15.2.22 virtual std::string activemq::commands::ActiveMQBytesMessage::readUTF () const [virtual]

Reads an UTF String from the BytesMessage stream.

Returns:

String from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of bytes stream has been reached.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 865).

6.15.2.23 virtual void activemq::commands::ActiveMQBytesMessage::reset () [virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions:

CMSException - If the provider fails to perform the reset operation.

MessageFormatException - If the **Message** (p. 2072) has an invalid format.

Implements **cms::BytesMessage** (p. 865).

6.15.2.24 virtual void activemq::commands::ActiveMQBytesMessage::setBodyBytes (const unsigned char * *buffer*, int *numBytes*) [virtual]

sets the bytes given to the message body.

Parameters:

buffer Byte Buffer to copy
numBytes Number of bytes in Buffer to copy

Exceptions:

CMSException - If an internal error occurs.
MessageNotWriteableException - if in Read Only Mode.

Implements **cms::BytesMessage** (p. 865).

6.15.2.25 virtual std::string activemq::commands::ActiveMQBytesMessage::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 2086).

6.15.2.26 virtual void activemq::commands::ActiveMQBytesMessage::writeBoolean (bool *value*) [virtual]

Writes a boolean to the bytes message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value boolean to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.
MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 866).

6.15.2.27 virtual void activemq::commands::ActiveMQBytesMessage::writeByte (unsigned char *value*) [virtual]

Writes a byte to the bytes message stream as a 1-byte value.

Parameters:

value byte to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.
MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 866).

6.15.2.28 virtual void activemq::commands::ActiveMQBytesMessage::writeBytes (const unsigned char * *value*, int *offset*, int *length*) [virtual]

Writes a portion of a byte array to the bytes message stream. size as the number of bytes to write.

Parameters:

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 866).

6.15.2.29 virtual void activemq::commands::ActiveMQBytesMessage::writeBytes (const std::vector< unsigned char > & *value*) [virtual]

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters:

value bytes to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 867).

6.15.2.30 virtual void activemq::commands::ActiveMQBytesMessage::writeChar (char *value*) [virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters:

value char to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 867).

6.15.2.31 virtual void activemq::commands::ActiveMQBytesMessage::writeDouble (double *value*) [virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters:

value double to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 867).

6.15.2.32 virtual void activemq::commands::ActiveMQBytesMessage::writeFloat (float *value*) [virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters:

value float to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 868).

6.15.2.33 virtual void activemq::commands::ActiveMQBytesMessage::writeInt (int *value*) [virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters:

value signed int to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 868).

6.15.2.34 virtual void activemq::commands::ActiveMQBytesMessage::writeLong (long long *value*) [virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters:

value signed long long to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 868).

6.15.2.35 virtual void activemq::commands::ActiveMQBytesMessage::writeShort (short *value*) [virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters:

value signed short to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 868).

6.15.2.36 virtual void activemq::commands::ActiveMQBytesMessage::writeString (const std::string & *value*) [virtual]

Writes an ASCII String to the Bytes message stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 869).

6.15.2.37 virtual void activemq::commands::ActiveMQBytesMessage::writeUnsignedShort (unsigned short *value*) [virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters:

value unsigned short to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 869).

6.15.2.38 virtual void activemq::commands::ActiveMQBytesMessage::writeUTF (const std::string & *value*) [virtual]

Writes an UTF String to the BytesMessage stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 869).

6.15.3 Field Documentation

6.15.3.1 const unsigned char activemq::commands::ActiveMQBytesMessage::ID_ACTIVEMQBYTESMESSAGE = 24 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQBytesMessage.h**

6.16 activemq::wireformat::openwire::marshal::generated::ActiveMQByt Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 228).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQBytesMessageMarshaller`
diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller:

Public Member Functions

- **ActiveMQBytesMessageMarshaller** ()
- virtual ~**ActiveMQBytesMessageMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.16.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 228). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.16.2 Constructor & Destructor Documentation

6.16.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::A () [inline]

6.16.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::~ () [inline, virtual]

6.16.3 Member Function Documentation

6.16.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::crea () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.16.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::getI () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.16.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::loos (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.16.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::loos (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.16.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tigh (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.16.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tigh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.16.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tigh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2187).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQBytesMessageMarshaller.h**

6.17 activemq::core::ActiveMQConnection Class Reference

Concrete connection used for all connectors to the ActiveMQ broker.

`#include <src/main/activemq/core/ActiveMQConnection.h>`Inheritance diagram for activemq::core::ActiveMQConnection:

Public Member Functions

- **ActiveMQConnection** (const **Pointer< transport::Transport >** transport, const **Pointer< decaf::util::Properties >** properties)

  Constructor.

- virtual ~**ActiveMQConnection** ()
- virtual void **addSession** (**Pointer< activemq::core::kernels::ActiveMQSessionKernel >** session)

  Adds the session resources for the given session instance.

- virtual void **removeSession** (**Pointer< activemq::core::kernels::ActiveMQSessionKernel >** session)

  Removes the session resources for the given session instance.

- virtual void **addProducer** (**Pointer< kernels::ActiveMQProducerKernel >** producer)

  Adds an active Producer to the Set of known producers.

- virtual void **removeProducer** (const **Pointer< commands::ProducerId >** &producerId)

  Removes an active Producer to the Set of known producers.

- virtual void **addDispatcher** (const **Pointer< commands::ConsumerId >** &consumer, **Dispatcher** *dispatcher)

  Adds a dispatcher for a consumer.

- virtual void **removeDispatcher** (const **Pointer< commands::ConsumerId >** &consumer)

  Removes the dispatcher for a consumer.

- virtual void **sendPullRequest** (const **commands::ConsumerInfo** *consumer, long long timeout)

  If supported sends a message pull request to the service provider asking for the delivery of a new message.

- bool **isClosed** () const

  Checks if this connection has been closed.

- bool **isStarted** () const

  Check if this connection has been started.

- bool **isTransportFailed** () const

  Checks if the Connection's Transport has failed.

- virtual void **destroyDestination** (const **commands::ActiveMQDestination** *destination)

  Requests that the Broker removes the given Destination.

- virtual void **destroyDestination** (const **cms::Destination** *destination)

  Requests that the Broker removes the given Destination.

- bool **isDuplicate** (**Dispatcher** *dispatcher, **Pointer< commands::Message >** message)

  Allows Consumers to check if an incoming Message is a Duplicate.

- void **rollbackDuplicate** (**Dispatcher** *dispatcher, **Pointer< commands::Message >** message)

  Mark message as received.

- virtual const **cms::ConnectionMetaData** * **getMetaData** () const

  Gets the metadata for this connection.
  Returns:

  the connection MetaData pointer (caller does not own it).
  Exceptions:

  CMSException (p. ***979***) *if the provider fails to get the connection metadata for this connection.*
  See also:

  ConnectionMetaData (p. *1140*)
  Since:

  2.0

- virtual **cms::Session** * **createSession** ()

  Creates an AUTO_ACKNOWLEDGE ***Session*** (p. *2680*).
  Exceptions:

  CMSException (p. ***979***)

- virtual std::string **getClientID** () const

  Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.
  Returns:

  Client Id String for this ***Connection*** (p. *1089*).
  Exceptions:

  CMSException (p. ***979***) *if the provider fails to return the client id or an internal error occurs.*

- virtual void **setClientID** (const std::string &clientID)

  Sets the client identifier for this connection.
  The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific ***ConnectionFactory*** (p. *1114*) *object and transparently assigned to the* ***Connection*** (p. *1089*) *object it creates.*

If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an ***IllegalStateException*** *(p. 1658).*

Parameters:

clientID *The unique client identifier to assign to the* ***Connection*** *(p. 1089).*

Exceptions:

CMSException *(p. 979) if the provider fails to set the client id due to some internal error.*
InvalidClientIDException *if the id given is somehow invalid or is a duplicate.*
IllegalStateException *(p. 1658) if the client tries to set the id after a* ***Connection*** *(p. 1089) method has been called.*

- virtual **cms::Session** * **createSession** (**cms::Session::AcknowledgeMode** ackMode)

  Creates a new ***Session*** *(p. 2680) to work for this* ***Connection*** *(p. 1089) using the specified acknowledgment mode.*

  Parameters:

  ackMode *the Acknowledgment Mode to use.*

  Exceptions:

  CMSException *(p. 979)*

- virtual void **close** ()

  Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

  Exceptions:

  CMSException *(p. 979)*

- virtual void **start** ()

  Starts the service.

  Exceptions:

  CMSException *(p. 979) if an internal error occurs while starting.*

- virtual void **stop** ()

  Stops this service.

  Exceptions:

  CMSException *(p. 979) - if an internal error occurs while stopping the Service.*

- virtual **cms::ExceptionListener** * **getExceptionListener** () const

  Gets the registered Exception Listener for this connection.

  Returns:

  pointer to an exception listener or NULL

- virtual void **setExceptionListener** (**cms::ExceptionListener** *listener)

  Sets the registered Exception Listener for this connection.

  Parameters:

  listener *pointer to and* ***ExceptionListener*** *(p. 1465)*

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

*Set an **MessageTransformer** (p. 2219) instance that is passed on to all **Session** (p. 2680) objects created from this **Connection** (p. 1089).*
*The CMS **code** (p. 1005) never takes ownership of the **MessageTransformer** (p. 2219) pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the **MessageTransformer** (p. 2219) has been assigned.*
Parameters:

transformer *Pointer to the **cms::MessageTransformer** (p. 2219) to set on all newly created **Session** (p. 2680) objects.*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  *Gets the currently configured **MessageTransformer** (p. 2219) for this **Connection** (p. 1089).*
  Returns:

  *the pointer to the currently set **cms::MessageTransformer** (p. 2219).*

- virtual **cms::DestinationSource** * **getDestinationSource** ()

  *Returns the **DestinationSource** (p. 1395)} object which can be used to listen to destinations being created or destroyed or to enquire about the current destinations available on the message Provider.*
  Returns:

  *a new instance of a **DestinationSource** (p. 1395) that is owned by the caller.*
  Exceptions:

  ***CMSException** (p. **979**) if an error occurs while creating the destination source.*

- void **setUsername** (const std::string &username)

  Sets the username that should be used when creating a new connection.

- const std::string & **getUsername** () const

  Gets the username that this factory will use when creating a new connection instance.

- void **setPassword** (const std::string &password)

  Sets the password that should be used when creating a new connection.

- const std::string & **getPassword** () const

  Gets the password that this factory will use when creating a new connection instance.

- void **setDefaultClientId** (const std::string &clientId)

  Sets the Client Id.

- void **setBrokerURL** (const std::string &brokerURL)

  Sets the Broker URL that should be used when creating a new connection instance.

- const std::string & **getBrokerURL** () const

  Gets the Broker URL that this factory will use when creating a new connection instance.

- void **setPrefetchPolicy** (**PrefetchPolicy** *policy)

  *Sets the **PrefetchPolicy** (p. 2397) instance that this factory should use when it creates new Connection instances.*

- **PrefetchPolicy** * **getPrefetchPolicy** () const

*Gets the pointer to the current **PrefetchPolicy** (p. 2397) that is in use by this ConnectionFactory.*

- void **setRedeliveryPolicy** (**RedeliveryPolicy** *policy)

  *Sets the **RedeliveryPolicy** (p. 2542) instance that this factory should use when it creates new Connection instances.*

- **RedeliveryPolicy** * **getRedeliveryPolicy** () const

  *Gets the pointer to the current **RedeliveryPolicy** (p. 2542) that is in use by this ConnectionFactory.*

- bool **isDispatchAsync** () const
- void **setDispatchAsync** (bool value)

  Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

- bool **isAlwaysSyncSend** () const

  Gets if the Connection should always send things Synchronously.

- void **setAlwaysSyncSend** (bool value)

  Sets if the Connection should always send things Synchronously.

- bool **isUseAsyncSend** () const

  Gets if the useAsyncSend option is set.

- void **setUseAsyncSend** (bool value)

  Sets the useAsyncSend option.

- bool **isUseCompression** () const

  Gets if the Connection is configured for Message body compression.

- void **setUseCompression** (bool value)

  Sets whether Message body compression is enabled.

- void **setCompressionLevel** (int value)

  Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

- int **getCompressionLevel** () const

  Gets the currently configured Compression level for Message bodies.

- unsigned int **getSendTimeout** () const

  Gets the assigned send timeout for this Connector.

- void **setSendTimeout** (unsigned int timeout)

  Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

- unsigned int **getCloseTimeout** () const

  Gets the assigned close timeout for this Connector.

- void **setCloseTimeout** (unsigned int timeout)

  Sets the close timeout to use when sending the disconnect request.

- unsigned int **getProducerWindowSize** () const

  Gets the configured producer window size for Producers that are created from this connector.

- void **setProducerWindowSize** (unsigned int windowSize)

  Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

- bool **isMessagePrioritySupported** () const
- void **setMessagePrioritySupported** (bool value)

  Set whether or not this factory should create Connection objects with the Message priority support function enabled.

- long long **getNextTempDestinationId** ()

  Get the Next Temporary Destination Id.

- long long **getNextLocalTransactionId** ()

  Get the Next Temporary Destination Id.

- bool **isWatchTopicAdvisories** () const

  *Is the Connection configured to watch for advisory messages to maintain **state** (p. 70) of temporary destination create and destroy.*

- void **setWatchTopicAdvisories** (bool value)

  Sets whether this Connection is listening for advisory messages regarding temporary destination creation and deletion.

- int **getAuditDepth** () const

  *Get the audit depth for Messages for consumers when using a fault tolerant **transport** (p. 72).*

- void **setAuditDepth** (int auditDepth)

  *Set the audit depth for Messages for consumers when using a fault tolerant **transport** (p. 72).*

- int **getAuditMaximumProducerNumber** () const

  The number of Producers that will be audited.

- void **setAuditMaximumProducerNumber** (int auditMaximumProducerNumber)

  The number of Producers that will be audited.

- bool **isCheckForDuplicates** () const

  Gets the value of the configured Duplicate Message detection feature.

- void **setCheckForDuplicates** (bool checkForDuplicates)

  Gets the value of the configured Duplicate Message detection feature.

- bool **isTransactedIndividualAck** () const

  when true, submit individual transacted acks immediately rather than with transaction completion.

- void **setTransactedIndividualAck** (bool transactedIndividualAck)

  when true, submit individual transacted acks immediately rather than with transaction completion.

- bool **isNonBlockingRedelivery** () const

  Returns true if non-blocking redelivery of Messages is configured for Consumers that are rolled back or recovered.

- void **setNonBlockingRedelivery** (bool nonBlockingRedelivery)

  When true a MessageConsumer will not stop Message delivery before re-delivering Messages from a rolled back transaction.

- long long **getConsumerFailoverRedeliveryWaitPeriod** () const

  Gets the delay period for a consumer redelivery.

- void **setConsumerFailoverRedeliveryWaitPeriod** (long long value)

  Sets the delay period for a consumer redelivery.

- bool **isOptimizeAcknowledge** () const
- void **setOptimizeAcknowledge** (bool optimizeAcknowledge)

  Sets if Consumers are configured to use Optimized Acknowledge by default.

- long long **getOptimizeAcknowledgeTimeOut** () const

  Gets the time between optimized ack batches in milliseconds.

- void **setOptimizeAcknowledgeTimeOut** (long long optimizeAcknowledgeTimeOut)

  The max time in milliseconds between optimized ack batches.

- long long **getOptimizedAckScheduledAckInterval** () const

  Gets the configured time interval that is used to force all MessageConsumers that have optimizedAcknowledge enabled to send an ack for any outstanding Message Acks.

- void **setOptimizedAckScheduledAckInterval** (long long optimizedAckScheduledAckInterval)

  Sets the amount of time between scheduled sends of any outstanding Message Acks for consumers that have been configured with optimizeAcknowledge enabled.

- bool **isUseRetroactiveConsumer** () const

  Should all created consumers be retroactive.

- void **setUseRetroactiveConsumer** (bool useRetroactiveConsumer)

  Sets whether or not retroactive consumers are enabled.

- bool **isExclusiveConsumer** () const

  Should all created consumers be exclusive.

- void **setExclusiveConsumer** (bool exclusiveConsumer)

  Enables or disables whether or not queue consumers should be exclusive or not for example to preserve ordering when not using Message Groups.

- bool **isSendAcksAsync** () const

Returns whether Message acknowledgments are sent asynchronously meaning no response is required from the broker before the ack completes.

- void **setSendAcksAsync** (bool sendAcksAsync)

  Sets whether Message acknowledgments are sent asynchronously meaning no response is required from the broker before the ack completes.

- void **addTransportListener** (**transport::TransportListener** *transportListener)

  *Adds a **transport** (p. 72) listener so that a client can be notified of events in the underlying **transport** (p. 72), client's are always notified after the event has been processed by the Connection class.*

- void **removeTransportListener** (**transport::TransportListener** *transportListener)

  Removes a registered TransportListener from the Connection's set of Transport listeners, this listener will no longer receive any Transport related events.

- virtual void **onCommand** (const **Pointer< commands::Command >** command)

  *Event handler for the receipt of a non-response command from the **transport** (p. 72).*

- virtual void **onException** (const **decaf::lang::Exception** &ex)

  *Event handler for an exception from a command **transport** (p. 72).*

- virtual void **transportInterrupted** ()

  *The **transport** (p. 72) has suffered an interruption from which it hopes to recover.*

- virtual void **transportResumed** ()

  *The **transport** (p. 72) has resumed after an interruption.*

- const **commands::ConnectionInfo** & **getConnectionInfo** () const

  Gets the ConnectionInfo for this Object, if the Connection is not open than this method throws an exception.

- const **commands::ConnectionId** & **getConnectionId** () const

  Gets the ConnectionId for this Object, if the Connection is not open than this method throws an exception.

- **transport::Transport** & **getTransport** () const

  Gets a reference to this object's Transport instance.

- **Pointer< threads::Scheduler >** **getScheduler** () const

  Gets a reference to the Connection objects built in Scheduler instance.

- std::string **getResourceManagerId** () const

  Returns the Id of the Resource Manager that this client will use should it be entered into an XA Transaction.

- void **cleanup** ()

  *Clean up this connection object, reseting it back to a **state** (p. 70) that mirrors what a newly created **ActiveMQConnection** (p. 232) object has.*

- void **oneway** (**Pointer< commands::Command >** command)

Sends a message without request that the broker send a response to indicate that it was received.

- **Pointer< commands::Response > syncRequest** (**Pointer< commands::Command** > command, unsigned int timeout=0)

  Sends a synchronous request and returns the response from the broker.

- void **asyncRequest** (**Pointer< commands::Command** > command, **cms::AsyncCallback** *onComplete)

  Sends a synchronous request and returns the response from the broker.

- virtual void **fire** (const **exceptions::ActiveMQException** &ex)

  Notify the exception listener.

- void **setTransportInterruptionProcessingComplete** ()

  Indicates that a Connection resource that is processing the transportInterrupted event has completed.

- void **setFirstFailureError** (**decaf::lang::Exception** *error)

  Sets the pointer to the first exception that caused the Connection to become failed.

- **decaf::lang::Exception** * **getFirstFailureError** () const

  Gets the pointer to the first exception that caused the Connection to become failed.

- void **onAsyncException** (const **decaf::lang::Exception** &ex)

  *Event handler for dealing with async **exceptions** (p. 67).*

- void **onClientInternalException** (const **decaf::lang::Exception** &ex)

  *Handles async client internal **exceptions** (p. 67) which don't usually affect the connection itself.*

- void **checkClosed** () const

  Check for Closed State and Throw an exception if true.

- void **checkClosedOrFailed** () const

  Check for Closed State and Failed State and Throw an exception if either is true.

- void **ensureConnectionInfoSent** ()

  If its not been sent, then send the ConnectionInfo to the Broker.

- **decaf::util::concurrent::ExecutorService** * **getExecutor** () const
- void **addTempDestination** (**Pointer< commands::ActiveMQTempDestination** > destination)

  Adds the given Temporary Destination to this Connections collection of known Temporary Destinations.

- void **removeTempDestination** (**Pointer< commands::ActiveMQTempDestination** > destination)

  Removes the given Temporary Destination to this Connections collection of known Temporary Destinations.

- void **deleteTempDestination** (**Pointer< commands::ActiveMQTempDestination** > destination)

Removes the given Temporary Destination to this Connections collection of known Temporary Destinations.

- void **cleanUpTempDestinations** ()

  *Removes any TempDestinations that this connection has cached, ignoring any **exceptions** (p. 67) generated because the destination is in use as they should not be removed.*

- bool **isDeleted** (**Pointer< commands::ActiveMQTempDestination >** destination) const

  Determines whether the supplied Temporary Destination has already been deleted from the Broker.

Protected Member Functions

- virtual **Pointer< commands::SessionId > getNextSessionId** ()
- void **disconnect** (long long lastDeliveredSequenceId)
- void **waitForTransportInterruptionProcessingToComplete** ()
- void **signalInterruptionProcessingComplete** ()
- const **decaf::util::Properties** & **getProperties** () const
- void **onControlCommand** (**Pointer< commands::Command >** command)
- void **onConnectionControl** (**Pointer< commands::Command >** command)
- void **onConsumerControl** (**Pointer< commands::Command >** command)

6.17.1 Detailed Description

Concrete connection used for all connectors to the ActiveMQ broker.

Since:

2.0

6.17.2 Constructor & Destructor Documentation

6.17.2.1 activemq::core::ActiveMQConnection::ActiveMQConnection (const Pointer< transport::Transport > *transport*, const Pointer< decaf::util::Properties > *properties*)

Constructor.

Parameters:

transport *(p. 72)* The Transport requested for this connection to the Broker.

properties The Properties that were defined for this connection

6.17.2.2 virtual activemq::core::ActiveMQConnection::~ActiveMQConnection () [virtual]

6.17.3 Member Function Documentation

6.17.3.1 virtual void activemq::core::ActiveMQConnection::addDispatcher (const Pointer< commands::ConsumerId > & *consumer*, Dispatcher * *dispatcher*) [virtual]

Adds a dispatcher for a consumer.

Parameters:

consumer - The consumer for which to register a dispatcher.

dispatcher - The dispatcher to handle incoming messages for the consumer.

Exceptions:

CMSException if an error occurs while removing performing the operation.

6.17.3.2 virtual void activemq::core::ActiveMQConnection::addProducer (Pointer< kernels::ActiveMQProducerKernel > *producer*) [virtual]

Adds an active Producer to the Set of known producers.

Parameters:

producer The Producer to add from the the known set.

Exceptions:

CMSException if an error occurs while removing performing the operation.

6.17.3.3 virtual void activemq::core::ActiveMQConnection::addSession (Pointer< activemq::core::kernels::ActiveMQSessionKernel > *session*) [virtual]

Adds the session resources for the given session instance.

Parameters:

session The session to be added to this connection.

Exceptions:

CMSException if an error occurs while removing performing the operation.

6.17.3.4 void activemq::core::ActiveMQConnection::addTempDestination (Pointer< commands::ActiveMQTempDestination > *destination*)

Adds the given Temporary Destination to this Connections collection of known Temporary Destinations.

Parameters:

destination The temporary destination that this connection should track.

6.17.3.5 void activemq::core::ActiveMQConnection::addTransportListener (transport::TransportListener * *transportListener*)

Adds a **transport** (p. 72) listener so that a client can be notified of events in the underlying **transport** (p. 72), client's are always notified after the event has been processed by the Connection class. Client's should ensure that the registered listener does not block or take a long amount of time to execute in order to not degrade performance of this Connection.

Parameters:

transportListener The TransportListener instance to add to this Connection's set of listeners to notify of Transport events.

6.17.3.6 void activemq::core::ActiveMQConnection::asyncRequest (Pointer< commands::Command > *command*, cms::AsyncCallback * *onComplete*)

Sends a synchronous request and returns the response from the broker. This method converts any error responses it receives into an exception.

Parameters:

command The Command object that is to be sent to the broker.

onComplete Completion callback that will be notified on send success or failure.

Exceptions:

BrokerException if the response from the broker is of type ExceptionResponse.

ActiveMQException if any other error occurs while sending the Command.

6.17.3.7 void activemq::core::ActiveMQConnection::checkClosed () const

Check for Closed State and Throw an exception if true.

Exceptions:

CMSException if the Connection is closed.

6.17.3.8 void activemq::core::ActiveMQConnection::checkClosedOrFailed () const

Check for Closed State and Failed State and Throw an exception if either is true.

Exceptions:

CMSException if the Connection is closed or failed.

6.17.3.9 void activemq::core::ActiveMQConnection::cleanup ()

Clean up this connection object, reseting it back to a **state** (p. 70) that mirrors what a newly created **ActiveMQConnection** (p. 232) object has.

6.17.3.10 void activemq::core::ActiveMQConnection::cleanUpTempDestinations ()

Removes any TempDestinations that this connection has cached, ignoring any **exceptions** (p. 67) generated because the destination is in use as they should not be removed. This method is useful for Connection pools that retain connection objects for long durations and want to periodically purge old temporary destination instances this connection is tracking.

6.17.3.11 virtual void activemq::core::ActiveMQConnection::close () [virtual]

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions:

CMSException *(*p. ***979****)*

Implements **cms::Connection** (p. 1090).

6.17.3.12 virtual cms::Session* activemq::core::ActiveMQConnection::createSession (cms::Session::AcknowledgeMode *ackMode*) [virtual]

Creates a new **Session** (p. 2680) to work for this **Connection** (p. 1089) using the specified acknowledgment mode.

Parameters:

ackMode the Acknowledgment Mode to use.

Exceptions:

CMSException *(*p. ***979****)*

Implements **cms::Connection** (p. 1091).

Reimplemented in **activemq::core::ActiveMQXAConnection** (p. 543).

6.17.3.13 virtual cms::Session* activemq::core::ActiveMQConnection::createSession () [virtual]

Creates an AUTO_ACKNOWLEDGE **Session** (p. 2680).

Exceptions:

CMSException *(*p. ***979****)*

Implements **cms::Connection** (p. 1091).

6.17.3.14 void activemq::core::ActiveMQConnection::deleteTempDestination (Pointer< commands::ActiveMQTempDestination > *destination*)

Removes the given Temporary Destination to this Connections collection of known Temporary Destinations.

Parameters:

destination The temporary destination that this connection should remove from the Broker.

Exceptions:

CMSException if the temporary destination is in use by an active Session.

6.17.3.15 virtual void activemq::core::ActiveMQConnection::destroyDestination (const cms::Destination * *destination*) [virtual]

Requests that the Broker removes the given Destination. Calling this method implies that the client is finished with the Destination and that no other messages will be sent or received for the given Destination. The Broker frees all resources it has associated with this Destination.

Parameters:

destination The CMS Destination the Broker will be requested to remove.

Exceptions:

NullPointerException If the passed Destination is Null

IllegalStateException If the connection is closed.

UnsupportedOperationException If the wire format in use does not support this operation.

ActiveMQException If any other error occurs during the attempt to destroy the destination.

6.17.3.16 virtual void activemq::core::ActiveMQConnection::destroyDestination (const commands::ActiveMQDestination * *destination*) [virtual]

Requests that the Broker removes the given Destination. Calling this method implies that the client is finished with the Destination and that no other messages will be sent or received for the given Destination. The Broker frees all resources it has associated with this Destination.

Parameters:

destination The Destination the Broker will be requested to remove.

Exceptions:

NullPointerException If the passed Destination is Null

IllegalStateException If the connection is closed.

UnsupportedOperationException If the wire format in use does not support this operation.

ActiveMQException If any other error occurs during the attempt to destroy the destination.

6.17.3.17 void activemq::core::ActiveMQConnection::disconnect (long long *lastDeliveredSequenceId*) [protected]

6.17.3.18 void activemq::core::ActiveMQConnection::ensureConnectionInfoSent ()

If its not been sent, then send the ConnectionInfo to the Broker.

6.17.3.19 virtual void activemq::core::ActiveMQConnection::fire (const exceptions::ActiveMQException & *ex*) [virtual]

Notify the exception listener.

Parameters:

ex the exception to fire

6.17.3.20 int activemq::core::ActiveMQConnection::getAuditDepth () const

Get the audit depth for Messages for consumers when using a fault tolerant **transport** (p. 72). The higher the value the more messages are checked for duplication, and the larger the performance impact of duplicate detection will be.

Returns:

the configured audit depth.

6.17.3.21 int activemq::core::ActiveMQConnection::getAuditMaximumProducerNumber () const

The number of Producers that will be audited.

Returns:

the configured number of producers to include in the audit.

6.17.3.22 const std::string& activemq::core::ActiveMQConnection::getBrokerURL () const

Gets the Broker URL that this factory will use when creating a new connection instance.

Returns:

brokerURL string

6.17.3.23 virtual std::string activemq::core::ActiveMQConnection::getClientID () const [virtual]

Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.

Returns:

Client Id String for this **Connection** (p. 1089).

Exceptions:

CMSException *(p. 979)* if the provider fails to return the client id or an internal error occurs.

Implements **cms::Connection** (p. 1091).

6.17.3.24 unsigned int activemq::core::ActiveMQConnection::getCloseTimeout () const

Gets the assigned close timeout for this Connector.

Returns:

the close timeout configured in the connection uri

6.17.3.25 int activemq::core::ActiveMQConnection::getCompressionLevel () const

Gets the currently configured Compression level for Message bodies.

Returns:

the int value of the current compression level.

6.17.3.26 const commands::ConnectionId& activemq::core::ActiveMQConnection::getConnectionId () const

Gets the ConnectionId for this Object, if the Connection is not open than this method throws an exception.

Exceptions:

ActiveMQException if an error occurs while performing this operation.

6.17.3.27 const commands::ConnectionInfo& activemq::core::ActiveMQConnection::getConnectionInfo () const

Gets the ConnectionInfo for this Object, if the Connection is not open than this method throws an exception.

Exceptions:

ActiveMQException if an error occurs while performing this operation.

6.17.3.28 long long activemq::core::ActiveMQConnection::getConsumerFailoverRedeliveryWaitPeriod () const

Gets the delay period for a consumer redelivery.

Returns:

configured time delay in milliseconds.

6.17.3.29 virtual cms::DestinationSource* activemq::core::ActiveMQConnection::getDestinationSource () [virtual]

Returns the **DestinationSource** (p. 1395)} object which can be used to listen to destinations being created or destroyed or to enquire about the current destinations available on the message Provider.

Returns:

a new instance of a **DestinationSource** (p. 1395) that is owned by the caller.

Exceptions:

CMSException *(*p. ***979****)* if an error occurs while creating the destination source.

Implements **cms::EnhancedConnection** (p. 1451).

6.17.3.30 virtual cms::ExceptionListener* activemq::core::ActiveMQConnection::getExceptionListener () const [virtual]

Gets the registered Exception Listener for this connection.

Returns:

pointer to an exception listener or NULL

Implements **cms::Connection** (p. 1091).

6.17.3.31 decaf::util::concurrent::ExecutorService* activemq::core::ActiveMQConnection::getExecutor () const

Returns:

the ExecutorService used to run jobs for this Connection

6.17.3.32 decaf::lang::Exception* activemq::core::ActiveMQConnection::getFirstFailureError () const

Gets the pointer to the first exception that caused the Connection to become failed.

Returns:

pointer to an Exception instance or NULL if none is set.

6.17.3.33 virtual cms::MessageTransformer* activemq::core::ActiveMQConnection::getMessageTransformer () const [virtual]

Gets the currently configured **MessageTransformer** (p. 2219) for this **Connection** (p. 1089).

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::Connection** (p. 1092).

6.17.3.34 virtual const cms::ConnectionMetaData* activemq::core::ActiveMQConnection::getMetaData () const [inline, virtual]

Gets the metadata for this connection.

Returns:

the connection MetaData pointer (caller does not own it).

Exceptions:

CMSException *(*p. ***979****)* if the provider fails to get the connection metadata for this connection.

See also:

ConnectionMetaData (p. 1140)

Since:

2.0

Implements **cms::Connection** (p. 1092).

6.17.3.35 long long activemq::core::ActiveMQConnection::getNextLocalTransactionId ()

Get the Next Temporary Destination Id.

Returns:

the next id in the sequence.

6.17.3.36 virtual Pointer<commands::SessionId> activemq::core::ActiveMQConnection::getNextSessionId () [protected, virtual]

Returns:

the next available Session Id.

6.17.3.37 long long activemq::core::ActiveMQConnection::getNextTempDestinationId ()

Get the Next Temporary Destination Id.

Returns:

the next id in the sequence.

6.17.3.38 long long activemq::core::ActiveMQConnection::getOptimizeAcknowledgeTimeOut () const

Gets the time between optimized ack batches in milliseconds.

Returns:

time between optimized ack batches in Milliseconds.

6.17.3.39 long long activemq::core::ActiveMQConnection::getOptimizedAckScheduledAckInterval () const

Gets the configured time interval that is used to force all MessageConsumers that have optimizedAcknowledge enabled to send an ack for any outstanding Message Acks. By default this value is set to zero meaning that the consumers will not do any background Message acknowledgment.

Returns:

the scheduledOptimizedAckInterval

6.17.3.40 const std::string& activemq::core::ActiveMQConnection::getPassword () const

Gets the password that this factory will use when creating a new connection instance.

Returns:

password string, "" for default credentials

6.17.3.41 PrefetchPolicy* activemq::core::ActiveMQConnection::getPrefetchPolicy () const

Gets the pointer to the current **PrefetchPolicy** (p. 2397) that is in use by this ConnectionFactory.

Returns:

a pointer to this objects **PrefetchPolicy** (p. 2397).

6.17.3.42 unsigned int activemq::core::ActiveMQConnection::getProducerWindowSize () const

Gets the configured producer window size for Producers that are created from this connector. This only applies if there is no send timeout and the producer is able to send asynchronously.

Returns:

size in bytes of messages that this producer can produce before it must block and wait for ProducerAck messages to free resources.

6.17.3.43 const decaf::util::Properties& activemq::core::ActiveMQConnection::getProperties () const [protected]

6.17.3.44 RedeliveryPolicy* activemq::core::ActiveMQConnection::getRedeliveryPolicy () const

Gets the pointer to the current **RedeliveryPolicy** (p. 2542) that is in use by this ConnectionFactory.

Returns:

a pointer to this objects **RedeliveryPolicy** (p. 2542).

6.17.3.45 std::string activemq::core::ActiveMQConnection::getResourceManagerId () const

Returns the Id of the Resource Manager that this client will use should it be entered into an XA Transaction.

Returns:

a string containing the resource manager Id for XA Transactions.

6.17.3.46 Pointer<threads::Scheduler> activemq::core::ActiveMQConnection::getScheduler () const

Gets a reference to the Connection objects built in Scheduler instance.

Returns:

a reference to a Scheduler instance owned by this Connection.

6.17.3.47 unsigned int activemq::core::ActiveMQConnection::getSendTimeout () const

Gets the assigned send timeout for this Connector.

Returns:

the send timeout configured in the connection uri

6.17.3.48 transport::Transport& activemq::core::ActiveMQConnection::getTransport () const

Gets a reference to this object's Transport instance.

Returns:

a reference to the Transport that is in use by this Connection.

6.17.3.49 const std::string& activemq::core::ActiveMQConnection::getUsername () const

Gets the username that this factory will use when creating a new connection instance.

Returns:

username string, "" for default credentials

6.17.3.50 bool activemq::core::ActiveMQConnection::isAlwaysSyncSend () const

Gets if the Connection should always send things Synchronously.

Returns:

true if sends should always be Synchronous.

6.17.3.51 bool activemq::core::ActiveMQConnection::isCheckForDuplicates () const

Gets the value of the configured Duplicate Message detection feature. When enabled and a fault tolerant **transport** (p. 72) is used (think failover) then this feature will help to detect and filter duplicate messages that might otherwise be delivered to a consumer after a connection failure.

Disabling this can increase performance since no Message auditing will occur.

Returns:

the checkForDuplicates value currently set.

6.17.3.52 bool activemq::core::ActiveMQConnection::isClosed () const [inline]

Checks if this connection has been closed.

Returns:

true if the connection is closed

6.17.3.53 bool activemq::core::ActiveMQConnection::isDeleted (Pointer< commands::ActiveMQTempDestination > *destination*) const

Determines whether the supplied Temporary Destination has already been deleted from the Broker. If watchTopicAdvisories is disabled this method will always return false.

Returns:

true if the temporary destination was deleted already.

6.17.3.54 bool activemq::core::ActiveMQConnection::isDispatchAsync () const

Returns:

The value of the dispatch asynchronously option sent to the broker.

6.17.3.55 bool activemq::core::ActiveMQConnection::isDuplicate (Dispatcher * *dispatcher*, Pointer< commands::Message > *message*)

Allows Consumers to check if an incoming Message is a Duplicate.

Parameters:

dispatcher The **Dispatcher** (p. 1412) that is checking the Message for Duplication.

message The Message that should be checked.

Returns:

true if the Message was seen before.

6.17.3.56 bool activemq::core::ActiveMQConnection::isExclusiveConsumer () const

Should all created consumers be exclusive.

Returns:

true if consumer will be created with the exclusive flag set.

6.17.3.57 bool activemq::core::ActiveMQConnection::isMessagePrioritySupported () const

Returns:

true if the Connections that this factory creates should support the message based priority settings.

6.17.3.58 bool activemq::core::ActiveMQConnection::isNonBlockingRedelivery () const

Returns true if non-blocking redelivery of Messages is configured for Consumers that are rolled back or recovered.

Returns:

true if non-blocking redelivery is enabled.

6.17.3.59 bool activemq::core::ActiveMQConnection::isOptimizeAcknowledge () const

Returns:

true if optimizeAcknowledge is enabled.

6.17.3.60 bool activemq::core::ActiveMQConnection::isSendAcksAsync () const

Returns whether Message acknowledgments are sent asynchronously meaning no response is required from the broker before the ack completes.

Returns:

the sendAcksAsync configured value.

6.17.3.61 bool activemq::core::ActiveMQConnection::isStarted () const [inline]

Check if this connection has been started.

Returns:

true if the start method has been called.

6.17.3.62 bool activemq::core::ActiveMQConnection::isTransactedIndividualAck () const

when true, submit individual transacted acks immediately rather than with transaction completion. This allows the acks to represent delivery status which can be persisted on rollback Used in conjunction with KahaDB set to Rewrite On Redelivery.

Returns:

true if this option is enabled.

6.17.3.63 bool activemq::core::ActiveMQConnection::isTransportFailed () const [inline]

Checks if the Connection's Transport has failed.

Returns:

true if the Connection's Transport has failed.

6.17.3.64 bool activemq::core::ActiveMQConnection::isUseAsyncSend () const

Gets if the useAsyncSend option is set.

Returns:

true if on false if not.

6.17.3.65 bool activemq::core::ActiveMQConnection::isUseCompression () const

Gets if the Connection is configured for Message body compression.

Returns:

if the Message body will be Compressed or not.

6.17.3.66 bool activemq::core::ActiveMQConnection::isUseRetroactiveConsumer () const

Should all created consumers be retroactive.

Returns:

true if consumer will be created with the retroactive flag set.

6.17.3.67 bool activemq::core::ActiveMQConnection::isWatchTopicAdvisories () const

Is the Connection configured to watch for advisory messages to maintain **state** (p. 70) of temporary destination create and destroy.

Returns:

true if the Connection will listen for temporary topic advisory messages.

6.17.3.68 void activemq::core::ActiveMQConnection::onAsyncException (const decaf::lang::Exception & *ex*)

Event handler for dealing with async **exceptions** (p. 67).

Parameters:

ex The exception that caused the error condition.

6.17.3.69 void activemq::core::ActiveMQConnection::onClientInternalException (const decaf::lang::Exception & *ex*)

Handles async client internal **exceptions** (p. 67) which don't usually affect the connection itself. These are reported but do not shutdown the Connection.

Parameters:

error the exception that the problem

6.17.3.70 virtual void activemq::core::ActiveMQConnection::onCommand (const Pointer< commands::Command > *command*) [virtual]

Event handler for the receipt of a non-response command from the **transport** (p. 72).

Parameters:

command the received command object.

Implements **activemq::transport::TransportListener** (p. 3146).

6.17.3.71 void activemq::core::ActiveMQConnection::onConnectionControl (Pointer< commands::Command > *command*) [protected]

6.17.3.72 void activemq::core::ActiveMQConnection::onConsumerControl (Pointer< commands::Command > *command*) [protected]

6.17.3.73 void activemq::core::ActiveMQConnection::onControlCommand (Pointer< commands::Command > *command*) [protected]

6.17.3.74 void activemq::core::ActiveMQConnection::oneway (Pointer< commands::Command > *command*)

Sends a message without request that the broker send a response to indicate that it was received.

Parameters:

command The Command object to send to the Broker.

Exceptions:

ActiveMQException if not currently connected, or if the operation fails for any reason.

6.17.3.75 virtual void activemq::core::ActiveMQConnection::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 72).

Parameters:

ex The exception.

Implements **activemq::transport::TransportListener** (p. 3147).

6.17.3.76 virtual void activemq::core::ActiveMQConnection::removeDispatcher (const Pointer< commands::ConsumerId > & *consumer*) [virtual]

Removes the dispatcher for a consumer.

Parameters:

consumer - The consumer for which to remove the dispatcher.

Exceptions:

CMSException if an error occurs while removing performing the operation.

6.17.3.77 virtual void activemq::core::ActiveMQConnection::removeProducer (const Pointer< commands::ProducerId > & *producerId*) [virtual]

Removes an active Producer to the Set of known producers.

Parameters:

producerId - The ProducerId to remove from the the known set.

Exceptions:

CMSException if an error occurs while removing performing the operation.

6.17.3.78 virtual void activemq::core::ActiveMQConnection::removeSession (Pointer< activemq::core::kernels::ActiveMQSessionKernel > *session*) [virtual]

Removes the session resources for the given session instance.

Parameters:

session The session to be unregistered from this connection.

Exceptions:

CMSException if an error occurs while removing performing the operation.

6.17.3.79 void activemq::core::ActiveMQConnection::removeTempDestination (Pointer< commands::ActiveMQTempDestination > *destination*)

Removes the given Temporary Destination to this Connections collection of known Temporary Destinations.

Parameters:

destination The temporary destination that this connection should stop tracking.

6.17.3.80 void activemq::core::ActiveMQConnection::removeTransportListener (transport::TransportListener * *transportListener*)

Removes a registered TransportListener from the Connection's set of Transport listeners, this listener will no longer receive any Transport related events. The caller is responsible for freeing the listener in all cases.

Parameters:

transportListener The pointer to the TransportListener to remove from the set of listeners.

6.17.3.81 void activemq::core::ActiveMQConnection::rollbackDuplicate (Dispatcher * *dispatcher*, Pointer< commands::Message > *message*)

Mark message as received.

Parameters:

dispatcher The **Dispatcher** (p. 1412) instance that has received the Message.

message The Message that has been received.

6.17.3.82 virtual void activemq::core::ActiveMQConnection::sendPullRequest (const commands::ConsumerInfo * *consumer*, long long *timeout*) [virtual]

If supported sends a message pull request to the service provider asking for the delivery of a new message. This is used in the case where the service provider has been configured with a zero prefetch or is only capable of delivering messages on a pull basis.

Parameters:

consumer - the ConsumerInfo for the requesting Consumer.

timeout - the time that the client is willing to wait.

Exceptions:

ActiveMQException if an error occurs while removing performing the operation.

6.17.3.83 void activemq::core::ActiveMQConnection::setAlwaysSyncSend (bool *value*)

Sets if the Connection should always send things Synchronously.

Parameters:

value true if sends should always be Synchronous.

6.17.3.84 void activemq::core::ActiveMQConnection::setAuditDepth (int *auditDepth*)

Set the audit depth for Messages for consumers when using a fault tolerant **transport** (p. 72). The higher the value the more messages are checked for duplication, and the larger the performance impact of duplicate detection will be.

Parameters:

auditDepth The configured audit depth.

6.17.3.85 void activemq::core::ActiveMQConnection::setAuditMaximumProducerNumber (int *auditMaximumProducerNumber*)

The number of Producers that will be audited.

Parameters:

auditMaximumProducerNumber The configured number of producers to include in the audit.

6.17.3.86 void activemq::core::ActiveMQConnection::setBrokerURL (const std::string & *brokerURL*)

Sets the Broker URL that should be used when creating a new connection instance.

Parameters:

brokerURL string

6.17.3.87 void activemq::core::ActiveMQConnection::setCheckForDuplicates (bool *checkForDuplicates*)

Gets the value of the configured Duplicate Message detection feature. When enabled and a fault tolerant **transport** (p. 72) is used (think failover) then this feature will help to detect and filter duplicate messages that might otherwise be delivered to a consumer after a connection failure.

Disabling this can increase performance since no Message auditing will occur.

Parameters:

checkForDuplicates The checkForDuplicates value to be configured.

6.17.3.88 virtual void activemq::core::ActiveMQConnection::setClientID (const std::string & *clientID*) [virtual]

Sets the client identifier for this connection.

The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific **ConnectionFactory** (p. 1114) object and transparently assigned to the **Connection** (p. 1089) object it creates.

If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an **IllegalStateException** (p. 1658).

Parameters:

clientID The unique client identifier to assign to the **Connection** (p. 1089).

Exceptions:

CMSException *(p. 979)* if the provider fails to set the client id due to some internal error.

InvalidClientIDException if the id given is somehow invalid or is a duplicate.

IllegalStateException *(*p. ***1658)*** if the client tries to set the id after a **Connection** (p. 1089) method has been called.

Implements **cms::Connection** (p. 1092).

6.17.3.89 void activemq::core::ActiveMQConnection::setCloseTimeout (unsigned int *timeout*)

Sets the close timeout to use when sending the disconnect request.

Parameters:

timeout - The time to wait for a close message.

6.17.3.90 void activemq::core::ActiveMQConnection::setCompressionLevel (int *value*)

Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression. The range of compression levels is [0..9] where 0 indicates best speed and 9 indicates best compression.

Parameters:

value A signed int value that controls the compression level.

6.17.3.91 void activemq::core::ActiveMQConnection::setConsumerFailoverRedeliveryWaitPeriod (long long *value*)

Sets the delay period for a consumer redelivery.

Parameters:

value The configured time delay in milliseconds.

6.17.3.92 void activemq::core::ActiveMQConnection::setDefaultClientId (const std::string & *clientId*)

Sets the Client Id.

Parameters:

clientId - The new clientId value.

6.17.3.93 void activemq::core::ActiveMQConnection::setDispatchAsync (bool *value*)

Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false. For slow consumers set it to true so that dispatching will not block fast consumers. .

Parameters:

value The value of the dispatch asynchronously option sent to the broker.

6.17.3.94 virtual void activemq::core::ActiveMQConnection::setExceptionListener (cms::ExceptionListener * *listener*) [virtual]

Sets the registered Exception Listener for this connection.

Parameters:

listener pointer to and ExceptionListener (p. 1465)

Implements **cms::Connection** (p. 1093).

6.17.3.95 void activemq::core::ActiveMQConnection::setExclusiveConsumer (bool *exclusiveConsumer*)

Enables or disables whether or not queue consumers should be exclusive or not for example to preserve ordering when not using Message Groups.

Parameters:

exclusiveConsumer The value of this configuration option.

6.17.3.96 void activemq::core::ActiveMQConnection::setFirstFailureError (decaf::lang::Exception * *error*)

Sets the pointer to the first exception that caused the Connection to become failed.

Parameters:

pointer to the exception instance that is to be the first failure error if the first error is already set this value is deleted.

6.17.3.97 void activemq::core::ActiveMQConnection::setMessagePrioritySupported (bool *value*)

Set whether or not this factory should create Connection objects with the Message priority support function enabled.

Parameters:

value Boolean indicating if Message priority should be enabled.

6.17.3.98 virtual void activemq::core::ActiveMQConnection::setMessageTransformer (cms::MessageTransformer * *transformer*) [virtual]

Set an **MessageTransformer** (p. 2219) instance that is passed on to all **Session** (p. 2680) objects created from this **Connection** (p. 1089).

The CMS **code** (p. 1005) never takes ownership of the **MessageTransformer** (p. 2219) pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the **MessageTransformer** (p. 2219) has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to set on all newly created **Session** (p. 2680) objects.

Implements **cms::Connection** (p. 1093).

6.17.3.99 void activemq::core::ActiveMQConnection::setNonBlockingRedelivery (bool *nonBlockingRedelivery*)

When true a MessageConsumer will not stop Message delivery before re-delivering Messages from a rolled back transaction. This implies that message order will not be preserved and also will result in the TransactedIndividualAck option to be enabled.

Parameters:

nonBlockingRedelivery The value to configure for non-blocking redelivery.

6.17.3.100 void activemq::core::ActiveMQConnection::setOptimizeAcknowledge (bool *optimizeAcknowledge*)

Sets if Consumers are configured to use Optimized Acknowledge by default.

Parameters:

optimizeAcknowledge The optimizeAcknowledge mode to set.

6.17.3.101 void activemq::core::ActiveMQConnection::setOptimizeAcknowledgeTimeOut (long long *optimizeAcknowledgeTimeOut*)

The max time in milliseconds between optimized ack batches.

Parameters:

optimizeAcknowledgeTimeOut The time in milliseconds for optimized ack batches.

6.17.3.102 void activemq::core::ActiveMQConnection::setOptimizedAckScheduledAckInterval (long long *optimizedAckScheduledAckInterval*)

Sets the amount of time between scheduled sends of any outstanding Message Acks for consumers that have been configured with optimizeAcknowledge enabled. Time is given in Milliseconds.

Parameters:

optimizedAckScheduledAckInterval The scheduledOptimizedAckInterval to use for new Consumers.

6.17.3.103 void activemq::core::ActiveMQConnection::setPassword (const std::string & *password*)

Sets the password that should be used when creating a new connection.

Parameters:

password string

6.17.3.104 void activemq::core::ActiveMQConnection::setPrefetchPolicy (PrefetchPolicy * *policy*)

Sets the **PrefetchPolicy** (p. 2397) instance that this factory should use when it creates new Connection instances. The **PrefetchPolicy** (p. 2397) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters:

policy The new **PrefetchPolicy** (p. 2397) that the ConnectionFactory should clone for Connections.

6.17.3.105 void activemq::core::ActiveMQConnection::setProducerWindowSize (unsigned int *windowSize*)

Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

Parameters:

windowSize - The size in bytes of the Producers memory window.

6.17.3.106 void activemq::core::ActiveMQConnection::setRedeliveryPolicy (RedeliveryPolicy * *policy*)

Sets the **RedeliveryPolicy** (p. 2542) instance that this factory should use when it creates new Connection instances. The **RedeliveryPolicy** (p. 2542) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters:

policy The new **RedeliveryPolicy** (p. 2542) that the ConnectionFactory should clone for Connections.

6.17.3.107 void activemq::core::ActiveMQConnection::setSendAcksAsync (bool *sendAcksAsync*)

Sets whether Message acknowledgments are sent asynchronously meaning no response is required from the broker before the ack completes.

Parameters:

sendAcksAsync The sendAcksAsync configuration value to set.

6.17.3.108 void activemq::core::ActiveMQConnection::setSendTimeout (unsigned int *timeout*)

Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

Parameters:

timeout - The time to wait for a response.

6.17.3.109 void activemq::core::ActiveMQConnection::setTransactedIndividualAck (bool *transactedIndividualAck*)

when true, submit individual transacted acks immediately rather than with transaction completion. This allows the acks to represent delivery status which can be persisted on rollback Used in conjunction with KahaDB set to Rewrite On Redelivery.

Parameters:

transactedIndividualAck The value to set.

6.17.3.110 void activemq::core::ActiveMQConnection::setTransportInterruptionProcessingComplete ()

Indicates that a Connection resource that is processing the transportInterrupted event has completed.

6.17.3.111 void activemq::core::ActiveMQConnection::setUseAsyncSend (bool *value*)

Sets the useAsyncSend option.

Parameters:

value - true to activate, false to disable.

6.17.3.112 void activemq::core::ActiveMQConnection::setUseCompression (bool *value*)

Sets whether Message body compression is enabled.

Parameters:

value Boolean indicating if Message body compression is enabled.

6.17.3.113 void activemq::core::ActiveMQConnection::setUseRetroactiveConsumer (bool *useRetroactiveConsumer*)

Sets whether or not retroactive consumers are enabled. Retroactive consumers allow non-durable topic subscribers to receive old messages that were published before the non-durable subscriber started.

Parameters:

useRetroactiveConsumer The value of this configuration option.

6.17.3.114 void activemq::core::ActiveMQConnection::setUsername (const std::string & *username*)

Sets the username that should be used when creating a new connection.

Parameters:

username string

6.17.3.115 void activemq::core::ActiveMQConnection::setWatchTopicAdvisories (bool *value*)

Sets whether this Connection is listening for advisory messages regarding temporary destination creation and deletion.

Parameters:

value Boolean indicating if advisory message monitoring should be enabled.

6.17.3.116 void activemq::core::ActiveMQConnection::signalInterruptionProcessingComplete () [protected]

6.17.3.117 virtual void activemq::core::ActiveMQConnection::start () [virtual]

Starts the service.

Exceptions:

CMSException (p. ***979***) if an internal error occurs while starting.

Implements **cms::Startable** (p. 2852).

6.17.3.118 virtual void activemq::core::ActiveMQConnection::stop () [virtual]

Stops this service.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2919).

6.17.3.119 Pointer<commands::Response> activemq::core::ActiveMQConnection::syncRequest (Pointer< commands::Command > *command*, unsigned int *timeout* = 0)

Sends a synchronous request and returns the response from the broker. This method converts any error responses it receives into an exception.

Parameters:

command The Command object that is to be sent to the broker.

timeout The time in milliseconds to wait for a response, default is zero or infinite.

Returns:

a Pointer instance to the Response object sent from the Broker.

Exceptions:

BrokerException if the response from the broker is of type ExceptionResponse.

ActiveMQException if any other error occurs while sending the Command.

6.17.3.120 virtual void activemq::core::ActiveMQConnection::transportInterrupted () [virtual]

The **transport** (p. 72) has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3147).

6.17.3.121 virtual void activemq::core::ActiveMQConnection::transportResumed () [virtual]

The **transport** (p. 72) has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3147).

6.17.3.122 void activemq::core::ActiveMQConnection::waitForTransportInterruptionProcessingToComplete () [protected]

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQConnection.h**

6.18 activemq::core::ActiveMQConnectionFactory Class Reference

`#include <src/main/activemq/core/ActiveMQConnectionFactory.h>`Inheritance diagram for activemq::core::ActiveMQConnectionFactory:

Public Member Functions

- **ActiveMQConnectionFactory** ()
- **ActiveMQConnectionFactory** (const std::string &uri, const std::string &username="", const std::string &password="")

  Constructor.

- **ActiveMQConnectionFactory** (const **decaf::net::URI** &uri, const std::string &username="", const std::string &password="")

  Constructor.

- virtual ~**ActiveMQConnectionFactory** ()
- virtual **cms::Connection** * **createConnection** ()

  Creates a connection with the default user identity.

- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password)

  Creates a connection with the specified user identity.

- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password, const std::string &clientId)

  Creates a connection with the specified user identity.

- void **setUsername** (const std::string &username)

  Sets the username that should be used when creating a new connection.

- const std::string & **getUsername** () const

  Gets the username that this factory will use when creating a new connection instance.

- void **setPassword** (const std::string &password)

  Sets the password that should be used when creating a new connection.

- const std::string & **getPassword** () const

  Gets the password that this factory will use when creating a new connection instance.

- std::string **getClientId** () const

  Gets the Configured Client Id.

- void **setClientId** (const std::string &clientId)

  Sets the Client Id.

- void **setBrokerURI** (const std::string &uri)

Sets the Broker URI that should be used when creating a new connection instance.

- void **setBrokerURI** (const **decaf::net::URI** &uri)

  Sets the Broker URI that should be used when creating a new connection instance.

- const **decaf::net::URI** & **getBrokerURI** () const

  Gets the Broker URI that this factory will use when creating a new connection instance.

- virtual void **setExceptionListener** (**cms::ExceptionListener** *listener)

  Set an CMS ExceptionListener that will be set on eat connection once it has been created.

- virtual **cms::ExceptionListener** * **getExceptionListener** () const

  Returns the currently set ExceptionListener that will be set on any new Connection instance that is created by this factory.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

  Set an MessageTransformer instance that is passed on to all Connection objects created from this ConnectionFactory.

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this ConnectionFactory.

- void **setPrefetchPolicy** (**PrefetchPolicy** *policy)

  *Sets the **PrefetchPolicy** (p. 2397) instance that this factory should use when it creates new Connection instances.*

- **PrefetchPolicy** * **getPrefetchPolicy** () const

  *Gets the pointer to the current **PrefetchPolicy** (p. 2397) that is in use by this ConnectionFactory.*

- void **setRedeliveryPolicy** (**RedeliveryPolicy** *policy)

  *Sets the **RedeliveryPolicy** (p. 2542) instance that this factory should use when it creates new Connection instances.*

- **RedeliveryPolicy** * **getRedeliveryPolicy** () const

  *Gets the pointer to the current **RedeliveryPolicy** (p. 2542) that is in use by this ConnectionFactory.*

- bool **isDispatchAsync** () const
- void **setDispatchAsync** (bool value)

  Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

- bool **isAlwaysSyncSend** () const

  Gets if the Connection should always send things Synchronously.

- void **setAlwaysSyncSend** (bool value)

  Sets if the Connection should always send things Synchronously.

- bool **isUseAsyncSend** () const

  Gets if the useAsyncSend option is set.

- void **setUseAsyncSend** (bool value)

  Sets the useAsyncSend option.

- bool **isSendAcksAsync** () const

  Returns whether Message acknowledgments are sent asynchronously meaning no response is required from the broker before the ack completes.

- void **setSendAcksAsync** (bool sendAcksAsync)

  Sets whether Message acknowledgments are sent asynchronously meaning no response is required from the broker before the ack completes.

- bool **isUseCompression** () const

  Gets if the Connection is configured for Message body compression.

- void **setUseCompression** (bool value)

  Sets whether Message body compression is enabled.

- void **setCompressionLevel** (int value)

  Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

- int **getCompressionLevel** () const

  Gets the currently configured Compression level for Message bodies.

- unsigned int **getSendTimeout** () const

  Gets the assigned send timeout for this Connector.

- void **setSendTimeout** (unsigned int timeout)

  Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

- unsigned int **getCloseTimeout** () const

  Gets the assigned close timeout for this Connector.

- void **setCloseTimeout** (unsigned int timeout)

  Sets the close timeout to use when sending the disconnect request.

- unsigned int **getProducerWindowSize** () const

  Gets the configured producer window size for Producers that are created from this connector.

- void **setProducerWindowSize** (unsigned int windowSize)

  Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

- bool **isMessagePrioritySupported** () const
- void **setMessagePrioritySupported** (bool value)

  Set whether or not this factory should create Connection objects with the Message priority support function enabled.

- bool **isUseRetroactiveConsumer** () const

Should all created consumers be retroactive.

- void **setUseRetroactiveConsumer** (bool useRetroactiveConsumer)

  Sets whether or not retroactive consumers are enabled.

- bool **isExclusiveConsumer** () const

  Should all created consumers be exclusive.

- void **setExclusiveConsumer** (bool exclusiveConsumer)

  Enables or disables whether or not queue consumers should be exclusive or not for example to preserve ordering when not using Message Groups.

- bool **isWatchTopicAdvisories** () const

  Is the Connection created by this factory configured to watch for advisory messages that inform the Connection about temporary destination create / destroy.

- void **setWatchTopicAdvisories** (bool value)

  Sets whether Connection's created by this factory will listen for advisory messages regarding temporary destination creation and deletion.

- int **getAuditDepth** () const

  *Get the audit depth for Messages for consumers when using a fault tolerant **transport** (p. 72).*

- void **setAuditDepth** (int auditDepth)

  *Set the audit depth for Messages for consumers when using a fault tolerant **transport** (p. 72).*

- int **getAuditMaximumProducerNumber** () const

  The number of Producers that will be audited.

- void **setAuditMaximumProducerNumber** (int auditMaximumProducerNumber)

  The number of Producers that will be audited.

- bool **isCheckForDuplicates** () const

  Gets the value of the configured Duplicate Message detection feature.

- void **setCheckForDuplicates** (bool checkForDuplicates)

  Gets the value of the configured Duplicate Message detection feature.

- bool **isTransactedIndividualAck** () const

  when true, submit individual transacted acks immediately rather than with transaction completion.

- void **setTransactedIndividualAck** (bool transactedIndividualAck)

  when true, submit individual transacted acks immediately rather than with transaction completion.

- bool **isNonBlockingRedelivery** () const

  Returns true if non-blocking redelivery of Messages is configured for Consumers that are rolled back or recovered.

- void **setNonBlockingRedelivery** (bool nonBlockingRedelivery)

When true a MessageConsumer will not stop Message delivery before re-delivering Messages from a rolled back transaction.

- long long **getConsumerFailoverRedeliveryWaitPeriod** () const

  Gets the delay period for a consumer redelivery.

- void **setConsumerFailoverRedeliveryWaitPeriod** (long long value)

  Sets the delay period for a consumer redelivery.

- bool **isOptimizeAcknowledge** () const
- void **setOptimizeAcknowledge** (bool optimizeAcknowledge)

  Sets if Consumers are configured to use Optimized Acknowledge by default.

- long long **getOptimizeAcknowledgeTimeOut** () const

  Gets the time between optimized ack batches in milliseconds.

- void **setOptimizeAcknowledgeTimeOut** (long long optimizeAcknowledgeTimeOut)

  The max time in milliseconds between optimized ack batches.

- long long **getOptimizedAckScheduledAckInterval** () const

  Gets the configured time interval that is used to force all MessageConsumers that have optimizedAcknowledge enabled to send an ack for any outstanding Message Acks.

- void **setOptimizedAckScheduledAckInterval** (long long optimizedAckScheduledAckInterval)

  Sets the amount of time between scheduled sends of any outstanding Message Acks for consumers that have been configured with optimizeAcknowledge enabled.

Static Public Member Functions

- static **cms::Connection** * **createConnection** (const std::string &uri, const std::string &username, const std::string &password, const std::string &clientId="")

  Creates a connection with the specified user identity.

Static Public Attributes

- static const std::string **DEFAULT_URI**

Protected Member Functions

- virtual **ActiveMQConnection** * **createActiveMQConnection** (const **Pointer**< **transport::Transport** > &transport, const **Pointer**< **decaf::util::Properties** > &properties)

  *Create a new **ActiveMQConnection** (p. 232) instnace using the provided Transport and Properties.*

6.18.1 Constructor & Destructor Documentation

6.18.1.1 activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory ()

6.18.1.2 activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory (const std::string & *uri*, const std::string & *username* = "", const std::string & *password* = "")

Constructor.

Parameters:

uri The URI of the Broker we are connecting to.

username The user name to authenticate with this connection.

password The password to authenticate with this connection.

6.18.1.3 activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory (const decaf::net::URI & *uri*, const std::string & *username* = "", const std::string & *password* = "")

Constructor.

Parameters:

uri The URI of the Broker we are connecting to.

username The user name to authenticate with this connection.

password The password to authenticate with this connection.

6.18.1.4 virtual activemq::core::ActiveMQConnectionFactory::~ActiveMQConnectionFactory () [virtual]

6.18.2 Member Function Documentation

6.18.2.1 virtual ActiveMQConnection* activemq::core::ActiveMQConnectionFactory::createActiveMQConnection (const Pointer< transport::Transport > & *transport*, const Pointer< decaf::util::Properties > & *properties*) [protected, virtual]

Create a new **ActiveMQConnection** (p. 232) instnace using the provided Transport and Properties. Subclasses can override this to control the actual type of **ActiveMQConnection** (p. 232) that is created.

Parameters:

transport *(p. 72)* The Transport that the Connection should use to communicate with the Broker.

properties The Properties that are assigned to the new Connection instance.

Returns:

a new **ActiveMQConnection** (p. 232) pointer instance.

Reimplemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 546).

6.18.2.2 static cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & *uri*, const std::string & *username*, const std::string & *password*, const std::string & *clientId* = "") [static]

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Parameters:

uri The URI of the Broker we are connecting to.

username The name of the user to authenticate with.

password The password for the user to authenticate with.

clientId The unique client id to assign to connection, defaults to "".

Exceptions:

CMSException.

6.18.2.3 virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & *username*, const std::string & *password*, const std::string & *clientId*) [virtual]

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters:

username The user name to authenticate with this connection.

password The password to authenticate with this connection.

clientId The client Id to assign to connection if "" then a random client Id is created for this connection.

Returns:

a Connection Pointer

Exceptions:

CMSSecurityException if the user credentials are invalid.

CMSException if an error occurs.

Implements **cms::ConnectionFactory** (p. 1115).

6.18.2.4 virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & *username*, const std::string & *password*) [virtual]

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called. The user name

and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters:

username The user name to authenticate with this connection.

password The password to authenticate with this connection.

Returns:

a Connection Pointer

Exceptions:

CMSSecurityException if the user credentials are invalid.

CMSException if an error occurs.

Implements **cms::ConnectionFactory** (p. 1116).

6.18.2.5 virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection () [virtual]

Creates a connection with the default user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Returns:

a Connection Pointer

Exceptions:

CMSException if an error occurs.

Implements **cms::ConnectionFactory** (p. 1116).

6.18.2.6 int activemq::core::ActiveMQConnectionFactory::getAuditDepth () const

Get the audit depth for Messages for consumers when using a fault tolerant **transport** (p. 72). The higher the value the more messages are checked for duplication, and the larger the performance impact of duplicate detection will be.

Returns:

the configured audit depth.

6.18.2.7 int activemq::core::ActiveMQConnectionFactory::getAuditMaximumProducerNumber () const

The number of Producers that will be audited.

Returns:

the configured number of producers to include in the audit.

6.18.2.8 const decaf::net::URI& activemq::core::ActiveMQConnectionFactory::getBrokerURI () const

Gets the Broker URI that this factory will use when creating a new connection instance.

Returns:

brokerURI string

6.18.2.9 std::string activemq::core::ActiveMQConnectionFactory::getClientId () const

Gets the Configured Client Id.

Returns:

the clientId.

6.18.2.10 unsigned int activemq::core::ActiveMQConnectionFactory::getCloseTimeout () const

Gets the assigned close timeout for this Connector.

Returns:

the close timeout configured in the connection uri

6.18.2.11 int activemq::core::ActiveMQConnectionFactory::getCompressionLevel () const

Gets the currently configured Compression level for Message bodies.

Returns:

the int value of the current compression level.

6.18.2.12 long long activemq::core::ActiveMQConnectionFactory::getConsumerFailoverRedeliveryWaitPeriod () const

Gets the delay period for a consumer redelivery.

Returns:

configured time delay in milliseconds.

6.18.2.13 virtual cms::ExceptionListener* activemq::core::ActiveMQConnectionFactory::getExceptionListener () const [virtual]

Returns the currently set ExceptionListener that will be set on any new Connection instance that is created by this factory.

Returns:

a pointer to a CMS ExceptionListener instance or NULL if not set.

Implements **cms::ConnectionFactory** (p. 1117).

6.18.2.14 virtual cms::MessageTransformer* activemq::core::ActiveMQConnectionFactory::getMessageTransformer () const [virtual]

Gets the currently configured MessageTransformer for this ConnectionFactory.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::ConnectionFactory** (p. 1117).

6.18.2.15 long long activemq::core::ActiveMQConnectionFactory::getOptimizeAcknowledgeTimeOut () const

Gets the time between optimized ack batches in milliseconds.

Returns:

time between optimized ack batches in Milliseconds.

6.18.2.16 long long activemq::core::ActiveMQConnectionFactory::getOptimizedAckScheduledAckInterval () const

Gets the configured time interval that is used to force all MessageConsumers that have optimizedAcknowledge enabled to send an ack for any outstanding Message Acks. By default this value is set to zero meaning that the consumers will not do any background Message acknowledgment.

Returns:

the scheduledOptimizedAckInterval

6.18.2.17 const std::string& activemq::core::ActiveMQConnectionFactory::getPassword () const

Gets the password that this factory will use when creating a new connection instance.

Returns:

password string, "" for default credentials

6.18.2.18 PrefetchPolicy* activemq::core::ActiveMQConnectionFactory::getPrefetchPolicy () const

Gets the pointer to the current **PrefetchPolicy** (p. 2397) that is in use by this ConnectionFactory.

Returns:

a pointer to this objects **PrefetchPolicy** (p. 2397).

6.18.2.19 unsigned int activemq::core::ActiveMQConnectionFactory::getProducerWindowSize () const

Gets the configured producer window size for Producers that are created from this connector. This only applies if there is no send timeout and the producer is able to send asynchronously.

Returns:

size in bytes of messages that this producer can produce before it must block and wait for ProducerAck messages to free resources.

6.18.2.20 RedeliveryPolicy* activemq::core::ActiveMQConnectionFactory::getRedeliveryPolicy () const

Gets the pointer to the current **RedeliveryPolicy** (p. 2542) that is in use by this ConnectionFactory.

Returns:

a pointer to this objects **RedeliveryPolicy** (p. 2542).

6.18.2.21 unsigned int activemq::core::ActiveMQConnectionFactory::getSendTimeout () const

Gets the assigned send timeout for this Connector.

Returns:

the send timeout configured in the connection uri

6.18.2.22 const std::string& activemq::core::ActiveMQConnectionFactory::getUsername () const

Gets the username that this factory will use when creating a new connection instance.

Returns:

username string, "" for default credentials

6.18.2.23 bool activemq::core::ActiveMQConnectionFactory::isAlwaysSyncSend () const

Gets if the Connection should always send things Synchronously.

Returns:

true if sends should always be Synchronous.

6.18.2.24 bool activemq::core::ActiveMQConnectionFactory::isCheckForDuplicates () const

Gets the value of the configured Duplicate Message detection feature. When enabled and a fault tolerant **transport** (p. 72) is used (think failover) then this feature will help to detect and filter duplicate messages that might otherwise be delivered to a consumer after a connection failure.

Disabling this can increase performance since no Message auditing will occur.

Returns:

the checkForDuplicates value currently set.

6.18.2.25 bool activemq::core::ActiveMQConnectionFactory::isDispatchAsync () const

Returns:

The value of the dispatch asynchronously option sent to the broker.

6.18.2.26 bool activemq::core::ActiveMQConnectionFactory::isExclusiveConsumer () const

Should all created consumers be exclusive.

Returns:

true if consumer will be created with the exclusive flag set.

6.18.2.27 bool activemq::core::ActiveMQConnectionFactory::isMessagePrioritySupported () const

Returns:

true if the Connections that this factory creates should support the message based priority settings.

6.18.2.28 bool activemq::core::ActiveMQConnectionFactory::isNonBlockingRedelivery () const

Returns true if non-blocking redelivery of Messages is configured for Consumers that are rolled back or recovered.

Returns:

true if non-blocking redelivery is enabled.

6.18.2.29 bool activemq::core::ActiveMQConnectionFactory::isOptimizeAcknowledge () const

Returns:

true if optimizeAcknowledge is enabled.

6.18.2.30 bool activemq::core::ActiveMQConnectionFactory::isSendAcksAsync () const

Returns whether Message acknowledgments are sent asynchronously meaning no response is required from the broker before the ack completes.

Returns:

the sendAcksAsync configured value. (defaults to true)

6.18.2.31 bool activemq::core::ActiveMQConnectionFactory::isTransactedIndividualAck () const

when true, submit individual transacted acks immediately rather than with transaction completion. This allows the acks to represent delivery status which can be persisted on rollback Used in conjunction with KahaDB set to Rewrite On Redelivery.

Returns:

true if this option is enabled.

6.18.2.32 bool activemq::core::ActiveMQConnectionFactory::isUseAsyncSend () const

Gets if the useAsyncSend option is set.

Returns:

true if on false if not.

6.18.2.33 bool activemq::core::ActiveMQConnectionFactory::isUseCompression () const

Gets if the Connection is configured for Message body compression.

Returns:

if the Message body will be Compressed or not.

6.18.2.34 bool activemq::core::ActiveMQConnectionFactory::isUseRetroactiveConsumer () const

Should all created consumers be retroactive.

Returns:

true if consumer will be created with the retroactive flag set.

6.18.2.35 bool activemq::core::ActiveMQConnectionFactory::isWatchTopicAdvisories () const

Is the Connection created by this factory configured to watch for advisory messages that inform the Connection about temporary destination create / destroy.

Returns:

true if Connection's will listen for temporary destination advisory messages.

6.18.2.36 void activemq::core::ActiveMQConnectionFactory::setAlwaysSyncSend (bool *value*)

Sets if the Connection should always send things Synchronously.

Parameters:

value true if sends should always be Synchronous.

6.18.2.37 void activemq::core::ActiveMQConnectionFactory::setAuditDepth (int *auditDepth*)

Set the audit depth for Messages for consumers when using a fault tolerant **transport** (p. 72). The higher the value the more messages are checked for duplication, and the larger the performance impact of duplicate detection will be.

Parameters:

auditDepth The configured audit depth.

6.18.2.38 void activemq::core::ActiveMQConnectionFactory::setAuditMaximumProducerNumber (int *auditMaximumProducerNumber*)

The number of Producers that will be audited.

Parameters:

auditMaximumProducerNumber The configured number of producers to include in the audit.

6.18.2.39 void activemq::core::ActiveMQConnectionFactory::setBrokerURI (const decaf::net::URI & *uri*)

Sets the Broker URI that should be used when creating a new connection instance.

Parameters:

brokerURI The URI of the broker that this client will connect to.

6.18.2.40 void activemq::core::ActiveMQConnectionFactory::setBrokerURI (const std::string & *uri*)

Sets the Broker URI that should be used when creating a new connection instance.

Parameters:

brokerURI The string form of the Broker URI, this will be converted to a URI object.

6.18.2.41 void activemq::core::ActiveMQConnectionFactory::setCheckForDuplicates (bool *checkForDuplicates*)

Gets the value of the configured Duplicate Message detection feature. When enabled and a fault tolerant **transport** (p. 72) is used (think failover) then this feature will help to detect and filter duplicate messages that might otherwise be delivered to a consumer after a connection failure.

Disabling this can increase performance since no Message auditing will occur.

Parameters:

checkForDuplicates The checkForDuplicates value to be configured.

6.18.2.42 void activemq::core::ActiveMQConnectionFactory::setClientId (const std::string & *clientId*)

Sets the Client Id.

Parameters:

clientId - The new clientId value.

6.18.2.43 void activemq::core::ActiveMQConnectionFactory::setCloseTimeout (unsigned int *timeout*)

Sets the close timeout to use when sending the disconnect request.

Parameters:

timeout - The time to wait for a close message.

6.18.2.44 void activemq::core::ActiveMQConnectionFactory::setCompressionLevel (int *value*)

Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression. The range of compression levels is [0..9] where 0 indicates best speed and 9 indicates best compression.

Parameters:

value A signed int value that controls the compression level.

6.18.2.45 void activemq::core::ActiveMQConnectionFactory::setConsumerFailoverRedeliveryWaitPeriod (long long *value*)

Sets the delay period for a consumer redelivery.

Parameters:

value The configured time delay in milliseconds.

6.18.2.46 void activemq::core::ActiveMQConnectionFactory::setDispatchAsync (bool *value*)

Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false. For slow consumers set it to true so that dispatching will not block fast consumers. .

Parameters:

value The value of the dispatch asynchronously option sent to the broker.

6.18.2.47 virtual void activemq::core::ActiveMQConnectionFactory::setExceptionListener (cms::ExceptionListener * *listener*) [virtual]

Set an CMS ExceptionListener that will be set on eat connection once it has been created. The factory does not take ownership of this pointer, the client must ensure that its lifetime is scoped to the connection that it is applied to.

Parameters:

listener The listener to set on the connection or NULL for no listener.

Implements **cms::ConnectionFactory** (p. 1117).

6.18.2.48 void activemq::core::ActiveMQConnectionFactory::setExclusiveConsumer (bool *exclusiveConsumer*)

Enables or disables whether or not queue consumers should be exclusive or not for example to preserve ordering when not using Message Groups.

Parameters:

exclusiveConsumer The value of this configuration option.

6.18.2.49 void activemq::core::ActiveMQConnectionFactory::setMessagePrioritySupported (bool *value*)

Set whether or not this factory should create Connection objects with the Message priority support function enabled.

Parameters:

value Boolean indicating if Message priority should be enabled.

6.18.2.50 virtual void activemq::core::ActiveMQConnectionFactory::setMessageTransformer (cms::MessageTransformer * *transformer*) [virtual]

Set an MessageTransformer instance that is passed on to all Connection objects created from this ConnectionFactory.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to set on all newly created Connection objects.

Implements **cms::ConnectionFactory** (p. 1117).

6.18.2.51 void activemq::core::ActiveMQConnectionFactory::setNonBlockingRedelivery (bool *nonBlockingRedelivery*)

When true a MessageConsumer will not stop Message delivery before re-delivering Messages from a rolled back transaction. This implies that message order will not be preserved and also will result in the TransactedIndividualAck option to be enabled.

Parameters:

nonBlockingRedelivery The value to configure for non-blocking redelivery.

6.18.2.52 void activemq::core::ActiveMQConnectionFactory::setOptimizeAcknowledge (bool *optimizeAcknowledge*)

Sets if Consumers are configured to use Optimized Acknowledge by default.

Parameters:

optimizeAcknowledge The optimizeAcknowledge mode to set.

6.18.2.53 void activemq::core::ActiveMQConnectionFactory::setOptimizeAcknowledgeTimeOut (long long *optimizeAcknowledgeTimeOut*)

The max time in milliseconds between optimized ack batches.

Parameters:

optimizeAcknowledgeTimeOut The time in milliseconds for optimized ack batches.

6.18.2.54 void activemq::core::ActiveMQConnectionFactory::setOptimizedAckScheduledAckInterval (long long *optimizedAckScheduledAckInterval*)

Sets the amount of time between scheduled sends of any outstanding Message Acks for consumers that have been configured with optimizeAcknowledge enabled. Time is given in Milliseconds.

Parameters:

optimizedAckScheduledAckInterval The scheduledOptimizedAckInterval to use for new Consumers.

6.18.2.55 void activemq::core::ActiveMQConnectionFactory::setPassword (const std::string & *password*)

Sets the password that should be used when creating a new connection.

Parameters:

password string

6.18.2.56 void activemq::core::ActiveMQConnectionFactory::setPrefetchPolicy (PrefetchPolicy * *policy*)

Sets the **PrefetchPolicy** (p. 2397) instance that this factory should use when it creates new Connection instances. The **PrefetchPolicy** (p. 2397) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters:

policy The new **PrefetchPolicy** (p. 2397) that the ConnectionFactory should clone for Connections.

6.18.2.57 void activemq::core::ActiveMQConnectionFactory::setProducerWindowSize (unsigned int *windowSize*)

Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

Parameters:

windowSize - The size in bytes of the Producers memory window.

6.18.2.58 void activemq::core::ActiveMQConnectionFactory::setRedeliveryPolicy (RedeliveryPolicy * *policy*)

Sets the **RedeliveryPolicy** (p. 2542) instance that this factory should use when it creates new Connection instances. The **RedeliveryPolicy** (p. 2542) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters:

policy The new **RedeliveryPolicy** (p. 2542) that the ConnectionFactory should clone for Connections.

6.18.2.59 void activemq::core::ActiveMQConnectionFactory::setSendAcksAsync (bool *sendAcksAsync*)

Sets whether Message acknowledgments are sent asynchronously meaning no response is required from the broker before the ack completes.

Parameters:

sendAcksAsync The sendAcksAsync configuration value to set.

6.18.2.60 void activemq::core::ActiveMQConnectionFactory::setSendTimeout (unsigned int *timeout*)

Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

Parameters:

timeout - The time to wait for a response.

6.18.2.61 void activemq::core::ActiveMQConnectionFactory::setTransactedIndividualAck (bool *transactedIndividualAck*)

when true, submit individual transacted acks immediately rather than with transaction completion. This allows the acks to represent delivery status which can be persisted on rollback Used in conjunction with KahaDB set to Rewrite On Redelivery.

Parameters:

transactedIndividualAck The value to set.

6.18.2.62 void activemq::core::ActiveMQConnectionFactory::setUseAsyncSend (bool *value*)

Sets the useAsyncSend option.

Parameters:

value - true to activate, false to disable.

6.18.2.63 void activemq::core::ActiveMQConnectionFactory::setUseCompression (bool *value*)

Sets whether Message body compression is enabled.

Parameters:

value Boolean indicating if Message body compression is enabled.

6.18.2.64 void activemq::core::ActiveMQConnectionFactory::setUseRetroactiveConsumer (bool *useRetroactiveConsumer*)

Sets whether or not retroactive consumers are enabled. Retroactive consumers allow non-durable topic subscribers to receive old messages that were published before the non-durable subscriber started.

Parameters:

useRetroactiveConsumer The value of this configuration option.

6.18.2.65 void activemq::core::ActiveMQConnectionFactory::setUsername (const std::string & *username*)

Sets the username that should be used when creating a new connection.

Parameters:

username string

6.18.2.66 void activemq::core::ActiveMQConnectionFactory::setWatchTopicAdvisories (bool *value*)

Sets whether Connection's created by this factory will listen for advisory messages regarding temporary destination creation and deletion.

Parameters:

value Boolean indicating if advisory message monitoring should be enabled.

6.18.3 Field Documentation

6.18.3.1 const std::string activemq::core::ActiveMQConnectionFactory::DEFAULT_URI [static]

6.19.1 Detailed Description

This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 232) class.

Since:

3.0

6.19.2 Constructor & Destructor Documentation

6.19.2.1 activemq::core::ActiveMQConnectionMetaData::ActiveMQConnectionMetaData ()

6.19.2.2 virtual activemq::core::ActiveMQConnectionMetaData::~ActiveMQConnectionMetaData () [virtual]

6.19.3 Member Function Documentation

6.19.3.1 virtual int activemq::core::ActiveMQConnectionMetaData::getCMSMajorVersion () const [virtual]

Gets the CMS major version number.

Returns:

the CMS API major version number

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1141).

6.19.3.2 virtual int activemq::core::ActiveMQConnectionMetaData::getCMSMinorVersion () const [virtual]

Gets the CMS minor version number.

Returns:

the CMS API minor version number

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1141).

6.19.3.3 virtual std::string activemq::core::ActiveMQConnectionMetaData::getCMSProviderName () const [virtual]

Gets the CMS provider name.

Returns:

the CMS provider name

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1141).

6.19.3.4 virtual std::string activemq::core::ActiveMQConnectionMetaData::getCMSVersion () const [virtual]

Gets the CMS API version.

Returns:

the CMS API Version in String form.

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1142).

6.19.3.5 virtual std::vector<std::string> activemq::core::ActiveMQConnectionMetaData::getCMSXPropertyNames () const [virtual]

Gets an Vector of the CMSX property names.

Returns:

an Vector of CMSX property names

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1142).

6.19.3.6 virtual int activemq::core::ActiveMQConnectionMetaData::getProviderMajorVersion () const [virtual]

Gets the CMS provider major version number.

Returns:

the CMS provider major version number

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1142).

6.19.3.7 virtual int activemq::core::ActiveMQConnectionMetaData::getProviderMinorVersion () const [virtual]

Gets the CMS provider minor version number.

Returns:

the CMS provider minor version number

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1142).

6.19.3.8 virtual int activemq::core::ActiveMQConnectionMetaData::getProviderPatchVersion () const [virtual]

Gets the CMS provider patch version number.

Returns:

the CMS provider patch version number

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1143).

6.19.3.9 virtual std::string activemq::core::ActiveMQConnectionMetaData::getProviderVersion () const [virtual]

Gets the CMS provider version.

Returns:

the CMS provider version

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 1143).

6.20.1 Detailed Description

Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back an forth between string and enum values.

6.20.2 Member Enumeration Documentation

6.20.2.1 enum activemq::core::ActiveMQConstants::AckType

Enumerator:

ACK_TYPE_DELIVERED
ACK_TYPE_POISON
ACK_TYPE_CONSUMED
ACK_TYPE_REDELIVERED
ACK_TYPE_INDIVIDUAL

6.20.2.2 enum activemq::core::ActiveMQConstants::DestinationActions

Enumerator:

DESTINATION_ADD_OPERATION
DESTINATION_REMOVE_OPERATION

6.20.2.3 enum activemq::core::ActiveMQConstants::DestinationOption

These values represent the options that can be appended to an Destination name, i.e. /topic/-foo?consumer.exclusive=true

Enumerator:

CONSUMER_PREFECTCHSIZE
CUNSUMER_MAXPENDINGMSGLIMIT
CONSUMER_NOLOCAL
CONSUMER_DISPATCHASYNC
CONSUMER_RETROACTIVE
CONSUMER_SELECTOR
CONSUMER_EXCLUSIVE
CONSUMER_PRIORITY
NUM_OPTIONS

6.20.2.4 enum activemq::core::ActiveMQConstants::TransactionState

Enumerator:

TRANSACTION_STATE_BEGIN
TRANSACTION_STATE_PREPARE
TRANSACTION_STATE_COMMITONEPHASE
TRANSACTION_STATE_COMMITTWOPHASE
TRANSACTION_STATE_ROLLBACK
TRANSACTION_STATE_RECOVER
TRANSACTION_STATE_FORGET
TRANSACTION_STATE_END

6.20.2.5 enum activemq::core::ActiveMQConstants::URIParam

These values represent the parameters that can be added to the connection URI that affect the ActiveMQ Core API.

Enumerator:

CONNECTION_SENDTIMEOUT
CONNECTION_PRODUCERWINDOWSIZE
CONNECTION_CLOSETIMEOUT
CONNECTION_ALWAYSSYNCSEND
CONNECTION_USEASYNCSEND
CONNECTION_USECOMPRESSION
CONNECTION_DISPATCHASYNC
PARAM_USERNAME
PARAM_PASSWORD

6.21 activemq::core::ActiveMQConsumer Class Reference

`#include <src/main/activemq/core/ActiveMQConsumer.h>`Inheritance diagram for activemq::core::ActiveMQConsumer:

Public Member Functions

- **ActiveMQConsumer** (const **Pointer< activemq::core::kernels::ActiveMQConsumerKernel >** &kernel)

  *Create a new **ActiveMQConsumer** (p. 295) that contains the pointer to the Kernel that implement the real MessageConsumer functionality.*

- virtual ~**ActiveMQConsumer** ()
- virtual void **start** ()

  Starts the service.

- virtual void **stop** ()

  Stops this service.

- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual **cms::Message** * **receive** ()

  Synchronously Receive a Message.

- virtual **cms::Message** * **receive** (int millisecs)

  Synchronously Receive a Message, time out after defined interval.

- virtual **cms::Message** * **receiveNoWait** ()

  Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

- virtual void **setMessageListener** (**cms::MessageListener** *listener)

  Sets the MessageListener that this class will send notifs on.

- virtual **cms::MessageListener** * **getMessageListener** () const

  Gets the MessageListener that this class will send mew Message notification events to.

- virtual void **setMessageAvailableListener** (**cms::MessageAvailableListener** *listener)

  Sets the MessageAvailableListener that this class will send events to if the consumer is in synchronous consumption mode and a new Message has arrived.

- virtual **cms::MessageAvailableListener** * **getMessageAvailableListener** () const

  Gets the MessageAvailableListener that this class will send mew Message notification events to.

- virtual std::string **getMessageSelector** () const

  Gets this message consumer's message selector expression.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

  *Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are dispatched to client **code** (p. 1005).*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this MessageConsumer.

- const **Pointer**< **commands::ConsumerInfo** > & **getConsumerInfo** () const

  Get the Consumer information for this consumer.

- const **Pointer**< **commands::ConsumerId** > & **getConsumerId** () const

  Get the Consumer Id for this consumer.

- bool **isClosed** () const
- int **getMessageAvailableCount** () const
- void **setRedeliveryPolicy** (**RedeliveryPolicy** *policy)

  *Sets the **RedeliveryPolicy** (p. 2542) this Consumer should use when a rollback is performed on a transacted Consumer.*

- **RedeliveryPolicy** * **getRedeliveryPolicy** () const

  Gets a pointer to this Consumer's Redelivery Policy object, the Consumer retains ownership of this pointer so the caller should not delete it.

- **decaf::lang::Exception** * **getFailureError** () const

  *Gets the error that caused this Consumer to be in a Failed **state** (p. 70), or NULL if there is no Error.*

- long long **getOptimizedAckScheduledAckInterval** () const

  Time in Milliseconds before an automatic acknowledge is done for any outstanding delivered Messages.

- void **setOptimizedAckScheduledAckInterval** (long long value)

  Sets the time in Milliseconds to schedule an automatic acknowledge of outstanding messages when optimize acknowledge is enabled.

- bool **isOptimizeAcknowledge** () const
- void **setOptimizeAcknowledge** (bool value)

  Enable or disable optimized acknowledge for this consumer.

6.21.1 Constructor & Destructor Documentation

6.21.1.1 activemq::core::ActiveMQConsumer::ActiveMQConsumer (const Pointer< activemq::core::kernels::ActiveMQConsumerKernel > & *kernel*)

Create a new **ActiveMQConsumer** (p. 295) that contains the pointer to the Kernel that implement the real MessageConsumer functionality.

Parameters:

ActiveMQConsumerKernel This Consumer's functionality kernel.

6.21.1.2 virtual activemq::core::ActiveMQConsumer::~ActiveMQConsumer () [virtual]

6.21.2 Member Function Documentation

6.21.2.1 virtual void activemq::core::ActiveMQConsumer::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSException - If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 965).

6.21.2.2 const Pointer<commands::ConsumerId>& activemq::core::ActiveMQConsumer::getConsumerId () const

Get the Consumer Id for this consumer.

Returns:

Reference to a Consumer Id Object

6.21.2.3 const Pointer<commands::ConsumerInfo>& activemq::core::ActiveMQConsumer::getConsumerInfo () const

Get the Consumer information for this consumer.

Returns:

Reference to a Consumer Info Object

6.21.2.4 decaf::lang::Exception* activemq::core::ActiveMQConsumer::getFailureError () const

Gets the error that caused this Consumer to be in a Failed **state** (p. 70), or NULL if there is no Error.

Returns:

pointer to the error that faulted this Consumer or NULL.

6.21.2.5 int activemq::core::ActiveMQConsumer::getMessageAvailableCount () const

Returns:

the number of Message's this consumer is waiting to Dispatch.

6.21.2.6 virtual cms::MessageAvailableListener* activemq::core::ActiveMQConsumer::getMessageAvailableListener () const [virtual]

Gets the MessageAvailableListener that this class will send mew Message notification events to.

Returns:

The listener of message events received by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2128).

6.21.2.7 virtual cms::MessageListener* activemq::core::ActiveMQConsumer::getMessageListener () const [virtual]

Gets the MessageListener that this class will send mew Message notification events to.

Returns:

The listener of messages received by this consumer

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2129).

6.21.2.8 virtual std::string activemq::core::ActiveMQConsumer::getMessageSelector () const [virtual]

Gets this message consumer's message selector expression.

Returns:

This Consumer's selector expression or "".

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2129).

6.21.2.9 virtual cms::MessageTransformer* activemq::core::ActiveMQConsumer::getMessageTransformer () const [virtual]

Gets the currently configured MessageTransformer for this MessageConsumer.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::MessageConsumer** (p. 2129).

6.21.2.10 long long activemq::core::ActiveMQConsumer::getOptimizedAckScheduledAckInterval () const

Time in Milliseconds before an automatic acknowledge is done for any outstanding delivered Messages. A value less than one means no task is scheduled.

Returns:

time in milliseconds for the scheduled ack task.

6.21.2.11 RedeliveryPolicy* activemq::core::ActiveMQConsumer::getRedeliveryPolicy () const

Gets a pointer to this Consumer's Redelivery Policy object, the Consumer retains ownership of this pointer so the caller should not delete it.

Returns:

a Pointer to a **RedeliveryPolicy** (p. 2542) that is in use by this Consumer.

6.21.2.12 bool activemq::core::ActiveMQConsumer::isClosed () const

Returns:

if this Consumer has been closed.

6.21.2.13 bool activemq::core::ActiveMQConsumer::isOptimizeAcknowledge () const

Returns:

true if this consumer is using optimize acknowledge mode.

6.21.2.14 virtual cms::Message* activemq::core::ActiveMQConsumer::receive (int *millisecs*) [virtual]

Synchronously Receive a Message, time out after defined interval. Returns null if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

6.21.2.15 virtual cms::Message* activemq::core::ActiveMQConsumer::receive () [virtual]

Synchronously Receive a Message.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

6.21.2.16 virtual cms::Message* activemq::core::ActiveMQConsumer::receiveNoWait () [virtual]

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

6.21.2.17 virtual void activemq::core::ActiveMQConsumer::setMessageAvailableListener (cms::MessageAvailableListener * *listener*) [virtual]

Sets the MessageAvailableListener that this class will send events to if the consumer is in synchronous consumption mode and a new Message has arrived.

Parameters:

listener The listener of new message events fired by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2131).

6.21.2.18 virtual void activemq::core::ActiveMQConsumer::setMessageListener (cms::MessageListener * *listener*) [virtual]

Sets the MessageListener that this class will send notifs on.

Parameters:

listener The listener of messages received by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2131).

6.21.2.19 virtual void activemq::core::ActiveMQConsumer::setMessageTransformer (cms::MessageTransformer * *transformer*) [virtual]

Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are dispatched to client **code** (p. 1005). The CMS **code** (p. 1005) never takes ownership of the MessageTransformer pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the MessageTransformer has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to apply on each **cms** (p. 91)::Message dispatch.

Implements **cms::MessageConsumer** (p. 2131).

6.21.2.20 void activemq::core::ActiveMQConsumer::setOptimizeAcknowledge (bool *value*)

Enable or disable optimized acknowledge for this consumer.

Parameters:

value True if optimize acknowledge is enabled, false otherwise.

6.21.2.21 void activemq::core::ActiveMQConsumer::setOptimizedAckScheduledAckInterval (long long *value*)

Sets the time in Milliseconds to schedule an automatic acknowledge of outstanding messages when optimize acknowledge is enabled. A value less than one means disable any scheduled tasks.

Parameters:

value The time interval to send scheduled acks.

6.21.2.22 void activemq::core::ActiveMQConsumer::setRedeliveryPolicy (RedeliveryPolicy * *policy*)

Sets the **RedeliveryPolicy** (p. 2542) this Consumer should use when a rollback is performed on a transacted Consumer. The Consumer takes ownership of the passed pointer. The Consumer's redelivery policy can never be null, a call to this method with a NULL pointer is ignored.

Parameters:

policy Pointer to a Redelivery Policy object that his Consumer will use.

6.21.2.23 virtual void activemq::core::ActiveMQConsumer::start () [virtual]

Starts the service.

Exceptions:

CMSException if an internal error occurs while starting.

Implements **cms::Startable** (p. 2852).

6.21.2.24 virtual void activemq::core::ActiveMQConsumer::stop () [virtual]

Stops this service.

Exceptions:

CMSException - if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2919).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQConsumer.h**

6.22 activemq::core::kernels::ActiveMQConsumerKernel Class Reference

`#include <src/main/activemq/core/kernels/ActiveMQConsumerKernel.h>`Inheritance diagram for activemq::core::kernels::ActiveMQConsumerKernel:

Public Member Functions

- **ActiveMQConsumerKernel** (**ActiveMQSessionKernel** *session, const **Pointer< commands::ConsumerId >** &id, const **Pointer< commands::ActiveMQDestination >** &destination, const std::string &name, const std::string &selector, int prefetch, int maxPendingMessageCount, bool noLocal, bool browser, bool dispatchAsync, **cms::MessageListener** *listener)
- virtual ~**ActiveMQConsumerKernel** ()
- virtual void **start** ()

  Starts the service.

- virtual void **stop** ()

  Stops this service.

- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual **cms::Message** * **receive** ()

  Synchronously Receive a Message.

- virtual **cms::Message** * **receive** (int millisecs)

  Synchronously Receive a Message, time out after defined interval.

- virtual **cms::Message** * **receiveNoWait** ()

  Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

- virtual void **setMessageListener** (**cms::MessageListener** *listener)

  Sets the MessageListener that this class will send notifs on.

- virtual **cms::MessageListener** * **getMessageListener** () const

  Gets the MessageListener that this class will send mew Message notification events to.

- virtual void **setMessageAvailableListener** (**cms::MessageAvailableListener** *listener)

  Sets the MessageAvailableListener that this class will send events to if the consumer is in synchronous consumption mode and a new Message has arrived.

- virtual **cms::MessageAvailableListener** * **getMessageAvailableListener** () const

  Gets the MessageAvailableListener that this class will send mew Message notification events to.

- virtual std::string **getMessageSelector** () const

Gets this message consumer's message selector expression.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

  *Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are dispatched to client **code** (p. 1005).*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this MessageConsumer.

- virtual void **dispatch** (const **Pointer**< **MessageDispatch** > &message)

  Dispatches a message to a particular consumer.

- virtual int **getHashCode** () const

  *HashCode method allowing **Dispatcher** (p. 1412) instances to be used in HashMap etc.*

- void **acknowledge** ()

  Method called to acknowledge all messages that have been received so far.

- void **acknowledge** (**Pointer**< **commands::MessageDispatch** > dispatch)

  Method called to acknowledge the Message contained in the given MessageDispatch.

- void **acknowledge** (**Pointer**< **commands::MessageDispatch** > dispatch, int ackType)

  Method called to acknowledge the Message contained in the given MessageDispatch.

- void **commit** ()

  Called to Commit the current set of messages in this Transaction.

- void **rollback** ()

  Called to Roll back the current set of messages in this Transaction.

- void **doClose** ()

  Performs the actual close operation on this consumer.

- void **dispose** ()

  Cleans up this objects internal resources.

- const **Pointer**< **commands::ConsumerInfo** > & **getConsumerInfo** () const

  Get the Consumer information for this consumer.

- const **Pointer**< **commands::ConsumerId** > & **getConsumerId** () const

  Get the Consumer Id for this consumer.

- bool **isClosed** () const
- bool **isSynchronizationRegistered** () const

  *Has this Consumer Transaction **Synchronization** (p. 2968) been added to the transaction.*

- void **setSynchronizationRegistered** (bool value)

  *Sets the **Synchronization** (p. 2968) Registered **state** (p. 70) of this consumer.*

- bool **iterate** ()

Deliver any pending messages to the registered MessageListener if there is one, return true if not all dispatched, or false if no listener or all pending messages have been dispatched.

- void **deliverAcks** ()

  Forces this consumer to send all pending acks to the broker.

- void **clearMessagesInProgress** ()

  Called on a Failover to clear any pending messages.

- void **inProgressClearRequired** ()

  Signals that a Failure occurred and that anything in-progress in the consumer should be cleared.

- long long **getLastDeliveredSequenceId** () const

  Gets the currently set Last Delivered Sequence Id.

- bool **isTransactedIndividualAck** () const

  Will Message's in a transaction be acknowledged using the Individual Acknowledge mode.

- void **setTransactedIndividualAck** (bool value)

  Set if Message's in a transaction be acknowledged using the Individual Acknowledge mode.

- long long **setFailoverRedeliveryWaitPeriod** () const

  Returns the delay after a failover before Message redelivery starts.

- void **setFailoverRedeliveryWaitPeriod** (long long value)

  Sets the time in milliseconds to delay after failover before starting message redelivery.

- void **setLastDeliveredSequenceId** (long long value)

  Sets the value of the Last Delivered Sequence Id.

- int **getMessageAvailableCount** () const
- void **setRedeliveryPolicy** (**RedeliveryPolicy** *policy)

  *Sets the **RedeliveryPolicy** (p. 2542) this Consumer should use when a rollback is performed on a transacted Consumer.*

- **RedeliveryPolicy** * **getRedeliveryPolicy** () const

  Gets a pointer to this Consumer's Redelivery Policy object, the Consumer retains ownership of this pointer so the caller should not delete it.

- void **setFailureError** (**decaf::lang::Exception** *error)

  *Sets the Exception that has caused this Consumer to be in a failed **state** (p. 70).*

- **decaf::lang::Exception** * **getFailureError** () const

  *Gets the error that caused this Consumer to be in a Failed **state** (p. 70), or NULL if there is no Error.*

- void **setPrefetchSize** (int prefetchSize)

  Sets the current prefetch size for the consumer as indicated by a Broker ConsumerControl command.

- bool **isInUse** (**Pointer**< **commands::ActiveMQDestination** > destination) const

Checks if the given destination is the Destination that this Consumer is subscribed to.

- long long **getOptimizedAckScheduledAckInterval** () const

  Time in Milliseconds before an automatic acknowledge is done for any outstanding delivered Messages.

- void **setOptimizedAckScheduledAckInterval** (long long value)

  Sets the time in Milliseconds to schedule an automatic acknowledge of outstanding messages when optimize acknowledge is enabled.

- bool **isOptimizeAcknowledge** () const
- void **setOptimizeAcknowledge** (bool value)

  Enable or disable optimized acknowledge for this consumer.

Protected Member Functions

- **Pointer< MessageDispatch > dequeue** (long long timeout)

  Used by synchronous receive methods to wait for messages to come in.

- void **beforeMessageIsConsumed** (**Pointer< commands::MessageDispatch >** dispatch)

  Pre-consume processing.

- void **afterMessageIsConsumed** (**Pointer< commands::MessageDispatch >** dispatch, bool messageExpired)

  Post-consume processing.

6.22.1 Constructor & Destructor Documentation

6.22.1.1 activemq::core::kernels::ActiveMQConsumerKernel::ActiveMQConsumerKernel (ActiveMQSessionKernel * *session*, const Pointer< commands::ConsumerId > & *id*, const Pointer< commands::ActiveMQDestination > & *destination*, const std::string & *name*, const std::string & *selector*, int *prefetch*, int *maxPendingMessageCount*, bool *noLocal*, bool *browser*, bool *dispatchAsync*, cms::MessageListener * *listener*)

6.22.1.2 virtual activemq::core::kernels::ActiveMQConsumerKernel::~ActiveMQConsumerKernel () [virtual]

6.22.2 Member Function Documentation

6.22.2.1 void activemq::core::kernels::ActiveMQConsumerKernel::acknowledge (Pointer< commands::MessageDispatch > *dispatch*, int *ackType*)

Method called to acknowledge the Message contained in the given MessageDispatch.

Exceptions:

CMSException if an error occurs while ack'ing the message.

6.22.2.2 void activemq::core::kernels::ActiveMQConsumerKernel::acknowledge (Pointer< commands::MessageDispatch > *dispatch*)

Method called to acknowledge the Message contained in the given MessageDispatch.

Exceptions:

CMSException if an error occurs while ack'ing the message.

6.22.2.3 void activemq::core::kernels::ActiveMQConsumerKernel::acknowledge ()

Method called to acknowledge all messages that have been received so far.

Exceptions:

CMSException if an error occurs while ack'ing the message.

6.22.2.4 void activemq::core::kernels::ActiveMQConsumerKernel::afterMessageIsConsumed (Pointer< commands::MessageDispatch > *dispatch*, bool *messageExpired*) [protected]

Post-consume processing.

Parameters:

dispatch - the consumed message

messageExpired - flag indicating if the message has expired.

6.22.2.5 void activemq::core::kernels::ActiveMQConsumerKernel::beforeMessageIsConsumed (Pointer< commands::MessageDispatch > *dispatch*) [protected]

Pre-consume processing.

Parameters:

dispatch - the message being consumed.

6.22.2.6 void activemq::core::kernels::ActiveMQConsumerKernel::clearMessagesInProgress ()

Called on a Failover to clear any pending messages.

6.22.2.7 virtual void activemq::core::kernels::ActiveMQConsumerKernel::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSException - If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 965).

6.22.2.8 void activemq::core::kernels::ActiveMQConsumerKernel::commit ()

Called to Commit the current set of messages in this Transaction.

Exceptions:

ActiveMQException if an error occurs while performing the operation.

6.22.2.9 void activemq::core::kernels::ActiveMQConsumerKernel::deliverAcks ()

Forces this consumer to send all pending acks to the broker.

Exceptions:

ActiveMQException if an error occurs while performing the operation.

6.22.2.10 Pointer<MessageDispatch> activemq::core::kernels::ActiveMQConsumerKernel::dequeue (long long *timeout*) [protected]

Used by synchronous receive methods to wait for messages to come in.

Parameters:

timeout - The maximum number of milliseconds to wait before returning.

If -1, it will block until a messages is received or this consumer is closed. If 0, will not block at all. If > 0, will wait at a maximum the specified number of milliseconds before returning.

Returns:

the message, if received within the allotted time. Otherwise NULL.

Exceptions:

InvalidStateException if this consumer is closed upon entering this method.

6.22.2.11 virtual void activemq::core::kernels::ActiveMQConsumerKernel::dispatch (const Pointer< MessageDispatch > & *message*) [virtual]

Dispatches a message to a particular consumer.

Parameters:

message The message to be dispatched to a waiting consumer.

Implements **activemq::core::Dispatcher** (p. 1412).

6.22.2.12 void activemq::core::kernels::ActiveMQConsumerKernel::dispose ()

Cleans up this objects internal resources.

Exceptions:

ActiveMQException if an error occurs while performing the operation.

6.22.2.13 void activemq::core::kernels::ActiveMQConsumerKernel::doClose ()

Performs the actual close operation on this consumer.

Exceptions:

ActiveMQException if an error occurs while performing the operation.

6.22.2.14 const Pointer<commands::ConsumerId>& activemq::core::kernels::ActiveMQConsumerKernel::getConsumerId () const

Get the Consumer Id for this consumer.

Returns:

Reference to a Consumer Id Object

6.22.2.15 const Pointer<commands::ConsumerInfo>& activemq::core::kernels::ActiveMQConsumerKernel::getConsumerInfo () const

Get the Consumer information for this consumer.

Returns:

Reference to a Consumer Info Object

6.22.2.16 decaf::lang::Exception* activemq::core::kernels::ActiveMQConsumerKernel::getFailureError () const

Gets the error that caused this Consumer to be in a Failed **state** (p. 70), or NULL if there is no Error.

Returns:

pointer to the error that faulted this Consumer or NULL.

6.22.2.17 virtual int activemq::core::kernels::ActiveMQConsumerKernel::getHashCode () const [virtual]

HashCode method allowing **Dispatcher** (p. 1412) instances to be used in HashMap etc.

Returns:

hash value for this **Dispatcher** (p. 1412).

Implements **activemq::core::Dispatcher** (p. 1412).

6.22.2.18 long long activemq::core::kernels::ActiveMQConsumerKernel::getLastDeliveredSequenceId () const

Gets the currently set Last Delivered Sequence Id.

Returns:

long long containing the sequence id of the last delivered Message.

6.22.2.19 int activemq::core::kernels::ActiveMQConsumerKernel::getMessageAvailableCount () const

Returns:

the number of Message's this consumer is waiting to Dispatch.

6.22.2.20 virtual cms::MessageAvailableListener* activemq::core::kernels::ActiveMQConsumerKernel::getMessageAvailableListener () const [virtual]

Gets the MessageAvailableListener that this class will send mew Message notification events to.

Returns:

The listener of message events received by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2128).

6.22.2.21 virtual cms::MessageListener* activemq::core::kernels::ActiveMQConsumerKernel::getMessageListener () const [virtual]

Gets the MessageListener that this class will send mew Message notification events to.

Returns:

The listener of messages received by this consumer

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2129).

6.22.2.22 virtual std::string activemq::core::kernels::ActiveMQConsumerKernel::getMessageSelector () const [virtual]

Gets this message consumer's message selector expression.

Returns:

This Consumer's selector expression or "".

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2129).

6.22.2.23 virtual cms::MessageTransformer* activemq::core::kernels::ActiveMQConsumerKernel::getMessageTransformer () const [virtual]

Gets the currently configured MessageTransformer for this MessageConsumer.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::MessageConsumer** (p. 2129).

6.22.2.24 long long activemq::core::kernels::ActiveMQConsumerKernel::getOptimizedAckScheduledAckInterval () const

Time in Milliseconds before an automatic acknowledge is done for any outstanding delivered Messages. A value less than one means no task is scheduled.

Returns:

time in milliseconds for the scheduled ack task.

6.22.2.25 RedeliveryPolicy* activemq::core::kernels::ActiveMQConsumerKernel::getRedeliveryPolicy () const

Gets a pointer to this Consumer's Redelivery Policy object, the Consumer retains ownership of this pointer so the caller should not delete it.

Returns:

a Pointer to a **RedeliveryPolicy** (p. 2542) that is in use by this Consumer.

6.22.2.26 void activemq::core::kernels::ActiveMQConsumerKernel::inProgressClearRequired ()

Signals that a Failure occurred and that anything in-progress in the consumer should be cleared.

6.22.2.27 bool activemq::core::kernels::ActiveMQConsumerKernel::isClosed () const

Returns:

if this Consumer has been closed.

6.22.2.28 bool activemq::core::kernels::ActiveMQConsumerKernel::isInUse (Pointer< commands::ActiveMQDestination > *destination*) const

Checks if the given destination is the Destination that this Consumer is subscribed to.

Returns:

true if the consumer is subscribed to the given destination.

6.22.2.29 bool activemq::core::kernels::ActiveMQConsumerKernel::isOptimizeAcknowledge () const

Returns:

true if this consumer is using optimize acknowledge mode.

6.22.2.30 bool activemq::core::kernels::ActiveMQConsumerKernel::isSynchronizationRegistered () const

Has this Consumer Transaction **Synchronization** (p. 2968) been added to the transaction.

Returns:

true if the synchronization has been added.

6.22.2.31 bool activemq::core::kernels::ActiveMQConsumerKernel::isTransactedIndividualAck () const

Will Message's in a transaction be acknowledged using the Individual Acknowledge mode.

Returns:

true if individual transacted acknowledge is enabled.

6.22.2.32 bool activemq::core::kernels::ActiveMQConsumerKernel::iterate ()

Deliver any pending messages to the registered MessageListener if there is one, return true if not all dispatched, or false if no listener or all pending messages have been dispatched.

6.22.2.33 virtual cms::Message* activemq::core::kernels::ActiveMQConsumerKernel::receive (int *millisecs*) [virtual]

Synchronously Receive a Message, time out after defined interval. Returns null if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

6.22.2.34 virtual cms::Message* activemq::core::kernels::ActiveMQConsumerKernel::receive () [virtual]

Synchronously Receive a Message.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

6.22.2.35 virtual cms::Message* activemq::core::kernels::ActiveMQConsumerKernel::receiveNoWait () [virtual]

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

6.22.2.36 void activemq::core::kernels::ActiveMQConsumerKernel::rollback ()

Called to Roll back the current set of messages in this Transaction.

Exceptions:

ActiveMQException if an error occurs while performing the operation.

6.22.2.37 void activemq::core::kernels::ActiveMQConsumerKernel::setFailoverRedeliveryWaitPeriod (long long *value*)

Sets the time in milliseconds to delay after failover before starting message redelivery.

Parameters:

value Time in milliseconds to delay after failover for redelivery start.

6.22.2.38 long long activemq::core::kernels::ActiveMQConsumerKernel::setFailoverRedeliveryWaitPeriod () const

Returns the delay after a failover before Message redelivery starts.

Returns:

time in milliseconds to wait after failover.

6.22.2.39 void activemq::core::kernels::ActiveMQConsumerKernel::setFailureError (decaf::lang::Exception * *error*)

Sets the Exception that has caused this Consumer to be in a failed **state** (p. 70).

Parameters:

error The error that is to be thrown when a Receive call is made.

6.22.2.40 void activemq::core::kernels::ActiveMQConsumerKernel::setLastDeliveredSequenceId (long long *value*)

Sets the value of the Last Delivered Sequence Id.

Parameters:

value The new value to assign to the Last Delivered Sequence Id property.

6.22.2.41 virtual void activemq::core::kernels::ActiveMQConsumerKernel::setMessageAvailableListener (cms::MessageAvailableListener * *listener*) [virtual]

Sets the MessageAvailableListener that this class will send events to if the consumer is in synchronous consumption mode and a new Message has arrived.

Parameters:

listener The listener of new message events fired by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2131).

6.22.2.42 virtual void activemq::core::kernels::ActiveMQConsumerKernel::setMessageListener (cms::MessageListener * *listener*) [virtual]

Sets the MessageListener that this class will send notifs on.

Parameters:

listener The listener of messages received by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2131).

6.22.2.43 virtual void activemq::core::kernels::ActiveMQConsumerKernel::setMessageTransformer (cms::MessageTransformer * *transformer*) [virtual]

Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are dispatched to client **code** (p. 1005). The CMS **code** (p. 1005) never takes ownership of the MessageTransformer pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the MessageTransformer has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to apply on each **cms** (p. 91)::Message dispatch.

Implements **cms::MessageConsumer** (p. 2131).

6.22.2.44 void activemq::core::kernels::ActiveMQConsumerKernel::setOptimizeAcknowledge (bool *value*)

Enable or disable optimized acknowledge for this consumer.

Parameters:

value True if optimize acknowledge is enabled, false otherwise.

6.22.2.45 void activemq::core::kernels::ActiveMQConsumerKernel::setOptimizedAckScheduledAckInterval (long long *value*)

Sets the time in Milliseconds to schedule an automatic acknowledge of outstanding messages when optimize acknowledge is enabled. A value less than one means disable any scheduled tasks.

Parameters:

value The time interval to send scheduled acks.

6.22.2.46 void activemq::core::kernels::ActiveMQConsumerKernel::setPrefetchSize (int *prefetchSize*)

Sets the current prefetch size for the consumer as indicated by a Broker ConsumerControl command.

6.22.2.47 void activemq::core::kernels::ActiveMQConsumerKernel::setRedeliveryPolicy (RedeliveryPolicy * *policy*)

Sets the **RedeliveryPolicy** (p. 2542) this Consumer should use when a rollback is performed on a transacted Consumer. The Consumer takes ownership of the passed pointer. The Consumer's redelivery policy can never be null, a call to this method with a NULL pointer is ignored.

Parameters:

policy Pointer to a Redelivery Policy object that his Consumer will use.

6.22.2.48 void activemq::core::kernels::ActiveMQConsumerKernel::setSynchronizationRegistered (bool *value*)

Sets the **Synchronization** (p. 2968) Registered **state** (p. 70) of this consumer.

Parameters:

value - true if registered false otherwise.

6.22.2.49 void activemq::core::kernels::ActiveMQConsumerKernel::setTransactedIndividualAck (bool *value*)

Set if Message's in a transaction be acknowledged using the Individual Acknowledge mode.

Parameters:

value True if individual transacted acknowledge is enabled.

6.22.2.50 virtual void activemq::core::kernels::ActiveMQConsumerKernel::start () [virtual]

Starts the service.

Exceptions:

CMSException if an internal error occurs while starting.

Implements **cms::Startable** (p. 2852).

6.22.2.51 virtual void activemq::core::kernels::ActiveMQConsumerKernel::stop () [virtual]

Stops this service.

Exceptions:

CMSException - if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2919).

The documentation for this class was generated from the following file:

6.23 activemq::library::ActiveMQCPP Class Reference

`#include <src/main/activemq/library/ActiveMQCPP.h>`

Public Member Functions

- virtual ~**ActiveMQCPP** ()

Static Public Member Functions

- static void **initializeLibrary** ()

  Initialize the ActiveMQ-CPP Library constructs, this method will init all the internal Registry objects and initialize the Decaf ***library*** *(*p. 69*).*

- static void **initializeLibrary** (int argc, char **argv)

  Initialize the ActiveMQ-CPP Library constructs, this method will initialize all the internal Registry objects and initialize the Decaf ***library*** *(*p. 69*).*

- static void **shutdownLibrary** ()

  Shutdown the ActiveMQ-CPP Library, freeing any resources that could not be freed up to this point.

Protected Member Functions

- **ActiveMQCPP** ()
- **ActiveMQCPP** (const **ActiveMQCPP** &)
- **ActiveMQCPP** & **operator**= (const **ActiveMQCPP** &)

6.23.1 Constructor & Destructor Documentation

6.23.1.1 activemq::library::ActiveMQCPP::ActiveMQCPP () [protected]

6.23.1.2 activemq::library::ActiveMQCPP::ActiveMQCPP (const ActiveMQCPP &) [protected]

6.23.1.3 virtual activemq::library::ActiveMQCPP::~ActiveMQCPP () [virtual]

6.23.2 Member Function Documentation

6.23.2.1 static void activemq::library::ActiveMQCPP::initializeLibrary (int *argc*, char ** *argv*) [static]

Initialize the ActiveMQ-CPP Library constructs, this method will initialize all the internal Registry objects and initialize the Decaf **library** (p. 69). This method takes the args passed to the main method of process for use is setting system properties and configuring the ActiveMQ-CPP Library.

Parameters:

argc - the count of arguments passed to this Process.

argv - the array of string arguments passed to this process.

Exceptions:

runtime_error if an error occurs while initializing this **library** (p. 69).

6.23.2.2 static void activemq::library::ActiveMQCPP::initializeLibrary () [static]

Initialize the ActiveMQ-CPP Library constructs, this method will init all the internal Registry objects and initialize the Decaf **library** (p. 69).

Exceptions:

runtime_error if an error occurs while initializing this **library** (p. 69).

6.23.2.3 ActiveMQCPP& activemq::library::ActiveMQCPP::operator= (const ActiveMQCPP &) [protected]

6.23.2.4 static void activemq::library::ActiveMQCPP::shutdownLibrary () [static]

Shutdown the ActiveMQ-CPP Library, freeing any resources that could not be freed up to this point. All the user created ActiveMQ-CPP objects and Decaf Library objects should have been destroyed by the time this method is called.

6.24.2.1 activemq::commands::ActiveMQDestination::ActiveMQDestination ()

6.24.2.2 activemq::commands::ActiveMQDestination::ActiveMQDestination (const std::string & *physicalName*)

6.24.2.3 virtual activemq::commands::ActiveMQDestination::~ActiveMQDestination () throw () [virtual]

6.24.3 Member Function Documentation

6.24.3.1 virtual ActiveMQDestination* activemq::commands::ActiveMQDestination::cloneDataStructure () const [inline, virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 422), **activemq::commands::ActiveMQTempDestination** (p. 494), **activemq::commands::ActiveMQTempQueue** (p. 503), **activemq::commands::ActiveMQTempTopic** (p. 511), and **activemq::commands::ActiveMQTopic** (p. 528).

References NULL.

6.24.3.2 virtual int activemq::commands::ActiveMQDestination::compareTo (const ActiveMQDestination & *value*) const [virtual]

6.24.3.3 virtual void activemq::commands::ActiveMQDestination::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 422), **activemq::commands::ActiveMQTempDestination** (p. 495), **activemq::commands::ActiveMQTempQueue** (p. 503), **activemq::commands::ActiveMQTempTopic** (p. 511), and **activemq::commands::ActiveMQTopic** (p. 528).

Referenced by activemq::commands::ActiveMQTempDestination::copyDataStructure().

6.24.3.4 static Pointer<ActiveMQDestination> activemq::commands::ActiveMQDestination::createDestination (int *type*, const std::string & *name*) [static]

Creates a Destination given the String Name to use and a Type.

Parameters:

type - The Type of Destination to Create

name - The Name to use in the creation of the Destination

Returns:

Pointer to a new **ActiveMQDestination** (p. 320) instance.

6.24.3.5 Pointer<ActiveMQDestination> activemq::commands::ActiveMQDestination::createDestination (const std::string & *name*) const [inline]

Create a new Destination that's of the same type as this one but with the given destination name.

Parameters:

name The name

Returns:

Pointer to a new **ActiveMQDestination** (p. 320).

6.24.3.6 static std::string activemq::commands::ActiveMQDestination::createTemporaryName (const std::string & *clientId*) [inline, static]

Create a temporary name from the clientId.

Parameters:

clientId

Returns:

6.24.3.7 virtual bool activemq::commands::ActiveMQDestination::equals (const ActiveMQDestination & *value*) const [virtual]

6.24.3.8 virtual bool activemq::commands::ActiveMQDestination::equals (const DataStructure * *value*) const [virtual]

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 422), **activemq::commands::ActiveMQTempDestination** (p. 495), **activemq::commands::ActiveMQTempQueue** (p. 504), **activemq::commands::ActiveMQTempTopic** (p. 512), and **activemq::commands::ActiveMQTopic** (p. 528).

Referenced by activemq::commands::ActiveMQTempDestination::equals().

6.24.3.9 static std::string activemq::commands::ActiveMQDestination::getClientId (const ActiveMQDestination * *destination*) [static]

From a temporary destination find the clientId of the Connection that created it.

Parameters:

destination

Returns:

the clientId or null if not a temporary destination

6.24.3.10 virtual const cms::Destination* activemq::commands::ActiveMQDestination::getCMSDestination () const [inline, virtual]

Returns:

the **cms::Destination** (p. 1377) interface pointer that the objects that derive from this class implement.

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 423), **activemq::commands::ActiveMQTempQueue** (p. 504), **activemq::commands::ActiveMQTempTopic** (p. 512), and **activemq::commands::ActiveMQTopic** (p. 529).

References NULL.

6.24.3.11 decaf::util::ArrayList< Pointer<ActiveMQDestination> > activemq::commands::ActiveMQDestination::getCompositeDestinations () const

Returns an ArrayList containing all the ActiveMQDestinations that comprise this Composite destination, if this destination is composite, otherwise it returns an empty list.

6.24.3.12 virtual unsigned char activemq::commands::ActiveMQDestination::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 423), **activemq::commands::ActiveMQTempDestination** (p. 495), **activemq::commands::ActiveMQTempQueue** (p. 504), **activemq::commands::ActiveMQTempTopic** (p. 512), and **activemq::commands::ActiveMQTopic** (p. 529).

6.24.3.13 virtual cms::Destination::DestinationType activemq::commands::ActiveMQDestination::getDestinationType () const [pure virtual]

Returns the Type of Destination that this object represents.

Returns:

int type qualifier.

Implemented in **activemq::commands::ActiveMQQueue** (p. 423), **activemq::commands::ActiveMQTempQueue** (p. 505), **activemq::commands::ActiveMQTempTopic** (p. 513), and **activemq::commands::ActiveMQTopic** (p. 529).

6.24.3.14 std::string activemq::commands::ActiveMQDestination::getDestinationTypeAsString () const

Returns the type of Destination that this object represents as a string, the available string values are, "Queue", "Topic", "TempQueue" and "TempTopic".

Returns:

The string value that represents the type of this destination.

6.24.3.15 int activemq::commands::ActiveMQDestination::getHashCode () const [inline]

6.24.3.16 const activemq::util::ActiveMQProperties& activemq::commands::ActiveMQDestination::getOptions () const [inline]

Returns:

a reference (const) to the options properties for this Destination.

6.24.3.17 virtual std::string activemq::commands::ActiveMQDestination::getOrderedTarget () const [inline, virtual]

Returns:

Returns the orderedTarget.

6.24.3.18 virtual std::string activemq::commands::ActiveMQDestination::getPhysicalName () const [inline, virtual]

Fetch this destination's physical name.

Returns:

const string containing the name

6.24.3.19 virtual bool activemq::commands::ActiveMQDestination::isAdvisory () const [inline, virtual]

Returns:

Returns the advisory.

6.24.3.20 virtual bool activemq::commands::ActiveMQDestination::isComposite () const [inline, virtual]

Returns true if this destination represents a collection of destinations; allowing a set of destinations to be published to or subscribed from in one CMS operation.

Returns:

true if this destination represents a collection of child destinations.

6.24.3.21 virtual bool activemq::commands::ActiveMQDestination::isExclusive () const [inline, virtual]

Returns:

Returns the exclusive.

6.24.3.22 virtual bool activemq::commands::ActiveMQDestination::isOrdered () const [inline, virtual]

Returns:

Returns the ordered.

6.24.3.23 virtual bool activemq::commands::ActiveMQDestination::isQueue () const [inline, virtual]

Returns true if a Queue Destination.

Returns:

true/false

6.24.3.24 virtual bool activemq::commands::ActiveMQDestination::isTemporary () const [inline, virtual]

Returns true if a temporary Destination.

Returns:

true/false

References cms::Destination::TEMPORARY_QUEUE, and cms::Destination::TEMPORARY_-TOPIC.

6.24.3.25 virtual bool activemq::commands::ActiveMQDestination::isTopic () const [inline, virtual]

Returns true if a Topic Destination.

Returns:

true/false

References cms::Destination::TEMPORARY_TOPIC, and cms::Destination::TOPIC.

6.24.3.26 virtual bool activemq::commands::ActiveMQDestination::isWildcard () const [inline, virtual]

Returns:

true if the destination matches multiple possible destinations

6.24.3.27 virtual bool activemq::commands::ActiveMQDestination::operator< (const ActiveMQDestination & *value*) const [virtual]

6.24.3.28 virtual bool activemq::commands::ActiveMQDestination::operator== (const ActiveMQDestination & *value*) const [virtual]

6.24.3.29 virtual void activemq::commands::ActiveMQDestination::setAdvisory (bool *advisory*) [inline, virtual]

Parameters:

advisory The advisory to set.

6.24.3.30 virtual void activemq::commands::ActiveMQDestination::setExclusive (bool *exclusive*) [inline, virtual]

Parameters:

exclusive The exclusive to set.

6.24.3.31 virtual void activemq::commands::ActiveMQDestination::setOrdered (bool *ordered*) [inline, virtual]

Parameters:

ordered The ordered to set.

6.24.3.32 virtual void activemq::commands::ActiveMQDestination::setOrderedTarget (const std::string & *orderedTarget*) [inline, virtual]

Parameters:

orderedTarget The orderedTarget to set.

6.24.3.33 virtual void activemq::commands::ActiveMQDestination::setPhysicalName (const std::string & *physicalName*) [virtual]

Set this destination's physical name.

Returns:

const string containing the name

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 496).

6.24.3.34 virtual std::string activemq::commands::ActiveMQDestination::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 424), **activemq::commands::ActiveMQTempDestination** (p. 496), **activemq::commands::ActiveMQTempQueue** (p. 505), **activemq::commands::ActiveMQTempTopic** (p. 513), and **activemq::commands::ActiveMQTopic** (p. 530).

6.25 activemq::core::ActiveMQDestinationEvent Class Reference

`#include <src/main/activemq/core/ActiveMQDestinationEvent.h>`Inheritance diagram for activemq::core::ActiveMQDestinationEvent:

Public Member Functions

- **ActiveMQDestinationEvent** (**decaf::lang::Pointer< commands::DestinationInfo >** destination)
- virtual ~**ActiveMQDestinationEvent** ()
- virtual const **cms::Destination** * **getDestination** () const

  Returns the destination that this event is related to, the returned destination remains the property of this event and should be cloned if the caller wishes to store it beyond the lifetime of this event object.

- virtual bool **isAddOperation** () const

  Returns true if this events represents the addition of a Destination.

- virtual bool **isRemoveOperation** () const

  Returns true if this events represents the removal of a Destination.

- **decaf::lang::Pointer< commands::DestinationInfo > getDestinationInfo** () const

  Returns the DestinationInfo object that triggered this event.

6.25.1 Constructor & Destructor Documentation

6.25.1.1 activemq::core::ActiveMQDestinationEvent::ActiveMQDestinationEvent (decaf::lang::Pointer< commands::DestinationInfo > *destination*)

6.25.1.2 virtual activemq::core::ActiveMQDestinationEvent::~ActiveMQDestinationEvent () `[virtual]`

6.25.2 Member Function Documentation

6.25.2.1 virtual const cms::Destination* activemq::core::ActiveMQDestinationEvent::getDestination () const `[virtual]`

Returns the destination that this event is related to, the returned destination remains the property of this event and should be cloned if the caller wishes to store it beyond the lifetime of this event object.

Returns:

a **cms::Destination** (p. 1377) instance that this event relates to.

Implements **cms::DestinationEvent** (p. 1380).

6.25.2.2 decaf::lang::Pointer<commands::DestinationInfo> activemq::core::ActiveMQDestinationEvent::getDestinationInfo () const [inline]

Returns the DestinationInfo object that triggered this event.

Returns:

the DestinationInfo object that triggered this event.

6.25.2.3 virtual bool activemq::core::ActiveMQDestinationEvent::isAddOperation () const [virtual]

Returns true if this events represents the addition of a Destination.

Returns:

true if this events represents the addition of a Destination.

Implements **cms::DestinationEvent** (p. 1381).

6.25.2.4 virtual bool activemq::core::ActiveMQDestinationEvent::isRemoveOperation () const [virtual]

Returns true if this events represents the removal of a Destination.

Returns:

true if this events represents the removal of a Destination.

Implements **cms::DestinationEvent** (p. 1381).

6.26.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::~Ac () [inline, virtual]

6.26.3 Member Function Documentation

6.26.3.1 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::looseM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 430), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 499), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 507), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 515), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 532).

6.26.3.2 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::looseU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 431), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 499), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 508), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 516), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 533).

6.26.3.3 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 431), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 500), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 508), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 516), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 533).

6.26.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 431), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 500), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 508), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 516), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 533).

6.26.3.5 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 432), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 501), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 509), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 517), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 534).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQDestinationMarshaller.h**

6.27 activemq::core::ActiveMQDestinationSource Class Reference

`#include <src/main/activemq/core/ActiveMQDestinationSource.h>`Inheritance diagram for activemq::core::ActiveMQDestinationSource:

Public Member Functions

- **ActiveMQDestinationSource** (**ActiveMQConnection** *connection)
- virtual ~**ActiveMQDestinationSource** ()
- virtual void **start** ()

  Starts the service.

- virtual void **stop** ()

  Stops this service.

- virtual void **setListener** (**cms::DestinationListener** *listener)

  Sets the current listener of Destination events.

- virtual **cms::DestinationListener** * **getListener** () const

  Gets the currently configured DestiantionListener for this event source.

- virtual std::vector< **cms::Queue** * > **getQueues** () const

  Returns a snapshot of the currently known Queues that are active on the CMS provider, this ***state*** *(p. 70) can change at any time as Destinations are added and deleted from the provider.*

- virtual std::vector< **cms::Topic** * > **getTopics** () const

  Returns a snapshot of the currently known Queues that are active on the CMS provider, this ***state*** *(p. 70) can change at any time as Destinations are added and deleted from the provider.*

- virtual std::vector< **cms::TemporaryQueue** * > **getTemporaryQueues** () const

  Returns a snapshot of the currently known Queues that are active on the CMS provider, this ***state*** *(p. 70) can change at any time as Destinations are added and deleted from the provider.*

- virtual std::vector< **cms::TemporaryTopic** * > **getTemporaryTopics** () const

  Returns a snapshot of the currently known Queues that are active on the CMS provider, this ***state*** *(p. 70) can change at any time as Destinations are added and deleted from the provider.*

6.27.1 Constructor & Destructor Documentation

6.27.1.1 activemq::core::ActiveMQDestinationSource::ActiveMQDestinationSource (ActiveMQConnection * *connection*)

6.27.1.2 virtual activemq::core::ActiveMQDestinationSource::~ActiveMQDestinationSource () [virtual]

6.27.2 Member Function Documentation

6.27.2.1 virtual cms::DestinationListener* activemq::core::ActiveMQDestinationSource::getListener () const [virtual]

Gets the currently configured DestiantionListener for this event source. The event source instance remains active in this DestinationSource until it is removed via a call to setListener(null) and should not be deleted until the client is sure it will not receive any future events.

Returns:

the configured DestinationListener for this event source or null if none.

Implements **cms::DestinationSource** (p. 1396).

6.27.2.2 virtual std::vector<cms::Queue*> activemq::core::ActiveMQDestinationSource::getQueues () const [virtual]

Returns a snapshot of the currently known Queues that are active on the CMS provider, this **state** (p. 70) can change at any time as Destinations are added and deleted from the provider. The destinations are cloned and placed into the returned vector, the caller is responsible for deleting these cloned objects.

Returns:

an STL vector containing the current list of known Queues.

Implements **cms::DestinationSource** (p. 1396).

6.27.2.3 virtual std::vector<cms::TemporaryQueue*> activemq::core::ActiveMQDestinationSource::getTemporaryQueues () const [virtual]

Returns a snapshot of the currently known Queues that are active on the CMS provider, this **state** (p. 70) can change at any time as Destinations are added and deleted from the provider. The destinations are cloned and placed into the returned vector, the caller is responsible for deleting these cloned objects.

Returns:

an STL vector containing the current list of known Queues.

Implements **cms::DestinationSource** (p. 1396).

6.27.2.4 virtual std::vector<cms::TemporaryTopic*> activemq::core::ActiveMQDestinationSource::getTemporaryTopics () const [virtual]

Returns a snapshot of the currently known Queues that are active on the CMS provider, this **state** (p. 70) can change at any time as Destinations are added and deleted from the provider. The destinations are cloned and placed into the returned vector, the caller is responsible for deleting these cloned objects.

Returns:

an STL vector containing the current list of known Queues.

Implements **cms::DestinationSource** (p. 1396).

6.27.2.5 virtual std::vector<cms::Topic*> activemq::core::ActiveMQDestinationSource::getTopics () const [virtual]

Returns a snapshot of the currently known Queues that are active on the CMS provider, this **state** (p. 70) can change at any time as Destinations are added and deleted from the provider. The destinations are cloned and placed into the returned vector, the caller is responsible for deleting these cloned objects.

Returns:

an STL vector containing the current list of known Queues.

Implements **cms::DestinationSource** (p. 1397).

6.27.2.6 virtual void activemq::core::ActiveMQDestinationSource::setListener (cms::DestinationListener * *listener*) [virtual]

Sets the current listener of Destination events. This class does not manage the lifetime of the configured listener, the client must ensure that it deletes the listener instance at the appropriate time.

Parameters:

listener The new listener to provide destination events to.

Implements **cms::DestinationSource** (p. 1397).

6.27.2.7 virtual void activemq::core::ActiveMQDestinationSource::start () [virtual]

Starts the service.

Exceptions:

CMSException if an internal error occurs while starting.

Implements **cms::Startable** (p. 2852).

6.27.2.8 virtual void activemq::core::ActiveMQDestinationSource::stop () [virtual]

Stops this service.

Exceptions:

CMSException - if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2919).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQDestinationSource.h**

6.28 activemq::exceptions::ActiveMQException Class Reference

`#include <src/main/activemq/exceptions/ActiveMQException.h>`Inheritance diagram for activemq::exceptions::ActiveMQException:

Public Member Functions

- **ActiveMQException** ()

  Default Constructor.

- **ActiveMQException** (const **ActiveMQException** &ex)

  Copy Constructor.

- **ActiveMQException** (const **decaf::lang::Exception** &ex)

  Copy Constructor.

- **ActiveMQException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **ActiveMQException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual ~**ActiveMQException** () throw ()
- virtual **ActiveMQException** * **clone** () const

  Clones this exception.

- virtual **cms::CMSException convertToCMSException** () const

  Converts this exception to a new CMSException.

6.28.1 Constructor & Destructor Documentation

6.28.1.1 activemq::exceptions::ActiveMQException::ActiveMQException ()

Default Constructor.

6.28.1.2 activemq::exceptions::ActiveMQException::ActiveMQException (const ActiveMQException & *ex*)

Copy Constructor.

Parameters:

ex The Exception whose internal data is copied into this instance.

6.28.1.3 activemq::exceptions::ActiveMQException::ActiveMQException (const decaf::lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex The Exception whose internal data is copied into this instance.

6.28.1.4 activemq::exceptions::ActiveMQException::ActiveMQException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs.

lineNumber The line number where the exception occurred.

msg The message to report.

... The list of primitives that are formatted into the message.

6.28.1.5 activemq::exceptions::ActiveMQException::ActiveMQException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.28.1.6 virtual activemq::exceptions::ActiveMQException::~ActiveMQException () throw () [virtual]

6.28.2 Member Function Documentation

6.28.2.1 virtual ActiveMQException* activemq::exceptions::ActiveMQException::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

Copy of this Exception object

Reimplemented from **decaf::lang::Exception** (p. 1460).

Reimplemented in **activemq::exceptions::BrokerException** (p. 714), and **activemq::exceptions::ConnectionFailedException** (p. 1119).

6.28.2.2 virtual cms::CMSException activemq::exceptions::ActiveMQException::convertToCMSException () const [virtual]

Converts this exception to a new CMSException.

Returns:

a CMSException with the data from this exception

The documentation for this class was generated from the following file:

- src/main/activemq/exceptions/**ActiveMQException.h**

6.29 activemq::commands::ActiveMQMapMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQMapMessage.h>`Inheritance diagram for activemq::commands::ActiveMQMapMessage:

Public Member Functions

- **ActiveMQMapMessage** ()
- virtual ~**ActiveMQMapMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual bool **isMarshalAware** () const

  Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

- virtual **ActiveMQMapMessage** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat)

  Called before marshaling is started to prepare the object to be marshaled.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual void **clearBody** () throw (cms::CMSException)

  Clears out the body of the message.

- virtual **cms::MapMessage** * **clone** () const

  Clone this message exactly, returns a new instance that the caller is required to delete.

- virtual bool **isEmpty** () const

  *Returns true if there are no values stored in the **MapMessage** (p. 2024) body.*
  Returns:

  *true if the body of the **MapMessage** (p. 2024) contains no elements.*
  Exceptions:

  ***CMSException** (p. **979**) if the operation fails due to an internal error.*

- virtual std::vector< std::string > **getMapNames** () const

  *Returns an Enumeration of all the names in the **MapMessage** (p. 2024) object.*

Returns:

STL Vector of String values, each of which is the name of an item in the ***MapMessage*** *(p. 2024)*

Exceptions:

CMSException *(p. **979**) - if the operation fails due to an internal error.*

- virtual bool **itemExists** (const std::string &name) const

Indicates whether an item exists in this ***MapMessage*** *(p. 2024) object.*

Parameters:

name *String name of the Object in question*

Returns:

boolean value indicating if the name is in the map

Exceptions:

CMSException *(p. **979**) - if the operation fails due to an internal error.*

- virtual **cms::Message::ValueType getValueType** (const std::string &key) const

Returns the value type for the given key mapping.
The CMS provider should translate all internal type identifiers into the CMS Value types returning UNKNOWN_ TYPE for any specialized types not directly supported in the CMS API.

Parameters:

key *The string key used to look up the value type mapping.*

Returns:

The ValueType contained in the given mapping.

Exceptions:

CMSException *(p. **979**) if no mapping exists that matches the requested key.*

- virtual bool **getBoolean** (const std::string &name) const

Returns the Boolean value of the Specified name.

Parameters:

name *Name of the value to fetch from the map*

Exceptions:

CMSException *(p. **979**) - if the operation fails due to an internal error.*
MessageFormatException *(p. **2172**) - if this type conversion is invalid.*

- virtual void **setBoolean** (const std::string &name, bool value)

Sets a boolean value with the specified name into the Map.

Parameters:

name *the name of the boolean*
value *the boolean value to set in the Map*

Exceptions:

CMSException *(p. **979**) - if the operation fails due to an internal error.*
MessageNotWritableException *- if the* ***Message*** *(p. 2090) is in Read-only Mode.*

- virtual unsigned char **getByte** (const std::string &name) const

Returns the Byte value of the Specified name.

Parameters:

name *Name of the value to fetch from the map*

Exceptions:

CMSException (p. ***979***) *- if the operation fails due to an internal error.*
MessageFormatException (p. ***2172***) *- if this type conversion is invalid.*

- virtual void **setByte** (const std::string &name, unsigned char value)

  Sets a Byte value with the specified name into the Map.

  Parameters:

  name *the name of the Byte*
  value *the Byte value to set in the Map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageNotWriteableException (p. ***2190***) *- if the* ***Message*** (p. *2090*) *is in Read-only Mode.*

- virtual std::vector< unsigned char > **getBytes** (const std::string &name) const

  Returns the Bytes value of the Specified name.

  Parameters:

  name *Name of the value to fetch from the map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageFormatException (p. ***2172***) *- if this type conversion is invalid.*

- virtual void **setBytes** (const std::string &name, const std::vector< unsigned char > &value)

  Sets a Bytes value with the specified name into the Map.

  Parameters:

  name *The name of the Bytes*
  value *The Bytes value to set in the Map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageNotWriteableException (p. ***2190***) *- if the* ***Message*** (p. *2090*) *is in Read-only Mode.*

- virtual char **getChar** (const std::string &name) const

  Returns the Char value of the Specified name.

  Parameters:

  name *name of the value to fetch from the map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageFormatException (p. ***2172***) *- if this type conversion is invalid.*

- virtual void **setChar** (const std::string &name, char value)

  Sets a Char value with the specified name into the Map.

  Parameters:

  name *the name of the Char*
  value *the Char value to set in the Map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageNotWriteableException (p. ***2190***) *- if the* ***Message*** (p. *2090*) *is in Read-only Mode.*

- virtual double **getDouble** (const std::string &name) const

  Returns the Double value of the Specified name.

  Parameters:

  name *Name of the value to fetch from the map*

  Exceptions:

  CMSException *(p. **979**) - if the operation fails due to an internal error.*
  MessageFormatException *(p. **2172**) - if this type conversion is invalid.*

- virtual void **setDouble** (const std::string &name, double value)

  Sets a Double value with the specified name into the Map.

  Parameters:

  name *The name of the Double*
  value *The Double value to set in the Map*

  Exceptions:

  CMSException *(p. **979**) - if the operation fails due to an internal error.*
  MessageNotWriteableException *(p. **2190**) - if the **Message** (p. 2090) is in Read-only Mode.*

- virtual float **getFloat** (const std::string &name) const

  Returns the Float value of the Specified name.

  Parameters:

  name *Name of the value to fetch from the map*

  Exceptions:

  CMSException *(p. **979**) - if the operation fails due to an internal error.*
  MessageFormatException *(p. **2172**) - if this type conversion is invalid.*

- virtual void **setFloat** (const std::string &name, float value)

  Sets a Float value with the specified name into the Map.

  Parameters:

  name *The name of the Float*
  value *The Float value to set in the Map*

  Exceptions:

  CMSException *(p. **979**) - if the operation fails due to an internal error.*
  MessageNotWriteableException *(p. **2190**) - if the **Message** (p. 2090) is in Read-only Mode.*

- virtual int **getInt** (const std::string &name) const

  Returns the Int value of the Specified name.

  Parameters:

  name *Name of the value to fetch from the map*

  Exceptions:

  CMSException *(p. **979**) - if the operation fails due to an internal error.*
  MessageFormatException *(p. **2172**) - if this type conversion is invalid.*

- virtual void **setInt** (const std::string &name, int value)

  Sets a Int value with the specified name into the Map.

  Parameters:

  name *The name of the Int*
  value *The Int value to set in the Map*

Exceptions:

CMSException (p. ***979***) *- if the operation fails due to an internal error.*
MessageNotWriteableException (p. ***2190***) *- if the* ***Message*** (p. *2090) is in Read-only Mode.*

- virtual long long **getLong** (const std::string &name) const

  Returns the Long value of the Specified name.

  Parameters:

  name *Name of the value to fetch from the map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageFormatException (p. ***2172***) *- if this type conversion is invalid.*

- virtual void **setLong** (const std::string &name, long long value)

  Sets a Long value with the specified name into the Map.

  Parameters:

  name *The name of the Long*
  value *The Long value to set in the Map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageNotWriteableException (p. ***2190***) *- if the* ***Message*** (p. *2090) is in Read-only Mode.*

- virtual short **getShort** (const std::string &name) const

  Returns the Short value of the Specified name.

  Parameters:

  name *Name of the value to fetch from the map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageFormatException (p. ***2172***) *- if this type conversion is invalid.*

- virtual void **setShort** (const std::string &name, short value)

  Sets a Short value with the specified name into the Map.

  Parameters:

  name *The name of the Short*
  value *The Short value to set in the Map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageNotWriteableException (p. ***2190***) *- if the* ***Message*** (p. *2090) is in Read-only Mode.*

- virtual std::string **getString** (const std::string &name) const

  Returns the String value of the Specified name.

  Parameters:

  name *Name of the value to fetch from the map*

  Exceptions:

  CMSException (p. ***979***) *- if the operation fails due to an internal error.*
  MessageFormatException (p. ***2172***) *- if this type conversion is invalid.*

- virtual void **setString** (const std::string &name, const std::string &value)

Sets a String value with the specified name into the Map.

Parameters:

name *The name of the String*
value *The String value to set in the Map*

Exceptions:

CMSException *(p. 979) - if the operation fails due to an internal error.*
MessageNotWriteableException *(p. 2190) - if the* ***Message*** *(p. 2090) is in Read-only Mode.*

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQMAPMESSAGE** = 25

Protected Member Functions

- **util::PrimitiveMap** & **getMap** ()

  Fetches a reference to this objects PrimitiveMap, if one needs to be created or unmarshaled, this will perform the correct steps.

- const **util::PrimitiveMap** & **getMap** () const
- virtual void **checkMapIsUnmarshalled** () const

  Performs the unmarshal on the Map if needed, otherwise just returns.

6.29.1 Constructor & Destructor Documentation

6.29.1.1 activemq::commands::ActiveMQMapMessage::ActiveMQMapMessage ()

6.29.1.2 virtual activemq::commands::ActiveMQMapMessage::~ActiveMQMapMessage () throw () [virtual]

6.29.2 Member Function Documentation

6.29.2.1 virtual void activemq::commands::ActiveMQMapMessage::beforeMarshal (wireformat::WireFormat * *wireFormat*) [virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters:

wireFormat The **wireformat** (p. 81) object to control marshaling

Exceptions:

IOException if an I/O error occurs.

Implements **activemq::wireformat::MarshalAware** (p. 2036).

6.29.2.2 virtual void activemq::commands::ActiveMQMapMessage::checkMapIsUnmarshalled () const [protected, virtual]

Performs the unmarshal on the Map if needed, otherwise just returns.

Exceptions:

NullPointerException if the internal Map is Null.

6.29.2.3 virtual void activemq::commands::ActiveMQMapMessage::clearBody () throw (cms::CMSException) [virtual]

Clears out the body of the message. This does not clear the headers or properties.

Exceptions:

CMSException - if an internal error occurs.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 377).

6.29.2.4 virtual cms::MapMessage* activemq::commands::ActiveMQMapMessage::clone () const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p. 2096).

References activemq::commands::Message::setReadOnlyBody(), and activemq::commands::Message::setReadOnlyProperties().

6.29.2.5 virtual ActiveMQMapMessage* activemq::commands::ActiveMQMapMessage::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 2076).

6.29.2.6 virtual void activemq::commands::ActiveMQMapMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Message** (p. 2077).

6.29.2.7 virtual bool activemq::commands::ActiveMQMapMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 378).

6.29.2.8 virtual bool activemq::commands::ActiveMQMapMessage::getBoolean (const std::string & *name*) const [virtual]

Returns the Boolean value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2026).

6.29.2.9 virtual unsigned char activemq::commands::ActiveMQMapMessage::getByte (const std::string & *name*) const [virtual]

Returns the Byte value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2026).

6.29.2.10 virtual std::vector<unsigned char> activemq::commands::ActiveMQMapMessage::getBytes (const std::string & *name*) const [virtual]

Returns the Bytes value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2027).

6.29.2.11 virtual char activemq::commands::ActiveMQMapMessage::getChar (const std::string & *name*) const [virtual]

Returns the Char value of the Specified name.

Parameters:

name name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2027).

6.29.2.12 virtual unsigned char activemq::commands::ActiveMQMapMessage::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 2079).

6.29.2.13 virtual double activemq::commands::ActiveMQMapMessage::getDouble (const std::string & *name*) const [virtual]

Returns the Double value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2027).

6.29.2.14 virtual float activemq::commands::ActiveMQMapMessage::getFloat (const std::string & *name*) const [virtual]

Returns the Float value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2028).

6.29.2.15 virtual int activemq::commands::ActiveMQMapMessage::getInt (const std::string & *name*) const [virtual]

Returns the Int value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2028).

6.29.2.16 virtual long long activemq::commands::ActiveMQMapMessage::getLong (const std::string & *name*) const [virtual]

Returns the Long value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2028).

6.29.2.17 const util::PrimitiveMap& activemq::commands::ActiveMQMapMessage::getMap () const [protected]

6.29.2.18 util::PrimitiveMap& activemq::commands::ActiveMQMapMessage::getMap () [protected]

Fetches a reference to this objects PrimitiveMap, if one needs to be created or unmarshaled, this will perform the correct steps.

Returns:

reference to a PrimtiveMap;

Exceptions:

NullPointerException if the internal Map is Null.

6.29.2.19 virtual std::vector< std::string > activemq::commands::ActiveMQMapMessage::getMapNames () const [virtual]

Returns an Enumeration of all the names in the **MapMessage** (p. 2024) object.

Returns:

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 2024)

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

Implements **cms::MapMessage** (p. 2028).

6.29.2.20 virtual short activemq::commands::ActiveMQMapMessage::getShort (const std::string & *name*) const [virtual]

Returns the Short value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2029).

6.29.2.21 virtual std::string activemq::commands::ActiveMQMapMessage::getString (const std::string & *name*) const [virtual]

Returns the String value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implements **cms::MapMessage** (p. 2029).

6.29.2.22 virtual cms::Message::ValueType activemq::commands::ActiveMQMapMessage::getValueType (const std::string & *key*) const [virtual]

Returns the value type for the given key mapping.

The CMS provider should translate all internal type identifiers into the CMS Value types returning UNKNOWN_TYPE for any specialized types not directly supported in the CMS API.

Parameters:

key The string key used to look up the value type mapping.

Returns:

The ValueType contained in the given mapping.

Exceptions:

CMSException (p. ***979***) if no mapping exists that matches the requested key.

Implements **cms::MapMessage** (p. 2029).

6.29.2.23 virtual bool activemq::commands::ActiveMQMapMessage::isEmpty () const [virtual]

Returns true if there are no values stored in the **MapMessage** (p. 2024) body.

Returns:

true if the body of the **MapMessage** (p. 2024) contains no elements.

Exceptions:

CMSException (p. ***979***) if the operation fails due to an internal error.

Implements **cms::MapMessage** (p. 2030).

6.29.2.24 virtual bool activemq::commands::ActiveMQMapMessage::isMarshalAware () const [inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns:

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::Message** (p. 2082).

6.29.2.25 virtual bool activemq::commands::ActiveMQMapMessage::itemExists (const std::string & *name*) const [virtual]

Indicates whether an item exists in this **MapMessage** (p. 2024) object.

Parameters:

name String name of the Object in question

Returns:

boolean value indicating if the name is in the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

Implements **cms::MapMessage** (p. 2030).

6.29.2.26 virtual void activemq::commands::ActiveMQMapMessage::setBoolean (const std::string & *name*, bool *value*) [virtual]

Sets a boolean value with the specified name into the Map.

Parameters:

name the name of the boolean

value the boolean value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWritableException - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2030).

6.29.2.27 virtual void activemq::commands::ActiveMQMapMessage::setByte (const std::string & *name*, unsigned char *value*) [virtual]

Sets a Byte value with the specified name into the Map.

Parameters:

name the name of the Byte

value the Byte value to set in the Map

Exceptions:

CMSException *(*p. ***979****)* - if the operation fails due to an internal error.

MessageNotWriteableException *(*p. ***2190****)* - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2031).

6.29.2.28 virtual void activemq::commands::ActiveMQMapMessage::setBytes (const std::string & *name*, const std::vector< unsigned char > & *value*) [virtual]

Sets a Bytes value with the specified name into the Map.

Parameters:

name The name of the Bytes

value The Bytes value to set in the Map

Exceptions:

CMSException *(*p. ***979****)* - if the operation fails due to an internal error.

MessageNotWriteableException *(*p. ***2190****)* - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2031).

6.29.2.29 virtual void activemq::commands::ActiveMQMapMessage::setChar (const std::string & *name*, char *value*) [virtual]

Sets a Char value with the specified name into the Map.

Parameters:

name the name of the Char

value the Char value to set in the Map

Exceptions:

CMSException *(*p. ***979****)* - if the operation fails due to an internal error.

MessageNotWriteableException *(*p. ***2190****)* - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2031).

6.29.2.30 virtual void activemq::commands::ActiveMQMapMessage::setDouble (const std::string & *name*, double *value*) [virtual]

Sets a Double value with the specified name into the Map.

Parameters:

name The name of the Double

value The Double value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2032).

6.29.2.31 virtual void activemq::commands::ActiveMQMapMessage::setFloat (const std::string & *name*, float *value*) [virtual]

Sets a Float value with the specified name into the Map.

Parameters:

name The name of the Float

value The Float value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2032).

6.29.2.32 virtual void activemq::commands::ActiveMQMapMessage::setInt (const std::string & *name*, int *value*) [virtual]

Sets a Int value with the specified name into the Map.

Parameters:

name The name of the Int

value The Int value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2032).

6.29.2.33 virtual void activemq::commands::ActiveMQMapMessage::setLong (const std::string & *name*, long long *value*) [virtual]

Sets a Long value with the specified name into the Map.

Parameters:

name The name of the Long

value The Long value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2033).

6.29.2.34 virtual void activemq::commands::ActiveMQMapMessage::setShort (const std::string & *name*, short *value*) [virtual]

Sets a Short value with the specified name into the Map.

Parameters:

name The name of the Short

value The Short value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2033).

6.29.2.35 virtual void activemq::commands::ActiveMQMapMessage::setString (const std::string & *name*, const std::string & *value*) [virtual]

Sets a String value with the specified name into the Map.

Parameters:

name The name of the String

value The String value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implements **cms::MapMessage** (p. 2033).

6.29.2.36 virtual std::string activemq::commands::ActiveMQMapMessage::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 2086).

6.29.3 Field Documentation

6.29.3.1 const unsigned char activemq::commands::ActiveMQMapMessage::ID_ACTIVEMQMAPMESSAGE = 25 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQMapMessage.h**

6.30 activemq::wireformat::openwire::marshal::generated::ActiveMQMa Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQMapMessageMarshaller** (p. 361).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQMapMessageMarshaller.h`
diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller:

Public Member Functions

- **ActiveMQMapMessageMarshaller** ()
- virtual ~**ActiveMQMapMessageMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.30.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQMapMessageMarshaller** (p. 361). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.30.2 Constructor & Destructor Documentation

6.30.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::Ac
() [inline]

6.30.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::~A
() [inline, virtual]

6.30.3 Member Function Documentation

6.30.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::creat
() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.30.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::getD
() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.30.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::loose
(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.30.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::loose (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.30.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.30.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.30.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2187).

The documentation for this class was generated from the following file:

6.31 activemq::commands::ActiveMQMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQMessage.h>`Inheritance diagram for activemq::commands::ActiveMQMessage:

Public Member Functions

- **ActiveMQMessage** ()
- virtual ~**ActiveMQMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual **ActiveMQMessage** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual **cms::Message** * **clone** () const

  Clone this message exactly, returns a new instance that the caller is required to delete.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQMESSAGE** = 23

6.31.1 Constructor & Destructor Documentation

6.31.1.1 activemq::commands::ActiveMQMessage::ActiveMQMessage ()

6.31.1.2 virtual activemq::commands::ActiveMQMessage::~ActiveMQMessage () throw () [inline, virtual]

6.31.2 Member Function Documentation

6.31.2.1 virtual cms::Message* activemq::commands::ActiveMQMessage::clone () const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p. 2096).

References activemq::commands::Message::setReadOnlyBody(), and activemq::commands::Message::setReadOnlyProperties().

6.31.2.2 virtual ActiveMQMessage* activemq::commands::ActiveMQMessage::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 2076).

6.31.2.3 virtual void activemq::commands::ActiveMQMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Message** (p. 2077).

6.31.2.4 virtual bool activemq::commands::ActiveMQMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 378).

6.31.2.5 virtual unsigned char activemq::commands::ActiveMQMessage::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 2079).

6.31.2.6 virtual std::string activemq::commands::ActiveMQMessage::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 2086).

6.32 activemq::core::ActiveMQMessageAudit Class Reference

`#include <src/main/activemq/core/ActiveMQMessageAudit.h>`

Public Member Functions

- **ActiveMQMessageAudit** ()

  Default Constructor windowSize = 2048, maximumNumberOfProducersToTrack = 64.

- **ActiveMQMessageAudit** (int auditDepth, int maximumNumberOfProducersToTrack)

  Construct a MessageAudit.

- **~ActiveMQMessageAudit** ()
- int **getAuditDepth** () const

  Gets the currently configured Audit Depth.

- void **setAuditDepth** (int value)

  Sets a new Audit Depth value.

- int **getMaximumNumberOfProducersToTrack** () const
- void **getMaximumNumberOfProducersToTrack** (int value)

  Sets the number of producers to track.

- bool **isDuplicate** (const std::string &msgId) const

  checks whether this messageId has been seen before and adds this messageId to the list

- bool **isDuplicate** (**decaf::lang::Pointer< commands::MessageId >** msgId) const

  Checks if this messageId has been seen before.

- void **rollback** (const std::string &msgId)

  Marks this message as being received.

- void **rollback** (**decaf::lang::Pointer< commands::MessageId >** msgId)

  Marks this message as being received.

- bool **isInOrder** (const std::string &msgId) const

  Check the MessageId is in order.

- bool **isInOrder** (**decaf::lang::Pointer< commands::MessageId >** msgId) const

  Check the MessageId is in order.

- long long **getLastSeqId** (**decaf::lang::Pointer< commands::ProducerId >** id) const
- void **clear** ()

  Clears this Audit.

Static Public Attributes

- static const int **DEFAULT_WINDOW_SIZE**
- static const int **MAXIMUM_PRODUCER_COUNT**

6.32.1 Constructor & Destructor Documentation

6.32.1.1 activemq::core::ActiveMQMessageAudit::ActiveMQMessageAudit ()

Default Constructor windowSize = 2048, maximumNumberOfProducersToTrack = 64.

6.32.1.2 activemq::core::ActiveMQMessageAudit::ActiveMQMessageAudit (int *auditDepth*, int *maximumNumberOfProducersToTrack*)

Construct a MessageAudit.

Parameters:

auditDepth The range of ids to track.

maximumNumberOfProducersToTrack The number of producers expected in the system

6.32.1.3 activemq::core::ActiveMQMessageAudit::~ActiveMQMessageAudit ()

6.32.2 Member Function Documentation

6.32.2.1 void activemq::core::ActiveMQMessageAudit::clear ()

Clears this Audit.

6.32.2.2 int activemq::core::ActiveMQMessageAudit::getAuditDepth () const

Gets the currently configured Audit Depth.

Returns:

the current audit depth setting

6.32.2.3 long long activemq::core::ActiveMQMessageAudit::getLastSeqId (decaf::lang::Pointer< commands::ProducerId > *id*) const

Returns:

the last sequence Id that we've audited for the given producer.

6.32.2.4 void activemq::core::ActiveMQMessageAudit::getMaximumNumberOfProducersToTrack (int *value*)

Sets the number of producers to track.

Parameters:

value The number of producers expected in the system

6.32.2.5 int activemq::core::ActiveMQMessageAudit::getMaximumNumberOfProducersToTrack () const

Returns:

the current number of producers that will be tracked.

6.32.2.6 bool activemq::core::ActiveMQMessageAudit::isDuplicate (decaf::lang::Pointer< commands::MessageId > *msgId*) const

Checks if this messageId has been seen before.

Parameters:

msgId The target MessageId to check.

Returns:

true if the message is a duplicate

6.32.2.7 bool activemq::core::ActiveMQMessageAudit::isDuplicate (const std::string & *msgId*) const

checks whether this messageId has been seen before and adds this messageId to the list

Parameters:

msgId The string value Message Id.

Returns:

true if the message is a duplicate.

6.32.2.8 bool activemq::core::ActiveMQMessageAudit::isInOrder (decaf::lang::Pointer< commands::MessageId > *msgId*) const

Check the MessageId is in order.

Parameters:

msgId The target MessageId to check.

Returns:

true if the MessageId is in order.

6.32.2.9 bool activemq::core::ActiveMQMessageAudit::isInOrder (const std::string & *msgId*) const

Check the MessageId is in order.

Parameters:

msgId The string value Message Id.

Returns:

true if the MessageId is in order.

6.32.2.10 void activemq::core::ActiveMQMessageAudit::rollback (decaf::lang::Pointer< commands::MessageId > *msgId*)

Marks this message as being received.

Parameters:

msgId The target MessageId to check.

6.32.2.11 void activemq::core::ActiveMQMessageAudit::rollback (const std::string & *msgId*)

Marks this message as being received.

Parameters:

msgId The string value Message Id.

6.32.2.12 void activemq::core::ActiveMQMessageAudit::setAuditDepth (int *value*)

Sets a new Audit Depth value.

Parameters:

value The range of ids to track.

6.32.3 Field Documentation

6.32.3.1 const int activemq::core::ActiveMQMessageAudit::DEFAULT_WINDOW_SIZE [static]

6.32.3.2 const int activemq::core::ActiveMQMessageAudit::MAXIMUM_PRODUCER_COUNT [static]

6.33 activemq::wireformat::openwire::marshal::generated::ActiveMQMes Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQMessageMarshaller** (p. 372).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQMessageMarshaller.h>`In diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller:

Public Member Functions

- **ActiveMQMessageMarshaller** ()
- virtual ~**ActiveMQMessageMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.33.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQMessageMarshaller** (p. 372). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.33.2 Constructor & Destructor Documentation

6.33.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::ActiveM () [inline]

6.33.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::~Active () [inline, virtual]

6.33.3 Member Function Documentation

6.33.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::createObj () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.33.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::getDataSt () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.33.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::looseMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.33.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::looseUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.33.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.33.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.33.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2187).

6.35 activemq::util::ActiveMQMessageTransformation Class Reference

`#include <src/main/activemq/util/ActiveMQMessageTransformation.h>`

Public Member Functions

- virtual ~**ActiveMQMessageTransformation** ()

Static Public Member Functions

- static bool **transformDestination** (const **cms::Destination** *destination, const **commands::ActiveMQDestination** **amqDestination)

  Creates a fast shallow copy of the current ActiveMQDestination or creates a whole new destination instance from an available CMS destination from another provider.

- static bool **transformMessage** (**cms::Message** *message, **core::ActiveMQConnection** *connection, **commands::Message** **amqMessage)

  Creates a fast shallow copy of the current ActiveMQMessage or creates a whole new message instance from an available CMS message from another provider.

- static void **copyProperties** (const **cms::Message** *fromMessage, **cms::Message** *toMessage)

  Copies the standard CMS and user defined properties from the given message to the specified message.

6.35.1 Constructor & Destructor Documentation

6.35.1.1 virtual activemq::util::ActiveMQMessageTransformation::~ActiveMQMessageTransformation () `[virtual]`

6.35.2 Member Function Documentation

6.35.2.1 static void activemq::util::ActiveMQMessageTransformation::copyProperties (const cms::Message * *fromMessage*, cms::Message * *toMessage*) `[static]`

Copies the standard CMS and user defined properties from the given message to the specified message.

Parameters:

fromMessage The message to take the properties from.

toMessage The message to add the properties to.

Exceptions:

CMSException if an error occurs during the copy.

6.35.2.2 static bool activemq::util::ActiveMQMessageTransformation::transformDestination (const cms::Destination * *destination*, const commands::ActiveMQDestination ** *amqDestination*) [static]

Creates a fast shallow copy of the current ActiveMQDestination or creates a whole new destination instance from an available CMS destination from another provider. This method will return true if the passed CMS Destination was cloned and a new Destination object created or false if the input Destination was already an ActiveMQ destination. The should use the return value as a hint to determine if it needs to delete the amqDestinatio object or not.

Parameters:

destination Destination to be converted into ActiveMQ's implementation.

amqDestination Pointer to a pointer where the casted or cloned AMQ destination is stored.

Returns:

true if the amqDestination is a new instance and not just a cast of the input destination.

Exceptions:

CMSException if an error occurs

6.35.2.3 static bool activemq::util::ActiveMQMessageTransformation::transformMessage (cms::Message * *message*, core::ActiveMQConnection * *connection*, commands::Message ** *amqMessage*) [static]

Creates a fast shallow copy of the current ActiveMQMessage or creates a whole new message instance from an available CMS message from another provider. This method will return true if the passed CMS Message was cloned and a new ActiveMQMessage object created or false if the input Message was already an ActiveMQMessage instance. The caller should use the return value as a hint to determine if it needs to delete the resulting ActiveMQMessage object or not.

Parameters:

message CMS Message to be converted into ActiveMQ's implementation.

amqMessage Pointer to a pointer where the casted or cloned AMQ message is stored.

Returns:

true if the amqMessage is a new instance and not just a cast of the input message.

Exceptions:

CMSException if an error occurs

Public Member Functions

- **ActiveMQObjectMessage** ()
- virtual ~**ActiveMQObjectMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **ActiveMQObjectMessage** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual **cms::Message** * **clone** () const

  Clone this message exactly, returns a new instance that the caller is required to delete.

- virtual void **setObjectBytes** (const std::vector< unsigned char > &bytes)

  Sets the payload bytes the represent the Object being transmitted.

- virtual std::vector< unsigned char > **getObjectBytes** () const

  Returns the byte array containing the serialized form of the transmitted Object.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQOBJECTMESSAGE** = 26

6.36.1 Constructor & Destructor Documentation

6.36.1.1 activemq::commands::ActiveMQObjectMessage::ActiveMQObjectMessage ()

6.36.1.2 virtual activemq::commands::ActiveMQObjectMessage::~ActiveMQObjectMessage () throw () [inline, virtual]

6.36.2 Member Function Documentation

6.36.2.1 virtual cms::Message* activemq::commands::ActiveMQObjectMessage::clone () const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p. 2096).

References activemq::commands::Message::setReadOnlyBody(), and activemq::commands::Message::setReadOnlyProperties().

6.36.2.2 virtual ActiveMQObjectMessage* activemq::commands::ActiveMQObjectMessage::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 2076).

6.36.2.3 virtual void activemq::commands::ActiveMQObjectMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Message** (p. 2077).

6.36.2.4 virtual bool activemq::commands::ActiveMQObjectMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 378).

6.36.2.5 virtual unsigned char activemq::commands::ActiveMQObjectMessage::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 2079).

6.36.2.6 virtual std::vector<unsigned char> activemq::commands::ActiveMQObjectMessage::getObjectBytes () const [virtual]

Returns the byte array containing the serialized form of the transmitted Object.

Returns:

a byte vector containing the serialized Object.

Exceptions:

CMSException - if the operation fails due to an internal error.

MessageNotReadableException - if the message is in write only mode.

Implements **cms::ObjectMessage** (p. 2275).

6.36.2.7 virtual void activemq::commands::ActiveMQObjectMessage::setObjectBytes (const std::vector< unsigned char > & *bytes*) [virtual]

Sets the payload bytes the represent the Object being transmitted.

Parameters:

bytes The byte array that contains the serialized object.

Exceptions:

CMSException - if the operation fails due to an internal error.

MessageNotWriteableException - if the **Message** (p. 2072) is in Read-only Mode.

Implements **cms::ObjectMessage** (p. 2276).

6.36.2.8 virtual std::string activemq::commands::ActiveMQObjectMessage::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 2086).

6.37.3 Member Function Documentation

6.37.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::cre () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.37.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::get () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.37.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::loo (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.37.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::loo (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.37.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.37.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.37.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2187).

The documentation for this class was generated from the following file:

6.38 activemq::core::ActiveMQProducer Class Reference

`#include <src/main/activemq/core/ActiveMQProducer.h>`Inheritance diagram for activemq::core::ActiveMQProducer:

Public Member Functions

- **ActiveMQProducer** (**Pointer< activemq::core::kernels::ActiveMQProducerKernel** > kernel)

  *Constructor, creates an instance of an **ActiveMQProducer** (p. 393) to wrap the provided ActiveMQProducerKernel.*

- virtual ~**ActiveMQProducer** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual void **send** (**cms::Message** *message)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, **cms::AsyncCallback** *callback)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive, **cms::AsyncCallback** *callback)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, **cms::AsyncCallback** *callback)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive, **cms::AsyncCallback** *callback)

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **setDeliveryMode** (int mode)

  Sets the delivery mode for this Producer.

- virtual int **getDeliveryMode** () const

  Gets the delivery mode for this Producer.

- virtual void **setDisableMessageID** (bool value)

  Sets if Message Ids are disabled for this Producer.

- virtual bool **getDisableMessageID** () const

  Gets if Message Ids are disabled for this Producer.

- virtual void **setDisableMessageTimeStamp** (bool value)

  Sets if Message Time Stamps are disabled for this Producer.

- virtual bool **getDisableMessageTimeStamp** () const

  Gets if Message Time Stamps are disabled for this Producer.

- virtual void **setPriority** (int priority)

  Sets the Priority that this Producers sends messages at.

- virtual int **getPriority** () const

  Gets the Priority level that this producer sends messages at.

- virtual void **setTimeToLive** (long long time)

  Sets the Time to Live that this Producers sends messages with.

- virtual long long **getTimeToLive** () const

  Gets the Time to Live that this producer sends messages with.

- virtual void **setSendTimeout** (long long time)

  Sets the Send Timeout that this Producers sends messages with.

- virtual long long **getSendTimeout** () const

  Gets the Send Timeout that this producer sends messages with.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

  *Set an MessageTransformer instance that is applied to all **cms::Message*** (p. 2090) *objects before they are sent on to the CMS bus.*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this MessageProducer.

- bool **isClosed** () const
- const **Pointer**< **commands::ProducerInfo** > & **getProducerInfo** () const

  Retries this object ProducerInfo pointer.

- const **Pointer**< **commands::ProducerId** > & **getProducerId** () const

  Retries this object ProducerId or NULL if closed.

6.38.1 Constructor & Destructor Documentation

6.38.1.1 activemq::core::ActiveMQProducer::ActiveMQProducer (Pointer< activemq::core::kernels::ActiveMQProducerKernel > *kernel*)

Constructor, creates an instance of an **ActiveMQProducer** (p. 393) to wrap the provided ActiveMQProducerKernel.

Parameters:

kernel The Producer kernel pointer that implements the producers functionality.

6.38.1.2 virtual activemq::core::ActiveMQProducer::~ActiveMQProducer () [virtual]

6.38.2 Member Function Documentation

6.38.2.1 virtual void activemq::core::ActiveMQProducer::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSException - If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 965).

6.38.2.2 virtual int activemq::core::ActiveMQProducer::getDeliveryMode () const [inline, virtual]

Gets the delivery mode for this Producer.

Returns:

The DeliveryMode

Implements **cms::MessageProducer** (p. 2194).

6.38.2.3 virtual bool activemq::core::ActiveMQProducer::getDisableMessageID () const [inline, virtual]

Gets if Message Ids are disabled for this Producer.

Returns:

a boolean indicating **state** (p. 70) enable / disable (true / false) for MessageIds.

Implements **cms::MessageProducer** (p. 2194).

6.38.2.4 virtual bool activemq::core::ActiveMQProducer::getDisableMessageTimeStamp () const [inline, virtual]

Gets if Message Time Stamps are disabled for this Producer.

Returns:

boolean indicating **state** (p. 70) of enable / disable (true / false)

Implements **cms::MessageProducer** (p. 2194).

6.38.2.5 virtual cms::MessageTransformer* activemq::core::ActiveMQProducer::getMessageTransformer () const [inline, virtual]

Gets the currently configured MessageTransformer for this MessageProducer.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::MessageProducer** (p. 2195).

6.38.2.6 virtual int activemq::core::ActiveMQProducer::getPriority () const [inline, virtual]

Gets the Priority level that this producer sends messages at.

Returns:

int based priority level

Implements **cms::MessageProducer** (p. 2195).

6.38.2.7 const Pointer<commands::ProducerId>& activemq::core::ActiveMQProducer::getProducerId () const [inline]

Retries this object ProducerId or NULL if closed.

Returns:

ProducerId Reference

6.38.2.8 const Pointer<commands::ProducerInfo>& activemq::core::ActiveMQProducer::getProducerInfo () const [inline]

Retries this object ProducerInfo pointer.

Returns:

ProducerInfo Reference

6.38.2.9 virtual long long activemq::core::ActiveMQProducer::getSendTimeout () const [inline, virtual]

Gets the Send Timeout that this producer sends messages with.

Returns:

The default send timeout value in milliseconds.

6.38.2.10 virtual long long activemq::core::ActiveMQProducer::getTimeToLive () const [inline, virtual]

Gets the Time to Live that this producer sends messages with.

Returns:

The default time to live value in milliseconds.

Implements **cms::MessageProducer** (p. 2195).

6.38.2.11 bool activemq::core::ActiveMQProducer::isClosed () const [inline]

Returns:

true if this Producer has been closed.

6.38.2.12 virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, cms::AsyncCallback * *onComplete*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2196).

6.38.2.13 virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2196).

6.38.2.14 virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * *destination*, cms::Message * *message*, cms::AsyncCallback * *onComplete*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

destination The destination on which to send the message

message the message to be sent.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2197).

6.38.2.15 virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * *destination*, cms::Message * *message*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

destination The destination on which to send the message

message the message to be sent.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2198).

6.38.2.16 virtual void activemq::core::ActiveMQProducer::send (cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, cms::AsyncCallback * *onComplete*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2198).

6.38.2.17 virtual void activemq::core::ActiveMQProducer::send (cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2199).

6.38.2.18 virtual void activemq::core::ActiveMQProducer::send (cms::Message * *message*, cms::AsyncCallback * *onComplete*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

message The message to be sent.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2199).

6.38.2.19 virtual void activemq::core::ActiveMQProducer::send (cms::Message * *message*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

message The message to be sent.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2200).

6.38.2.20 virtual void activemq::core::ActiveMQProducer::setDeliveryMode (int *mode*) [inline, virtual]

Sets the delivery mode for this Producer.

Parameters:

mode - The DeliveryMode to use for Message sends.

Implements **cms::MessageProducer** (p. 2200).

6.38.2.21 virtual void activemq::core::ActiveMQProducer::setDisableMessageID (bool *value*) [inline, virtual]

Sets if Message Ids are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Implements **cms::MessageProducer** (p. 2201).

6.38.2.22 virtual void activemq::core::ActiveMQProducer::setDisableMessageTimeStamp (bool *value*) [inline, virtual]

Sets if Message Time Stamps are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Implements **cms::MessageProducer** (p. 2201).

6.38.2.23 virtual void activemq::core::ActiveMQProducer::setMessageTransformer (cms::MessageTransformer * *transformer*) [inline, virtual]

Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are sent on to the CMS bus. The CMS **code** (p. 1005) never takes ownership of the MessageTransformer pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the MessageTransformer has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to apply on each **cms** (p. 91)::;MessageSend.

Implements **cms::MessageProducer** (p. 2201).

6.38.2.24 virtual void activemq::core::ActiveMQProducer::setPriority (int *priority*) [inline, virtual]

Sets the Priority that this Producers sends messages at.

Parameters:

priority int value for Priority level

Implements **cms::MessageProducer** (p. 2202).

6.38.2.25 virtual void activemq::core::ActiveMQProducer::setSendTimeout (long long *time*) [inline, virtual]

Sets the Send Timeout that this Producers sends messages with.

Parameters:

time The new default send timeout value in milliseconds.

6.38.2.26 virtual void activemq::core::ActiveMQProducer::setTimeToLive (long long *time*) [inline, virtual]

Sets the Time to Live that this Producers sends messages with.

Parameters:

time The new default time to live value in milliseconds.

Implements **cms::MessageProducer** (p. 2202).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQProducer.h**

6.39 activemq::core::kernels::ActiveMQProducerKernel Class Reference

`#include <src/main/activemq/core/kernels/ActiveMQProducerKernel.h>`Inheritance diagram for activemq::core::kernels::ActiveMQProducerKernel:

Public Member Functions

- **ActiveMQProducerKernel** (**ActiveMQSessionKernel** *session, const **Pointer**< **commands::ProducerId** > &producerId, const **Pointer**< **commands::ActiveMQDestination** > &destination, long long sendTimeout)

  *Constructor, creates an instance of an **ActiveMQProducerKernel** (p. 404).*

- virtual ~**ActiveMQProducerKernel** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual void **send** (**cms::Message** *message)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, **cms::AsyncCallback** *callback)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive, **cms::AsyncCallback** *callback)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, **cms::AsyncCallback** *callback)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive, **cms::AsyncCallback** *callback)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

  *Set an MessageTransformer instance that is applied to all **cms::Message*** (p. 2090) *objects before they are sent on to the CMS bus.*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this MessageProducer.

- virtual void **setDeliveryMode** (int mode)

  Sets the delivery mode for this Producer.

- virtual int **getDeliveryMode** () const

  Gets the delivery mode for this Producer.

- virtual void **setDisableMessageID** (bool value)

  Sets if Message Ids are disabled for this Producer.

- virtual bool **getDisableMessageID** () const

  Gets if Message Ids are disabled for this Producer.

- virtual void **setDisableMessageTimeStamp** (bool value)

  Sets if Message Time Stamps are disabled for this Producer.

- virtual bool **getDisableMessageTimeStamp** () const

  Gets if Message Time Stamps are disabled for this Producer.

- virtual void **setPriority** (int priority)

  Sets the Priority that this Producers sends messages at.

- virtual int **getPriority** () const

  Gets the Priority level that this producer sends messages at.

- virtual void **setTimeToLive** (long long time)

  Sets the Time to Live that this Producers sends messages with.

- virtual long long **getTimeToLive** () const

  Gets the Time to Live that this producer sends messages with.

- virtual void **setSendTimeout** (long long time)

  Sets the Send Timeout that this Producers sends messages with.

- virtual long long **getSendTimeout** () const

  Gets the Send Timeout that this producer sends messages with.

- bool **isClosed** () const
- const **Pointer< commands::ProducerInfo >** & **getProducerInfo** () const

Retries this object ProducerInfo pointer.

- const **Pointer< commands::ProducerId >** & **getProducerId** () const

  Retries this object ProducerId or NULL if closed.

- virtual void **onProducerAck** (const **commands::ProducerAck** &ack)

  Handles the work of Processing a ProducerAck Command from the Broker.

- void **dispose** ()

  Performs Producer object cleanup but doesn't attempt to send the Remove command to the broker.

- long long **getNextMessageSequence** ()

6.39.1 Constructor & Destructor Documentation

6.39.1.1 activemq::core::kernels::ActiveMQProducerKernel::ActiveMQProducerKernel (ActiveMQSessionKernel * *session*, const Pointer< commands::ProducerId > & *producerId*, const Pointer< commands::ActiveMQDestination > & *destination*, long long *sendTimeout*)

Constructor, creates an instance of an **ActiveMQProducerKernel** (p. 404).

Parameters:

session The Session which is the parent of this Producer.

parent Pointer to the **cms::MessageProducer** (p. 2192) that will wrap this kernel object.

producerId Pointer to a ProducerId object which identifies this producer.

destination The assigned Destination this Producer sends to, or null if not set. The Producer does not own the Pointer passed.

sendTimeout The configured send timeout for this Producer.

6.39.1.2 virtual activemq::core::kernels::ActiveMQProducerKernel::~ActiveMQProducerKernel () [virtual]

6.39.2 Member Function Documentation

6.39.2.1 virtual void activemq::core::kernels::ActiveMQProducerKernel::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSException - If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 965).

6.39.2.2 void activemq::core::kernels::ActiveMQProducerKernel::dispose ()

Performs Producer object cleanup but doesn't attempt to send the Remove command to the broker. Called when the parent resource if closed first to avoid the message send and avoid any **exceptions** (p. 67) that might be thrown from an attempt to send a remove command to a failed **transport** (p. 72).

6.39.2.3 virtual int activemq::core::kernels::ActiveMQProducerKernel::getDeliveryMode () const [inline, virtual]

Gets the delivery mode for this Producer.

Returns:

The DeliveryMode

Implements **cms::MessageProducer** (p. 2194).

6.39.2.4 virtual bool activemq::core::kernels::ActiveMQProducerKernel::getDisableMessageID () const [inline, virtual]

Gets if Message Ids are disabled for this Producer.

Returns:

a boolean indicating **state** (p. 70) enable / disable (true / false) for MessageIds.

Implements **cms::MessageProducer** (p. 2194).

6.39.2.5 virtual bool activemq::core::kernels::ActiveMQProducerKernel::getDisableMessageTimeStamp () const [inline, virtual]

Gets if Message Time Stamps are disabled for this Producer.

Returns:

boolean indicating **state** (p. 70) of enable / disable (true / false)

Implements **cms::MessageProducer** (p. 2194).

6.39.2.6 virtual cms::MessageTransformer* activemq::core::kernels::ActiveMQProducerKernel::getMessageTransformer () const [inline, virtual]

Gets the currently configured MessageTransformer for this MessageProducer.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::MessageProducer** (p. 2195).

6.39.2.7 long long activemq::core::kernels::ActiveMQProducerKernel::getNextMessageSequence () [inline]

Returns:

the next sequence number for a Message sent from this Producer.

6.39.2.8 virtual int activemq::core::kernels::ActiveMQProducerKernel::getPriority () const [inline, virtual]

Gets the Priority level that this producer sends messages at.

Returns:

int based priority level

Implements **cms::MessageProducer** (p. 2195).

6.39.2.9 const Pointer<commands::ProducerId>& activemq::core::kernels::ActiveMQProducerKernel::getProducerId () const [inline]

Retries this object ProducerId or NULL if closed.

Returns:

ProducerId Reference

6.39.2.10 const Pointer<commands::ProducerInfo>& activemq::core::kernels::ActiveMQProducerKernel::getProducerInfo () const [inline]

Retries this object ProducerInfo pointer.

Returns:

ProducerInfo Reference

6.39.2.11 virtual long long activemq::core::kernels::ActiveMQProducerKernel::getSendTimeout () const [inline, virtual]

Gets the Send Timeout that this producer sends messages with.

Returns:

The default send timeout value in milliseconds.

6.39.2.12 virtual long long activemq::core::kernels::ActiveMQProducerKernel::getTimeToLive () const [inline, virtual]

Gets the Time to Live that this producer sends messages with.

Returns:

The default time to live value in milliseconds.

Implements **cms::MessageProducer** (p. 2195).

6.39.2.13 bool activemq::core::kernels::ActiveMQProducerKernel::isClosed () const [inline]

Returns:

true if this Producer has been closed.

6.39.2.14 virtual void activemq::core::kernels::ActiveMQProducerKernel::onProducerAck (const commands::ProducerAck & *ack*) [virtual]

Handles the work of Processing a ProducerAck Command from the Broker.

Parameters:

ack - The ProducerAck message received from the Broker.

6.39.2.15 virtual void activemq::core::kernels::ActiveMQProducerKernel::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, cms::AsyncCallback * *onComplete*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2196).

6.39.2.16 virtual void activemq::core::kernels::ActiveMQProducerKernel::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2196).

6.39.2.17 virtual void activemq::core::kernels::ActiveMQProducerKernel::send (const cms::Destination * *destination*, cms::Message * *message*, cms::AsyncCallback * *onComplete*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

destination The destination on which to send the message

message the message to be sent.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2197).

6.39.2.18 virtual void activemq::core::kernels::ActiveMQProducerKernel::send (const cms::Destination * *destination*, cms::Message * *message*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

destination The destination on which to send the message

message the message to be sent.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2198).

6.39.2.19 virtual void activemq::core::kernels::ActiveMQProducerKernel::send (cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, cms::AsyncCallback * *onComplete*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2198).

6.39.2.20 virtual void activemq::core::kernels::ActiveMQProducerKernel::send (cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2199).

6.39.2.21 virtual void activemq::core::kernels::ActiveMQProducerKernel::send (cms::Message * *message*, cms::AsyncCallback * *onComplete*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

message The message to be sent.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2199).

6.39.2.22 virtual void activemq::core::kernels::ActiveMQProducerKernel::send (cms::Message * *message*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

message The message to be sent.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2200).

6.39.2.23 virtual void activemq::core::kernels::ActiveMQProducerKernel::setDeliveryMode (int *mode*) [inline, virtual]

Sets the delivery mode for this Producer.

Parameters:

mode - The DeliveryMode to use for Message sends.

Implements **cms::MessageProducer** (p. 2200).

6.39.2.24 virtual void activemq::core::kernels::ActiveMQProducerKernel::setDisableMessageID (bool *value*) [inline, virtual]

Sets if Message Ids are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Implements **cms::MessageProducer** (p. 2201).

6.39.2.25 virtual void activemq::core::kernels::ActiveMQProducerKernel::setDisableMessageTimeStamp (bool *value*) [inline, virtual]

Sets if Message Time Stamps are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Implements **cms::MessageProducer** (p. 2201).

6.39.2.26 virtual void activemq::core::kernels::ActiveMQProducerKernel::setMessageTransformer (cms::MessageTransformer * *transformer*) [inline, virtual]

Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are sent on to the CMS bus.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to apply on each **cms** (p. 91)::;MessageSend.

Implements **cms::MessageProducer** (p. 2201).

6.39.2.27 virtual void activemq::core::kernels::ActiveMQProducerKernel::setPriority (int *priority*) [inline, virtual]

Sets the Priority that this Producers sends messages at.

Parameters:

priority int value for Priority level

Implements **cms::MessageProducer** (p. 2202).

6.39.2.28 virtual void activemq::core::kernels::ActiveMQProducerKernel::setSendTimeout (long long *time*) [inline, virtual]

Sets the Send Timeout that this Producers sends messages with.

Parameters:

time The new default send timeout value in milliseconds.

6.39.2.29 virtual void activemq::core::kernels::ActiveMQProducerKernel::setTimeToLive (long long *time*) [inline, virtual]

Sets the Time to Live that this Producers sends messages with.

Parameters:

time The new default time to live value in milliseconds.

Implements **cms::MessageProducer** (p. 2202).

The documentation for this class was generated from the following file:

- src/main/activemq/core/kernels/**ActiveMQProducerKernel.h**

6.40 activemq::util::ActiveMQProperties Class Reference

Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 2486) object.

`#include <src/main/activemq/util/ActiveMQProperties.h>`Inheritance diagram for activemq::util::ActiveMQProperties:

Public Member Functions

- **ActiveMQProperties** ()
- virtual ~**ActiveMQProperties** ()
- virtual **decaf::util::Properties** & **getProperties** ()
- virtual const **decaf::util::Properties** & **getProperties** () const
- virtual void **setProperties** (**decaf::util::Properties** &props)
- virtual int **size** () const

  Returns the current count of all the Properties that are currently stored in the Properties object.

- virtual bool **isEmpty** () const

  Returns true if the properties object is empty.

- virtual const char * **getProperty** (const std::string &name) const

  Looks up the value for the given property.

- virtual std::string **getProperty** (const std::string &name, const std::string &defaultValue) const

  Looks up the value for the given property.

- virtual void **setProperty** (const std::string &name, const std::string &value)

  Sets the value for a given property.

- virtual bool **hasProperty** (const std::string &name) const

  Check to see if the Property exists in the set.

- virtual std::string **remove** (const std::string &name)

  Removes the property with the given name.

- virtual std::vector< std::string > **propertyNames** () const

  Returns a vector containing all the names of the properties currently stored in the Properties object.

- virtual std::vector< std::pair< std::string, std::string > > **toArray** () const

  Method that serializes the contents of the property map to an array.

- virtual void **copy** (const CMSProperties *source)
- virtual CMSProperties * **clone** () const

  Clones this object.

- virtual void **clear** ()

Clears all properties from the map.

- virtual std::string **toString** () const

  Formats the contents of the Properties Object into a string that can be logged, etc.

6.40.1 Detailed Description

Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 2486) object.

Since:

2.0

6.40.2 Constructor & Destructor Documentation

6.40.2.1 activemq::util::ActiveMQProperties::ActiveMQProperties ()

6.40.2.2 virtual activemq::util::ActiveMQProperties::~ActiveMQProperties () [virtual]

6.40.3 Member Function Documentation

6.40.3.1 virtual void activemq::util::ActiveMQProperties::clear () [inline, virtual]

Clears all properties from the map.

Implements **cms::CMSProperties** (p. 986).

6.40.3.2 virtual CMSProperties* activemq::util::ActiveMQProperties::clone () const [virtual]

Clones this object.

Returns:

a replica of this object.

Implements **cms::CMSProperties** (p. 986).

6.40.3.3 virtual void activemq::util::ActiveMQProperties::copy (const CMSProperties * *source*) [virtual]

6.40.3.4 virtual const decaf::util::Properties& activemq::util::ActiveMQProperties::getProperties () const [inline, virtual]

6.40.3.5 virtual decaf::util::Properties& activemq::util::ActiveMQProperties::getProperties () [inline, virtual]

6.40.3.6 virtual std::string activemq::util::ActiveMQProperties::getProperty (const std::string & *name*, const std::string & *defaultValue*) const [inline, virtual]

Looks up the value for the given property.

Parameters:

name the name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns:

The value of the property specified by `name`, if it exists, otherwise the `defaultValue`.

Implements **cms::CMSProperties** (p. 986).

6.40.3.7 virtual const char* activemq::util::ActiveMQProperties::getProperty (const std::string & *name*) const [inline, virtual]

Looks up the value for the given property.

Parameters:

name The name of the property to be looked up.

Returns:

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implements **cms::CMSProperties** (p. 987).

6.40.3.8 virtual bool activemq::util::ActiveMQProperties::hasProperty (const std::string & *name*) const [inline, virtual]

Check to see if the Property exists in the set.

Parameters:

name the name of the property to check

Returns:

true if property exists, false otherwise.

Implements **cms::CMSProperties** (p. 987).

6.40.3.9 virtual bool activemq::util::ActiveMQProperties::isEmpty () const [inline, virtual]

Returns true if the properties object is empty.

Returns:

true if empty

Implements **cms::CMSProperties** (p. 987).

6.40.3.10 virtual std::vector<std::string> activemq::util::ActiveMQProperties::propertyNames () const [inline, virtual]

Returns a vector containing all the names of the properties currently stored in the Properties object.

Returns:

an STL std::vector<std::string> with all the currently stored property names.

Implements **cms::CMSProperties** (p. 987).

6.40.3.11 virtual std::string activemq::util::ActiveMQProperties::remove (const std::string & *name*) [inline, virtual]

Removes the property with the given name. If the property existed in the collection then it is removed and returned, otherwise an empty string is returned.

Parameters:

name the name of the property to be removed.

Returns:

the value that was removed from the Properties, or empty string.

Implements **cms::CMSProperties** (p. 988).

6.40.3.12 virtual void activemq::util::ActiveMQProperties::setProperties (decaf::util::Properties & *props*) [inline, virtual]

6.40.3.13 virtual void activemq::util::ActiveMQProperties::setProperty (const std::string & *name*, const std::string & *value*) [inline, virtual]

Sets the value for a given property. If the property already exists, overwrites the value.

Parameters:

name The name of the value to be written.

value The value to be written.

Implements **cms::CMSProperties** (p. 988).

6.40.3.14 virtual int activemq::util::ActiveMQProperties::size () const [inline, virtual]

Returns the current count of all the Properties that are currently stored in the Properties object.

Returns:

the number of properties currently stored.

Implements **cms::CMSProperties** (p. 988).

6.40.3.15 virtual std::vector<std::pair<std::string, std::string> > activemq::util::ActiveMQProperties::toArray () const [inline, virtual]

Method that serializes the contents of the property map to an array.

Returns:

list of pairs where the first is the name and the second is the value.

Implements **cms::CMSProperties** (p. 988).

6.40.3.16 virtual std::string activemq::util::ActiveMQProperties::toString () const [inline, virtual]

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns:

string value of this object.

Implements **cms::CMSProperties** (p. 988).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**ActiveMQProperties.h**

6.41 activemq::commands::ActiveMQQueue Class Reference

`#include <src/main/activemq/commands/ActiveMQQueue.h>`Inheritance diagram for activemq::commands::ActiveMQQueue:

Public Member Functions

- **ActiveMQQueue** ()
- **ActiveMQQueue** (const std::string &name)
- virtual ~**ActiveMQQueue** () throw ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **ActiveMQQueue** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const
- virtual const **cms::Queue** * **getCMSDestination** () const
- virtual **cms::Destination::DestinationType** **getDestinationType** () const

  Returns the Type of Destination that this object represents.

- virtual **cms::Destination** * **clone** () const

  Creates a new instance of this destination type that is a copy of this one, and returns it.

- virtual void **copy** (const **cms::Destination** &source)
- virtual const **cms::CMSProperties** & **getCMSProperties** () const

  Retrieve any properties that might be part of the destination that was specified.

- virtual bool **equals** (const **cms::Destination** &other) const
- virtual std::string **getQueueName** () const

  Gets the name of this queue.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQQUEUE** = 100

6.41.1 Constructor & Destructor Documentation

6.41.1.1 activemq::commands::ActiveMQQueue::ActiveMQQueue ()

6.41.1.2 activemq::commands::ActiveMQQueue::ActiveMQQueue (const std::string & *name*)

6.41.1.3 virtual activemq::commands::ActiveMQQueue::~ActiveMQQueue () throw () [virtual]

6.41.2 Member Function Documentation

6.41.2.1 virtual cms::Destination* activemq::commands::ActiveMQQueue::clone () const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implements **cms::Destination** (p. 1378).

6.41.2.2 virtual ActiveMQQueue* activemq::commands::ActiveMQQueue::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 323).

6.41.2.3 virtual void activemq::commands::ActiveMQQueue::copy (const cms::Destination & *source*) [inline, virtual]

6.41.2.4 virtual void activemq::commands::ActiveMQQueue::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 323).

6.41.2.5 virtual bool activemq::commands::ActiveMQQueue::equals (const cms::Destination & *other*) const [virtual]

6.41.2.6 virtual bool activemq::commands::ActiveMQQueue::equals (const DataStructure * *value*) const [virtual]

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 324).

6.41.2.7 virtual const cms::Queue* activemq::commands::ActiveMQQueue::getCMSDestination () const [inline, virtual]

Returns:

the **cms::Destination** (p. 1377) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 325).

6.41.2.8 virtual const cms::CMSProperties& activemq::commands::ActiveMQQueue::getCMSProperties () const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 1379).

6.41.2.9 virtual unsigned char activemq::commands::ActiveMQQueue::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 325).

6.41.2.10 virtual cms::Destination::DestinationType activemq::commands::ActiveMQQueue::getDestinationType () const [inline, virtual]

Returns the Type of Destination that this object represents.

Returns:

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 326).

References cms::Destination::QUEUE.

6.41.2.11 virtual std::string activemq::commands::ActiveMQQueue::getQueueName () const [inline, virtual]

Gets the name of this queue.

Returns:

The queue name.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Queue** (p. 2514).

6.41.2.12 virtual std::string activemq::commands::ActiveMQQueue::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 329).

6.41.3 Field Documentation

6.41.3.1 const unsigned char activemq::commands::ActiveMQQueue::ID_ACTIVEMQQUEUE = 100 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQQueue.h**

6.42 activemq::core::ActiveMQQueueBrowser Class Reference

`#include <src/main/activemq/core/ActiveMQQueueBrowser.h>`Inheritance diagram for activemq::core::ActiveMQQueueBrowser:

Public Member Functions

- **ActiveMQQueueBrowser** (**activemq::core::kernels::ActiveMQSessionKernel** *session, const **Pointer**< **commands::ConsumerId** > &consumerId, const **Pointer**< **commands::ActiveMQDestination** > &destination, const std::string &selector, bool dispatchAsync)
- virtual ~**ActiveMQQueueBrowser** ()
- virtual const **cms::Queue** * **getQueue** () const
- virtual std::string **getMessageSelector** () const
- virtual **cms::MessageEnumeration** * **getEnumeration** ()

  Gets a pointer to an Enumeration object for browsing the Messages currently in the Queue in the order that a client would receive them.

- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual bool **hasMoreMessages** ()

  Returns true if there are more Message in the Browser that can be retrieved via the ***nextMessage*** *method.*

- virtual **cms::Message** * **nextMessage** ()

  Returns the Next Message in the Queue if one is present, if no more Message's are available then an Exception is thrown.

Friends

- class **Browser**

6.42.1 Constructor & Destructor Documentation

6.42.1.1 activemq::core::ActiveMQQueueBrowser::ActiveMQQueueBrowser (activemq::core::kernels::ActiveMQSessionKernel * *session*, const Pointer< commands::ConsumerId > & *consumerId*, const Pointer< commands::ActiveMQDestination > & *destination*, const std::string & *selector*, bool *dispatchAsync*)

6.42.1.2 virtual activemq::core::ActiveMQQueueBrowser::~ActiveMQQueueBrowser () [virtual]

6.42.2 Member Function Documentation

6.42.2.1 virtual void activemq::core::ActiveMQQueueBrowser::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSException - If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 965).

6.42.2.2 virtual cms::MessageEnumeration* activemq::core::ActiveMQQueueBrowser::getEnumeration () [virtual]

Gets a pointer to an Enumeration object for browsing the Messages currently in the Queue in the order that a client would receive them. The pointer returned is owned by the browser and should not be deleted by the client application.

Returns:

a pointer to a Queue Enumeration, this Pointer is owned by the QueueBrowser and should not be deleted by the client.

Exceptions:

CMSException if an internal error occurs.

Implements **cms::QueueBrowser** (p. 2519).

6.42.2.3 virtual std::string activemq::core::ActiveMQQueueBrowser::getMessageSelector () const [virtual]

Returns:

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions:

CMSException if an internal error occurs.

Implements **cms::QueueBrowser** (p. 2520).

6.42.2.4 virtual const cms::Queue* activemq::core::ActiveMQQueueBrowser::getQueue () const [virtual]

Returns:

the Queue that this browser is listening on.

Exceptions:

CMSException if an internal error occurs.

Implements **cms::QueueBrowser** (p. 2520).

6.42.2.5 virtual bool activemq::core::ActiveMQQueueBrowser::hasMoreMessages () [virtual]

Returns true if there are more Message in the Browser that can be retrieved via the `nextMessage` method. If this method returns false and the `nextMessage` method is called then an Exception will be thrown.

Returns:

true if more Message's are available in the Browser.

Implements **cms::MessageEnumeration** (p. 2168).

6.42.2.6 virtual cms::Message* activemq::core::ActiveMQQueueBrowser::nextMessage () [virtual]

Returns the Next Message in the Queue if one is present, if no more Message's are available then an Exception is thrown. If a Message object pointer is returned then that object becomes the property of the caller and must be deleted by the caller when finished.

Returns:

The next Message in the Queue.

Exceptions:

CMSException if no more Message's currently in the Queue.

Implements **cms::MessageEnumeration** (p. 2169).

6.43.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::~ActiveM () [inline, virtual]

6.43.3 Member Function Documentation

6.43.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::createObjec () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.43.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::getDataStru () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.43.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::looseMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 334).

6.43.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::looseUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 334).

6.43.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 335).

6.43.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 335).

6.43.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 336).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQQueueMarshaller.h**

6.44 activemq::core::ActiveMQSession Class Reference

`#include <src/main/activemq/core/ActiveMQSession.h>`Inheritance diagram for activemq::core::ActiveMQSession:

Public Member Functions

- **ActiveMQSession** (**Pointer< activemq::core::kernels::ActiveMQSessionKernel > kernel**)
- virtual ~**ActiveMQSession** ()
- virtual void **start** ()

  Stops asynchronous message delivery.

- virtual void **stop** ()

  Starts asynchronous message delivery.

- bool **isStarted** () const

  *Indicates whether or not the session is currently in the started **state** (p. 70).*

- virtual void **close** ()

  Closes this session as well as any active child consumers or producers.

- virtual void **commit** ()

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual void **recover** ()

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination)

  Creates a MessageConsumer for the specified destination.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createDurableConsumer** (const **cms::Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)

  Creates a durable subscriber to the specified topic, using a Message selector.

- virtual **cms::MessageProducer** * **createProducer** (const **cms::Destination** *destination)

  Creates a MessageProducer to send messages to the specified destination.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::Queue** * **createQueue** (const std::string &queueName)

  Creates a queue identity given a Queue name.

- virtual **cms::Topic** * **createTopic** (const std::string &topicName)

  Creates a topic identity given a Queue name.

- virtual **cms::TemporaryQueue** * **createTemporaryQueue** ()

  Creates a TemporaryQueue object.

- virtual **cms::TemporaryTopic** * **createTemporaryTopic** ()

  Creates a TemporaryTopic object.

- virtual **cms::Message** * **createMessage** ()

  Creates a new Message.

- virtual **cms::BytesMessage** * **createBytesMessage** ()

  Creates a BytesMessage.

- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, int bytesSize)

  Creates a BytesMessage and sets the payload to the passed value.

- virtual **cms::StreamMessage** * **createStreamMessage** ()

  Creates a new StreamMessage.

- virtual **cms::TextMessage** * **createTextMessage** ()

  Creates a new TextMessage.

- virtual **cms::TextMessage** * **createTextMessage** (const std::string &text)

  Creates a new TextMessage and set the text to the value given.

- virtual **cms::MapMessage** * **createMapMessage** ()

  Creates a new MapMessage.

- virtual **cms::Session::AcknowledgeMode** **getAcknowledgeMode** () const

  Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () const

  Gets if the Sessions is a Transacted Session.

- virtual void **unsubscribe** (const std::string &name)

  Unsubscribes a durable subscription that has been created by a client.

- **cms::ExceptionListener** * **getExceptionListener** ()

  This method gets any registered exception listener of this sessions connection and returns it.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

  Set an MessageTransformer instance that is passed on to all MessageProducer and MessageConsumer objects created from this Session.

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this Session.

- const **commands::SessionInfo** & **getSessionInfo** () const

  Gets the Session Information object for this session, if the session is closed than this method throws an exception.

- const **commands::SessionId** & **getSessionId** () const

  Gets the Session Id object for this session, if the session is closed than this method throws an exception.

- **ActiveMQConnection** * **getConnection** () const

  Gets the ***ActiveMQConnection*** *(p. 232) that is associated with this session.*

Protected Attributes

- **Pointer< activemq::core::kernels::ActiveMQSessionKernel > kernel**

6.44.1 Constructor & Destructor Documentation

6.44.1.1 activemq::core::ActiveMQSession::ActiveMQSession (Pointer< activemq::core::kernels::ActiveMQSessionKernel > *kernel*)

6.44.1.2 virtual activemq::core::ActiveMQSession::~ActiveMQSession () [virtual]

6.44.2 Member Function Documentation

6.44.2.1 virtual void activemq::core::ActiveMQSession::close () [virtual]

Closes this session as well as any active child consumers or producers.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2683).

6.44.2.2 virtual void activemq::core::ActiveMQSession::commit () [virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2684).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 548).

6.44.2.3 virtual cms::QueueBrowser* activemq::core::ActiveMQSession::createBrowser (const cms::Queue * *queue*, const std::string & *selector*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

selector the Message selector to filter which messages are browsed.

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2684).

6.44.2.4 virtual cms::QueueBrowser* activemq::core::ActiveMQSession::createBrowser (const cms::Queue * *queue*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2684).

6.44.2.5 virtual cms::BytesMessage* activemq::core::ActiveMQSession::createBytesMessage (const unsigned char * *bytes*, int *bytesSize*) [virtual]

Creates a BytesMessage and sets the payload to the passed value.

Parameters:

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2685).

6.44.2.6 virtual cms::BytesMessage* activemq::core::ActiveMQSession::createBytesMessage () [virtual]

Creates a BytesMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2685).

6.44.2.7 virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*, bool *noLocal*) [virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2685).

6.44.2.8 virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*) [virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2686).

6.44.2.9 virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * *destination*) [virtual]

Creates a MessageConsumer for the specified destination.

Parameters:

destination the Destination that this consumer receiving messages for.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2686).

6.44.2.10 virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createDurableConsumer (const cms::Topic * *destination*, const std::string & *name*, const std::string & *selector*, bool *noLocal* = false) [virtual]

Creates a durable subscriber to the specified topic, using a Message selector. Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters:

destination the topic to subscribe to

name The name used to identify the subscription

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2687).

6.44.2.11 virtual cms::MapMessage* activemq::core::ActiveMQSession::createMapMessage () [virtual]

Creates a new MapMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2687).

6.44.2.12 virtual cms::Message* activemq::core::ActiveMQSession::createMessage () [virtual]

Creates a new Message.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2688).

6.44.2.13 virtual cms::MessageProducer* activemq::core::ActiveMQSession::createProducer (const cms::Destination * *destination*) [virtual]

Creates a MessageProducer to send messages to the specified destination.

Parameters:

destination the Destination to send on

Returns:

New MessageProducer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.
InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2688).

6.44.2.14 virtual cms::Queue* activemq::core::ActiveMQSession::createQueue (const std::string & *queueName*) [virtual]

Creates a queue identity given a Queue name.

Parameters:

queueName the name of the new Queue

Returns:

new Queue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2688).

6.44.2.15 virtual cms::StreamMessage* activemq::core::ActiveMQSession::createStreamMessage () [virtual]

Creates a new StreamMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

6.44.2.16 virtual cms::TemporaryQueue* activemq::core::ActiveMQSession::createTemporaryQueue () [virtual]

Creates a TemporaryQueue object.

Returns:

new TemporaryQueue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

6.44.2.17 virtual cms::TemporaryTopic* activemq::core::ActiveMQSession::createTemporaryTopic () [virtual]

Creates a TemporaryTopic object.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

6.44.2.18 virtual cms::TextMessage* activemq::core::ActiveMQSession::createTextMessage (const std::string & *text*) [virtual]

Creates a new TextMessage and set the text to the value given.

Parameters:

text the initial text for the message

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

6.44.2.19 virtual cms::TextMessage* activemq::core::ActiveMQSession::createTextMessage () [virtual]

Creates a new TextMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

6.44.2.20 virtual cms::Topic* activemq::core::ActiveMQSession::createTopic (const std::string & *topicName*) [virtual]

Creates a topic identity given a Queue name.

Parameters:

topicName the name of the new Topic

Returns:

new Topic pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

6.44.2.21 virtual cms::Session::AcknowledgeMode activemq::core::ActiveMQSession::getAcknowledgeMode () const [inline, virtual]

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2691).

6.44.2.22 ActiveMQConnection* activemq::core::ActiveMQSession::getConnection () const [inline]

Gets the **ActiveMQConnection** (p. 232) that is associated with this session.

6.44.2.23 cms::ExceptionListener* activemq::core::ActiveMQSession::getExceptionListener () [inline]

This method gets any registered exception listener of this sessions connection and returns it. Mainly intended for use by the objects that this session creates so that they can notify the client of **exceptions** (p. 67) that occur in the context of another thread.

Returns:

cms::ExceptionListener (p. 1465) pointer or NULL

6.44.2.24 virtual cms::MessageTransformer* activemq::core::ActiveMQSession::getMessageTransformer () const [inline, virtual]

Gets the currently configured MessageTransformer for this Session.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::Session** (p. 2691).

6.44.2.25 const commands::SessionId& activemq::core::ActiveMQSession::getSessionId () const [inline]

Gets the Session Id object for this session, if the session is closed than this method throws an exception.

Returns:

SessionId Reference

6.44.2.26 const commands::SessionInfo& activemq::core::ActiveMQSession::getSessionInfo () const [inline]

Gets the Session Information object for this session, if the session is closed than this method throws an exception.

Returns:

SessionInfo Reference

6.44.2.27 bool activemq::core::ActiveMQSession::isStarted () const [inline]

Indicates whether or not the session is currently in the started **state** (p. 70).

6.44.2.28 virtual bool activemq::core::ActiveMQSession::isTransacted () const [inline, virtual]

Gets if the Sessions is a Transacted Session.

Returns:

transacted true - false.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2691).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 549).

6.44.2.29 virtual void activemq::core::ActiveMQSession::recover () [virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Implements **cms::Session** (p. 2692).

6.44.2.30 virtual void activemq::core::ActiveMQSession::rollback () [virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.
IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2692).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 549).

6.44.2.31 virtual void activemq::core::ActiveMQSession::setMessageTransformer (cms::MessageTransformer * *transformer*) [inline, virtual]

Set an MessageTransformer instance that is passed on to all MessageProducer and MessageConsumer objects created from this Session.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to set on all MessageConsumers and MessageProducers.

Implements **cms::Session** (p. 2692).

6.44.2.32 virtual void activemq::core::ActiveMQSession::start () [virtual]

Stops asynchronous message delivery.

Implements **cms::Startable** (p. 2852).

6.44.2.33 virtual void activemq::core::ActiveMQSession::stop () [virtual]

Starts asynchronous message delivery.

Implements **cms::Stoppable** (p. 2919).

6.44.2.34 virtual void activemq::core::ActiveMQSession::unsubscribe (const std::string & *name*) [virtual]

Unsubscribes a durable subscription that has been created by a client. This method deletes the **state** (p. 70) being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

name The name used to identify this subscription

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2693).

6.44.3 Field Documentation

6.44.3.1 Pointer<activemq::core::kernels::ActiveMQSessionKernel> activemq::core::ActiveMQSession::kernel [protected]

  wakeup this executer and dispatch any pending messages.

- virtual void **start** ()

  Starts the dispatching.

- virtual void **stop** ()

  Stops dispatching.

- virtual void **close** ()

  Terminates the dispatching thread.

- virtual bool **isRunning** () const
- virtual bool **isEmpty** ()
- virtual void **clear** ()

  Removes all queued messages and destroys them.

- virtual bool **iterate** ()

  *Iterates on the **MessageDispatchChannel** (p. 2150) sending all pending messages to the Consumers they are destined for.*

- std::vector< **Pointer**< **MessageDispatch** > > **getUnconsumedMessages** ()

6.45.1 Detailed Description

Delegate dispatcher for a single session. Contains a thread to provide for asynchronous dispatching.

6.45.2 Constructor & Destructor Documentation

6.45.2.1 activemq::core::ActiveMQSessionExecutor::ActiveMQSessionExecutor (activemq::core::kernels::ActiveMQSessionKernel * *session*)

Creates an un-started executor for the given session.

6.45.2.2 virtual activemq::core::ActiveMQSessionExecutor::~ActiveMQSessionExecutor () [virtual]

Calls **stop()** (p. 449) then **clear()** (p. 447).

6.45.3 Member Function Documentation

6.45.3.1 virtual void activemq::core::ActiveMQSessionExecutor::clear () [inline, virtual]

Removes all queued messages and destroys them.

6.45.3.2 virtual void activemq::core::ActiveMQSessionExecutor::clearMessagesInProgress () [inline, virtual]

Removes all messages in the Dispatch Channel so that non are delivered.

6.45.3.3 virtual void activemq::core::ActiveMQSessionExecutor::close () [inline, virtual]

Terminates the dispatching thread. Once this is called, the executor is no longer usable.

6.45.3.4 virtual void activemq::core::ActiveMQSessionExecutor::execute (const Pointer< MessageDispatch > & *data*) [virtual]

Executes the dispatch. Adds the given data to the end of the queue.

Parameters:

data - the data to be dispatched.

6.45.3.5 virtual void activemq::core::ActiveMQSessionExecutor::executeFirst (const Pointer< MessageDispatch > & *data*) [virtual]

Executes the dispatch. Adds the given data to the beginning of the queue.

Parameters:

data - the data to be dispatched.

6.45.3.6 std::vector< Pointer<MessageDispatch> > activemq::core::ActiveMQSessionExecutor::getUnconsumedMessages () [inline]

Returns:

a vector containing all the unconsumed messages, this clears the Message Dispatch Channel when called.

6.45.3.7 virtual bool activemq::core::ActiveMQSessionExecutor::hasUncomsumedMessages () const [inline, virtual]

Returns:

true if there are any pending messages in the dispatch channel.

6.45.3.8 virtual bool activemq::core::ActiveMQSessionExecutor::isEmpty () [inline, virtual]

Returns:

true if there are no messages in the Dispatch Channel.

6.45.3.9 virtual bool activemq::core::ActiveMQSessionExecutor::isRunning () const [inline, virtual]

Returns:

true indicates if the executor is started

6.45.3.10 virtual bool activemq::core::ActiveMQSessionExecutor::iterate () [virtual]

Iterates on the **MessageDispatchChannel** (p. 2150) sending all pending messages to the Consumers they are destined for.

Returns:

false if there are no more messages to dispatch.

Implements **activemq::threads::Task** (p. 2989).

6.45.3.11 virtual void activemq::core::ActiveMQSessionExecutor::start () [virtual]

Starts the dispatching.

6.45.3.12 virtual void activemq::core::ActiveMQSessionExecutor::stop () [virtual]

Stops dispatching.

6.45.3.13 virtual void activemq::core::ActiveMQSessionExecutor::wakeup () [virtual]

wakeup this executer and dispatch any pending messages.

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQSessionExecutor.h**

6.46 activemq::core::kernels::ActiveMQSessionKernel Class Reference

`#include <src/main/activemq/core/kernels/ActiveMQSessionKernel.h>`Inheritance diagram for activemq::core::kernels::ActiveMQSessionKernel:

Public Member Functions

- **ActiveMQSessionKernel** (**ActiveMQConnection** *__connection__, const **Pointer**< **commands::SessionId** > &id, **cms::Session::AcknowledgeMode** **ackMode**, const **decaf::util::Properties** &properties)
- virtual ~**ActiveMQSessionKernel** ()
- virtual void **redispatch** (**MessageDispatchChannel** &unconsumedMessages)

  Redispatches the given set of unconsumed messages to the consumers.

- virtual void **start** ()

  Stops asynchronous message delivery.

- virtual void **stop** ()

  Starts asynchronous message delivery.

- bool **isStarted** () const

  *Indicates whether or not the session is currently in the started **state** (p. 70).*

- virtual bool **isAutoAcknowledge** () const
- virtual bool **isDupsOkAcknowledge** () const
- virtual bool **isClientAcknowledge** () const
- virtual bool **isIndividualAcknowledge** () const
- void **fire** (const **exceptions::ActiveMQException** &ex)

  Fires the given exception to the exception listener of the connection.

- virtual void **dispatch** (const **Pointer**< **MessageDispatch** > &message)

  Dispatches a message to a particular consumer.

- virtual void **close** ()

  Closes this session as well as any active child consumers or producers.

- virtual void **commit** ()

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual void **recover** ()

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination)

  Creates a MessageConsumer for the specified destination.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createDurableConsumer** (const **cms::Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)

  Creates a durable subscriber to the specified topic, using a Message selector.

- virtual **cms::MessageProducer** * **createProducer** (const **cms::Destination** *destination)

  Creates a MessageProducer to send messages to the specified destination.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::Queue** * **createQueue** (const std::string &queueName)

  Creates a queue identity given a Queue name.

- virtual **cms::Topic** * **createTopic** (const std::string &topicName)

  Creates a topic identity given a Queue name.

- virtual **cms::TemporaryQueue** * **createTemporaryQueue** ()

  Creates a TemporaryQueue object.

- virtual **cms::TemporaryTopic** * **createTemporaryTopic** ()

  Creates a TemporaryTopic object.

- virtual **cms::Message** * **createMessage** ()

  Creates a new Message.

- virtual **cms::BytesMessage** * **createBytesMessage** ()

  Creates a BytesMessage.

- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, int bytesSize)

  Creates a BytesMessage and sets the payload to the passed value.

- virtual **cms::StreamMessage** * **createStreamMessage** ()

Creates a new StreamMessage.

- virtual **cms::TextMessage** * **createTextMessage** ()

  Creates a new TextMessage.

- virtual **cms::TextMessage** * **createTextMessage** (const std::string &text)

  Creates a new TextMessage and set the text to the value given.

- virtual **cms::MapMessage** * **createMapMessage** ()

  Creates a new MapMessage.

- virtual **cms::Session::AcknowledgeMode** **getAcknowledgeMode** () const

  Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () const

  Gets if the Sessions is a Transacted Session.

- virtual void **unsubscribe** (const std::string &name)

  Unsubscribes a durable subscription that has been created by a client.

- void **send** (**kernels::ActiveMQProducerKernel** *producer, **Pointer**< **commands::ActiveMQDestination** > destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive, **util::MemoryUsage** *producerWindow, long long sendTimeout, **cms::AsyncCallback** *onComplete)

  Sends a message from the Producer specified using this session's connection the message will be sent using the best available means depending on the configuration of the connection.

- **cms::ExceptionListener** * **getExceptionListener** ()

  This method gets any registered exception listener of this sessions connection and returns it.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

  Set an MessageTransformer instance that is passed on to all MessageProducer and MessageConsumer objects created from this Session.

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this Session.

- const **commands::SessionInfo** & **getSessionInfo** () const

  Gets the Session Information object for this session, if the session is closed than this method throws an exception.

- const **commands::SessionId** & **getSessionId** () const

  Gets the Session Id object for this session, if the session is closed than this method throws an exception.

- **ActiveMQConnection** * **getConnection** () const

  *Gets the **ActiveMQConnection** (p. 232) that is associated with this session.*

- **Pointer**< **threads::Scheduler** > **getScheduler** () const

  Gets a Pointer to this Session's Scheduler instance.

- long long **getLastDeliveredSequenceId** () const

  Gets the currently set Last Delivered Sequence Id.

- void **setLastDeliveredSequenceId** (long long value)

  Sets the value of the Last Delivered Sequence Id.

- void **oneway** (**Pointer< commands::Command >** command)

  Sends a Command to the broker without requesting any Response be returned.

- **Pointer< commands::Response > syncRequest** (**Pointer< commands::Command >** command, unsigned int timeout=0)

  Sends a synchronous request and returns the response from the broker.

- void **addConsumer** (**Pointer< ActiveMQConsumerKernel >** consumer)

  Adds a MessageConsumerKernel to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.

- void **removeConsumer** (**Pointer< ActiveMQConsumerKernel >** consumer)

  Dispose of a MessageConsumer from this session.

- void **addProducer** (**Pointer< ActiveMQProducerKernel >** producer)

  Adds a MessageProducer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.

- void **removeProducer** (**Pointer< ActiveMQProducerKernel >** producer)

  Dispose of a MessageProducer from this session.

- virtual void **doStartTransaction** ()

  Starts if not already start a Transaction for this Session.

- **Pointer< ActiveMQTransactionContext > getTransactionContext** ()

  Gets the Pointer to this Session's TransactionContext.

- void **acknowledge** ()

  Request that the Session inform all its consumers to Acknowledge all Message's that have been received so far.

- void **deliverAcks** ()

  Request that this Session inform all of its consumers to deliver their pending acks.

- void **clearMessagesInProgress** ()

  Request that this Session inform all of its consumers to clear all messages that are currently in progress.

- void **wakeup** ()

  Causes the Session to wakeup its executer and ensure all messages are dispatched.

- **Pointer< commands::ConsumerId > getNextConsumerId** ()

  Get the Next available Consumer Id.

- **Pointer< commands::ProducerId > getNextProducerId** ()

Get the Next available Producer Id.

- void **doClose** ()

  Performs the actual Session close operations.

- void **dispose** ()

  Cleans up the Session object's resources without attempting to send the Remove command to the broker, this can be called from ***ActiveMQConnection*** *(p. 232) when it knows that the* ***transport*** *(p. 72) is down and the doClose method would throw an exception when it attempt to send the Remove Command.*

- void **setPrefetchSize** (**Pointer< commands::ConsumerId >** id, int prefetch)

  Set the prefetch level for the given consumer if it exists in this Session to the value specified.

- void **close** (**Pointer< commands::ConsumerId >** id)

  Close the specified consumer if present in this Session.

- bool **isInUse** (**Pointer< commands::ActiveMQDestination >** destination)

  Checks if the given destination is currently in use by any consumers in this Session.

- **Pointer< ActiveMQProducerKernel > lookupProducerKernel** (**Pointer< commands::ProducerId >** id)
- **Pointer< ActiveMQConsumerKernel > lookupConsumerKernel** (**Pointer< commands::ConsumerId >** id)
- bool **iterateConsumers** ()

  Gives each consumer a chance to dispatch messages that have been enqueued by calling each consumers iterate method.

- void **checkMessageListener** () const

  Checks if any MessageConsumer owned by this Session has a set MessageListener and throws an exception if so.

- virtual int **getHashCode** () const

  Returns a Hash Code for this Session based on its SessionId.

- void **sendAck** (**decaf::lang::Pointer< commands::MessageAck >** ack, bool async=false)

  Sends the given MessageAck command to the Broker either via Synchronous call or an Asynchronous call depending on the value of the async parameter.

Protected Attributes

- SessionConfig * **config**
- **Pointer< commands::SessionInfo > sessionInfo**

  SessionInfo for this Session.

- **Pointer< ActiveMQTransactionContext > transaction**

  Transaction Management object.

- **ActiveMQConnection * connection**

Connection.

- **AtomicBoolean closed**
  Indicates that this connection has been closed, it is no longer usable after this becomes true.
- std::auto_ptr< **ActiveMQSessionExecutor** > **executor**
  Sends incoming messages to the registered consumers.
- **cms::Session::AcknowledgeMode ackMode**
  This Sessions Acknowledgment mode.
- **util::LongSequenceGenerator producerIds**
  Next available Producer Id.
- **util::LongSequenceGenerator producerSequenceIds**
  Next available Producer Sequence Id.
- **util::LongSequenceGenerator consumerIds**
  Next available Consumer Id.
- long long **lastDeliveredSequenceId**
  Last Delivered Sequence Id.

Friends

- class **activemq::core::ActiveMQSessionExecutor**

6.46.1 Constructor & Destructor Documentation

6.46.1.1 activemq::core::kernels::ActiveMQSessionKernel::ActiveMQSessionKernel (ActiveMQConnection * *connection*, const Pointer< commands::SessionId > & *id*, cms::Session::AcknowledgeMode *ackMode*, const decaf::util::Properties & *properties*)

6.46.1.2 virtual activemq::core::kernels::ActiveMQSessionKernel::~ActiveMQSessionKernel () [virtual]

6.46.2 Member Function Documentation

6.46.2.1 void activemq::core::kernels::ActiveMQSessionKernel::acknowledge ()

Request that the Session inform all its consumers to Acknowledge all Message's that have been received so far.

6.46.2.2 void activemq::core::kernels::ActiveMQSessionKernel::addConsumer (Pointer< ActiveMQConsumerKernel > *consumer*)

Adds a MessageConsumerKernel to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.

Parameters:

consumer The **ActiveMQConsumerKernel** (p. 303) instance to add to this session.

Exceptions:

ActiveMQException if an internal error occurs.

6.46.2.3 void activemq::core::kernels::ActiveMQSessionKernel::addProducer (Pointer< ActiveMQProducerKernel > *producer*)

Adds a MessageProducer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.

Parameters:

producer The **ActiveMQProducerKernel** (p. 404) instance to add to this session.

Exceptions:

ActiveMQException if an internal error occurs.

6.46.2.4 void activemq::core::kernels::ActiveMQSessionKernel::checkMessageListener () const

Checks if any MessageConsumer owned by this Session has a set MessageListener and throws an exception if so. This enforces the rule that the MessageConsumers belonging to a Session either operate in sync or async receive as a group.

6.46.2.5 void activemq::core::kernels::ActiveMQSessionKernel::clearMessagesInProgress ()

Request that this Session inform all of its consumers to clear all messages that are currently in progress.

6.46.2.6 void activemq::core::kernels::ActiveMQSessionKernel::close (Pointer< commands::ConsumerId > *id*)

Close the specified consumer if present in this Session.

Parameters:

id The consumer Id to close.

6.46.2.7 virtual void activemq::core::kernels::ActiveMQSessionKernel::close () [virtual]

Closes this session as well as any active child consumers or producers.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2683).

6.46.2.8 virtual void activemq::core::kernels::ActiveMQSessionKernel::commit () [virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2684).

Reimplemented in **activemq::core::kernels::ActiveMQXASessionKernel** (p. 550).

6.46.2.9 virtual cms::QueueBrowser* activemq::core::kernels::ActiveMQSessionKernel::createBrowser (const cms::Queue * *queue*, const std::string & *selector*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

selector the Message selector to filter which messages are browsed.

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2684).

6.46.2.10 virtual cms::QueueBrowser* activemq::core::kernels::ActiveMQSessionKernel::createBrowser (const cms::Queue * *queue*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2684).

6.46.2.11 virtual cms::BytesMessage* activemq::core::kernels::ActiveMQSessionKernel::createBytesMessage (const unsigned char * *bytes*, int *bytesSize*) [virtual]

Creates a BytesMessage and sets the payload to the passed value.

Parameters:

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2685).

6.46.2.12 virtual cms::BytesMessage* activemq::core::kernels::ActiveMQSessionKernel::createBytesMessage () [virtual]

Creates a BytesMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2685).

6.46.2.13 virtual cms::MessageConsumer* activemq::core::kernels::ActiveMQSessionKernel::createConsumer (const cms::Destination * *destination*, const std::string & *selector*, bool *noLocal*) [virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2685).

6.46.2.14 virtual cms::MessageConsumer* activemq::core::kernels::ActiveMQSessionKernel::createConsumer (const cms::Destination * *destination*, const std::string & *selector*) [virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2686).

6.46.2.15 virtual cms::MessageConsumer* activemq::core::kernels::ActiveMQSessionKernel::createConsumer (const cms::Destination * *destination*) [virtual]

Creates a MessageConsumer for the specified destination.

Parameters:

destination the Destination that this consumer receiving messages for.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2686).

6.46.2.16 virtual cms::MessageConsumer* activemq::core::kernels::ActiveMQSessionKernel::createDurableConsumer (const cms::Topic * *destination*, const std::string & *name*, const std::string & *selector*, bool *noLocal* = false) [virtual]

Creates a durable subscriber to the specified topic, using a Message selector. Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters:

destination the topic to subscribe to

name The name used to identify the subscription

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2687).

6.46.2.17 virtual cms::MapMessage* activemq::core::kernels::ActiveMQSessionKernel::createMapMessage () [virtual]

Creates a new MapMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2687).

6.46.2.18 virtual cms::Message* activemq::core::kernels::ActiveMQSessionKernel::createMessage () [virtual]

Creates a new Message.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2688).

6.46.2.19 virtual cms::MessageProducer* activemq::core::kernels::ActiveMQSessionKernel::createProducer (const cms::Destination * *destination*) [virtual]

Creates a MessageProducer to send messages to the specified destination.

Parameters:

destination the Destination to send on

Returns:

New MessageProducer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2688).

6.46.2.20 virtual cms::Queue* activemq::core::kernels::ActiveMQSessionKernel::createQueue (const std::string & *queueName*) [virtual]

Creates a queue identity given a Queue name.

Parameters:

queueName the name of the new Queue

Returns:

new Queue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2688).

6.46.2.21 virtual cms::StreamMessage* activemq::core::kernels::ActiveMQSessionKernel::createStreamMessage () [virtual]

Creates a new StreamMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

6.46.2.22 virtual cms::TemporaryQueue* activemq::core::kernels::ActiveMQSessionKernel::createTemporaryQueue () [virtual]

Creates a TemporaryQueue object.

Returns:

new TemporaryQueue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

6.46.2.23 virtual cms::TemporaryTopic* activemq::core::kernels::ActiveMQSessionKernel::createTemporaryTopic () [virtual]

Creates a TemporaryTopic object.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

6.46.2.24 virtual cms::TextMessage* activemq::core::kernels::ActiveMQSessionKernel::createTextMessage (const std::string & *text*) [virtual]

Creates a new TextMessage and set the text to the value given.

Parameters:

text the initial text for the message

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

6.46.2.25 virtual cms::TextMessage* activemq::core::kernels::ActiveMQSessionKernel::createTextMessage () [virtual]

Creates a new TextMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

6.46.2.26 virtual cms::Topic* activemq::core::kernels::ActiveMQSessionKernel::createTopic (const std::string & *topicName*) [virtual]

Creates a topic identity given a Queue name.

Parameters:

topicName the name of the new Topic

Returns:

new Topic pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

6.46.2.27 void activemq::core::kernels::ActiveMQSessionKernel::deliverAcks ()

Request that this Session inform all of its consumers to deliver their pending acks.

6.46.2.28 virtual void activemq::core::kernels::ActiveMQSessionKernel::dispatch (const Pointer< MessageDispatch > & *message*) [virtual]

Dispatches a message to a particular consumer.

Parameters:

message - the message to be dispatched

Implements **activemq::core::Dispatcher** (p. 1412).

6.46.2.29 void activemq::core::kernels::ActiveMQSessionKernel::dispose ()

Cleans up the Session object's resources without attempting to send the Remove command to the broker, this can be called from **ActiveMQConnection** (p. 232) when it knows that the **transport** (p. 72) is down and the doClose method would throw an exception when it attempt to send the Remove Command.

6.46.2.30 void activemq::core::kernels::ActiveMQSessionKernel::doClose ()

Performs the actual Session close operations. This method is meant for use by **ActiveMQConnection** (p. 232), the connection object calls this when it has been closed to skip some of the extraneous processing done by the client level close method.

6.46.2.31 virtual void activemq::core::kernels::ActiveMQSessionKernel::doStartTransaction () [virtual]

Starts if not already start a Transaction for this Session. If the session is not a Transacted Session then an exception is thrown. If a transaction is already in progress then this method has no effect.

Exceptions:

ActiveMQException if this is not a Transacted Session.

Reimplemented in **activemq::core::kernels::ActiveMQXASessionKernel** (p. 551).

6.46.2.32 void activemq::core::kernels::ActiveMQSessionKernel::fire (const exceptions::ActiveMQException & *ex*)

Fires the given exception to the exception listener of the connection.

6.46.2.33 virtual cms::Session::AcknowledgeMode activemq::core::kernels::ActiveMQSessionKernel::getAcknowledgeMode () const [virtual]

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2691).

6.46.2.34 ActiveMQConnection* activemq::core::kernels::ActiveMQSessionKernel::getConnection () const [inline]

Gets the **ActiveMQConnection** (p. 232) that is associated with this session.

6.46.2.35 cms::ExceptionListener* activemq::core::kernels::ActiveMQSessionKernel::getExceptionListener ()

This method gets any registered exception listener of this sessions connection and returns it. Mainly intended for use by the objects that this session creates so that they can notify the client of **exceptions** (p. 67) that occur in the context of another thread.

Returns:

the registered **cms::ExceptionListener** (p. 1465) pointer or NULL

6.46.2.36 virtual int activemq::core::kernels::ActiveMQSessionKernel::getHashCode () const [virtual]

Returns a Hash Code for this Session based on its SessionId.

Returns:

an int hash **code** (p. 1005) based on the string balue of SessionId.

Implements **activemq::core::Dispatcher** (p. 1412).

6.46.2.37 long long activemq::core::kernels::ActiveMQSessionKernel::getLastDeliveredSequenceId () const [inline]

Gets the currently set Last Delivered Sequence Id.

Returns:

long long containing the sequence id of the last delivered Message.

6.46.2.38 virtual cms::MessageTransformer* activemq::core::kernels::ActiveMQSessionKernel::getMessageTransformer () const [virtual]

Gets the currently configured MessageTransformer for this Session.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::Session** (p. 2691).

6.46.2.39 Pointer<commands::ConsumerId> activemq::core::kernels::ActiveMQSessionKernel::getNextConsumerId ()

Get the Next available Consumer Id.

Returns:

the next id in the sequence.

6.46.2.40 Pointer<commands::ProducerId> activemq::core::kernels::ActiveMQSessionKernel::getNextProducerId ()

Get the Next available Producer Id.

Returns:

the next id in the sequence.

6.46.2.41 Pointer<threads::Scheduler> activemq::core::kernels::ActiveMQSessionKernel::getScheduler () const

Gets a Pointer to this Session's Scheduler instance.

6.46.2.42 const commands::SessionId& activemq::core::kernels::ActiveMQSessionKernel::getSessionId () const [inline]

Gets the Session Id object for this session, if the session is closed than this method throws an exception.

Returns:

SessionId Reference

6.46.2.43 const commands::SessionInfo& activemq::core::kernels::ActiveMQSessionKernel::getSessionInfo () const [inline]

Gets the Session Information object for this session, if the session is closed than this method throws an exception.

Returns:

SessionInfo Reference

6.46.2.44 Pointer<ActiveMQTransactionContext> activemq::core::kernels::ActiveMQSessionKernel::getTransactionContext () [inline]

Gets the Pointer to this Session's TransactionContext.

Returns:

a Pointer to this Session's TransactionContext

6.46.2.45 virtual bool activemq::core::kernels::ActiveMQSessionKernel::isAutoAcknowledge () const [inline, virtual]

Reimplemented in **activemq::core::kernels::ActiveMQXASessionKernel** (p. 551).

References cms::Session::AUTO_ACKNOWLEDGE.

6.46.2.46 virtual bool activemq::core::kernels::ActiveMQSessionKernel::isClientAcknowledge () const [inline, virtual]

References cms::Session::CLIENT_ACKNOWLEDGE.

6.46.2.47 virtual bool activemq::core::kernels::ActiveMQSessionKernel::isDupsOkAcknowledge () const [inline, virtual]

References cms::Session::DUPS_OK_ACKNOWLEDGE.

6.46.2.48 virtual bool activemq::core::kernels::ActiveMQSessionKernel::isIndividualAcknowledge () const [inline, virtual]

References cms::Session::INDIVIDUAL_ACKNOWLEDGE.

6.46.2.49 bool activemq::core::kernels::ActiveMQSessionKernel::isInUse (Pointer< commands::ActiveMQDestination > *destination*)

Checks if the given destination is currently in use by any consumers in this Session.

Returns:

true if there is a consumer of this destination in this Session.

6.46.2.50 bool activemq::core::kernels::ActiveMQSessionKernel::isStarted () const

Indicates whether or not the session is currently in the started **state** (p. 70).

6.46.2.51 virtual bool activemq::core::kernels::ActiveMQSessionKernel::isTransacted () const [virtual]

Gets if the Sessions is a Transacted Session.

Returns:

transacted true - false.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2691).

Reimplemented in **activemq::core::kernels::ActiveMQXASessionKernel** (p. 551).

6.46.2.52 bool activemq::core::kernels::ActiveMQSessionKernel::iterateConsumers ()

Gives each consumer a chance to dispatch messages that have been enqueued by calling each consumers iterate method. Returns true if this method needs to be called again because a consumer requires further processing time to complete its dispatching. Once all consumers are done this method returns false.

Returns:

true if more iterations are needed false otherwise.

6.46.2.53 Pointer<ActiveMQConsumerKernel> activemq::core::kernels::ActiveMQSessionKernel::lookupConsumerKernel (Pointer< commands::ConsumerId > *id*)

Returns:

a Pointer to an **ActiveMQConsumerKernel** (p. 303) using its ConsumerId, or NULL.

6.46.2.54 Pointer<ActiveMQProducerKernel> activemq::core::kernels::ActiveMQSessionKernel::lookupProducerKernel (Pointer< commands::ProducerId > *id*)

Returns:

a Pointer to an **ActiveMQProducerKernel** (p. 404) using its ProducerId, or NULL.

6.46.2.55 void activemq::core::kernels::ActiveMQSessionKernel::oneway (Pointer< commands::Command > *command*)

Sends a Command to the broker without requesting any Response be returned.

Parameters:

command The message to send to the Broker.

Exceptions:

ActiveMQException if not currently connected, or if the operation fails for any reason.

6.46.2.56 virtual void activemq::core::kernels::ActiveMQSessionKernel::recover () [virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Implements **cms::Session** (p. 2692).

6.46.2.57 virtual void activemq::core::kernels::ActiveMQSessionKernel::redispatch (MessageDispatchChannel & *unconsumedMessages*) [virtual]

Redispatches the given set of unconsumed messages to the consumers.

Parameters:

unconsumedMessages - unconsumed messages to be redelivered.

6.46.2.58 void activemq::core::kernels::ActiveMQSessionKernel::removeConsumer (Pointer< ActiveMQConsumerKernel > *consumer*)

Dispose of a MessageConsumer from this session. Removes it from the Connection and clean up any resources associated with it.

Parameters:

consumer The **ActiveMQConsumerKernel** (p. 303) instance to remove from this session.

Exceptions:

ActiveMQException if an internal error occurs.

6.46.2.59 void activemq::core::kernels::ActiveMQSessionKernel::removeProducer (Pointer< ActiveMQProducerKernel > *producer*)

Dispose of a MessageProducer from this session. Removes it from the Connection and clean up any resources associated with it.

Parameters:

producer The Producer kernel instance to remove from this session.

Exceptions:

ActiveMQException if an internal error occurs.

6.46.2.60 virtual void activemq::core::kernels::ActiveMQSessionKernel::rollback () [virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2692).

Reimplemented in **activemq::core::kernels::ActiveMQXASessionKernel** (p. 552).

6.46.2.61 void activemq::core::kernels::ActiveMQSessionKernel::send (kernels::ActiveMQProducerKernel * *producer*, Pointer< commands::ActiveMQDestination > *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, util::MemoryUsage * *producerWindow*, long long *sendTimeout*, cms::AsyncCallback * *onComplete*)

Sends a message from the Producer specified using this session's connection the message will be sent using the best available means depending on the configuration of the connection. Asynchronous sends will be chosen if at all possible.

Parameters:

producer The sending Producer

destination The target destination for the Message.

message The message to send to the broker.

deliveryMode The delivery mode to assign to the outgoing message.

priority The priority value to assign to the outgoing message.

timeToLive The time to live for the outgoing message.

usage Pointer to a Usage tracker which if set will be increased by the size of the given message.

sendTimeout The amount of time to block during send before failing, or 0 to wait forever.

Exceptions:

CMSException if an error occurs while sending the message.

6.46.2.62 void activemq::core::kernels::ActiveMQSessionKernel::sendAck (decaf::lang::Pointer< commands::MessageAck > *ack*, bool *async* = `false`)

Sends the given MessageAck command to the Broker either via Synchronous call or an Asynchronous call depending on the value of the async parameter.

Parameters:

ack The MessageAck command to send.

async True if the command can be sent asynchronously.

6.46.2.63 void activemq::core::kernels::ActiveMQSessionKernel::setLastDeliveredSequenceId (long long *value*) `[inline]`

Sets the value of the Last Delivered Sequence Id.

Parameters:

value The new value to assign to the Last Delivered Sequence Id property.

6.46.2.64 virtual void activemq::core::kernels::ActiveMQSessionKernel::setMessageTransformer (cms::MessageTransformer * *transformer*) [virtual]

Set an MessageTransformer instance that is passed on to all MessageProducer and MessageConsumer objects created from this Session.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to set on all MessageConsumers and MessageProducers.

Implements **cms::Session** (p. 2692).

6.46.2.65 void activemq::core::kernels::ActiveMQSessionKernel::setPrefetchSize (Pointer< commands::ConsumerId > *id*, int *prefetch*)

Set the prefetch level for the given consumer if it exists in this Session to the value specified.

Parameters:

id The consumer Id to search for and set prefetch level.

prefetch The new prefetch value.

6.46.2.66 virtual void activemq::core::kernels::ActiveMQSessionKernel::start () [virtual]

Stops asynchronous message delivery.

Implements **cms::Startable** (p. 2852).

6.46.2.67 virtual void activemq::core::kernels::ActiveMQSessionKernel::stop () [virtual]

Starts asynchronous message delivery.

Implements **cms::Stoppable** (p. 2919).

6.46.2.68 Pointer<commands::Response> activemq::core::kernels::ActiveMQSessionKernel::syncRequest (Pointer< commands::Command > *command*, unsigned int *timeout* = 0)

Sends a synchronous request and returns the response from the broker. Converts any error responses into an exception.

Parameters:

command The command to send to the broker.

timeout The time to wait for a response, default is zero or infinite.

Returns:

Pointer to a Response object that the broker has returned for the Command sent.

Exceptions:

ActiveMQException thrown if an error response was received from the broker, or if any other error occurred.

6.46.2.69 virtual void activemq::core::kernels::ActiveMQSessionKernel::unsubscribe (const std::string & *name*) [virtual]

Unsubscribes a durable subscription that has been created by a client. This method deletes the **state** (p. 70) being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

name The name used to identify this subscription

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2693).

6.46.2.70 void activemq::core::kernels::ActiveMQSessionKernel::wakeup ()

Causes the Session to wakeup its executer and ensure all messages are dispatched.

6.46.3 Friends And Related Function Documentation

6.46.3.1 friend class activemq::core::ActiveMQSessionExecutor [friend]

6.46.4 Field Documentation

6.46.4.1 cms::Session::AcknowledgeMode activemq::core::kernels::ActiveMQSessionKernel::ackMode [protected]

This Sessions Acknowledgment mode.

6.46.4.2 AtomicBoolean activemq::core::kernels::ActiveMQSessionKernel::closed [protected]

Indicates that this connection has been closed, it is no longer usable after this becomes true.

6.46.4.3 SessionConfig* activemq::core::kernels::ActiveMQSessionKernel::config [protected]

6.46.4.4 ActiveMQConnection* activemq::core::kernels::ActiveMQSessionKernel::connection [protected]

Connection.

6.46.4.5 util::LongSequenceGenerator activemq::core::kernels::ActiveMQSessionKernel::consumerIds [protected]

Next available Consumer Id.

6.46.4.6 std::auto_ptr<ActiveMQSessionExecutor> activemq::core::kernels::ActiveMQSessionKernel::executor [protected]

Sends incoming messages to the registered consumers.

6.46.4.7 long long activemq::core::kernels::ActiveMQSessionKernel::lastDeliveredSequenceId [protected]

Last Delivered Sequence Id.

6.46.4.8 util::LongSequenceGenerator activemq::core::kernels::ActiveMQSessionKernel::producerIds [protected]

Next available Producer Id.

6.46.4.9 util::LongSequenceGenerator activemq::core::kernels::ActiveMQSessionKernel::producerSequenceIds [protected]

Next available Producer Sequence Id.

6.46.4.10 Pointer<commands::SessionInfo> activemq::core::kernels::ActiveMQSessionKernel::sessionInfo [protected]

SessionInfo for this Session.

6.46.4.11 Pointer<ActiveMQTransactionContext> activemq::core::kernels::ActiveMQSessionKernel::transaction [protected]

Transaction Management object.

The documentation for this class was generated from the following file:

- src/main/activemq/core/kernels/**ActiveMQSessionKernel.h**

6.47 activemq::commands::ActiveMQStreamMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQStreamMessage.h>`Inheritance diagram for activemq::commands::ActiveMQStreamMessage:

Public Member Functions

- **ActiveMQStreamMessage** ()
- virtual ~**ActiveMQStreamMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **ActiveMQStreamMessage** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual void **onSend** ()

  *Allows derived **Message** (p. 2072) classes to perform tasks before a message is sent.*

- virtual **cms::StreamMessage** * **clone** () const

  Clone this message exactly, returns a new instance that the caller is required to delete.

- virtual void **clearBody** ()

  Clears out the body of the message.

- virtual **ValueType** **getNextValueType** () const

  Returns the value type for the element in the StreamMessage.

- virtual void **reset** ()

  Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

- virtual bool **readBoolean** () const

  Reads a Boolean from the Stream message stream.

- virtual void **writeBoolean** (bool value)

  Writes a boolean to the Stream message stream as a 1-byte value.

- virtual unsigned char **readByte** () const

Reads a Byte from the Stream message stream.

- virtual void **writeByte** (unsigned char value)

  Writes a byte to the Stream message stream as a 1-byte value.

- virtual int **readBytes** (std::vector< unsigned char > &value) const

  Reads a byte array from the Stream message stream.

- virtual void **writeBytes** (const std::vector< unsigned char > &value)

  Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

- virtual int **readBytes** (unsigned char *buffer, int length) const

  Reads a portion of the Stream message stream.

- virtual void **writeBytes** (const unsigned char *value, int offset, int length)

  Writes a portion of a byte array to the Stream message stream.

- virtual char **readChar** () const

  Reads a Char from the Stream message stream.

- virtual void **writeChar** (char value)

  Writes a char to the Stream message stream as a 1-byte value.

- virtual float **readFloat** () const

  Reads a 32 bit float from the Stream message stream.

- virtual void **writeFloat** (float value)

  Writes a float to the Stream message stream as a 4 byte value.

- virtual double **readDouble** () const

  Reads a 64 bit double from the Stream message stream.

- virtual void **writeDouble** (double value)

  Writes a double to the Stream message stream as a 8 byte value.

- virtual short **readShort** () const

  Reads a 16 bit signed short from the Stream message stream.

- virtual void **writeShort** (short value)

  Writes a signed short to the Stream message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const

  Reads a 16 bit unsigned short from the Stream message stream.

- virtual void **writeUnsignedShort** (unsigned short value)

  Writes a unsigned short to the Stream message stream as a 2 byte value.

- virtual int **readInt** () const

  Reads a 32 bit signed integer from the Stream message stream.

- virtual void **writeInt** (int value)

  Writes a signed int to the Stream message stream as a 4 byte value.

- virtual long long **readLong** () const

  Reads a 64 bit long from the Stream message stream.

- virtual void **writeLong** (long long value)

  Writes a long long to the Stream message stream as a 8 byte value.

- virtual std::string **readString** () const

  Reads an ASCII String from the Stream message stream.

- virtual void **writeString** (const std::string &value)

  Writes an ASCII String to the Stream message stream.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQSTREAMMESSAGE** = 27

6.47.1 Constructor & Destructor Documentation

6.47.1.1 activemq::commands::ActiveMQStreamMessage::ActiveMQStreamMessage ()

6.47.1.2 virtual activemq::commands::ActiveMQStreamMessage::~ActiveMQStreamMessage () throw () [virtual]

6.47.2 Member Function Documentation

6.47.2.1 virtual void activemq::commands::ActiveMQStreamMessage::clearBody () [virtual]

Clears out the body of the message. This does not clear the headers or properties.

Exceptions:

CMSException - if an internal error occurs.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 377).

6.47.2.2 virtual cms::StreamMessage* activemq::commands::ActiveMQStreamMessage::clone () const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p. 2096).

References activemq::commands::Message::setReadOnlyBody(), and activemq::commands::Message::setReadOnlyProperties().

6.47.2.3 virtual ActiveMQStreamMessage* activemq::commands::ActiveMQStreamMessage::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 2076).

6.47.2.4 virtual void activemq::commands::ActiveMQStreamMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Message** (p. 2077).

6.47.2.5 virtual bool activemq::commands::ActiveMQStreamMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 378).

6.47.2.6 virtual unsigned char activemq::commands::ActiveMQStreamMessage::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 2079).

6.47.2.7 virtual ValueType activemq::commands::ActiveMQStreamMessage::getNextValueType () const [virtual]

Returns the value type for the element in the StreamMessage. The CMS provider should translate all internal type identifiers into the CMS Value types returning UNKNOWN_TYPE for any specialized types not directly supported in the CMS API. The call can fail if the StreamMessage is currently in the middle of a ready of a Byte array.

Returns:

The ValueType contained in the next message element.

Exceptions:

CMSException if no property exists that matches the requested key.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if the message contains invalid data.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2925).

6.47.2.8 virtual void activemq::commands::ActiveMQStreamMessage::onSend () [virtual]

Allows derived **Message** (p. 2072) classes to perform tasks before a message is sent.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 379).

6.47.2.9 virtual bool activemq::commands::ActiveMQStreamMessage::readBoolean () const [virtual]

Reads a Boolean from the Stream message stream.

Returns:

boolean value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2925).

6.47.2.10 virtual unsigned char activemq::commands::ActiveMQStreamMessage::readByte () const [virtual]

Reads a Byte from the Stream message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2926).

6.47.2.11 virtual int activemq::commands::ActiveMQStreamMessage::readBytes (unsigned char * *buffer*, int *length*) const [virtual]

Reads a portion of the Stream message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an CMSException is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2926).

6.47.2.12 virtual int activemq::commands::ActiveMQStreamMessage::readBytes (std::vector< unsigned char > & *value*) const [virtual]

Reads a byte array from the Stream message stream. If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2927).

6.47.2.13 virtual char activemq::commands::ActiveMQStreamMessage::readChar () const [virtual]

Reads a Char from the Stream message stream.

Returns:

char value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2927).

6.47.2.14 virtual double activemq::commands::ActiveMQStreamMessage::readDouble () const [virtual]

Reads a 64 bit double from the Stream message stream.

Returns:

double value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2928).

6.47.2.15 virtual float activemq::commands::ActiveMQStreamMessage::readFloat () const [virtual]

Reads a 32 bit float from the Stream message stream.

Returns:

double value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2928).

6.47.2.16 virtual int activemq::commands::ActiveMQStreamMessage::readInt () const [virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns:

int value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2928).

6.47.2.17 virtual long long activemq::commands::ActiveMQStreamMessage::readLong () const [virtual]

Reads a 64 bit long from the Stream message stream.

Returns:

long long value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2929).

6.47.2.18 virtual short activemq::commands::ActiveMQStreamMessage::readShort () const [virtual]

Reads a 16 bit signed short from the Stream message stream.

Returns:

short value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2929).

6.47.2.19 virtual std::string activemq::commands::ActiveMQStreamMessage::readString () const [virtual]

Reads an ASCII String from the Stream message stream.

Returns:

String from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.

MessageEOFException - if unexpected end of message stream has been reached.

MessageFormatException - if this type conversion is invalid.

MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2930).

6.47.2.20 virtual unsigned short activemq::commands::ActiveMQStreamMessage::readUnsignedShort () const [virtual]

Reads a 16 bit unsigned short from the Stream message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSException - if the CMS provider fails to read the message due to some internal error.
MessageEOFException - if unexpected end of message stream has been reached.
MessageFormatException - if this type conversion is invalid.
MessageNotReadableException - if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2930).

6.47.2.21 virtual void activemq::commands::ActiveMQStreamMessage::reset () [virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions:

CMSException - If the provider fails to perform the reset operation.
MessageFormatException - If the **Message** (p. 2072) has an invalid format.

Implements **cms::StreamMessage** (p. 2930).

6.47.2.22 virtual std::string activemq::commands::ActiveMQStreamMessage::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 2086).

6.47.2.23 virtual void activemq::commands::ActiveMQStreamMessage::writeBoolean (bool *value*) [virtual]

Writes a boolean to the Stream message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value boolean to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.
MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2931).

6.47.2.24 virtual void activemq::commands::ActiveMQStreamMessage::writeByte (unsigned char *value*) [virtual]

Writes a byte to the Stream message stream as a 1-byte value.

Parameters:

value byte to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2931).

6.47.2.25 virtual void activemq::commands::ActiveMQStreamMessage::writeBytes (const unsigned char * *value*, int *offset*, int *length*) [virtual]

Writes a portion of a byte array to the Stream message stream. size as the number of bytes to write.

Parameters:

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2931).

6.47.2.26 virtual void activemq::commands::ActiveMQStreamMessage::writeBytes (const std::vector< unsigned char > & *value*) [virtual]

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters:

value bytes to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2932).

6.47.2.27 virtual void activemq::commands::ActiveMQStreamMessage::writeChar (char *value*) [virtual]

Writes a char to the Stream message stream as a 1-byte value.

Parameters:

value char to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2932).

6.47.2.28 virtual void activemq::commands::ActiveMQStreamMessage::writeDouble (double *value*) [virtual]

Writes a double to the Stream message stream as a 8 byte value.

Parameters:

value double to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2932).

6.47.2.29 virtual void activemq::commands::ActiveMQStreamMessage::writeFloat (float *value*) [virtual]

Writes a float to the Stream message stream as a 4 byte value.

Parameters:

value float to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2933).

6.47.2.30 virtual void activemq::commands::ActiveMQStreamMessage::writeInt (int *value*) [virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters:

value signed int to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2933).

6.47.2.31 virtual void activemq::commands::ActiveMQStreamMessage::writeLong (long long *value*) [virtual]

Writes a long long to the Stream message stream as a 8 byte value.

Parameters:

value signed long long to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2933).

6.47.2.32 virtual void activemq::commands::ActiveMQStreamMessage::writeShort (short *value*) [virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters:

value signed short to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2934).

6.47.2.33 virtual void activemq::commands::ActiveMQStreamMessage::writeString (const std::string & *value*) [virtual]

Writes an ASCII String to the Stream message stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2934).

6.47.2.34 virtual void activemq::commands::ActiveMQStreamMessage::writeUnsignedShort (unsigned short *value*) [virtual]

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters:

value unsigned short to write to the stream

Exceptions:

CMSException - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException - if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2934).

6.47.3 Field Documentation

6.47.3.1 const unsigned char activemq::commands::ActiveMQStreamMessage::ID_ACTIVEMQSTREAMMESSAGE = 27 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQStreamMessage.h**

6.48 activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQStreamMessageMarshaller** (p. 489).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQStreamMessageMarshaller`
diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller:

Public Member Functions

- **ActiveMQStreamMessageMarshaller** ()
- virtual ~**ActiveMQStreamMessageMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.48.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQStreamMessageMarshaller** (p. 489). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.48.2 Constructor & Destructor Documentation

6.48.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::

() [inline]

6.48.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::

() [inline, virtual]

6.48.3 Member Function Documentation

6.48.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::cr

() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.48.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::ge

() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.48.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::lo

(**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.48.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::loo (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.48.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.48.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.48.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2187).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQStreamMessageMarshaller.h**

6.49 activemq::commands::ActiveMQTempDestination Class Reference

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual void **setPhysicalName** (const std::string &**physicalName**)

  Set this destination's physical name.

- void **setConnection** (**core::ActiveMQConnection** ***connection**)

  Sets the Parent Connection that is notified when this destination is destroyed.

- **core::ActiveMQConnection** * **getConnection** () const

  Retrieves the Parent Connection that created this Connection.

- std::string **getConnectionId** () const

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTEMPDESTINATION** = 0

Protected Attributes

- **core::ActiveMQConnection** * **connection**

  Connection that we call back on close to allow this resource to be cleaned up correctly at this end and at the Broker End.

- std::string **connectionId**

  The Connection Id of the Connection that created this Temporary Destination.

- int **sequenceId**

6.49.1 Constructor & Destructor Documentation

6.49.1.1 activemq::commands::ActiveMQTempDestination::ActiveMQTempDestination ()

6.49.1.2 activemq::commands::ActiveMQTempDestination::ActiveMQTempDestination (const std::string & *name*)

6.49.1.3 virtual activemq::commands::ActiveMQTempDestination::~ActiveMQTempDestination () throw () [virtual]

6.49.2 Member Function Documentation

6.49.2.1 virtual ActiveMQTempDestination* activemq::commands::ActiveMQTempDestination::cloneDataStructure () const [inline, virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 323).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 503), and **activemq::commands::ActiveMQTempTopic** (p. 511).

References NULL.

6.49.2.2 virtual void activemq::commands::ActiveMQTempDestination::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSException - If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 965).

6.49.2.3 virtual void activemq::commands::ActiveMQTempDestination::copyDataStructure (const DataStructure * *src*) [inline, virtual]

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 323).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 503), and **activemq::commands::ActiveMQTempTopic** (p. 511).

References activemq::commands::ActiveMQDestination::copyDataStructure().

6.49.2.4 virtual bool activemq::commands::ActiveMQTempDestination::equals (const DataStructure * *value*) const [inline, virtual]

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 324).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 504), and **activemq::commands::ActiveMQTempTopic** (p. 512).

References activemq::commands::ActiveMQDestination::equals().

6.49.2.5 core::ActiveMQConnection* activemq::commands::ActiveMQTempDestination::getConnection () const [inline]

Retrieves the Parent Connection that created this Connection.

Returns:

pointer to a Connection if one was set, false otherwise.

6.49.2.6 std::string activemq::commands::ActiveMQTempDestination::getConnectionId () const [inline]

Returns:

the connection Id of the Connection that created this temporary destination.

6.49.2.7 virtual unsigned char activemq::commands::ActiveMQTempDestination::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 325).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 504), and **activemq::commands::ActiveMQTempTopic** (p. 512).

6.49.2.8 void activemq::commands::ActiveMQTempDestination::setConnection (core::ActiveMQConnection * *connection*) [inline]

Sets the Parent Connection that is notified when this destination is destroyed.

Parameters:

connection The parent connection to be used to destroy this destination if closed..

6.49.2.9 virtual void activemq::commands::ActiveMQTempDestination::setPhysicalName (const std::string & *physicalName*) [virtual]

Set this destination's physical name.

Returns:

const string containing the name

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 329).

6.49.2.10 virtual std::string activemq::commands::ActiveMQTempDestination::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 329).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 505), and **activemq::commands::ActiveMQTempTopic** (p. 513).

6.49.3 Field Documentation

6.49.3.1 core::ActiveMQConnection* activemq::commands::ActiveMQTempDestination::connection [protected]

Connection that we call back on close to allow this resource to be cleaned up correctly at this end and at the Broker End.

6.49.3.2 std::string activemq::commands::ActiveMQTempDestination::connectionId [protected]

The Connection Id of the Connection that created this Temporary Destination.

6.49.3.3 const unsigned char activemq::commands::ActiveMQTempDestination::ID_ACTIVEMQTEMPDESTINATION = 0 [static]

6.49.3.4 int activemq::commands::ActiveMQTempDestination::sequenceId [protected]

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.50.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQTempDestinationMarshaller** (p. 498). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.50.2 Constructor & Destructor Documentation

6.50.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller () [inline]

6.50.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller () [inline, virtual]

6.50.3 Member Function Documentation

6.50.3.1 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::l (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 334).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshalle** (p. 507), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 515).

6.50.3.2 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::l (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 334).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshalle** (p. 508), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 516).

6.50.3.3 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::t (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 335).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshalle** (p. 508), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 516).

6.50.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::t (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 335).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshalle** (p. 508), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 516).

6.50.3.5 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::t (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 336).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshalle** (p. 509), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 517).

The documentation for this class was generated from the following file:

6.51.1 Constructor & Destructor Documentation

6.51.1.1 activemq::commands::ActiveMQTempQueue::ActiveMQTempQueue ()

6.51.1.2 activemq::commands::ActiveMQTempQueue::ActiveMQTempQueue (const std::string & *name*)

6.51.1.3 virtual activemq::commands::ActiveMQTempQueue::~ActiveMQTempQueue () throw () [virtual]

6.51.2 Member Function Documentation

6.51.2.1 virtual cms::Destination* activemq::commands::ActiveMQTempQueue::clone () const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implements **cms::Destination** (p. 1378).

6.51.2.2 virtual ActiveMQTempQueue* activemq::commands::ActiveMQTempQueue::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 494).

6.51.2.3 virtual void activemq::commands::ActiveMQTempQueue::copy (const cms::Destination & *source*) [inline, virtual]

6.51.2.4 virtual void activemq::commands::ActiveMQTempQueue::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 495).

6.51.2.5 virtual void activemq::commands::ActiveMQTempQueue::destroy () [virtual]

Destroy's the Temporary Destination at the Provider.

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::TemporaryQueue** (p. 3012).

6.51.2.6 virtual bool activemq::commands::ActiveMQTempQueue::equals (const cms::Destination & *other*) const [virtual]

6.51.2.7 virtual bool activemq::commands::ActiveMQTempQueue::equals (const DataStructure * *value*) const [virtual]

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 495).

6.51.2.8 virtual const cms::TemporaryQueue* activemq::commands::ActiveMQTempQueue::getCMSDestination () const [inline, virtual]

Returns:

the **cms::Destination** (p. 1377) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 325).

6.51.2.9 virtual const cms::CMSProperties& activemq::commands::ActiveMQTempQueue::getCMSProperties () const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 1379).

6.51.2.10 virtual unsigned char activemq::commands::ActiveMQTempQueue::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 495).

6.51.2.11 virtual cms::Destination::DestinationType activemq::commands::ActiveMQTempQueue::getDestinationType () const [inline, virtual]

Returns the Type of Destination that this object represents.

Returns:

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 326).

References cms::Destination::TEMPORARY_QUEUE.

6.51.2.12 virtual std::string activemq::commands::ActiveMQTempQueue::getQueueName () const [inline, virtual]

Gets the name of this queue.

Returns:

The queue name.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Queue** (p. 2514).

6.51.2.13 virtual std::string activemq::commands::ActiveMQTempQueue::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 496).

6.51.3 Field Documentation

6.52.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::~Ac () [inline, virtual]

6.52.3 Member Function Documentation

6.52.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::create () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.52.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::getDa () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.52.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::looseM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 499).

6.52.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::looseU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 499).

6.52.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 500).

6.52.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 500).

6.52.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 501).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQTempQueueMarshaller.h**

6.53 activemq::commands::ActiveMQTempTopic Class Reference

`#include <src/main/activemq/commands/ActiveMQTempTopic.h>`Inheritance diagram for activemq::commands::ActiveMQTempTopic:

Public Member Functions

- **ActiveMQTempTopic** ()
- **ActiveMQTempTopic** (const std::string &name)
- virtual ~**ActiveMQTempTopic** () throw ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **ActiveMQTempTopic** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const
- virtual const **cms::TemporaryTopic** * **getCMSDestination** () const
- virtual **cms::Destination::DestinationType** **getDestinationType** () const

  Returns the Type of Destination that this object represents.

- virtual **cms::Destination** * **clone** () const

  Creates a new instance of this destination type that is a copy of this one, and returns it.

- virtual void **copy** (const **cms::Destination** &source)
- virtual const **cms::CMSProperties** & **getCMSProperties** () const

  Retrieve any properties that might be part of the destination that was specified.

- virtual bool **equals** (const **cms::Destination** &other) const
- virtual std::string **getTopicName** () const

  Gets the name of this topic.

- virtual void **destroy** ()

  Destroy's the Temporary Destination at the Provider.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTEMPTOPIC** = 103

6.53.1 Constructor & Destructor Documentation

6.53.1.1 activemq::commands::ActiveMQTempTopic::ActiveMQTempTopic ()

6.53.1.2 activemq::commands::ActiveMQTempTopic::ActiveMQTempTopic (const std::string & *name*)

6.53.1.3 virtual activemq::commands::ActiveMQTempTopic::~ActiveMQTempTopic () throw () [virtual]

6.53.2 Member Function Documentation

6.53.2.1 virtual cms::Destination* activemq::commands::ActiveMQTempTopic::clone () const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implements **cms::Destination** (p. 1378).

6.53.2.2 virtual ActiveMQTempTopic* activemq::commands::ActiveMQTempTopic::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 494).

6.53.2.3 virtual void activemq::commands::ActiveMQTempTopic::copy (const cms::Destination & *source*) [inline, virtual]

6.53.2.4 virtual void activemq::commands::ActiveMQTempTopic::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 495).

6.53.2.5 virtual void activemq::commands::ActiveMQTempTopic::destroy () [virtual]

Destroy's the Temporary Destination at the Provider.

Exceptions:

CMSException

Implements **cms::TemporaryTopic** (p. 3013).

6.53.2.6 virtual bool activemq::commands::ActiveMQTempTopic::equals (const cms::Destination & *other*) const [virtual]

6.53.2.7 virtual bool activemq::commands::ActiveMQTempTopic::equals (const DataStructure * *value*) const [virtual]

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 495).

6.53.2.8 virtual const cms::TemporaryTopic* activemq::commands::ActiveMQTempTopic::getCMSDestination () const [inline, virtual]

Returns:

the **cms::Destination** (p. 1377) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 325).

6.53.2.9 virtual const cms::CMSProperties& activemq::commands::ActiveMQTempTopic::getCMSProperties () const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 1379).

6.53.2.10 virtual unsigned char activemq::commands::ActiveMQTempTopic::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 495).

6.53.2.11 virtual cms::Destination::DestinationType activemq::commands::ActiveMQTempTopic::getDestinationType () const [inline, virtual]

Returns the Type of Destination that this object represents.

Returns:

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 326).

References cms::Destination::TEMPORARY_TOPIC.

6.53.2.12 virtual std::string activemq::commands::ActiveMQTempTopic::getTopicName () const [inline, virtual]

Gets the name of this topic.

Returns:

The topic name.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Topic** (p. 3096).

6.53.2.13 virtual std::string activemq::commands::ActiveMQTempTopic::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 496).

6.53.3 Field Documentation

6.53.3.1 const unsigned char activemq::commands::ActiveMQTempTopic::ID_ACTIVEMQTEMPTOPIC = 103 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQTempTopic.h**

6.54 activemq::wireformat::openwire::marshal::generated::ActiveMQTem Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 514).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQTempTopicMarshaller.h>`
diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller:

Public Member Functions

- **ActiveMQTempTopicMarshaller** ()
- virtual ~**ActiveMQTempTopicMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.54.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 514). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.54.2 Constructor & Destructor Documentation

6.54.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::Activ () [inline]

6.54.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::~Act () [inline, virtual]

6.54.3 Member Function Documentation

6.54.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::createC () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.54.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::getDat () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.54.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::looseM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 499).

6.54.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::looseU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 499).

6.54.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 500).

6.54.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 500).

6.54.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationM** (p. 501).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQTempTopicMarshaller.h**

6.55 activemq::commands::ActiveMQTextMessage Class Reference

6.55.1 Constructor & Destructor Documentation

6.55.1.1 activemq::commands::ActiveMQTextMessage::ActiveMQTextMessage ()

6.55.1.2 virtual activemq::commands::ActiveMQTextMessage::~ActiveMQTextMessage () throw () [virtual]

6.55.2 Member Function Documentation

6.55.2.1 virtual void activemq::commands::ActiveMQTextMessage::beforeMarshal (wireformat::WireFormat * *wireFormat*) [virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters:

wireFormat The **wireformat** (p. 81) object to control marshaling

Exceptions:

IOException if an I/O error occurs.

Implements **activemq::wireformat::MarshalAware** (p. 2036).

6.55.2.2 virtual void activemq::commands::ActiveMQTextMessage::clearBody () [virtual]

Clears out the body of the message. This does not clear the headers or properties.

Exceptions:

CMSException - if an internal error occurs.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 377).

6.55.2.3 virtual cms::TextMessage* activemq::commands::ActiveMQTextMessage::clone () const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p. 2096).

References activemq::commands::Message::setReadOnlyBody(), and activemq::commands::Message::setReadOnlyProperties().

6.55.2.4 virtual ActiveMQTextMessage* activemq::commands::ActiveMQTextMessage::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 2076).

6.55.2.5 virtual void activemq::commands::ActiveMQTextMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Message** (p. 2077).

6.55.2.6 virtual bool activemq::commands::ActiveMQTextMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 378).

6.55.2.7 virtual unsigned char activemq::commands::ActiveMQTextMessage::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 2079).

6.55.2.8 virtual unsigned int activemq::commands::ActiveMQTextMessage::getSize () const [virtual]

Returns the Size of this message in Bytes.

Returns:

number of bytes this message equates to.

Reimplemented from **activemq::commands::Message** (p. 2081).

6.55.2.9 virtual std::string activemq::commands::ActiveMQTextMessage::getText () const [virtual]

Gets the message character buffer.

Returns:

The message character buffer.

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::TextMessage** (p. 3014).

6.55.2.10 virtual void activemq::commands::ActiveMQTextMessage::setText (const std::string & *msg*) [virtual]

Sets the message contents.

Parameters:

msg The message buffer.

Exceptions:

CMSException - if an internal error occurs.

MessageNotWriteableException - if the message is in read-only mode..

Implements **cms::TextMessage** (p. 3015).

6.55.2.11 virtual void activemq::commands::ActiveMQTextMessage::setText (const char * *msg*) [virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters:

msg The message buffer.

Exceptions:

CMSException - if an internal error occurs.

MessageNotWriteableException - if the message is in read-only mode..

Implements **cms::TextMessage** (p. 3015).

6.55.2.12 virtual std::string activemq::commands::ActiveMQTextMessage::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 2086).

6.55.3 Field Documentation

6.55.3.1 const unsigned char activemq::commands::ActiveMQTextMessage::ID_ACTIVEMQTEXTMESSAGE = 28 [static]

() [inline, virtual]

6.56.3 Member Function Documentation

6.56.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::creat
() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.56.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::getD
() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.56.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::loose
(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.56.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::loose (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185).

6.56.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.56.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186).

6.56.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tight (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2187).

The documentation for this class was generated from the following file:

6.57.2 Member Function Documentation

6.57.2.1 virtual cms::Destination* activemq::commands::ActiveMQTopic::clone () const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implements **cms::Destination** (p. 1378).

6.57.2.2 virtual ActiveMQTopic* activemq::commands::ActiveMQTopic::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 323).

6.57.2.3 virtual void activemq::commands::ActiveMQTopic::copy (const cms::Destination & *source*) [inline, virtual]

6.57.2.4 virtual void activemq::commands::ActiveMQTopic::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 323).

6.57.2.5 virtual bool activemq::commands::ActiveMQTopic::equals (const cms::Destination & *other*) const [virtual]

6.57.2.6 virtual bool activemq::commands::ActiveMQTopic::equals (const DataStructure * *value*) const [virtual]

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 324).

6.57.2.7 virtual const cms::Topic* activemq::commands::ActiveMQTopic::getCMSDestination () const [inline, virtual]

Returns:

the **cms::Destination** (p. 1377) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 325).

6.57.2.8 virtual const cms::CMSProperties& activemq::commands::ActiveMQTopic::getCMSProperties () const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 1379).

6.57.2.9 virtual unsigned char activemq::commands::ActiveMQTopic::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 325).

6.57.2.10 virtual cms::Destination::DestinationType activemq::commands::ActiveMQTopic::getDestinationType () const [inline, virtual]

Returns the Type of Destination that this object represents.

Returns:

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 326).

References cms::Destination::TOPIC.

6.57.2.11 virtual std::string activemq::commands::ActiveMQTopic::getTopicName () const [inline, virtual]

Gets the name of this topic.

Returns:

The topic name.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Topic** (p. 3096).

6.57.2.12 virtual std::string activemq::commands::ActiveMQTopic::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 329).

6.57.3 Field Documentation

6.57.3.1 const unsigned char activemq::commands::ActiveMQTopic::ID_ACTIVEMQTOPIC = 101 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQTopic.h**

6.58 activemq::wireformat::openwire::marshal::generated::ActiveMQTop Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQTopicMarshaller** (p. 531).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQTopicMarshaller.h>`Inhe
diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller:

Public Member Functions

- **ActiveMQTopicMarshaller** ()
- virtual ~**ActiveMQTopicMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.58.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ActiveMQTopicMarshaller** (p. 531). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.58.2 Constructor & Destructor Documentation

6.58.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::ActiveMQ () [inline]

6.58.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::~ActiveM () [inline, virtual]

6.58.3 Member Function Documentation

6.58.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.58.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::getDataStru () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.58.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::looseMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 334).

6.58.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::looseUnmars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 334).

6.58.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 335).

6.58.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 335).

6.58.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightUnmars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshal** (p. 336).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQTopicMarshaller.h**

6.59 activemq::core::ActiveMQTransactionContext Class Reference

Transaction Management class, hold messages that are to be redelivered upon a request to rollback.

`#include <src/main/activemq/core/ActiveMQTransactionContext.h>`Inheritance diagram for activemq::core::ActiveMQTransactionContext:

Public Member Functions

- **ActiveMQTransactionContext** (**activemq::core::kernels::ActiveMQSessionKernel** *session, const **decaf::util::Properties** &properties)

  Constructor.

- virtual ~**ActiveMQTransactionContext** ()
- virtual void **addSynchronization** (const **Pointer< Synchronization >** &sync)

  *Adds a **Synchronization** (p. 2968) to this Transaction.*

- virtual void **removeSynchronization** (const **Pointer< Synchronization >** &sync)

  *Removes a **Synchronization** (p. 2968) to this Transaction.*

- virtual void **begin** ()

  Begins a new transaction if one is not currently in progress.

- virtual void **commit** ()

  Commit the current Transaction.

- virtual void **rollback** ()

  Rollback the current Transaction.

- virtual const **decaf::lang::Pointer< commands::TransactionId >** & **getTransactionId** () const

  Get the Transaction Id object for the current Transaction, returns NULL if no transaction is running.

- virtual bool **isInTransaction** () const

  Checks to see if there is currently a Transaction in progress returns false if not, true otherwise.

- virtual bool **isInLocalTransaction** () const

  Checks to see if there is currently an Local Transaction in progess, returns false if not, true otherwise.

- virtual bool **isInXATransaction** () const

  Checks to see if there is currently an XA Transaction in progess, returns false if not, true otherwise.

- virtual void **commit** (const **cms::Xid** *xid, bool onePhase)

Commits a global transaction.

- virtual void **end** (const **cms::Xid** *xid, int flags)
  Ends the work done for a transaction branch.
- virtual void **forget** (const **cms::Xid** *xid)
  Informs the Resource Manager that it can forget about a specified transaction branch.
- virtual int **getTransactionTimeout** () const
  Gets the transaction timeout value for this XAResource.
- virtual bool **isSameRM** (const **cms::XAResource** *theXAResource)
- virtual int **prepare** (const **cms::Xid** *xid)
  Requests the Resource manager to prepare to commit a specified transaction.
- virtual int **recover** (int flag, **cms::Xid** **recovered)
  Get a list of prepared transaction branches.
- virtual void **rollback** (const **cms::Xid** *xid)
  Requests the Resource Manager to rollback a specified transaction branch.
- virtual bool **setTransactionTimeout** (int seconds)
  Sets the transaction timeout value for this XAResource.
- virtual void **start** (const **cms::Xid** *xid, int flags)
  Starts work for a specified transaction branch.

6.59.1 Detailed Description

Transaction Management class, hold messages that are to be redelivered upon a request to rollback. The Transaction represents an always running transaction, when it is committed or rolled back it silently creates a new transaction for the next set of messages. The only way to permanently end this transaction is to delete it.

Since:

2.0

6.59.2 Constructor & Destructor Documentation

6.59.2.1 activemq::core::ActiveMQTransactionContext::ActiveMQTransactionContext (activemq::core::kernels::ActiveMQSessionKernel * *session*, const decaf::util::Properties & *properties*)

Constructor.

Parameters:

session The session that contains this transaction

properties Configuration parameters for this object

6.59.2.2 virtual activemq::core::ActiveMQTransactionContext::~ActiveMQTransactionContext () [virtual]

6.59.3 Member Function Documentation

6.59.3.1 virtual void activemq::core::ActiveMQTransactionContext::addSynchronization (const Pointer< Synchronization > & *sync*) [virtual]

Adds a **Synchronization** (p. 2968) to this Transaction.

Parameters:

sync - The **Synchronization** (p. 2968) instance to add.

6.59.3.2 virtual void activemq::core::ActiveMQTransactionContext::begin () [virtual]

Begins a new transaction if one is not currently in progress.

Exceptions:

ActiveMQException

6.59.3.3 virtual void activemq::core::ActiveMQTransactionContext::commit (const cms::Xid * *xid*, bool *onePhase*) [virtual]

Commits a global transaction.

Parameters:

xid the XID which identifies the global transaction.

onePhase true if the resource manager should use a one-phase commit protocol to commit the transaction.

Exceptions:

XAException if an error occurred.

Possible errors are identified by the errorcode in the XAException and include: XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, XA_HEURMIX, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO. In addition, one of the XA_RB* errors can occur if the transaction was not committed and onePhase was set to true. On completion of this method, the Resource Manager has rolled back the transaction and released resources held by the transaction.

Implements **cms::XAResource** (p. 3273).

6.59.3.4 virtual void activemq::core::ActiveMQTransactionContext::commit () [virtual]

Commit the current Transaction.

Exceptions:

ActiveMQException

6.59.3.5 virtual void activemq::core::ActiveMQTransactionContext::end (const cms::Xid * *xid*, int *flags*) [virtual]

Ends the work done for a transaction branch. The Resource Manager disconnects the XA resource from the transaction branch and allows the transaction to complete.

Parameters:

xid the XID which identifies the global transaction. Should have previously been used as the parameter to a start. method.

flags a flags integer - one of: XAResource::TMSUCCESS, XAResource::TMFAIL, or XAResource::TMSUSPEND.

TMSUCCESS means that this section of work completed successfully.

TMFAIL means that this section of work failed. The Resource Manager can mark the transaction for rollback only.

TMSUSPEND means that this section of work is suspended and not yet complete. The associated transaction context is also suspended and must be restarted with a call to **start(Xid, int)** (p. ??) with the TMRESUME flag.

Exceptions:

XAException if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB*.

Implements **cms::XAResource** (p. 3273).

6.59.3.6 virtual void activemq::core::ActiveMQTransactionContext::forget (const cms::Xid * *xid*) [virtual]

Informs the Resource Manager that it can forget about a specified transaction branch.

Parameters:

xid the XID which identifies the global transaction.

Exceptions:

XAException if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implements **cms::XAResource** (p. 3274).

6.59.3.7 virtual const decaf::lang::Pointer<commands::TransactionId>& activemq::core::ActiveMQTransactionContext::getTransactionId () const [virtual]

Get the Transaction Id object for the current Transaction, returns NULL if no transaction is running.

Returns:

TransactionInfo

Exceptions:

InvalidStateException if a Transaction is not in progress.

6.59.3.8 virtual int activemq::core::ActiveMQTransactionContext::getTransactionTimeout () const [virtual]

Gets the transaction timeout value for this XAResource. The default timeout value is the default timeout value set for the Resource Manager.

Returns:

the transaction timeout value for this XAResource in seconds.

Exceptions:

XAException if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.

Implements **cms::XAResource** (p. 3274).

6.59.3.9 virtual bool activemq::core::ActiveMQTransactionContext::isInLocalTransaction () const [virtual]

Checks to see if there is currently an Local Transaction in progess, returns false if not, true otherwise.

Returns:

true if an Local Transaction is in progress.

6.59.3.10 virtual bool activemq::core::ActiveMQTransactionContext::isInTransaction () const [virtual]

Checks to see if there is currently a Transaction in progress returns false if not, true otherwise.

Returns:

true if a transaction is in progress.

6.59.3.11 virtual bool activemq::core::ActiveMQTransactionContext::isInXATransaction () const [virtual]

Checks to see if there is currently an XA Transaction in progess, returns false if not, true otherwise.

Returns:

true if an XA Transaction is in progress.

6.59.3.12 virtual bool activemq::core::ActiveMQTransactionContext::isSameRM (const cms::XAResource * *theXAResource*) [virtual]

6.59.3.13 virtual int activemq::core::ActiveMQTransactionContext::prepare (const cms::Xid * *xid*) [virtual]

Requests the Resource manager to prepare to commit a specified transaction.

Parameters:

xid the XID which identifies the global transaction.

Returns:

an integer: XA_RDONLY or XA_OK. XA_OK implies that the transaction work has been prepared normally, XA_RDONLY implies that the transaction branch is read only and has been committed. If there is a failure which requires a rollback, an XAException is raised.

Exceptions:

XAException if an error occurs. Possible error identified in the errorcode include: XA_-RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_-PROTO.

Implements **cms::XAResource** (p. 3275).

6.59.3.14 virtual int activemq::core::ActiveMQTransactionContext::recover (int *flag*, cms::Xid ** *recovered*) [virtual]

Get a list of prepared transaction branches. Typically used by a transaction manager during recovery to find transaction branches that are in prepared or heuristically completed states.

Parameters:

flag an integer. Must be one of: XAResource::TMSTARTRSCAN, XAResource::TMENDRSCAN, XAResource::TMNOFLAGS.

Returns:

an array of zero or more XIDs identifying the transaction branches in the prepared or heuristically completed states.

Exceptions:

XAException if an error occurs. Possible error identified in the errorcode include: XAER_-RMERR, XAER_RMFAIL, XAER_INVAL, and XAER_PROTO.

Implements **cms::XAResource** (p. 3275).

6.59.3.15 virtual void activemq::core::ActiveMQTransactionContext::removeSynchronization (const Pointer< Synchronization > & *sync*) [virtual]

Removes a **Synchronization** (p. 2968) to this Transaction.

Parameters:

sync - The **Synchronization** (p. 2968) instance to add.

6.59.3.16 virtual void activemq::core::ActiveMQTransactionContext::rollback (const cms::Xid * *xid*) [virtual]

Requests the Resource Manager to rollback a specified transaction branch.

Parameters:

xid the XID which identifies the transaction branch.

Exceptions:

XAException if an error occurs.

Implements **cms::XAResource** (p. 3275).

6.59.3.17 virtual void activemq::core::ActiveMQTransactionContext::rollback () [virtual]

Rollback the current Transaction.

Exceptions:

ActiveMQException

6.59.3.18 virtual bool activemq::core::ActiveMQTransactionContext::setTransactionTimeout (int *seconds*) [virtual]

Sets the transaction timeout value for this XAResource. If the value is set to 0, the default timeout value for the Resource Manager is used.

Parameters:

seconds the new Timeout value in seconds.

Returns:

true if the transaction timeout value has been updated, false otherwise.

Exceptions:

XAException if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

Implements **cms::XAResource** (p. 3276).

6.59.3.19 virtual void activemq::core::ActiveMQTransactionContext::start (const cms::Xid * *xid*, int *flags*) [virtual]

Starts work for a specified transaction branch.

Parameters:

xid the XID which identifies the transaction branch.

flags an integer. Must be one of XAResource::TMNOFLAGS, XAResource::TMJOIN, or XAResource::TMRESUME.

TMJOIN implies that the start applies to joining a transaction previously passed to the Resource Manager.

TMRESUME implies that the start applies to a suspended transaction that should be restarted.

If TMNOFLAGS is specified, then if the transaction has been previously seen by the Resource Manager, an XAException is raised with the **code** (p. 1005) XAER_DUPID.

Exceptions:

XAException if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implements **cms::XAResource** (p. 3276).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQTransactionContext.h**

6.60 activemq::core::ActiveMQXAConnection Class Reference

`#include <src/main/activemq/core/ActiveMQXAConnection.h>`Inheritance diagram for activemq::core::ActiveMQXAConnection:

Public Member Functions

- **ActiveMQXAConnection** (const **Pointer< transport::Transport >** &transport, const **Pointer< decaf::util::Properties >** &properties)
- virtual ~**ActiveMQXAConnection** ()
- virtual **cms::XASession** * **createXASession** ()

  Creates an XASession object.

- virtual **cms::Session** * **createSession** (**cms::Session::AcknowledgeMode** ackMode)

  *Creates a new **Session** (p. 2680) to work for this **Connection** (p. 1089) using the specified acknowledgment mode.*

  Parameters:

  ***ackMode** the Acknowledgment Mode to use.*

  Exceptions:

  ***CMSException** (p. **979**)*

6.60.1 Constructor & Destructor Documentation

6.60.1.1 activemq::core::ActiveMQXAConnection::ActiveMQXAConnection (const Pointer< transport::Transport > & *transport*, const Pointer< decaf::util::Properties > & *properties*)

6.60.1.2 virtual activemq::core::ActiveMQXAConnection::~ActiveMQXAConnection () [virtual]

6.60.2 Member Function Documentation

6.60.2.1 virtual cms::Session* activemq::core::ActiveMQXAConnection::createSession (cms::Session::AcknowledgeMode *ackMode*) [virtual]

Creates a new **Session** (p. 2680) to work for this **Connection** (p. 1089) using the specified acknowledgment mode.

Parameters:

ackMode the Acknowledgment Mode to use.

Exceptions:

***CMSException** (p. **979**)*

Reimplemented from **activemq::core::ActiveMQConnection** (p. 244).

6.60.2.2 virtual cms::XASession* activemq::core::ActiveMQXAConnection::createXASession () [virtual]

Creates an XASession object.

Returns:

a newly created XASession instance, caller owns the pointer.

Exceptions:

CMSException If the XAConnection object fails to create the XASession instance due to an internal error.

Implements **cms::XAConnection** (p. 3261).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQXAConnection.h**

6.61 activemq::core::ActiveMQXAConnectionFactory Class Reference

`#include <src/main/activemq/core/ActiveMQXAConnectionFactory.h>`Inheritance diagram for activemq::core::ActiveMQXAConnectionFactory:

Public Member Functions

  Constructor.

- virtual ~**ActiveMQXAConnectionFactory** ()
- virtual **cms::XAConnection** * **createXAConnection** ()

  Creates an XAConnection with the default user name and password.

- virtual **cms::XAConnection** * **createXAConnection** (const std::string &userName, const std::string &password)

  Creates an XA connection with the specified user name and password.

Protected Member Functions

- virtual **ActiveMQConnection** * **createActiveMQConnection** (const **Pointer**< **transport::Transport** > &transport, const **Pointer**< **decaf::util::Properties** > &properties)

  *Create a new **ActiveMQConnection** (p. 232) instnace using the provided Transport and Properties.*

6.61.1 Constructor & Destructor Documentation

6.61.1.1 activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory ()

6.61.1.2 activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory (const std::string & *uri*, const std::string & *username* = "", const std::string & *password* = "")

Constructor.

Parameters:

uri the URI of the Broker we are connecting to.

username to authenticate with, defaults to ""

password to authenticate with, defaults to ""

6.61.1.3 activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory (const decaf::net::URI & *uri*, const std::string & *username* = "", const std::string & *password* = "")

Constructor.

Parameters:

uri the URI of the Broker we are connecting to.

username to authenticate with, defaults to ""

password to authenticate with, defaults to ""

6.61.1.4 virtual activemq::core::ActiveMQXAConnectionFactory::~ActiveMQXAConnectionFactory () [virtual]

6.61.2 Member Function Documentation

6.61.2.1 virtual ActiveMQConnection* activemq::core::ActiveMQXAConnectionFactory::createActiveMQConnection (const Pointer< transport::Transport > & *transport*, const Pointer< decaf::util::Properties > & *properties*) [protected, virtual]

Create a new **ActiveMQConnection** (p. 232) instnace using the provided Transport and Properties. Subclasses can override this to control the actual type of **ActiveMQConnection** (p. 232) that is created.

Parameters:

transport *(p. 72)* The Transport that the Connection should use to communicate with the Broker.

properties The Properties that are assigned to the new Connection instance.

Returns:

a new **ActiveMQConnection** (p. 232) pointer instance.

Reimplemented from **activemq::core::ActiveMQConnectionFactory** (p. 272).

6.61.2.2 virtual cms::XAConnection* activemq::core::ActiveMQXAConnectionFactory::createXAConnection (const std::string & *userName*, const std::string & *password*) [virtual]

Creates an XA connection with the specified user name and password. The connection is created in stopped mode just as the standard ConnectionFactory creates a new Connection. No messages will be delivered until the Connection.start method is explicitly called.

Returns:

a new XAConnectionFactory instance, the caller owns the returned pointer.

Exceptions:

CMSException if an internal error occurs while creating the Connection.

CMSSecurityException if the client authentication fails because the user name or password are invalid.

Implements **cms::XAConnectionFactory** (p. 3263).

6.61.2.3 virtual cms::XAConnection* activemq::core::ActiveMQXAConnectionFactory::createXAConnection () [virtual]

Creates an XAConnection with the default user name and password. The connection is created in stopped mode just as the standard Connection object is created from the ConnectionFactory. No messages will be delivered until the Connection.start method is explicitly called.

Returns:

a new XAConnectionFactory instance, the caller owns the returned pointer.

Exceptions:

CMSException if an internal error occurs while creating the Connection.

CMSSecurityException if the client authentication fails because the user name or password are invalid.

Implements **cms::XAConnectionFactory** (p. 3264).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQXAConnectionFactory.h**

6.62 activemq::core::ActiveMQXASession Class Reference

`#include <src/main/activemq/core/ActiveMQXASession.h>`Inheritance diagram for activemq::core::ActiveMQXASession:

Public Member Functions

- **ActiveMQXASession** (**Pointer< activemq::core::kernels::ActiveMQXASessionKernel > kernel**)
- virtual ~**ActiveMQXASession** ()
- virtual bool **isTransacted** () const

  Gets if the Sessions is a Transacted Session.

- virtual bool **isAutoAcknowledge** () const
- virtual void **doStartTransaction** ()
- virtual void **commit** ()

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual **cms::XAResource** * **getXAResource** () const

  Returns the XA resource associated with this Session to the caller.

6.62.1 Constructor & Destructor Documentation

6.62.1.1 activemq::core::ActiveMQXASession::ActiveMQXASession (Pointer< activemq::core::kernels::ActiveMQXASessionKernel > *kernel*)

6.62.1.2 virtual activemq::core::ActiveMQXASession::~ActiveMQXASession () [virtual]

6.62.2 Member Function Documentation

6.62.2.1 virtual void activemq::core::ActiveMQXASession::commit () [virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Reimplemented from **activemq::core::ActiveMQSession** (p. 436).

6.62.2.2 virtual void activemq::core::ActiveMQXASession::doStartTransaction () [virtual]

6.62.2.3 virtual cms::XAResource* activemq::core::ActiveMQXASession::getXAResource () const [virtual]

Returns the XA resource associated with this Session to the caller. The client can use the provided XA resource to interact with the XA Transaction Manager in use in the client application.

Returns:

an XAResouce instance to the caller, the caller does not own this pointer and should not delete it.

Implements **cms::XASession** (p. 3279).

6.62.2.4 virtual bool activemq::core::ActiveMQXASession::isAutoAcknowledge () const [virtual]

6.62.2.5 virtual bool activemq::core::ActiveMQXASession::isTransacted () const [virtual]

Gets if the Sessions is a Transacted Session.

Returns:

transacted true - false.

Exceptions:

CMSException - If an internal error occurs.

Reimplemented from **activemq::core::ActiveMQSession** (p. 443).

6.62.2.6 virtual void activemq::core::ActiveMQXASession::rollback () [virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Reimplemented from **activemq::core::ActiveMQSession** (p. 444).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQXASession.h**

6.63 activemq::core::kernels::ActiveMQXASessionKernel Class Reference

`#include <src/main/activemq/core/kernels/ActiveMQXASessionKernel.h>`Inheritance diagram for activemq::core::kernels::ActiveMQXASessionKernel:

Public Member Functions

- **ActiveMQXASessionKernel** (**ActiveMQConnection** *__connection__, const **Pointer**< **commands::SessionId** > &sessionId, const **decaf::util::Properties** &properties)
- virtual ~**ActiveMQXASessionKernel** ()
- virtual bool **isTransacted** () const

  Gets if the Sessions is a Transacted Session.

- virtual bool **isAutoAcknowledge** () const
- virtual void **doStartTransaction** ()

  Starts if not already start a Transaction for this Session.

- virtual void **commit** ()

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual **cms::XAResource** * **getXAResource** () const

  Returns the XA resource associated with this Session to the caller.

6.63.1 Constructor & Destructor Documentation

6.63.1.1 activemq::core::kernels::ActiveMQXASessionKernel::ActiveMQXASessionKernel (ActiveMQConnection * *connection*, const Pointer< commands::SessionId > & *sessionId*, const decaf::util::Properties & *properties*)

6.63.1.2 virtual activemq::core::kernels::ActiveMQXASessionKernel::~ActiveMQXASessionKernel () [virtual]

6.63.2 Member Function Documentation

6.63.2.1 virtual void activemq::core::kernels::ActiveMQXASessionKernel::commit () [virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Reimplemented from **activemq::core::kernels::ActiveMQSessionKernel** (p. 457).

6.63.2.2 virtual void activemq::core::kernels::ActiveMQXASessionKernel::doStartTransaction () [virtual]

Starts if not already start a Transaction for this Session. If the session is not a Transacted Session then an exception is thrown. If a transaction is already in progress then this method has no effect.

Exceptions:

ActiveMQException if this is not a Transacted Session.

Reimplemented from **activemq::core::kernels::ActiveMQSessionKernel** (p. 463).

6.63.2.3 virtual cms::XAResource* activemq::core::kernels::ActiveMQXASessionKernel::getXAResource () const [virtual]

Returns the XA resource associated with this Session to the caller. The client can use the provided XA resource to interact with the XA Transaction Manager in use in the client application.

Returns:

an XAResouce instance to the caller, the caller does not own this pointer and should not delete it.

Implements **cms::XASession** (p. 3279).

6.63.2.4 virtual bool activemq::core::kernels::ActiveMQXASessionKernel::isAutoAcknowledge () const [virtual]

Reimplemented from **activemq::core::kernels::ActiveMQSessionKernel** (p. 466).

6.63.2.5 virtual bool activemq::core::kernels::ActiveMQXASessionKernel::isTransacted () const [virtual]

Gets if the Sessions is a Transacted Session.

Returns:

transacted true - false.

Exceptions:

CMSException - If an internal error occurs.

Reimplemented from **activemq::core::kernels::ActiveMQSessionKernel** (p. 467).

6.63.2.6 virtual void activemq::core::kernels::ActiveMQXASessionKernel::rollback () [virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Reimplemented from **activemq::core::kernels::ActiveMQSessionKernel** (p. 469).

The documentation for this class was generated from the following file:

- src/main/activemq/core/kernels/**ActiveMQXASessionKernel.h**

6.64 decaf::util::zip::Adler32 Class Reference

Clas that can be used to compute an Adler-32 **Checksum** (p. 956) for a data stream.

`#include <src/main/decaf/util/zip/Adler32.h>`Inheritance diagram for decaf::util::zip::Adler32:

Public Member Functions

- **Adler32** ()
- virtual ~**Adler32** ()
- virtual long long **getValue** () const
- virtual void **reset** ()

  Reset the checksum to its initial value.

- virtual void **update** (const std::vector< unsigned char > &buffer)

  Updates the current checksum with the specified vector of bytes.

- virtual void **update** (const std::vector< unsigned char > &buffer, int offset, int length)

  Updates the current checksum with the specified array of bytes.

- virtual void **update** (const unsigned char *buffer, int size, int offset, int length)

  Updates the current checksum with the specified array of bytes.

- virtual void **update** (int byte)

  Updates the current checksum with the specified byte value.

6.64.1 Detailed Description

Clas that can be used to compute an Adler-32 **Checksum** (p. 956) for a data stream. The Alder-32 checksum trades reliability for speed over the CRC-32 algorithm.

Since:

1.0

6.64.2 Constructor & Destructor Documentation

6.64.2.1 decaf::util::zip::Adler32::Adler32 ()

6.64.2.2 virtual decaf::util::zip::Adler32::~Adler32 () [virtual]

6.64.3 Member Function Documentation

6.64.3.1 virtual long long decaf::util::zip::Adler32::getValue () const [virtual]

Returns:

the current checksum value.

Implements **decaf::util::zip::Checksum** (p. 956).

6.64.3.2 virtual void decaf::util::zip::Adler32::reset () [virtual]

Reset the checksum to its initial value.

Implements **decaf::util::zip::Checksum** (p. 957).

6.64.3.3 virtual void decaf::util::zip::Adler32::update (int *byte*) [virtual]

Updates the current checksum with the specified byte value.

Parameters:

byte The byte value to update the current **Checksum** (p. 956) with (0..255).

Implements **decaf::util::zip::Checksum** (p. 957).

6.64.3.4 virtual void decaf::util::zip::Adler32::update (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

size The size of the passed buffer.

offset The position in the buffer to start reading.

length The amount of data to read from the byte buffer.

Exceptions:

NullPointerException if the passed buffer is NULL.

IndexOutOfBoundsException if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 957).

6.64.3.5 virtual void decaf::util::zip::Adler32::update (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

offset The position in the buffer to start reading.

length The amount of data to read from the byte buffer.

Exceptions:

IndexOutOfBoundsException if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 957).

6.64.3.6 virtual void decaf::util::zip::Adler32::update (const std::vector< unsigned char > & *buffer*) [virtual]

Updates the current checksum with the specified vector of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

Implements **decaf::util::zip::Checksum** (p. 958).

6.65 activemq::core::AdvisoryConsumer Class Reference

`#include <src/main/activemq/core/AdvisoryConsumer.h>`Inheritance diagram for activemq::core::AdvisoryConsumer:

Public Member Functions

- **AdvisoryConsumer** (**ActiveMQConnection** *connection, **Pointer**< **commands::ConsumerId** > consumerId)
- virtual ~**AdvisoryConsumer** ()
- void **dispose** ()
- virtual void **dispatch** (const **Pointer**< **MessageDispatch** > &message)

  Dispatches a message to a particular consumer.

- virtual int **getHashCode** () const

  *HashCode method allowing **Dispatcher** (p. 1412) instances to be used in HashMap etc.*

6.65.1 Constructor & Destructor Documentation

6.65.1.1 activemq::core::AdvisoryConsumer::AdvisoryConsumer (ActiveMQConnection * *connection*, Pointer< commands::ConsumerId > *consumerId*)

6.65.1.2 virtual activemq::core::AdvisoryConsumer::~AdvisoryConsumer () [virtual]

6.65.2 Member Function Documentation

6.65.2.1 virtual void activemq::core::AdvisoryConsumer::dispatch (const Pointer< MessageDispatch > & *message*) [virtual]

Dispatches a message to a particular consumer.

Parameters:

message The message to be dispatched to a waiting consumer.

Implements **activemq::core::Dispatcher** (p. 1412).

6.65.2.2 void activemq::core::AdvisoryConsumer::dispose ()

6.65.2.3 virtual int activemq::core::AdvisoryConsumer::getHashCode () const [virtual]

HashCode method allowing **Dispatcher** (p. 1412) instances to be used in HashMap etc.

Returns:

hash value for this **Dispatcher** (p. 1412).

Implements **activemq::core::Dispatcher** (p. 1412).

6.66 activemq::util::AdvisorySupport Class Reference

Support class that provides various static constants for use in constructing Destination names for the ActiveMQ advisory destinations.

`#include <src/main/activemq/util/AdvisorySupport.h>`

Public Member Functions

- ~**AdvisorySupport** ()

Static Public Member Functions

- static **commands::ActiveMQDestination** * **getTempDestinationCompositeAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume the advisory messages for both Temporary Topic and Temporary Queue creation on the broker.

- static **commands::ActiveMQDestination** * **getAllDestinationsCompositeAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume the advisory messages for all Destinations created by the Broker, Queue, Topic, Temporary Queue and Temporary Topic.

- static std::vector< **commands::ActiveMQDestination** * > **getAllDestinationAdvisoryTopics** (const **cms::Destination** *destination)

  Returns a new vector that contains pointers to all the available advisory topics for the given destination.

- static std::vector< **commands::ActiveMQDestination** * > **getAllDestinationAdvisoryTopics** (const **commands::ActiveMQDestination** *destination)

  Returns a new vector that contains pointers to all the available advisory topics for the given destination.

- static **commands::ActiveMQDestination** * **getConnectionAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume advisory messages for Connections.

- static **commands::ActiveMQDestination** * **getQueueAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume advisory messages for Queues.

- static **commands::ActiveMQDestination** * **getTopicAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume advisory messages for Topics.

- static **commands::ActiveMQDestination** * **getTempQueueAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume advisory messages for Temporary Queues.

- static **commands::ActiveMQDestination** * **getTempTopicAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume advisory messages for Temporary Topics.

- static **commands::ActiveMQDestination** * **getConsumerAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for Consumer events.

- static **commands::ActiveMQDestination** * **getConsumerAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for Consumer events.

- static **commands::ActiveMQDestination** * **getProducerAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for Producer events.

- static **commands::ActiveMQDestination** * **getProducerAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for Producer events.

- static **commands::ActiveMQDestination** * **getExpiredMessageTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getExpiredMessageTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getExpiredTopicMessageAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getExpiredTopicMessageAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getExpiredQueueMessageAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getExpiredQueueMessageAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getNoConsumersAdvisoryTopic** (const **cms::Destination** *destination)

Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getNoConsumersAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getNoTopicConsumersAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getNoTopicConsumersAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getNoQueueConsumersAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getNoQueueConsumersAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

- static **commands::ActiveMQDestination** * **getSlowConsumerAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for slow consumers of messages on the specified destination.

- static **commands::ActiveMQDestination** * **getSlowConsumerAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for slow consumers of messages on the specified destination.

- static **commands::ActiveMQDestination** * **getFastProducerAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for fast producers of messages on the specified destination.

- static **commands::ActiveMQDestination** * **getFastProducerAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for fast producers of messages on the specified destination.

- static **commands::ActiveMQDestination** * **getMessageDiscardedAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when a message is discarded on the specified destination.

- static **commands::ActiveMQDestination** * **getMessageDiscardedAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when a message is discarded on the specified destination.

- static **commands::ActiveMQDestination** * **getMessageDeliveredAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when a message is dispatched to the specified destination.

- static **commands::ActiveMQDestination** * **getMessageDeliveredAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when a message is dispatched to the specified destination.

- static **commands::ActiveMQDestination** * **getMessageConsumedAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when a message is consumed from the specified destination.

- static **commands::ActiveMQDestination** * **getMessageConsumedAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when a message is consumed from the specified destination.

- static **commands::ActiveMQDestination** * **getMessageDLQdAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when a message is sent to the DLQ from the specified destination.

- static **commands::ActiveMQDestination** * **getMessageDLQdAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when a message is sent to the DLQ from the specified destination.

- static **commands::ActiveMQDestination** * **getMasterBrokerAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume advisory messages for Master Brokers.

- static **commands::ActiveMQDestination** * **getNetworkBridgeAdvisoryTopic** ()

  Returns a new Pointer to an Destination that will consume advisory messages for Network Bridges.

- static **commands::ActiveMQDestination** * **getFullAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages when the given destination has become full and cannot receive more messages.

- static **commands::ActiveMQDestination** * **getFullAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

Returns a new Pointer to an Destination that will consume advisory messages when the given destination has become full and cannot receive more messages.

- static **commands::ActiveMQDestination** * **getDestinationAdvisoryTopic** (const **cms::Destination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for events related to Destination such as create and delete.

- static **commands::ActiveMQDestination** * **getDestinationAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

  Returns a new Pointer to an Destination that will consume advisory messages for events related to Destination such as create and delete.

- static bool **isDestinationAdvisoryTopic** (const **cms::Destination** *destination)
- static bool **isDestinationAdvisoryTopic** (const **commands::ActiveMQDestination** *destination)

6.66.1 Detailed Description

Support class that provides various static constants for use in constructing Destination names for the ActiveMQ advisory destinations. Methods that can create Advisory Topic instances for commonly used Advisory messages are also provided here.

6.66.2 Constructor & Destructor Documentation

6.66.2.1 activemq::util::AdvisorySupport::~AdvisorySupport ()

6.66.3 Member Function Documentation

6.66.3.1 static std::vector<commands::ActiveMQDestination*> activemq::util::AdvisorySupport::getAllDestinationAdvisoryTopics (const commands::ActiveMQDestination * *destination*) [static]

Returns a new vector that contains pointers to all the available advisory topics for the given destination.

Returns:

vector of all advisory topics that will receive events for the given destination..

6.66.3.2 static std::vector<commands::ActiveMQDestination*> activemq::util::AdvisorySupport::getAllDestinationAdvisoryTopics (const cms::Destination * *destination*) [static]

Returns a new vector that contains pointers to all the available advisory topics for the given destination.

Returns:

vector of all advisory topics that will receive events for the given destination..

6.66.3.3 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getAllDestinationsCompositeAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume the advisory messages for all Destinations created by the Broker, Queue, Topic, Temporary Queue and Temporary Topic.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.4 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getConnectionAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume advisory messages for Connections.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.5 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getConsumerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for Consumer events.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.6 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getConsumerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for Consumer events.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.7 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getDestinationAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for events related to Destination such as create and delete.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.8 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getDestinationAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for events related to Destination such as create and delete.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.9 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getExpiredMessageTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.10 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getExpiredMessageTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.11 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getExpiredQueueMessageAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.12 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getExpiredQueueMessageAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.13 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getExpiredTopicMessageAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.14 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getExpiredTopicMessageAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for expiration events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.15 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getFastProducerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for fast producers of messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.16 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getFastProducerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for fast producers of messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.17 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getFullAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when the given destination has become full and cannot receive more messages.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.18 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getFullAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when the given destination has become full and cannot receive more messages.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.19 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMasterBrokerAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume advisory messages for Master Brokers.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.20 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMessageConsumedAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when a message is consumed from the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.21 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMessageConsumedAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when a message is consumed from the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.22 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMessageDeliveredAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when a message is dispatched to the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.23 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMessageDeliveredAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when a message is dispatched to the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.24 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMessageDiscardedAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when a message is discarded on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.25 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMessageDiscardedAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when a message is discarded on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.26 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMessageDLQdAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when a message is sent to the DLQ from the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.27 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getMessageDLQdAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages when a message is sent to the DLQ from the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.28 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getNetworkBridgeAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume advisory messages for Network Bridges.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.29 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getNoConsumersAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.30 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getNoConsumersAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.31 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getNoQueueConsumersAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.32 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getNoQueueConsumersAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.33 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getNoTopicConsumersAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.34 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getNoTopicConsumersAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for no consumer events for messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.35 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getProducerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for Producer events.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.36 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getProducerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for Producer events.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.37 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getQueueAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume advisory messages for Queues.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.38 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getSlowConsumerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for slow consumers of messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.39 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getSlowConsumerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns a new Pointer to an Destination that will consume advisory messages for slow consumers of messages on the specified destination.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.40 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getTempDestinationCompositeAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume the advisory messages for both Temporary Topic and Temporary Queue creation on the broker.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.41 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getTempQueueAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume advisory messages for Temporary Queues.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.42 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getTempTopicAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume advisory messages for Temporary Topics.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.43 static commands::ActiveMQDestination* activemq::util::AdvisorySupport::getTopicAdvisoryTopic () [static]

Returns a new Pointer to an Destination that will consume advisory messages for Topics.

Returns:

Pointer to the requested Advisory Topic destination.

6.66.3.44 static bool activemq::util::AdvisorySupport::isAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an advisory topic.

6.66.3.45 static bool activemq::util::AdvisorySupport::isAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an advisory topic.

6.66.3.46 static bool activemq::util::AdvisorySupport::isConnectionAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Connection advisory topic.

6.66.3.47 static bool activemq::util::AdvisorySupport::isConnectionAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Connection advisory topic.

6.66.3.48 static bool activemq::util::AdvisorySupport::isConsumerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Consumer advisory topic.

6.66.3.49 static bool activemq::util::AdvisorySupport::isConsumerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Consumer advisory topic.

6.66.3.50 static bool activemq::util::AdvisorySupport::isDestinationAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is a Destination advisory topic.

6.66.3.51 static bool activemq::util::AdvisorySupport::isDestinationAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is a Destination advisory topic.

6.66.3.52 static bool activemq::util::AdvisorySupport::isFastProducerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Fast Producer advisory topic.

6.66.3.53 static bool activemq::util::AdvisorySupport::isFastProducerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Fast Producer advisory topic.

6.66.3.54 static bool activemq::util::AdvisorySupport::isFullAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Destination Full advisory topic.

6.66.3.55 static bool activemq::util::AdvisorySupport::isFullAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Destination Full advisory topic.

6.66.3.56 static bool activemq::util::AdvisorySupport::isMasterBrokerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Master Broker Consumed advisory topic.

6.66.3.57 static bool activemq::util::AdvisorySupport::isMasterBrokerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Master Broker advisory topic.

6.66.3.58 static bool activemq::util::AdvisorySupport::isMessageConsumedAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Message Consumed advisory topic.

6.66.3.59 static bool activemq::util::AdvisorySupport::isMessageConsumedAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Message Consumed advisory topic.

6.66.3.60 static bool activemq::util::AdvisorySupport::isMessageDeliveredAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Message Delivered advisory topic.

6.66.3.61 static bool activemq::util::AdvisorySupport::isMessageDeliveredAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Message Delivered advisory topic.

6.66.3.62 static bool activemq::util::AdvisorySupport::isMessageDiscardedAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Message Discarded advisory topic.

6.66.3.63 static bool activemq::util::AdvisorySupport::isMessageDiscardedAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Message Discarded advisory topic.

6.66.3.64 static bool activemq::util::AdvisorySupport::isMessageDLQdAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Message DLQ'd advisory topic.

6.66.3.65 static bool activemq::util::AdvisorySupport::isMessageDLQdAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Message DLQ'd advisory topic.

6.66.3.66 static bool activemq::util::AdvisorySupport::isNetworkBridgeAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Network Bridge advisory topic.

6.66.3.67 static bool activemq::util::AdvisorySupport::isNetworkBridgeAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Network Bridge advisory topic.

6.66.3.68 static bool activemq::util::AdvisorySupport::isProducerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Producer advisory topic.

6.66.3.69 static bool activemq::util::AdvisorySupport::isProducerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Producer advisory topic.

6.66.3.70 static bool activemq::util::AdvisorySupport::isSlowConsumerAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is an Slow Consumer advisory topic.

6.66.3.71 static bool activemq::util::AdvisorySupport::isSlowConsumerAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is an Slow Consumer advisory topic.

6.66.3.72 static bool activemq::util::AdvisorySupport::isTempDestinationAdvisoryTopic (const commands::ActiveMQDestination * *destination*) [static]

Returns:

true if the specified destination is a Temporary Destination advisory topic.

6.66.3.73 static bool activemq::util::AdvisorySupport::isTempDestinationAdvisoryTopic (const cms::Destination * *destination*) [static]

Returns:

true if the specified destination is a Temporary Destination advisory topic.

6.67 decaf::lang::Appendable Class Reference

An object to which char sequences and values can be appended.

`#include <src/main/decaf/lang/Appendable.h>`Inheritance diagram for decaf::lang::Appendable:

Public Member Functions

- virtual ~**Appendable** ()
- virtual **Appendable** & **append** (char value)=0

  Appends the specified character to this ***Appendable*** *(*p. 580*).*
- virtual **Appendable** & **append** (const **CharSequence** *csq)=0

  Appends the specified character sequence to this ***Appendable*** *(*p. 580*).*
- virtual **Appendable** & **append** (const **CharSequence** *csq, int start, int end)=0

  Appends a subsequence of the specified character sequence to this ***Appendable*** *(*p. 580*).*

6.67.1 Detailed Description

An object to which char sequences and values can be appended. The **Appendable** (p. 580) interface must be implemented by any class whose instances are intended to receive formatted output from a Formatter.

TODO The characters to be appended should be valid Unicode characters as described in Unicode **Character** (p. 914) Representation. Note that supplementary characters may be composed of multiple 16-bit char values.

Appendables are not necessarily safe for multithreaded access. **Thread** (p. 3016) safety is the responsibility of classes that extend and implement this interface.

Since this interface may be implemented by existing classes with different styles of error handling there is no guarantee that errors will be propagated to the invoker.

Since:

1.0

6.67.2 Constructor & Destructor Documentation

6.67.2.1 virtual decaf::lang::Appendable::~Appendable () [virtual]

6.67.3 Member Function Documentation

6.67.3.1 virtual Appendable& decaf::lang::Appendable::append (const CharSequence * *csq*, int *start*, int *end*) [pure virtual]

Appends a subsequence of the specified character sequence to this **Appendable** (p. 580).

Parameters:

csq - The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".

start The index of the first character in the subsequence.

end The index of the character following the last character in the subsequence.

Returns:

a Reference to this **Appendable** (p. 580)

Exceptions:

Exception *(p. 1458)* if an error occurs.

IndexOutOfBoundsException start is greater than end, or end is greater than csq.length()

Implemented in **decaf::io::Writer** (p. 3253), and **decaf::nio::CharBuffer** (p. 937).

6.67.3.2 virtual Appendable& decaf::lang::Appendable::append (const CharSequence * *csq*) [pure virtual]

Appends the specified character sequence to this **Appendable** (p. 580).

Parameters:

csq The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".

Returns:

a Reference to this **Appendable** (p. 580).

Exceptions:

Exception *(p. 1458)* if an error occurs.

Implemented in **decaf::io::Writer** (p. 3253), and **decaf::nio::CharBuffer** (p. 938).

6.67.3.3 virtual Appendable& decaf::lang::Appendable::append (char *value*) [pure virtual]

Appends the specified character to this **Appendable** (p. 580).

Parameters:

value The character to append.

Returns:

a Reference to this **Appendable** (p. 580)

Exceptions:

Exception *(p. 1458)* if an error occurs.

Implemented in **decaf::io::Writer** (p. 3254), and **decaf::nio::CharBuffer** (p. 938).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Appendable.h**

6.68 decaf::internal::AprPool Class Reference

Wraps an APR pool object so that classes in **decaf** (p. 96) can create a static member for use in static methods where apr function calls that need a pool are made.

`#include <src/main/decaf/internal/AprPool.h>`

Public Member Functions

- **AprPool** ()
- virtual ~**AprPool** ()
- apr_pool_t * **getAprPool** () const

  *Gets the **internal** (p. 97) APR Pool.*

- void **cleanup** ()

  Clears data that was allocated by this pool.

Static Public Member Functions

- static apr_pool_t * **getGlobalPool** ()

  Gets a pointer to the Global APR Pool used for the Application.

6.68.1 Detailed Description

Wraps an APR pool object so that classes in **decaf** (p. 96) can create a static member for use in static methods where apr function calls that need a pool are made.

6.68.2 Constructor & Destructor Documentation

6.68.2.1 decaf::internal::AprPool::AprPool ()

6.68.2.2 virtual decaf::internal::AprPool::~AprPool () [virtual]

6.68.3 Member Function Documentation

6.68.3.1 void decaf::internal::AprPool::cleanup ()

Clears data that was allocated by this pool. Users should call this after getting the data from the APR functions and copying it to someplace safe.

6.68.3.2 apr_pool_t* decaf::internal::AprPool::getAprPool () const

Gets the **internal** (p. 97) APR Pool.

Returns:

the **internal** (p. 97) APR pool

6.68.3.3 static apr_pool_t* decaf::internal::AprPool::getGlobalPool () [static]

Gets a pointer to the Global APR Pool used for the Application.

Returns:

pointer to the global APR Pool

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**AprPool.h**

6.69 decaf::util::ArrayList< E > Class Template Reference

`#include <src/main/decaf/util/ArrayList.h>`Inheritance diagram for decaf::util::ArrayList< E >:

Public Member Functions

- **ArrayList** ()
- **ArrayList** (const **Collection**< E > &collection)
- **ArrayList** (const **ArrayList**< E > &arrayList)
- **ArrayList** (int initialCapacity)
- virtual ~**ArrayList** ()
- **ArrayList**< E > & **operator**= (const **ArrayList**< E > &list)

  Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

- **ArrayList**< E > & **operator**= (const **Collection**< E > &collection)
- bool **operator**== (const **ArrayList**< E > &other) const
- bool **operator!**= (const **ArrayList**< E > &other) const
- void **ensureCapacity** (int minimumCapacity)

  *Increases the capacity of this **ArrayList** (p. 585) instance, if necessary, to ensure that it can hold at least the number of elements specified by the minimum capacity argument.*

- void **trimToSize** ()

  *Trims the **internal** (p. 97) array to match the current size of the **ArrayList** (p. 585).*

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).

- virtual bool **isEmpty** () const

  Returns true if this collection contains no elements.

- virtual int **size** () const

  Returns the number of elements in this collection.

- virtual E **set** (int index, const E &element)

  Replaces the element at the specified position in this list with the specified element.

- virtual E **get** (int index) const

  Gets the element contained at position passed.

- virtual bool **add** (const E &value)

  Returns true if this collection changed as a result of the call.

- virtual void **add** (int index, const E &element)

  Inserts the specified element at the specified position in this list.

- virtual bool **addAll** (const **Collection**< E > &collection)

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual bool **addAll** (int index, const **Collection**< E > &collection)

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).
  Parameters:

  value *The reference to the element to remove from this* ***Collection*** *(*p. *1006).*
  Returns:

  true if the collection was changed, false otherwise.
  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(*p. *1006) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual E **removeAt** (int index)

  Removes the element at the specified position in this list.

- virtual bool **contains** (const E &value) const

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).
  Parameters:

  value *The value to check for presence in the collection.*
  Returns:

  true if there is at least one of the elements in the collection
  Exceptions:

  NullPointerException *if the* ***Collection*** *(*p. *1006) contains pointers and the* ***Collection*** *(*p. *1006) does not allow for NULL elements (optional check).*

  This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual int **indexOf** (const E &value) const

  Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual int **lastIndexOf** (const E &value) const

  Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual std::vector< E > **toArray** () const

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(*p. *1006**).*

- virtual std::string **toString** () const

template<typename E> class decaf::util::ArrayList< E >

6.69.1 Constructor & Destructor Documentation

6.69.1.1 template<typename E> decaf::util::ArrayList< E >::ArrayList () [inline]

6.69.1.2 template<typename E> decaf::util::ArrayList< E >::ArrayList (const Collection< E > & *collection*) [inline]

6.69.1.3 template<typename E> decaf::util::ArrayList< E >::ArrayList (const ArrayList< E > & *arrayList*) [inline]

6.69.1.4 template<typename E> decaf::util::ArrayList< E >::ArrayList (int *initialCapacity*) [inline]

6.69.1.5 template<typename E> virtual decaf::util::ArrayList< E >::~ArrayList () [inline, virtual]

6.69.2 Member Function Documentation

6.69.2.1 template<typename E> virtual void decaf::util::ArrayList< E >::add (int *index*, const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list. Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index The index at which the specified element is to be inserted.

element The element to be inserted in this **List** (p. 1902).

Exceptions:

IndexOutOfBoundsException if the index is greater than size of the **List** (p. 1902).

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1903).

6.69.2.2 template<typename E> virtual bool decaf::util::ArrayList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 158).

6.69.2.3 template<typename E> virtual bool decaf::util::ArrayList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation). Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1006) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 159).

6.69.2.4 template<typename E> virtual bool decaf::util::ArrayList< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty). This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 143).

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::operator=().

6.69.2.5 template<typename E> virtual void decaf::util::ArrayList< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractList< E >** (p. 160).

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::operator=().

6.69.2.6 template<typename E> virtual bool decaf::util::ArrayList< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element. This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 145).

6.69.2.7 template<typename E> void decaf::util::ArrayList< E >::ensureCapacity (int *minimumCapacity*) [inline]

Increases the capacity of this **ArrayList** (p. 585) instance, if necessary, to ensure that it can hold at least the number of elements specified by the minimum capacity argument. If the capacity is already greater than or equal to the minimum capacity argument then the array is left unchanged.

Parameters:

minimumCapacity The desired minimum capacity for this **ArrayList** (p. 585).

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::ArrayList().

6.69.2.8 template<typename E> virtual E decaf::util::ArrayList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters:

index The position to get.

Returns:

value at index specified.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

Implements **decaf::util::List< E >** (p. 1905).

6.69.2.9 template<typename E> virtual int decaf::util::ArrayList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 160).

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::contains(), and decaf::util::ArrayList< Pointer< ActiveMQDestination > >::remove().

6.69.2.10 template<typename E> virtual bool decaf::util::ArrayList< E >::isEmpty () const [inline, virtual]

Returns true if this collection contains no elements. This implementation returns **size()** (p. 594) == 0.

Returns:

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

6.69.2.11 template<typename E> virtual int decaf::util::ArrayList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 162).

6.69.2.12 template<typename E> bool decaf::util::ArrayList< E >::operator!= (const ArrayList< E > & *other*) const [inline]

6.69.2.13 template<typename E> ArrayList<E>& decaf::util::ArrayList< E >::operator= (const Collection< E > & *collection*) [inline]

6.69.2.14 template<typename E> ArrayList<E>& decaf::util::ArrayList< E >::operator= (const ArrayList< E > & *collection*) [inline]

Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

Parameters:

collection - the collection to copy

Returns:

a reference to this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 148).

6.69.2.15 template<typename E> bool decaf::util::ArrayList< E >::operator== (const ArrayList< E > & *other*) const [inline]

6.69.2.16 template<typename E> virtual bool decaf::util::ArrayList< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object. This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 149).

6.69.2.17 template<typename E> virtual E decaf::util::ArrayList< E >::removeAt (int *index*) [inline, virtual]

Removes the element at the specified position in this list. Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

Reimplemented from **decaf::util::AbstractList< E >** (p. 165).

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::remove().

6.69.2.18 template<typename E> virtual E decaf::util::ArrayList< E >::set (int *index*, const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters:

index The index of the element to replace.

element The element to be stored at the specified position.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1911).

6.69.2.19 template<typename E> virtual int decaf::util::ArrayList< E >::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1015).

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::ArrayList().

6.69.2.20 template<typename E> virtual std::vector<E> decaf::util::ArrayList< E >::toArray () const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1006). All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns:

an vector of copies of all the elements from this **Collection** (p. 1006)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 150).

6.69.2.21 template<typename E> virtual std::string decaf::util::ArrayList< E >::toString () const [inline, virtual]

6.69.2.22 template<typename E> void decaf::util::ArrayList< E >::trimToSize () [inline]

Trims the **internal** (p. 97) array to match the current size of the **ArrayList** (p. 585). This compacts the **internal** (p. 97) array to save storage space used by this **ArrayList** (p. 585).

The documentation for this class was generated from the following file:

6.70 decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator Class Reference

`#include <src/main/decaf/util/concurrent/CopyOnWriteArrayList.h>`Inheritance diagram for decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator:

Public Member Functions

- **ArrayListIterator** (**decaf::lang::Pointer**< Array > array, int index)
- virtual ~**ArrayListIterator** ()
- virtual E **next** ()

  Returns the next element in the iteration.

- virtual bool **hasNext** () const

  Returns true if the iteration has more elements.

- virtual void **remove** ()

  Removes from the underlying collection the last element returned by the iterator (optional operation).

- virtual void **add** (const E &e DECAF_UNUSED)
- virtual void **set** (const E &e DECAF_UNUSED)
- virtual bool **hasPrevious** () const

  Returns true if this list iterator has more elements when traversing the list in the reverse direction.

- virtual E **previous** ()

  Returns the previous element in the list.

- virtual int **nextIndex** () const

  Returns the index of the element that would be returned by a subsequent call to next.

- virtual int **previousIndex** () const

  Returns the index of the element that would be returned by a subsequent call to previous.

template<typename E> class decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator

6.70.1 Constructor & Destructor Documentation

6.70.1.1 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::ArrayListIterator (decaf::lang::Pointer< Array > *array*, int *index*) `[inline]`

6.70.1.2 template<typename E> virtual decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::~ArrayListIterator () `[inline, virtual]`

References NULL, and decaf::lang::Pointer< T, REFCOUNTER >::reset().

6.70.2 Member Function Documentation

6.70.2.1 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::add (const E &e *DECAF_UNUSED*) [inline, virtual]

6.70.2.2 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::hasNext () const [inline, virtual]

Returns true if the iteration has more elements. Returns false if the next call to next would result in an **NoSuchElementException** (p. 2260) to be thrown.

Returns:

true if there are more elements available for iteration.

Implements **decaf::util::Iterator< E >** (p. 1802).

6.70.2.3 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::hasPrevious () const [inline, virtual]

Returns true if this list iterator has more elements when traversing the list in the reverse direction. (In other words, returns true if previous would return an element rather than throwing an exception.)

Returns:

true if the list iterator has more elements when traversing the list in the reverse direction.

Implements **decaf::util::ListIterator< E >** (p. 1914).

6.70.2.4 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::next () [inline, virtual]

Returns the next element in the iteration. Calling this method repeatedly until the **hasNext()** (p. 596) method returns false will return each element in the underlying collection exactly once.

Returns:

the next element in the iteration of elements.

Exceptions:

NoSuchElementException *(p. 2260)* if the iteration has no more elements.

Implements **decaf::util::Iterator< E >** (p. 1803).

6.70.2.5 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::nextIndex () const [inline, virtual]

Returns the index of the element that would be returned by a subsequent call to next. (Returns list size if the list iterator is at the end of the list.)

Returns:

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

Implements **decaf::util::ListIterator< E >** (p. 1914).

6.70.2.6 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::previous () [inline, virtual]

Returns the previous element in the list. This method may be called repeatedly to iterate through the list backwards, or intermixed with calls to next to go back and forth. (Note that alternating calls to next and previous will return the same element repeatedly.)

Returns:

the previous element in the list.

Exceptions:

NoSuchElementException (p. *2260*) if the iteration has no previous element.

Implements **decaf::util::ListIterator< E >** (p. 1915).

6.70.2.7 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::previousIndex () const [inline, virtual]

Returns the index of the element that would be returned by a subsequent call to previous. (Returns -1 if the list iterator is at the beginning of the list.)

Returns:

the index of the element that would be returned by a subsequent call to previous, or -1 if list iterator is at beginning of list.

Implements **decaf::util::ListIterator< E >** (p. 1915).

6.70.2.8 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::remove () [inline, virtual]

Removes from the underlying collection the last element returned by the iterator (optional operation). This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this **Iterator** (p. 1802).

IllegalStateException if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

Implements **decaf::util::Iterator< E >** (p. 1803).

6.70.2.9 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::set (const E &e *DECAF_UNUSED*) [inline, virtual]

6.71.1 Detailed Description

template<typename T> class decaf::lang::ArrayPointer< T >

Decaf's implementation of a Smart **Pointer** (p. 2370) that is a template on a Type and is **Thread** (p. 3016) Safe if the default Reference Counter is used. This **Pointer** (p. 2370) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of `ReferenceCounter`.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 2370) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 2370) in a STL container that requires it, **Pointer** (p. 2370) provides an implementation of std::less.

Since:

1.0

6.71.2 Member Typedef Documentation

6.71.2.1 template<typename T> typedef const T& decaf::lang::ArrayPointer< T >::ConstReferenceType

6.71.2.2 template<typename T> typedef T* decaf::lang::ArrayPointer< T >::PointerType

6.71.2.3 template<typename T> typedef T& decaf::lang::ArrayPointer< T >::ReferenceType

6.71.3 Constructor & Destructor Documentation

6.71.3.1 template<typename T> decaf::lang::ArrayPointer< T >::ArrayPointer () [inline]

Default Constructor. Initialized the contained array pointer to NULL, using the subscript operator results in an exception unless reset to contain a real value.

Referenced by decaf::lang::ArrayPointer< HashMapEntry * >::clone(), and decaf::lang::ArrayPointer< HashMapEntry * >::reset().

6.71.3.2 template<typename T> decaf::lang::ArrayPointer< T >::ArrayPointer (int *size*) [inline]

Create a new **ArrayPointer** (p. 599) instance and allocates an **internal** (p. 97) array that is sized using the passed in size value.

Parameters:

size The size of the array to allocate for this **ArrayPointer** (p. 599) instance.

6.71.3.3 template<typename T> decaf::lang::ArrayPointer< T >::ArrayPointer (int *size*, const T & *fillWith*) [inline]

Create a new **ArrayPointer** (p. 599) instance and allocates an **internal** (p. 97) array that is sized using the passed in size value. The array elements are initialized with the given value.

Parameters:

size The size of the array to allocate for this **ArrayPointer** (p. 599) instance.

fillWith The value to initialize each element of the newly allocated array with.

6.71.3.4 template<typename T> decaf::lang::ArrayPointer< T >::ArrayPointer (const PointerType *value*, int *size*) [inline, explicit]

Explicit Constructor, creates an **ArrayPointer** (p. 599) that contains value with a single reference. This object now has ownership until a call to release.

Parameters:

value The pointer to the instance of the array we are taking ownership of.

size The size of the array this object is taking ownership of.

6.71.3.5 template<typename T> decaf::lang::ArrayPointer< T >::ArrayPointer (const ArrayPointer< T > & *value*) [inline]

Copy constructor. Copies the value contained in the **ArrayPointer** (p. 599) to the new instance and increments the reference counter.

6.71.3.6 template<typename T> virtual decaf::lang::ArrayPointer< T >::~ArrayPointer () [inline, virtual]

6.71.4 Member Function Documentation

6.71.4.1 template<typename T> ArrayPointer decaf::lang::ArrayPointer< T >::clone () const [inline]

Creates a new **ArrayPointer** (p. 599) instance that is a clone of the value contained in this **ArrayPointer** (p. 599).

Returns:

an **ArrayPointer** (p. 599) that contains a copy of the data in this **ArrayPointer** (p. 599).

6.71.4.2 template<typename T> PointerType decaf::lang::ArrayPointer< T >::get () const [inline]

Gets the real array pointer that is contained within this **Pointer** (p. 2370). This is not really safe since the caller could delete or alter the pointer but it mimics the STL auto_ptr and gives access in cases where the caller absolutely needs the real **Pointer** (p. 2370). Use at your own risk.

Returns:

the contained pointer.

Referenced by decaf::lang::ArrayPointer< HashMapEntry * >::clone(), decaf::lang::ArrayPointerComparator< T >::compare(), decaf::lang::operator!=(), decaf::lang::ArrayPointer< HashMapEntry * >::operator!=(), std::less< decaf::lang::ArrayPointer< T > >::operator()(), decaf::lang::ArrayPointerComparator< T >::operator()(), decaf::lang::operator==(), and decaf::lang::ArrayPointer< HashMapEntry * >::operator==().

6.71.4.3 template<typename T> int decaf::lang::ArrayPointer< T >::length () const [inline]

Returns the current size of the contained array or zero if the array is NULL.

Returns:

the size of the array or zero if the array is NULL

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::clear(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::containsValue(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::copy(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::getEntry(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::putImpl(),

decaf::util::HashMap< E, Set< E > *, HASHCODE >::rehash(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::removeEntry(), and decaf::util::HashMap< E, Set< E > *, HASHCODE >::~HashMap().

6.71.4.4 template<typename T> bool decaf::lang::ArrayPointer< T >::operator! () const [inline]

6.71.4.5 template<typename T> template<typename T1 > bool decaf::lang::ArrayPointer< T >::operator!= (const ArrayPointer< T1 > & *right*) const [inline]

6.71.4.6 template<typename T> template<typename T1 > ArrayPointer& decaf::lang::ArrayPointer< T >::operator= (const ArrayPointer< T1 > & *right*) [inline]

6.71.4.7 template<typename T> ArrayPointer& decaf::lang::ArrayPointer< T >::operator= (const ArrayPointer< T > & *right*) [inline]

Assigns the value of right to this **Pointer** (p. 2370) and increments the reference Count.

Parameters:

right - **Pointer** (p. 2370) on the right hand side of an operator= call to this.

6.71.4.8 template<typename T> template<typename T1 > bool decaf::lang::ArrayPointer< T >::operator== (const ArrayPointer< T1 > & *right*) const [inline]

6.71.4.9 template<typename T> ConstReferenceType decaf::lang::ArrayPointer< T >::operator[] (int *index*) const [inline]

6.71.4.10 template<typename T> ReferenceType decaf::lang::ArrayPointer< T >::operator[] (int *index*) [inline]

Dereference Operator, returns a reference to the Contained value. This method throws an NullPointerException if the contained value is NULL.

Returns:

reference to the contained pointer.

Exceptions:

NullPointerException if the contained value is Null

6.71.4.11 template<typename T> T* decaf::lang::ArrayPointer< T >::release () [inline]

Releases the **Pointer** (p. 2370) held and resets the **internal** (p. 97) pointer value to Null. This method is not guaranteed to be safe if the **Pointer** (p. 2370) is held by more than one object or this method is called from more than one thread.

Parameters:

value - The new value to contain.

Returns:

The pointer instance that was held by this **Pointer** (p. 2370) object, the pointer is no longer owned by this **Pointer** (p. 2370) and won't be freed when this **Pointer** (p. 2370) goes out of scope.

6.71.4.12 template<typename T> void decaf::lang::ArrayPointer< T >::reset (T * *value*, int *size* = 0) [inline]

Resets the **ArrayPointer** (p. 599) to hold the new value. Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 2370) to a NULL pointer.

Parameters:

value The new array pointer value to contain.

size The size of the new array value this object now contains.

6.71.4.13 template<typename T> void decaf::lang::ArrayPointer< T >::swap (ArrayPointer< T > & *value*) [inline]

Exception (p. 1458) Safe Swap Function.

Parameters:

value - the value to swap with this.

Referenced by decaf::lang::ArrayPointer< HashMapEntry * >::operator=(), and decaf::lang::ArrayPointer< HashMapEntry * >::swap().

- virtual int **compare** (const **ArrayPointer**< T > &left, const **ArrayPointer**< T > &right) const

6.72.1 Detailed Description

template<typename T> class decaf::lang::ArrayPointerComparator< T >

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this **ArrayPointer** (p. 599). This allows for a basic ordering to be acheived in Decaf containers.

Custom implementations are possible where an array of some type has a logical natural ordering such as array of integers where the sum of all ints in the array is used.

Public Member Functions

- virtual ~**Arrays** ()

Static Public Member Functions

- template<typename E >
  static void **fill** (E *array, int size, const E &value)

  Fills an array with the specified element.

- template<typename E >
  static void **fill** (E *array, int size, int start, int end, const E &value)

  Fills an array with the specified element within the range given.

6.73.1 Constructor & Destructor Documentation

6.73.1.1 virtual decaf::util::Arrays::~Arrays () [virtual]

6.73.2 Member Function Documentation

6.73.2.1 template<typename E > static void decaf::util::Arrays::fill (E * *array*, int *size*, int *start*, int *end*, const E & *value*) [inline, static]

Fills an array with the specified element within the range given.

Parameters:

array The Array to fill.

size The actual size of the array passed.

start The index to start the fill from (inclusive).

end The index to fill to (exclusive).

value The value to fill the array with.

Exceptions:

NullPointerException if array is Null.

IllegalArgumentException if the size parameter is negative, or the start index is greater than the end index.

IndexOutOfBoundsException if the start index is negative or the end index is greater than the size parameter.

References NULL.

6.73.2.2 template<typename E > static void decaf::util::Arrays::fill (E * *array*, int *size*, const E & *value*) [inline, static]

Fills an array with the specified element.

Parameters:

array The Array to fill.

size The actual size of the array passed.

value The value to fill the array with.

Exceptions:

NullPointerException if array is Null.

IllegalArgumentException if the size parameter is negative, or the start index is greater than the end index.

References NULL.

Referenced by decaf::lang::ArrayPointer< HashMapEntry * >::ArrayPointer().

6.74 cms::AsyncCallback Class Reference

Asynchronous event interface for CMS asynchronous operations.

`#include <src/main/cms/AsyncCallback.h>`Inheritance diagram for cms::AsyncCallback:

Public Member Functions

- virtual ~**AsyncCallback** ()
- virtual void **onSuccess** ()=0

  Called when the asynchronous operation has completed successfully.

6.74.1 Detailed Description

Asynchronous event interface for CMS asynchronous operations. For operations in CMS that allow for Asynchronous execution the caller provides an instance of this interface. If the asynchronous action is successful the onSuccess method is invoked, otherwise the onException method of **cms::ExceptionListener** (p. 1465) is called.

Since:

3.0

6.75 decaf::util::concurrent::atomic::AtomicBoolean Class Reference

A boolean value that may be updated atomically.

`#include <src/main/decaf/util/concurrent/atomic/AtomicBoolean.h>`

Public Member Functions

- **AtomicBoolean** ()
  *Creates a new **AtomicBoolean** (p. 610) whose initial value is false.*
- **AtomicBoolean** (bool initialValue)
  *Creates a new **AtomicBoolean** (p. 610) with the initial value.*
- virtual ~**AtomicBoolean** ()
- bool **get** () const
  *Gets the current value of this **AtomicBoolean** (p. 610).*
- void **set** (bool newValue)
  Unconditionally sets to the given value.
- bool **compareAndSet** (bool expect, bool update)
  Atomically sets the value to the given updated value if the current value == the expected value.
- bool **getAndSet** (bool newValue)
  Atomically sets to the given value and returns the previous value.
- std::string **toString** () const
  Returns the String representation of the current value.

6.75.1 Detailed Description

A boolean value that may be updated atomically. An **AtomicBoolean** (p. 610) is used in applications such as atomically updated flags, and cannot be used as a replacement for a Boolean.

6.75.2 Constructor & Destructor Documentation

6.75.2.1 decaf::util::concurrent::atomic::AtomicBoolean::AtomicBoolean ()

Creates a new **AtomicBoolean** (p. 610) whose initial value is false.

6.75.2.2 decaf::util::concurrent::atomic::AtomicBoolean::AtomicBoolean (bool *initialValue*)

Creates a new **AtomicBoolean** (p. 610) with the initial value.

Parameters:

initialValue - The initial value of this boolean.

6.75.2.3 virtual decaf::util::concurrent::atomic::AtomicBoolean::~AtomicBoolean () [inline, virtual]

6.75.3 Member Function Documentation

6.75.3.1 bool decaf::util::concurrent::atomic::AtomicBoolean::compareAndSet (bool *expect*, bool *update*)

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters:

expect - the expected value

update - the new value

Returns:

true if successful. False return indicates that the actual value was not equal to the expected value.

6.75.3.2 bool decaf::util::concurrent::atomic::AtomicBoolean::get () const [inline]

Gets the current value of this **AtomicBoolean** (p. 610).

Returns:

the currently set value.

6.75.3.3 bool decaf::util::concurrent::atomic::AtomicBoolean::getAndSet (bool *newValue*)

Atomically sets to the given value and returns the previous value.

Parameters:

newValue - the new value

Returns:

the previous value

6.75.3.4 void decaf::util::concurrent::atomic::AtomicBoolean::set (bool *newValue*) [inline]

Unconditionally sets to the given value.

Parameters:

newValue - the new value

6.75.3.5 std::string decaf::util::concurrent::atomic::AtomicBoolean::toString () const

Returns the String representation of the current value.

Returns:

the String representation of the current value.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/atomic/**AtomicBoolean.h**

6.76 decaf::util::concurrent::atomic::AtomicInteger Class Reference

An int value that may be updated atomically.

`#include <src/main/decaf/util/concurrent/atomic/AtomicInteger.h>`Inheritance diagram for decaf::util::concurrent::atomic::AtomicInteger:

Public Member Functions

- **AtomicInteger** ()

  *Create a new **AtomicInteger** (p. 613) with an initial value of 0.*

- **AtomicInteger** (int initialValue)

  *Create a new **AtomicInteger** (p. 613) with the given initial value.*

- virtual ~**AtomicInteger** ()
- int **get** () const

  Gets the current value.

- void **set** (int newValue)

  Sets to the given value.

- int **getAndSet** (int newValue)

  Atomically sets to the given value and returns the old value.

- bool **compareAndSet** (int expect, int update)

  Atomically sets the value to the given updated value if the current value == the expected value.

- int **getAndIncrement** ()

  Atomically increments by one the current value.

- int **getAndDecrement** ()

  Atomically decrements by one the current value.

- int **getAndAdd** (int delta)

  Atomically adds the given value to the current value.

- int **incrementAndGet** ()

  Atomically increments by one the current value.

- int **decrementAndGet** ()

  Atomically decrements by one the current value.

- int **addAndGet** (int delta)

  Atomically adds the given value to the current value.

- std::string **toString** () const

Returns the String representation of the current value.

- int **intValue** () const

  Description copied from class: Number Returns the value of the specified number as an int.

- long long **longValue** () const

  Description copied from class: Number Returns the value of the specified number as a long.

- float **floatValue** () const

  Description copied from class: Number Returns the value of the specified number as a float.

- double **doubleValue** () const

  Description copied from class: Number Returns the value of the specified number as a double.

6.76.1 Detailed Description

An int value that may be updated atomically. An **AtomicInteger** (p. 613) is used in applications such as atomically incremented counters, and cannot be used as a replacement for an Integer. However, this class does extend Number to allow uniform access by tools and utilities that deal with numerically-based classes.

6.76.2 Constructor & Destructor Documentation

6.76.2.1 decaf::util::concurrent::atomic::AtomicInteger::AtomicInteger ()

Create a new **AtomicInteger** (p. 613) with an initial value of 0.

6.76.2.2 decaf::util::concurrent::atomic::AtomicInteger::AtomicInteger (int *initialValue*)

Create a new **AtomicInteger** (p. 613) with the given initial value.

Parameters:

initialValue - The initial value of this object.

6.76.2.3 virtual decaf::util::concurrent::atomic::AtomicInteger::~AtomicInteger () [inline, virtual]

6.76.3 Member Function Documentation

6.76.3.1 int decaf::util::concurrent::atomic::AtomicInteger::addAndGet (int *delta*)

Atomically adds the given value to the current value.

Parameters:

delta - the value to add.

Returns:

the updated value.

6.76.3.2 bool decaf::util::concurrent::atomic::AtomicInteger::compareAndSet (int *expect*, int *update*)

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters:

expect - the expected value

update - the new value

Returns:

true if successful. False return indicates that the actual value was not equal to the expected value.

6.76.3.3 int decaf::util::concurrent::atomic::AtomicInteger::decrementAndGet ()

Atomically decrements by one the current value.

Returns:

the updated value.

Referenced by decaf::util::concurrent::atomic::AtomicRefCounter::release().

6.76.3.4 double decaf::util::concurrent::atomic::AtomicInteger::doubleValue () const [virtual]

Description copied from class: Number Returns the value of the specified number as a double. This may involve rounding.

Returns:

the numeric value represented by this object after conversion to type double.

Implements **decaf::lang::Number** (p. 2270).

6.76.3.5 float decaf::util::concurrent::atomic::AtomicInteger::floatValue () const [virtual]

Description copied from class: Number Returns the value of the specified number as a float. This may involve rounding.

Returns:

the numeric value represented by this object after conversion to type float.

Implements **decaf::lang::Number** (p. 2270).

6.76.3.6 int decaf::util::concurrent::atomic::AtomicInteger::get () const [inline]

Gets the current value.

Returns:

the current value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::drainTo(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::offer(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::peek(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::poll(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::put(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::remainingCapacity(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::size(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::take(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::toArray(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::toString().

6.76.3.7 int decaf::util::concurrent::atomic::AtomicInteger::getAndAdd (int *delta*)

Atomically adds the given value to the current value.

Parameters:

delta - The value to add.

Returns:

the previous value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::drainTo().

6.76.3.8 int decaf::util::concurrent::atomic::AtomicInteger::getAndDecrement ()

Atomically decrements by one the current value.

Returns:

the previous value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::poll(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::take().

6.76.3.9 int decaf::util::concurrent::atomic::AtomicInteger::getAndIncrement ()

Atomically increments by one the current value.

Returns:

the previous value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::offer(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::put().

6.76.3.10 int decaf::util::concurrent::atomic::AtomicInteger::getAndSet (int *newValue*)

Atomically sets to the given value and returns the old value.

Parameters:

newValue - the new value.

Returns:

the previous value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::clear().

6.76.3.11 int decaf::util::concurrent::atomic::AtomicInteger::incrementAndGet ()

Atomically increments by one the current value.

Returns:

the updated value.

Referenced by decaf::util::concurrent::atomic::AtomicRefCounter::AtomicRefCounter().

6.76.3.12 int decaf::util::concurrent::atomic::AtomicInteger::intValue () const [virtual]

Description copied from class: Number Returns the value of the specified number as an int. This may involve rounding or truncation.

Returns:

the numeric value represented by this object after conversion to type int.

Implements **decaf::lang::Number** (p. 2270).

6.76.3.13 long long decaf::util::concurrent::atomic::AtomicInteger::longValue () const [virtual]

Description copied from class: Number Returns the value of the specified number as a long. This may involve rounding or truncation.

Returns:

the numeric value represented by this object after conversion to type long long.

Implements **decaf::lang::Number** (p. 2270).

6.76.3.14 void decaf::util::concurrent::atomic::AtomicInteger::set (int *newValue*) [inline]

Sets to the given value.

Parameters:

newValue - the new value

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::clear().

6.76.3.15 std::string decaf::util::concurrent::atomic::AtomicInteger::toString () const

Returns the String representation of the current value.

Returns:

the String representation of the current value.

The documentation for this class was generated from the following file:

References decaf::util::concurrent::atomic::AtomicInteger::decrementAndGet().

6.77.2.2 void decaf::util::concurrent::atomic::AtomicRefCounter::swap (AtomicRefCounter & *other*) [inline, protected]

Swaps this instance's reference counter with the one given, this allows for copy-and-swap semantics of this object.

Parameters:

other The value to swap with this one's.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/atomic/**AtomicRefCounter.h**

6.78 decaf::util::concurrent::atomic::AtomicReference< T > Class Template Reference

An Pointer reference that may be updated atomically.

`#include <src/main/decaf/util/concurrent/atomic/AtomicReference.h>`

Public Member Functions

- **AtomicReference** ()
- **AtomicReference** (T *value)
- virtual ~**AtomicReference** ()
- T * **get** () const

  Gets the Current Value.

- void **set** (T *newValue)

  Sets the Current value of this Reference.

- bool **compareAndSet** (T *expect, T *update)

  Atomically sets the value to the given updated value if the current value == the expected value.

- T * **getAndSet** (T *newValue)

  Atomically sets to the given value and returns the old value.

- std::string **toString** () const

  Returns the String representation of the current value.

6.78.1 Detailed Description

template<typename T> class decaf::util::concurrent::atomic::AtomicReference< T >

An Pointer reference that may be updated atomically.

6.78.2 Constructor & Destructor Documentation

6.78.2.1 template<typename T > decaf::util::concurrent::atomic::AtomicReference< T >::AtomicReference () [inline]

6.78.2.2 template<typename T > decaf::util::concurrent::atomic::AtomicReference< T >::AtomicReference (T * *value*) [inline]

6.78.2.3 template<typename T > virtual decaf::util::concurrent::atomic::AtomicReference< T >::~AtomicReference () [inline, virtual]

6.78.3 Member Function Documentation

6.78.3.1 template<typename T > bool decaf::util::concurrent::atomic::AtomicReference< T >::compareAndSet (T * *expect*, T * *update*) [inline]

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters:

expect - the expected value

update - the new value

Returns:

true if successful. False return indicates that the actual value was not equal to the expected value.

6.78.3.2 template<typename T > T* decaf::util::concurrent::atomic::AtomicReference< T >::get () const [inline]

Gets the Current Value.

Returns:

the current value of this Reference.

6.78.3.3 template<typename T > T* decaf::util::concurrent::atomic::AtomicReference< T >::getAndSet (T * *newValue*) [inline]

Atomically sets to the given value and returns the old value.

Parameters:

newValue- the new value

Returns:

the previous value.

Referenced by decaf::util::concurrent::atomic::AtomicReference< T >::set().

6.78.3.4 template<typename T > void decaf::util::concurrent::atomic::AtomicReference< T >::set (T * *newValue*) [inline]

Sets the Current value of this Reference.

Parameters:

newValue The new Value of this Reference.

References decaf::util::concurrent::atomic::AtomicReference< T >::getAndSet().

6.78.3.5 template<typename T > std::string decaf::util::concurrent::atomic::AtomicReference< T >::toString () const [inline]

Returns the String representation of the current value.

Returns:

string representation of the current value.

The documentation for this class was generated from the following file:

Public Member Functions

- **BackupTransport** (**BackupTransportPool** *failover)
- virtual ~**BackupTransport** ()
- **decaf::net::URI getUri** () const

  Gets the URI assigned to this Backup.

- void **setUri** (const **decaf::net::URI** &uri)

  *Sets the URI assigned to this **Transport** (p. 3125).*

- const **Pointer**< **Transport** > & **getTransport** ()

  *Gets the currently held **transport** (p. 72).*

- void **setTransport** (const **Pointer**< **Transport** > transport)

  *Sets the held **transport** (p. 72), if not NULL then start to listen for **exceptions** (p. 67) from the held **transport** (p. 72).*

- virtual void **onException** (const **decaf::lang::Exception** &ex)

  *Event handler for an exception from a command **transport** (p. 72).*

- bool **isClosed** () const

  *Has the **Transport** (p. 3125) been shutdown and no longer usable.*

- void **setClosed** (bool value)

  *Sets the closed flag on this **Transport** (p. 3125).*

- bool **isPriority** () const
- void **setPriority** (bool value)

  *Set if this **transport** (p. 72) is a Priority backup or not.*

6.80.1 Constructor & Destructor Documentation

6.80.1.1 activemq::transport::failover::BackupTransport::BackupTransport (BackupTransportPool * *failover*)

6.80.1.2 virtual activemq::transport::failover::BackupTransport::~BackupTransport () [virtual]

6.80.2 Member Function Documentation

6.80.2.1 const Pointer<Transport>& activemq::transport::failover::BackupTransport::getTransport () [inline]

Gets the currently held **transport** (p. 72).

Returns:

pointer to the held **transport** (p. 72) or NULL if not set.

6.80.2.2 decaf::net::URI activemq::transport::failover::BackupTransport::getUri () const [inline]

Gets the URI assigned to this Backup.

Returns:

the assigned URI

6.80.2.3 bool activemq::transport::failover::BackupTransport::isClosed () const [inline]

Has the **Transport** (p. 3125) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3125)

6.80.2.4 bool activemq::transport::failover::BackupTransport::isPriority () const [inline]

Returns:

true if this **transport** (p. 72) was in the priority backup list.

6.80.2.5 virtual void activemq::transport::failover::BackupTransport::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 72). The **BackupTransport** (p. 627) closes its internal **Transport** (p. 3125) when an exception is received and returns the URI to the pool of URIs to attempt connections to.

Parameters:

ex The exception that was passed to this listener to handle.

Implements **activemq::transport::TransportListener** (p. 3147).

6.80.2.6 void activemq::transport::failover::BackupTransport::setClosed (bool *value*) [inline]

Sets the closed flag on this **Transport** (p. 3125).

Parameters:

value - true for closed.

6.80.2.7 void activemq::transport::failover::BackupTransport::setPriority (bool *value*) [inline]

Set if this **transport** (p. 72) is a Priority backup or not.

Parameters:

value True if this is a priority backup.

6.80.2.8 void activemq::transport::failover::BackupTransport::setTransport (const Pointer< Transport > *transport*) [inline]

Sets the held **transport** (p. 72), if not NULL then start to listen for **exceptions** (p. 67) from the held **transport** (p. 72).

Parameters:

transport *(p. 72)* The **transport** (p. 72) to hold.

References NULL.

6.80.2.9 void activemq::transport::failover::BackupTransport::setUri (const decaf::net::URI & *uri*) [inline]

Sets the URI assigned to this **Transport** (p. 3125).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**BackupTransport.h**

6.81 activemq::transport::failover::BackupTransportPool Class Reference

`#include <src/main/activemq/transport/failover/BackupTransportPool.h>`Inheritance diagram for activemq::transport::failover::BackupTransportPool:

Public Member Functions

- **BackupTransportPool** (**FailoverTransport** *parent, const **Pointer**< **CompositeTaskRunner** > taskRunner, const **Pointer**< **CloseTransportsTask** > closeTask, const **Pointer**< **URIPool** > uriPool, const **Pointer**< **URIPool** > updates, const **Pointer**< **URIPool** > priorityUriPool)
- **BackupTransportPool** (**FailoverTransport** *parent, int backupPoolSize, const **Pointer**< **CompositeTaskRunner** > taskRunner, const **Pointer**< **CloseTransportsTask** > closeTask, const **Pointer**< **URIPool** > uriPool, const **Pointer**< **URIPool** > updates, const **Pointer**< **URIPool** > priorityUriPool)
- virtual ~**BackupTransportPool** ()
- void **close** ()

  Closes down the pool and destroys any Backups contained in the pool.

- virtual bool **isPending** () const

  Return true if we don't currently have enough Connected Transports.

- **Pointer**< **BackupTransport** > **getBackup** ()

  *Get a Connected **Transport** (p. 3125) from the pool of Backups if any are present, otherwise it return a NULL Pointer.*

- virtual bool **iterate** ()

  Connect to a Backup Broker if we haven't already connected to the max number of Backups.

- int **getBackupPoolSize** () const

  Gets the Max number of Backups this Task will create.

- void **setBackupPoolSize** (int size)

  Sets the Max number of Backups this Task will create.

- bool **isEnabled** () const

  *Gets if the backup **Transport** (p. 3125) Pool has been enabled or not, when not enabled no backups are created and any that were are destroyed.*

- void **setEnabled** (bool value)

  *Sets if this Backup **Transport** (p. 3125) Pool is enabled.*

- bool **isPriorityBackupAvailable** () const

  Returns true if there is a Backup in the pool that's on the priority backups list.

Friends

- class **BackupTransport**

6.81.1 Constructor & Destructor Documentation

6.81.1.1 activemq::transport::failover::BackupTransportPool::BackupTransportPool (FailoverTransport * *parent*, const Pointer< CompositeTaskRunner > *taskRunner*, const Pointer< CloseTransportsTask > *closeTask*, const Pointer< URIPool > *uriPool*, const Pointer< URIPool > *updates*, const Pointer< URIPool > *priorityUriPool*)

6.81.1.2 activemq::transport::failover::BackupTransportPool::BackupTransportPool (FailoverTransport * *parent*, int *backupPoolSize*, const Pointer< CompositeTaskRunner > *taskRunner*, const Pointer< CloseTransportsTask > *closeTask*, const Pointer< URIPool > *uriPool*, const Pointer< URIPool > *updates*, const Pointer< URIPool > *priorityUriPool*)

6.81.1.3 virtual activemq::transport::failover::BackupTransportPool::~BackupTransportPool () [virtual]

6.81.2 Member Function Documentation

6.81.2.1 void activemq::transport::failover::BackupTransportPool::close ()

Closes down the pool and destroys any Backups contained in the pool.

6.81.2.2 Pointer<BackupTransport> activemq::transport::failover::BackupTransportPool::getBackup ()

Get a Connected **Transport** (p. 3125) from the pool of Backups if any are present, otherwise it return a NULL Pointer.

Returns:

Pointer to a Connected **Transport** (p. 3125) or NULL

6.81.2.3 int activemq::transport::failover::BackupTransportPool::getBackupPoolSize () const [inline]

Gets the Max number of Backups this Task will create.

Returns:

the max number of active BackupTransports that will be created.

6.81.2.4 bool activemq::transport::failover::BackupTransportPool::isEnabled () const [inline]

Gets if the backup **Transport** (p. 3125) Pool has been enabled or not, when not enabled no backups are created and any that were are destroyed.

Returns:

true if enable.

6.81.2.5 virtual bool activemq::transport::failover::BackupTransportPool::isPending () const [virtual]

Return true if we don't currently have enough Connected Transports.

Implements **activemq::threads::CompositeTask** (p. 1045).

6.81.2.6 bool activemq::transport::failover::BackupTransportPool::isPriorityBackupAvailable () const

Returns true if there is a Backup in the pool that's on the priority backups list.

Returns:

true if there is a priority backup available.

6.81.2.7 virtual bool activemq::transport::failover::BackupTransportPool::iterate () [virtual]

Connect to a Backup Broker if we haven't already connected to the max number of Backups.

Implements **activemq::threads::Task** (p. 2989).

6.81.2.8 void activemq::transport::failover::BackupTransportPool::setBackupPoolSize (int *size*) [inline]

Sets the Max number of Backups this Task will create.

Parameters:

size - the max number of active BackupTransports that will be created.

6.81.2.9 void activemq::transport::failover::BackupTransportPool::setEnabled (bool *value*)

Sets if this Backup **Transport** (p. 3125) Pool is enabled. When not enabled no Backups are created and any that were are destroyed.

Parameters:

value - true to enable backup creation, false to disable.

6.82.1.1 activemq::commands::BaseCommand::BaseCommand () [inline]

6.82.1.2 virtual activemq::commands::BaseCommand::~BaseCommand () [inline, virtual]

6.82.2 Member Function Documentation

6.82.2.1 virtual void activemq::commands::BaseCommand::copyDataStructure (const DataStructure * *src*) [inline, virtual]

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 205), **activemq::commands::ActiveMQBytesMessage** (p. 216), **activemq::commands::ActiveMQMapMessage** (p. 350), **activemq::commands::ActiveMQMessage** (p. 366), **activemq::commands::ActiveMQObjectMessage** (p. 386), **activemq::commands::ActiveMQStreamMessage** (p. 478), **activemq::commands::ActiveMQTextMessage** (p. 520), **activemq::commands::BrokerError** (p. 711), **activemq::commands::BrokerInfo** (p. 725), **activemq::commands::ConnectionControl** (p. 1097), **activemq::commands::ConnectionError** (p. 1107), **activemq::commands::ConnectionInfo** (p. 1131), **activemq::commands::ConsumerControl** (p. 1165), **activemq::commands::ConsumerInfo** (p. 1184), **activemq::commands::ControlCommand** (p. 1197), **activemq::commands::DataArrayResponse** (p. 1239), **activemq::commands::DataResponse** (p. 1281), **activemq::commands::DestinationInfo** (p. 1384), **activemq::commands::ExceptionResponse** (p. 1467), **activemq::commands::FlushCommand** (p. 1563), **activemq::commands::IntegerResponse** (p. 1754), **activemq::commands::KeepAliveInfo** (p. 1835), **activemq::commands::Message** (p. 2077), **activemq::commands::MessageAck** (p. 2118), **activemq::commands::MessageDispatch** (p. 2146), **activemq::commands::MessageDispatchNotification** (p. 2160), **activemq::commands::MessagePull** (p. 2211), **activemq::commands::ProducerAck** (p. 2457), **activemq::commands::ProducerInfo** (p. 2477), **activemq::commands::RemoveInfo** (p. 2573), **activemq::commands::RemoveSubscriptionInfo** (p. 2581), **activemq::commands::ReplayCommand** (p. 2590), **activemq::commands::Response** (p. 2607), **activemq::commands::SessionInfo** (p. 2704), **activemq::commands::ShutdownInfo** (p. 2750), **activemq::commands::TransactionInfo** (p. 3107), and **activemq::commands::WireFormatInfo** (p. 3236).

References getCommandId(), and isResponseRequired().

6.82.2.2 virtual bool activemq::commands::BaseCommand::equals (const DataStructure * *value*) const [inline, virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 206), **activemq::commands::ActiveMQBytesMessage** (p. 216), **activemq::commands::ActiveMQMapMessage** (p. 351), **activemq::commands::ActiveMQMessage** (p. 366), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 378), **activemq::commands::ActiveMQObjectMessage** (p. 386), **activemq::commands::ActiveMQStreamMessage** (p. 478), **activemq::commands::ActiveMQTextMessage** (p. 520), **activemq::commands::BrokerInfo** (p. 725), **activemq::commands::ConnectionControl** (p. 1098), **activemq::commands::ConnectionError** (p. 1107), **activemq::commands::ConnectionInfo** (p. 1131), **activemq::commands::ConsumerControl** (p. 1165), **activemq::commands::ConsumerInfo** (p. 1184), **activemq::commands::ControlCommand** (p. 1197), **activemq::commands::DataArrayResponse** (p. 1239), **activemq::commands::DataResponse** (p. 1281), **activemq::commands::DestinationInfo** (p. 1384), **activemq::commands::ExceptionResponse** (p. 1467), **activemq::commands::FlushCommand** (p. 1563), **activemq::commands::IntegerResponse** (p. 1754), **activemq::commands::KeepAliveInfo** (p. 1835), **activemq::commands::Message** (p. 2077), **activemq::commands::MessageAck** (p. 2118), **activemq::commands::MessageDispatch** (p. 2146), **activemq::commands::MessageDispatchNotification** (p. 2160), **activemq::commands::MessagePull** (p. 2211), **activemq::commands::ProducerAck** (p. 2457), **activemq::commands::ProducerInfo** (p. 2477), **activemq::commands::RemoveInfo** (p. 2573), **activemq::commands::RemoveSubscriptionInfo** (p. 2581), **activemq::commands::ReplayCommand** (p. 2590), **activemq::commands::Response** (p. 2607), **activemq::commands::SessionInfo** (p. 2704), **activemq::commands::ShutdownInfo** (p. 2750), **activemq::commands::TransactionInfo** (p. 3107), **activemq::commands::WireFormatInfo** (p. 3236), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 378), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 378), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 378), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 378), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 378), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 378).

References activemq::commands::BaseDataStructure::equals().

6.82.2.3 virtual int activemq::commands::BaseCommand::getCommandId () const [inline, virtual]

Gets the **Command** (p. 1019) Id of this **Message** (p. 2072).

Returns:

Command (p. 1019) Id

Implements **activemq::commands::Command** (p. 1020).

Referenced by copyDataStructure().

6.82.2.4 virtual bool activemq::commands::BaseCommand::isBrokerInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1020).

Reimplemented in **activemq::commands::BrokerInfo** (p. 727).

6.82.2.5 virtual bool activemq::commands::BaseCommand::isConnectionControl () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1020).

Reimplemented in **activemq::commands::ConnectionControl** (p. 1099).

6.82.2.6 virtual bool activemq::commands::BaseCommand::isConnectionError () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1020).

Reimplemented in **activemq::commands::ConnectionError** (p. 1108).

6.82.2.7 virtual bool activemq::commands::BaseCommand::isConnectionInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1020).

Reimplemented in **activemq::commands::ConnectionInfo** (p. 1133).

6.82.2.8 virtual bool activemq::commands::BaseCommand::isConsumerControl () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1021).

Reimplemented in **activemq::commands::ConsumerControl** (p. 1166).

6.82.2.9 virtual bool activemq::commands::BaseCommand::isConsumerInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1021).

Reimplemented in **activemq::commands::ConsumerInfo** (p. 1186).

6.82.2.10 virtual bool activemq::commands::BaseCommand::isControlCommand () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1021).

Reimplemented in **activemq::commands::ControlCommand** (p. 1198).

6.82.2.11 virtual bool activemq::commands::BaseCommand::isDestinationInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1021).

6.82.2.12 virtual bool activemq::commands::BaseCommand::isFlushCommand () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1021).

Reimplemented in **activemq::commands::FlushCommand** (p. 1564).

6.82.2.13 virtual bool activemq::commands::BaseCommand::isKeepAliveInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1021).

Reimplemented in **activemq::commands::KeepAliveInfo** (p. 1835).

6.82.2.14 virtual bool activemq::commands::BaseCommand::isMessage () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1021).

Reimplemented in **activemq::commands::Message** (p. 2083).

6.82.2.15 virtual bool activemq::commands::BaseCommand::isMessageAck () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1021).

Reimplemented in **activemq::commands::MessageAck** (p. 2119).

6.82.2.16 virtual bool activemq::commands::BaseCommand::isMessageDispatch () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1022).

Reimplemented in **activemq::commands::MessageDispatch** (p. 2147).

6.82.2.17 virtual bool activemq::commands::BaseCommand::isMessageDispatchNotification () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1022).

Reimplemented in **activemq::commands::MessageDispatchNotification** (p. 2161).

6.82.2.18 virtual bool activemq::commands::BaseCommand::isMessagePull () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1022).

Reimplemented in **activemq::commands::MessagePull** (p. 2212).

6.82.2.19 virtual bool activemq::commands::BaseCommand::isProducerAck () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1022).

Reimplemented in **activemq::commands::ProducerAck** (p. 2458).

6.82.2.20 virtual bool activemq::commands::BaseCommand::isProducerInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1022).

Reimplemented in **activemq::commands::ProducerInfo** (p. 2478).

6.82.2.21 virtual bool activemq::commands::BaseCommand::isRemoveInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1022).

Reimplemented in **activemq::commands::RemoveInfo** (p. 2574).

6.82.2.22 virtual bool activemq::commands::BaseCommand::isRemoveSubscriptionInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1022).

Reimplemented in **activemq::commands::RemoveSubscriptionInfo** (p. 2582).

6.82.2.23 virtual bool activemq::commands::BaseCommand::isReplayCommand () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1022).

Reimplemented in **activemq::commands::ReplayCommand** (p. 2591).

6.82.2.24 virtual bool activemq::commands::BaseCommand::isResponse () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1023).

Reimplemented in **activemq::commands::Response** (p. 2608).

6.82.2.25 virtual bool activemq::commands::BaseCommand::isResponseRequired () const [inline, virtual]

Is a **Response** (p. 2606) required for this **Command** (p. 1019).

Returns:

true if a response is required.

Implements **activemq::commands::Command** (p. 1023).

Referenced by copyDataStructure().

6.82.2.26 virtual bool activemq::commands::BaseCommand::isSessionInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1023).

6.82.2.27 virtual bool activemq::commands::BaseCommand::isShutdownInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1023).

Reimplemented in **activemq::commands::ShutdownInfo** (p. 2750).

6.82.2.28 virtual bool activemq::commands::BaseCommand::isTransactionInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1023).

Reimplemented in **activemq::commands::TransactionInfo** (p. 3108).

6.82.2.29 virtual bool activemq::commands::BaseCommand::isWireFormatInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 1023).

Reimplemented in **activemq::commands::WireFormatInfo** (p. 3239).

6.82.2.30 virtual void activemq::commands::BaseCommand::setCommandId (int *id*) [inline, virtual]

Sets the **Command** (p. 1019) Id of this **Message** (p. 2072).

Parameters:

id **Command** (p. 1019) Id

Implements **activemq::commands::Command** (p. 1023).

6.82.2.31 virtual void activemq::commands::BaseCommand::setResponseRequired (const bool *required*) [inline, virtual]

Set if this **Message** (p. 2072) requires a **Response** (p. 2606).

Parameters:

required true if response is required

Implements **activemq::commands::Command** (p. 1024).

6.82.2.32 virtual std::string activemq::commands::BaseCommand::toString () const [inline, virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Implements **activemq::commands::Command** (p. 1024).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 207), **activemq::commands::ActiveMQBytesMessage** (p. 223), **activemq::commands::ActiveMQMapMessage** (p. 359), **activemq::commands::ActiveMQMessage** (p. 367), **activemq::commands::ActiveMQObjectMessage** (p. 388), **activemq::commands::ActiveMQStreamMessage** (p. 484), **activemq::commands::ActiveMQTextMessage** (p. 522), **activemq::commands::BrokerInfo** (p. 728), **activemq::commands::ConnectionControl** (p. 1100), **activemq::commands::ConnectionError** (p. 1108), **activemq::commands::ConnectionInfo** (p. 1134), **activemq::commands::ConsumerControl** (p. 1167), **activemq::commands::ConsumerInfo** (p. 1187), **activemq::commands::ControlCommand** (p. 1198), **activemq::commands::DataArrayResponse** (p. 1240), **activemq::commands::DataResponse** (p. 1282), **activemq::commands::DestinationInfo** (p. 1386), **activemq::commands::ExceptionResponse** (p. 1468), **activemq::commands::FlushCommand** (p. 1564), **activemq::commands::IntegerResponse** (p. 1755), **activemq::commands::KeepAliveInfo** (p. 1835), **activemq::commands::Message** (p. 2086), **activemq::commands::MessageAck** (p. 2120), **activemq::commands::MessageDispatch** (p. 2148), **activemq::commands::MessageDispatchNotification** (p. 2162), **activemq::commands::MessagePull** (p. 2213), **activemq::commands::ProducerAck** (p. 2458), **activemq::commands::ProducerInfo** (p. 2479), **activemq::commands::RemoveInfo** (p. 2574), **activemq::commands::RemoveSubscriptionInfo** (p. 2583), **activemq::commands::ReplayCommand** (p. 2591), **activemq::commands::Response** (p. 2608), **activemq::commands::SessionInfo** (p. 2705), **activemq::commands::ShutdownInfo** (p. 2750), **activemq::commands::TransactionInfo** (p. 3108), and **activemq::commands::WireFormatInfo** (p. 3241).

6.83.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **BaseCommandMarshaller** (p. 642). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.83.2 Constructor & Destructor Documentation

6.83.2.1 activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::BaseComm () [inline]

6.83.2.2 virtual activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::~BaseCom () [inline, virtual]

6.83.3 Member Function Documentation

6.83.3.1 virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshall** (p. 210), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 229), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 362), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 373), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 390), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 490), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 524), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 732), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 1103), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 1111), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 1137), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1170), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1192), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1200), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1242), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1284), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 1389), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1470), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1566), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1757), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1838), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 2123), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 2156), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller**

6.83.3.2 virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::looseUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.83.3.3 virtual int activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 211), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 230), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 363), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 374), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 391), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 491), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 525), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 733), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 1104), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 1112), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 1138), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1171), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1193), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1201), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1243), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1285), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 1390), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1471), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1567), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller**

(p. 1758), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller**

(p. 2709), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller**
(p. 2754), and **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller**
(p. 3112).

6.83.3.4 virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::tightMarshal

(OpenWireFormat * ***format***, **commands::DataStructure** * ***command***, **decaf::io::DataOutputStream** * ***ds***, **utils::BooleanStream** * ***bs***) `[virtual]`

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshall**
(p. 211), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller**
(p. 230), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller**

6.83.3.5 virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::tightUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshall** (p. 212), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 231), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 364), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 375), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 492), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 526), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 734), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 1105), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 1113), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 1139), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1172), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller**

(p. 1194), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller**

6.84 activemq::wireformat::openwire::marshal::BaseDataStreamMarshal Class Reference

Base class for all Marshallers that **marshal** (p. 83) DataStructures to and from the wire using the OpenWire protocol.

`#include <src/main/activemq/wireformat/openwire/marshal/BaseDataStreamMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller:

Public Member Functions

- virtual ~**BaseDataStreamMarshaller** ()
- virtual int **tightMarshal1** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **utils::BooleanStream** *bs AMQCPP_UNUSED)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataOutputStream** *ds AMQCPP_UNUSED, **utils::BooleanStream** *bs AMQCPP_UNUSED)

  Tight Marshal to the given stream.

- virtual void **tightUnmarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataInputStream** *dis AMQCPP_UNUSED, **utils::BooleanStream** *bs AMQCPP_UNUSED)

  Tight Un-Marshal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataOutputStream** *ds AMQCPP_UNUSED)

  Tight Marshal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataInputStream** *dis AMQCPP_UNUSED)

  Loose Un-Marshal to the given stream.

Static Public Member Functions

- static std::string **toString** (const **commands::MessageId** *id)

  Converts the object to a String.

- static std::string **toString** (const **commands::ProducerId** *id)

  Converts the object to a String.

- static std::string **toString** (const **commands::TransactionId** *txnId)

Converts the given transaction ID into a String.

- static std::string **toHexFromBytes** (const std::vector< unsigned char > &data)

  given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Protected Member Functions

- virtual **commands::DataStructure** * **tightUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Unmarshal the cached object.

- virtual int **tightMarshalCachedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **utils::BooleanStream** *bs)

  Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

- virtual void **tightMarshalCachedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

- virtual void **looseMarshalCachedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut)

  Loosely marshals the passed DataStructure based object to the passed stream returning nothing.

- virtual **commands::DataStructure** * **looseUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

  Loose Unmarshal the cached object.

- virtual int **tightMarshalNestedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **utils::BooleanStream** *bs)

  Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

- virtual void **tightMarshalNestedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

- virtual **commands::DataStructure** * **tightUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Unmarshal the nested object.

- virtual **commands::DataStructure** * **looseUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

  Loose Unmarshal the nested object.

- virtual void **looseMarshalNestedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut)

  Loose marshall the nested object.

- virtual std::string **tightUnmarshalString** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Performs Tight Unmarshaling of String Objects.

- virtual int **tightMarshalString1** (const std::string &value, **utils::BooleanStream** *bs)

  Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

- virtual void **tightMarshalString2** (const std::string &value, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marshals the passed string to the streams passed.

- virtual void **looseMarshalString** (const std::string value, **decaf::io::DataOutputStream** *dataOut)

  Loose Marshal the String to the DataOuputStream passed.

- virtual std::string **looseUnmarshalString** (**decaf::io::DataInputStream** *dataIn)

  Loose Un-Marshal the String to the DataOuputStream passed.

- virtual int **tightMarshalLong1** (**OpenWireFormat** *wireFormat, long long value, **utils::BooleanStream** *bs)

  *Tightly **marshal** (p. 83) the long long to the BooleanStream passed.*

- virtual void **tightMarshalLong2** (**OpenWireFormat** *wireFormat, long long value, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  *Tightly **marshal** (p. 83) the long long to the Streams passed.*

- virtual long long **tightUnmarshalLong** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  *Tight **marshal** (p. 83) the long long type.*

- virtual void **looseMarshalLong** (**OpenWireFormat** *wireFormat, long long value, **decaf::io::DataOutputStream** *dataOut)

  *Tightly **marshal** (p. 83) the long long to the BooleanStream passed.*

- virtual long long **looseUnmarshalLong** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

  *Loose **marshal** (p. 83) the long long type.*

- virtual std::vector< unsigned char > **tightUnmarshalByteArray** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Unmarshal an array of char.

- virtual std::vector< unsigned char > **looseUnmarshalByteArray** (**decaf::io::DataInputStream** *dataIn)

  Loose Unmarshal an array of char.

- virtual std::vector< unsigned char > **tightUnmarshalConstByteArray** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs, int size)

  Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

- virtual std::vector< unsigned char > **looseUnmarshalConstByteArray** (**decaf::io::DataInputStream** *dataIn, int size)

  Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

- virtual **commands::DataStructure** * **tightUnmarshalBrokerError** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Unarshall the Error object.

- virtual int **tightMarshalBrokerError1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **utils::BooleanStream** *bs)

  Tight Marshal the Error object.

- virtual void **tightMarshalBrokerError2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marshal the Error object.

- virtual **commands::DataStructure** * **looseUnmarshalBrokerError** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

  Loose Unarshal the Error object.

- virtual void **looseMarshalBrokerError** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut)

  Tight Marshal the Error object.

- template<typename T >
  int **tightMarshalObjectArray1** (**OpenWireFormat** *wireFormat, std::vector< T > objects, **utils::BooleanStream** *bs)

  Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.

- template<typename T >
  void **tightMarshalObjectArray2** (**OpenWireFormat** *wireFormat, std::vector< T > objects, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

- template<typename T >
  void **looseMarshalObjectArray** (**OpenWireFormat** *wireFormat, std::vector< T > objects, **decaf::io::DataOutputStream** *dataOut)

  Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

- virtual std::string **readAsciiString** (**decaf::io::DataInputStream** *dataIn)

  Given an DataInputStream read a know ASCII formatted string from the input and return that string.

6.84.1 Detailed Description

Base class for all Marshallers that **marshal** (p. 83) DataStructures to and from the wire using the OpenWire protocol.

Since:

2.0

6.84.2 Constructor & Destructor Documentation

6.84.2.1 virtual activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::~BaseDataStreamM () [inline, virtual]

6.84.3 Member Function Documentation

6.84.3.1 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshal (OpenWireFormat *format *AMQCPP_UNUSED*, commands::DataStructure *command *AMQCPP_UNUSED*, decaf::io::DataOutputStream *ds *AMQCPP_UNUSED*) [inline, virtual]

Tight Marshal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

6.84.3.2 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalBrokerEr (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Tight Marshal the Error object.

Parameters:

wireFormat - The OpenwireFormat properties

data - Error to Marshal

dataOut - stream to write marshalled data to

Exceptions:

IOException if an error occurs.

6.84.3.3 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalCachedO (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Loosely marshals the passed DataStructure based object to the passed stream returning nothing.

Parameters:

wireFormat - The OpenwireFormat properties

data - DataStructure Object Pointer to **marshal** (p. 83)

dataOut - stream to write marshaled data to

Exceptions:

IOException if an error occurs.

6.84.3.4 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalLong (OpenWireFormat * *wireFormat*, long long *value*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Tightly **marshal** (p. 83) the long long to the BooleanStream passed.

Parameters:

wireFormat - The OpenwireFormat properties

value - long long to **marshal** (p. 83)

dataOut - DataOutputStream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

6.84.3.5 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalNestedOb (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Loose marshall the nested object.

Parameters:

wireFormat - The OpenwireFormat properties

object - DataStructure Object Pointer to **marshal** (p. 83)

dataOut - stream to write marshaled data to

Exceptions:

IOException if an error occurs.

6.84.3.6 template<typename T > void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectAr (OpenWireFormat * *wireFormat*, std::vector< T > *objects*, decaf::io::DataOutputStream * *dataOut*) [inline, protected]

Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters:

wireFormat - The OpenwireFormat properties

objects - array of DataStructure object pointers.

dataOut - stream to write marshalled data to

Returns:

size of the marshalled data

Exceptions:

IOException if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, decaf::io::DataOutputStream::writeBoolean(), and decaf::io::DataOutputStream::writeShort().

6.84.3.7 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalString (const std::string *value*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Loose Marshal the String to the DataOuputStream passed.

Parameters:

value - string to **marshal** (p. 83)

dataOut - stream to write marshaled form to

Exceptions:

IOException if an error occurs.

6.84.3.8 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshal (OpenWireFormat *format *AMQCPP_UNUSED*, commands::DataStructure *command *AMQCPP_UNUSED*, decaf::io::DataInputStream *dis *AMQCPP_UNUSED*) [inline, virtual]

Loose Un-Marshal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

6.84.3.9 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalBroker (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Unarshal the Error object.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshalled form from

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.84.3.10 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalByteA (decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Unmarshal an array of char.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

Returns:

the unmarshalled vector of chars.

Exceptions:

IOException if an error occurs.

6.84.3.11 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalCache (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Unmarshal the cached object.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.84.3.12 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalConst (decaf::io::DataInputStream * *dataIn*, int *size*) [protected, virtual]

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

size - size of the const array to unmarshal

Returns:

the unmarshaled vector of chars.

Exceptions:

IOException if an error occurs.

6.84.3.13 virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalLong (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose **marshal** (p. 83) the long long type.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

Returns:

the unmarshaled long long

Exceptions:

IOException if an error occurs.

6.84.3.14 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalNeste (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Unmarshal the nested object.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.84.3.15 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalString (decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Un-Marshal the String to the DataOuputStream passed.

Parameters:

dataIn - stream to read marshaled form from

Returns:

the unmarshaled string

Exceptions:

IOException if an error occurs.

6.84.3.16 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::readAsciiString (decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Given an DataInputStream read a know ASCII formatted string from the input and return that string.

Parameters:

dataIn - DataInputStream to read from

Returns:

string value read from stream

6.84.3.17 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal1 (OpenWireFormat *format *AMQCPP_UNUSED*, commands::DataStructure *command *AMQCPP_UNUSED*, utils::BooleanStream *bs *AMQCPP_UNUSED*) [inline, virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

6.84.3.18 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal2 (OpenWireFormat *format *AMQCPP_UNUSED*, commands::DataStructure *command *AMQCPP_UNUSED*, decaf::io::DataOutputStream *ds *AMQCPP_UNUSED*, utils::BooleanStream *bs *AMQCPP_UNUSED*) [inline, virtual]

Tight Marshal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

6.84.3.19 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerE (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshal the Error object.

Parameters:

wireFormat - The OpenwireFormat properties

data - Error to Marshal

bs - boolean stream to **marshal** (p. 83) to.

Returns:

size of the marshalled data

Exceptions:

IOException if an error occurs.

6.84.3.20 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerE (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshal the Error object.

Parameters:

wireFormat - The OpenwireFormat properties

data - Error to Marshal

dataOut - stream to write marshalled data to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

6.84.3.21 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedC (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters:

wireFormat - The OpenwireFormat properties

data - DataStructure Object Pointer to **marshal** (p. 83)

bs - boolean stream to **marshal** (p. 83) to.

Returns:

size of data written.

Exceptions:

IOException if an error occurs.

6.84.3.22 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedO (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters:

wireFormat - The OpenwireFormat properties

data - DataStructure Object Pointer to **marshal** (p. 83)

bs - boolean stream to **marshal** (p. 83) to.

dataOut - stream to write marshaled data to

Exceptions:

IOException if an error occurs.

6.84.3.23 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalLong1 (OpenWireFormat * *wireFormat*, long long *value*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly **marshal** (p. 83) the long long to the BooleanStream passed.

Parameters:

wireFormat - The OpenwireFormat properties

value - long long to **marshal** (p. 83)

bs - boolean stream to **marshal** (p. 83) to.

Returns:

size of data written.

Exceptions:

IOException if an error occurs.

6.84.3.24 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalLong2 (OpenWireFormat * *wireFormat*, long long *value*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly **marshal** (p. 83) the long long to the Streams passed.

Parameters:

wireFormat - The OpenwireFormat properties

value - long long to **marshal** (p. 83)

dataOut - stream to write marshaled form to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

6.84.3.25 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedO (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters:

wireFormat - The OpenwireFormat properties

object - DataStructure Object Pointer to **marshal** (p. 83)

bs - boolean stream to **marshal** (p. 83) to.

Returns:

size of data written.

Exceptions:

IOException if an error occurs.

6.84.3.26 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedO (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters:

wireFormat - The OpenwireFormat properties

object - DataStructure Object Pointer to **marshal** (p. 83)

bs - boolean stream to **marshal** (p. 83) to.

dataOut - stream to write marshaled data to

Exceptions:

IOException if an error occurs.

6.84.3.27 template<typename T > int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectA (OpenWireFormat * *wireFormat*, std::vector< T > *objects*, utils::BooleanStream * *bs*) [inline, protected]

Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.

Parameters:

wireFormat - The OpenwireFormat properties

objects - array of DataStructure object pointers.

bs - boolean stream to **marshal** (p. 83) to.

Returns:

size of the marshalled data

Exceptions:

IOException if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, and activemq::wireformat::openwire::utils::BooleanStream::writeBoolean().

6.84.3.28 template<typename T > void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectA (OpenWireFormat * *wireFormat*, std::vector< T > *objects*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [inline, protected]

Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters:

wireFormat - The OpenwireFormat properties

objects - array of DataStructure object pointers.

dataOut - stream to write marshalled data to

bs - boolean stream to **marshal** (p. 83) to.

Returns:

size of the marshalled data

Exceptions:

IOException if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, activemq::wireformat::openwire::utils::BooleanStream::readBoolean(), and decaf::io::DataOutputStream::writeShort().

6.84.3.29 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString1 (const std::string & *value*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

Parameters:

value - string to **marshal** (p. 83)

bs - BooleanStream to use.

Returns:

size of marshaled string.

Exceptions:

IOException if an error occurs.

6.84.3.30 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString2 (const std::string & *value*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshals the passed string to the streams passed.

Parameters:

value - string to **marshal** (p. 83)

dataOut - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

6.84.3.31 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshal (OpenWireFormat *format *AMQCPP_UNUSED*, commands::DataStructure *command *AMQCPP_UNUSED*, decaf::io::DataInputStream *dis *AMQCPP_UNUSED*, utils::BooleanStream *bs *AMQCPP_UNUSED*) [inline, virtual]

Tight Un-Marshal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to Un-Marshal from.

Exceptions:

IOException if an error occurs.

6.84.3.32 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalBroke (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Unarshall the Error object.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshalled form from

bs - boolean stream to **marshal** (p. 83) to.

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.84.3.33 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalByteA (decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Unmarshal an array of char.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Returns:

the unmarshaled vector of chars.

Exceptions:

IOException if an error occurs.

6.84.3.34 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalCache (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Unmarshal the cached object.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

bs - boolean stream to **marshal** (p. 83) to.

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.84.3.35 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalConst (decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*, int *size*) [protected, virtual]

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

size - size of the const array to unmarshal

Returns:

the unmarshaled vector of chars.

Exceptions:

IOException if an error occurs.

6.84.3.36 virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalLong (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight **marshal** (p. 83) the long long type.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

bs - boolean stream to **marshal** (p. 83) to.

Returns:

the unmarshaled long long

Exceptions:

IOException if an error occurs.

6.84.3.37 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalNeste (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Unmarshal the nested object.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

bs - boolean stream to **marshal** (p. 83) to.

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.84.3.38 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalString (decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Performs Tight Unmarshaling of String Objects.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Returns:

the unmarshaled string.

Exceptions:

IOException if an error occurs.

6.84.3.39 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toHexFromBytes (const std::vector< unsigned char > & *data*) [static]

given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Parameters:

data - unsigned char data array pointer

Returns:

a string coded in hex that represents the data

6.84.3.40 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::TransactionId * *txnId*) [static]

Converts the given transaction ID into a String.

Parameters:

txnId - TransactionId poitner

Returns:

string representation of the id

6.84.3.41 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::ProducerId * *id*) [static]

Converts the object to a String.

Parameters:

id - ProducerId pointer

Returns:

string representing the id

6.84.3.42 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::MessageId * *id*) [static]

Converts the object to a String.

Parameters:

id - MessageId pointer

Returns:

string representing the id

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getCMSMessageID().

`#include <src/main/decaf/net/BindException.h>`Inheritance diagram for decaf::net::BindException:

Public Member Functions

- **BindException** ()

  Default Constructor.

- **BindException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **BindException** (const **BindException** &ex)

  Copy Constructor.

- **BindException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **BindException** (const std::exception *cause)

  Constructor.

- **BindException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **BindException** * **clone** () const

  Clones this exception.

- virtual ~**BindException** () throw ()

6.86.1 Constructor & Destructor Documentation

6.86.1.1 decaf::net::BindException::BindException ()

Default Constructor.

6.86.1.2 decaf::net::BindException::BindException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.86.1.3 decaf::net::BindException::BindException (const BindException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.86.1.4 decaf::net::BindException::BindException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.86.1.5 decaf::net::BindException::BindException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.86.1.6 decaf::net::BindException::BindException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.86.1.7 virtual decaf::net::BindException::~BindException () throw () [virtual]

6.86.2 Member Function Documentation

6.86.2.1 virtual BindException* decaf::net::BindException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2788).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**BindException.h**

6.87 decaf::util::BitSet Class Reference

This class implements a vector of bits that grows as needed.

`#include <src/main/decaf/util/BitSet.h>`

Public Member Functions

- **BitSet** ()

  *Creates a new **BitSet** (p. 676) whose bits are all false.*

- **BitSet** (int bitCount)

  Creates a bit set whose initial size is large enough to explicitly represent bits with indices in the range 0 through bitCount-1.

- **BitSet** (const **BitSet** &set)

  Copy Constructor.

- **BitSet** & **operator**= (const **BitSet** &set)

  Assignment.

- virtual ~**BitSet** ()
- bool **operator**== (const **BitSet** &other) const

  Boolean comparison operator ==.

- bool **operator!**= (const **BitSet** &other) const

  Boolean comparison operator !=.

- void **AND** (const **BitSet** &set)

  Performs a logical AND of this target bit set with the argument bit set.

- void **OR** (const **BitSet** &set)

  Performs a logical OR of this bit set with the bit set argument.

- void **andNot** (const **BitSet** &set)

  *Clears all of the bits in this **BitSet** (p. 676) whose corresponding bit is set in the specified **BitSet** (p. 676).*

- int **cardinality** ()

  *Returns the number of bits set to true in this **BitSet** (p. 676).*

- void **clear** ()

  *Sets all of the bits in this **BitSet** (p. 676) to false.*

- void **clear** (int index)

  Sets the bit specified by the index to false.

- void **clear** (int fromIndex, int toIndex)

  Sets the bits from the specified fromIndex (inclusive) to the specified toIndex (exclusive) to false.

- bool **equals** (const **BitSet** &set) const

  Compares this object against the specified object.

- void **flip** (int index)

  Sets the bit at the specified index to the complement of its current value.

- void **flip** (int fromIndex, int toIndex)

  Sets each bit from the specified fromIndex (inclusive) to the specified toIndex (exclusive) to the complement of its current value.

- bool **get** (int index) const

  Returns the value of the bit with the specified index.

- **BitSet get** (int fromIndex, int toIndex) const

  *Returns a new **BitSet** (p. 676) composed of bits from this **BitSet** (p. 676) from fromIndex (inclusive) to toIndex (exclusive).*

- bool **intersects** (const **BitSet** &set) const

  *Returns true if the specified **BitSet** (p. 676) has any bits set to true that are also set to true in this **BitSet** (p. 676).*

- bool **isEmpty** () const

  *Returns true if this **BitSet** (p. 676) contains no bits that are set to true.*

- int **length** () const

  *Returns the "logical size" of this **BitSet** (p. 676): the index of the highest set bit in the **BitSet** (p. 676) plus one.*

- int **nextClearBit** (int index) const

  Returns the index of the first bit that is set to false that occurs on or after the specified starting index.

- int **nextSetBit** (int index) const

  Returns the index of the first bit that is set to true that occurs on or after the specified starting index.

- void **set** (int index)

  Sets the bit at the specified index to true.

- void **set** (int index, bool value)

  Sets the bit at the specified index to the specified value.

- void **set** (int fromIndex, int toIndex)

  Sets the bits from the specified fromIndex (inclusive) to the specified toIndex (exclusive) to true.

- void **set** (int fromIndex, int toIndex, bool value)

  Sets the bits from the specified fromIndex (inclusive) to the specified toIndex (exclusive) to the value given.

- int **size** () const

  *Returns the number of bits of space actually in use by this **BitSet** (p. 676) to represent bit values.*

- std::string **toString** () const

  Returns a string representation of this bit set.

- void **XOR** (const **BitSet** &set)

  Performs a logical XOR of this bit set with the bit set argument.

6.87.1 Detailed Description

This class implements a vector of bits that grows as needed. Each component of the bit set has a boolean value. The bits of a **BitSet** (p. 676) are indexed by nonnegative integers. Individual indexed bits can be examined, set, or cleared. One **BitSet** (p. 676) may be used to modify the contents of another **BitSet** (p. 676) through logical AND, logical inclusive OR, and logical exclusive OR operations.

By default, all bits in the set initially have the value false.

Every bit set has a current size, which is the number of bits of space currently in use by the bit set. Note that the size is related to the implementation of a bit set, so it may change with implementation. The length of a bit set relates to logical length of a bit set and is defined independently of implementation.

A **BitSet** (p. 676) is not safe for multi-threaded use without external synchronization.

Since:

1.0

6.87.2 Constructor & Destructor Documentation

6.87.2.1 decaf::util::BitSet::BitSet ()

Creates a new **BitSet** (p. 676) whose bits are all false.

6.87.2.2 decaf::util::BitSet::BitSet (int *bitCount*)

Creates a bit set whose initial size is large enough to explicitly represent bits with indices in the range 0 through bitCount-1. All bits are initially false. If the bitCount is not a multiple of 64 then the count is rounded to the next closest multiple of 64.

Parameters:

bitCount The number of bits this **BitSet** (p. 676) should hold.

Exceptions:

NegativeArraySizeException if bitCount is negative.

6.87.2.3 decaf::util::BitSet::BitSet (const BitSet & *set*)

Copy Constructor.

6.87.2.4 virtual decaf::util::BitSet::~BitSet () [virtual]

6.87.3 Member Function Documentation

6.87.3.1 void decaf::util::BitSet::AND (const BitSet & *set*)

Performs a logical AND of this target bit set with the argument bit set. This bit set is modified so that each bit in it has the value true if and only if it both initially had the value true and the corresponding bit in the bit set argument also had the value true.

Parameters:

set The **BitSet** (p. 676) to perform this action against.

6.87.3.2 void decaf::util::BitSet::andNot (const BitSet & *set*)

Clears all of the bits in this **BitSet** (p. 676) whose corresponding bit is set in the specified **BitSet** (p. 676).

Parameters:

set The **BitSet** (p. 676) to perform this action against.

6.87.3.3 int decaf::util::BitSet::cardinality ()

Returns the number of bits set to true in this **BitSet** (p. 676).

Returns:

the number of bits set to true in this **BitSet** (p. 676).

6.87.3.4 void decaf::util::BitSet::clear (int *fromIndex*, int *toIndex*)

Sets the bits from the specified fromIndex (inclusive) to the specified toIndex (exclusive) to false.

Parameters:

fromIndex The index (inclusive) to start setting bits to false.

toIndex The index (exclusive) to stop setting bits to false.

Exceptions:

IndexOutOfBoundsException if fromIndex is negative, or toIndex is negative, or fromIndex is larger than toIndex.

6.87.3.5 void decaf::util::BitSet::clear (int *index*)

Sets the bit specified by the index to false.

Parameters:

index The index of the bit whose value is to be set to false

Exceptions:

IndexOutOfBoundsException if the index value is negative.

6.87.3.6 void decaf::util::BitSet::clear ()

Sets all of the bits in this **BitSet** (p. 676) to false.

6.87.3.7 bool decaf::util::BitSet::equals (const BitSet & *set*) const

Compares this object against the specified object. The result is true if and only if is a Bitset object that has exactly the same set of bits set to true as this bit set. That is, for every nonnegative int index k,

set.get(k) == this->get(k)

must be true. The current sizes of the two bit sets are not compared.

Returns:

true if the sets are the same, false otherwise.

6.87.3.8 void decaf::util::BitSet::flip (int *fromIndex*, int *toIndex*)

Sets each bit from the specified fromIndex (inclusive) to the specified toIndex (exclusive) to the complement of its current value.

Parameters:

fromIndex The index (inclusive) to start setting bits to its compliment.

toIndex The index (exclusive) to stop setting bits to its compliment.

Exceptions:

IndexOutOfBoundsException if fromIndex is negative, or toIndex is negative, or fromIndex is larger than toIndex.

6.87.3.9 void decaf::util::BitSet::flip (int *index*)

Sets the bit at the specified index to the complement of its current value.

Parameters:

index The index of the bit whose value is to be set to its compliment.

Exceptions:

IndexOutOfBoundsException if the index value is negative.

6.87.3.10 BitSet decaf::util::BitSet::get (int *fromIndex*, int *toIndex*) const

Returns a new **BitSet** (p. 676) composed of bits from this **BitSet** (p. 676) from fromIndex (inclusive) to toIndex (exclusive).

Parameters:

fromIndex The index (inclusive) to start at.

toIndex The index (exclusive) to stop at.

Returns:

a new **BitSet** (p. 676) containing the specified values.

Exceptions:

IndexOutOfBoundsException if fromIndex is negative, or toIndex is negative, or fromIndex is larger than toIndex.

6.87.3.11 bool decaf::util::BitSet::get (int *index*) const

Returns the value of the bit with the specified index. The value is true if the bit with the given index is currently set in this **BitSet** (p. 676); otherwise, the result is false.

Parameters:

index The index of the bit in question.

Returns:

the value of the bit with the specified index.

Exceptions:

IndexOutOfBoundsException if the index value is negative.

6.87.3.12 bool decaf::util::BitSet::intersects (const BitSet & *set*) const

Returns true if the specified **BitSet** (p. 676) has any bits set to true that are also set to true in this **BitSet** (p. 676).

Parameters:

set **BitSet** (p. 676) to intersect with.

Returns:

boolean indicating whether this **BitSet** (p. 676) intersects the specified **BitSet** (p. 676).

6.87.3.13 bool decaf::util::BitSet::isEmpty () const

Returns true if this **BitSet** (p. 676) contains no bits that are set to true.

Returns:

true if the set is empty, false otherwise.

6.87.3.14 int decaf::util::BitSet::length () const

Returns the "logical size" of this **BitSet** (p. 676): the index of the highest set bit in the **BitSet** (p. 676) plus one. Returns zero if the **BitSet** (p. 676) contains no set bits.

Returns:

the logical size of the **BitSet** (p. 676).

6.87.3.15 int decaf::util::BitSet::nextClearBit (int *index*) const

Returns the index of the first bit that is set to false that occurs on or after the specified starting index.

Parameters:

index The index to start the search from (inclusive).

Returns:

the index of the next clear bit.

Exceptions:

IndexOutOfBoundsException if the index value is negative.

6.87.3.16 int decaf::util::BitSet::nextSetBit (int *index*) const

Returns the index of the first bit that is set to true that occurs on or after the specified starting index.

Parameters:

index The index to start the search from (inclusive).

Returns:

the index of the next set bit.

Exceptions:

IndexOutOfBoundsException if the index value is negative.

6.87.3.17 bool decaf::util::BitSet::operator!= (const BitSet & *other*) const [inline]

Boolean comparison operator !=.

Parameters:

other The other **BitSet** (p. 676) to compare to this one.

6.87.3.18 BitSet& decaf::util::BitSet::operator= (const BitSet & *set*)

Assignment.

6.87.3.19 bool decaf::util::BitSet::operator== (const BitSet & *other*) const [inline]

Boolean comparison operator ==.

Parameters:

other The other **BitSet** (p. 676) to compare to this one.

6.87.3.20 void decaf::util::BitSet::OR (const BitSet & *set*)

Performs a logical OR of this bit set with the bit set argument. This bit set is modified so that a bit in it has the value true if and only if it either already had the value true or the corresponding bit in the bit set argument has the value true.

Parameters:

set The **BitSet** (p. 676) to perform this action against.

6.87.3.21 void decaf::util::BitSet::set (int *fromIndex*, int *toIndex*, bool *value*)

Sets the bits from the specified fromIndex (inclusive) to the specified toIndex (exclusive) to the value given.

Parameters:

fromIndex The index (inclusive) to start at.

toIndex The index (exclusive) to stop at.

value The boolean value to assign to the target bits.

Exceptions:

IndexOutOfBoundsException if fromIndex is negative, or toIndex is negative, or fromIndex is larger than toIndex.

6.87.3.22 void decaf::util::BitSet::set (int *fromIndex*, int *toIndex*)

Sets the bits from the specified fromIndex (inclusive) to the specified toIndex (exclusive) to true.

Parameters:

fromIndex The index (inclusive) to start at.

toIndex The index (exclusive) to stop at.

Exceptions:

IndexOutOfBoundsException if fromIndex is negative, or toIndex is negative, or fromIndex is larger than toIndex.

6.87.3.23 void decaf::util::BitSet::set (int *index*, bool *value*)

Sets the bit at the specified index to the specified value.

Parameters:

index The index to set.

value The value to assign to the given bit.

Exceptions:

IndexOutOfBoundsException if the index value is negative.

6.87.3.24 void decaf::util::BitSet::set (int *index*)

Sets the bit at the specified index to true.

Parameters:

index The index to set to true.

Exceptions:

IndexOutOfBoundsException if the index value is negative.

6.87.3.25 int decaf::util::BitSet::size () const

Returns the number of bits of space actually in use by this **BitSet** (p. 676) to represent bit values. The maximum element in the set is the size - 1st element.

Returns:

the number of bits currently in this bit set.

6.87.3.26 std::string decaf::util::BitSet::toString () const

Returns a string representation of this bit set. For every index for which this **BitSet** (p. 676) contains a bit in the set state, the decimal representation of that index is included in the result. Such indices are listed in order from lowest to highest, separated by ", " (a comma and a space) and surrounded by braces, resulting in the usual mathematical notation for a set of integers.

Returns:

string representation of the **BitSet** (p. 676).

6.87.3.27 void decaf::util::BitSet::XOR (const BitSet & *set*)

Performs a logical XOR of this bit set with the bit set argument. This bit set is modified so that a bit in it has the value true if and only if one of the following statements holds:

* The bit initially has the value true, and the corresponding bit in the argument has the value false. * The bit initially has the value false, and the corresponding bit in the argument has the value true.

Parameters:

set The **BitSet** (p. 676) to use.

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.88.1 Detailed Description

This is a blocking version of a byte buffer stream. Read operations block until the requested data becomes available in the **internal** (p. 97) buffer via a call to setByteArray.

6.88.2 Constructor & Destructor Documentation

6.88.2.1 decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream ()

Default Constructor - uses a default **internal** (p. 97) buffer.

6.88.2.2 decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream (const unsigned char * *buffer*, int *bufferSize*)

Constructor that initializes the **internal** (p. 97) buffer.

See also:

setByteArray (p. 688).

6.88.2.3 virtual decaf::io::BlockingByteArrayInputStream::~BlockingByteArrayInputStream () [virtual]

6.88.3 Member Function Documentation

6.88.3.1 virtual int decaf::io::BlockingByteArrayInputStream::available () const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(*p. ***1787***)* if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1708).

6.88.3.2 virtual void decaf::io::BlockingByteArrayInputStream::close () [virtual]

Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions:

IOException *(*p. ***1787***)* if an I/O error occurs while closing the **InputStream** (p. 1707).

Reimplemented from **decaf::io::InputStream** (p. 1709).

6.88.3.3 virtual int decaf::io::BlockingByteArrayInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1709).

6.88.3.4 virtual int decaf::io::BlockingByteArrayInputStream::doReadByte () [protected, virtual]

Implements **decaf::io::InputStream** (p. 1710).

6.88.3.5 virtual void decaf::io::BlockingByteArrayInputStream::setByteArray (const unsigned char * *buffer*, int *bufferSize*) [virtual]

6.88.3.6 virtual long long decaf::io::BlockingByteArrayInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(*p. *1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1713).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**BlockingByteArrayInputStream.h**

6.89 decaf::util::concurrent::BlockingQueue< E > Class Template Reference

A **decaf::util::Queue** (p. 2515) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.

  Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

- virtual E **take** ()=0

  Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

- virtual bool **poll** (E &result, long long timeout, const **TimeUnit** &unit)=0

  Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

- virtual int **remainingCapacity** () const =0

  Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

- virtual int **drainTo** (**Collection**< E > &c)=0

  Removes all available elements from this queue and adds them to the given collection.

- virtual int **drainTo** (**Collection**< E > &c, int maxElements)=0

  Removes at most the given number of available elements from this queue and adds them to the given collection.

6.89.1 Detailed Description

template<typename E> class decaf::util::concurrent::BlockingQueue< E >

A **decaf::util::Queue** (p. 2515) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element. `BlockingQueue` (p. 690) methods come in four forms, with different ways of handling operations that cannot be satisfied immediately, but may be satisfied at some

point in the future: one throws an exception, the second returns a special value (either `true` or `false`, depending on the operation), the third blocks the current thread indefinitely until the operation can succeed, and the fourth blocks for only a given maximum time limit before giving up. These methods are summarized in the following table:

	Throws exception	*Boolean Flag*	*Blocks*	*Times out*
Insert	**add(e)** (p. 176)	**offer(e)** (p. 693)	**put(e)** (p. 694)	**offer(e, time, unit)** (p. ??)
Remove	**remove()** (p. 178)	**poll()** (p. 694)	**take()** (p. 695)	**poll(time, unit)** (p. ??)
Examine	**element()** (p. 177)	**peek()** (p. 2517)	*not applicable*	*not applicable*

A `BlockingQueue` (p. 690) may be capacity bounded. At any given time it may have a `remainingCapacity` beyond which no additional elements can be `put` without blocking. A `BlockingQueue` (p. 690) without any intrinsic capacity constraints always reports a remaining capacity of `Integer::MAX_VALUE`.

`BlockingQueue` (p. 690) implementations are designed to be used primarily for producer-consumer queues, but additionally support **decaf::util::Collection** (p. 1006) interface. So, for example, it is possible to remove an arbitrary element from a queue using `remove(x)`. However, such operations are in general *not* performed very efficiently, and are intended for only occasional use, such as when a queued message is cancelled.

`BlockingQueue` (p. 690) implementations are thread-safe. All queuing methods achieve their effects atomically using **internal** (p. 97) **locks** (p. 134) or other forms of concurrency control. However, the *bulk* **Collection** (p. 1006) operations `addAll`, `containsAll`, `retainAll` and `removeAll` are *not* necessarily performed atomically unless specified otherwise in an implementation. So it is possible, for example, for `addAll(c)` to fail (throwing an exception) after adding only some of the elements in `c`.

A `BlockingQueue` (p. 690) does *not* intrinsically support any kind of "close" or "shutdown" operation to indicate that no more items will be added. The needs and usage of such features tend to be implementation-dependent. For example, a common tactic is for producers to insert special *end-of-stream* or *poison* objects, that are interpreted accordingly when taken by consumers.

Usage example, based on a typical producer-consumer scenario. Note that a `BlockingQueue` (p. 690) can safely be used with multiple producers and multiple consumers.

```
class Producer : public Runnable {
private:

    BlockingQueue* queue;

public:

    Producer( BlockingQueue* q ) : queue( q ) {}

    virtual void run() {
        try {
            while( true ) { queue->put( produce() ); }
        } catch( InterruptedException& ex ) { ... handle ...}
    }

    Object produce() { ... }
}
```

```
class Consumer : public Runnable {
private:

    BlockingQueue* queue;

public:

    Consumer( BlockingQueue* q ) : queue( q ) {}

    virtual void run() {
        try {
            while( true ) { consume( queue->take() (p. 695) ); }
        } catch( InterruptedException& ex ) { ... handle ...}
    }

    void consume( Object& x ) { ... }
}

int main( int argc, char** argv ) {

    BlockingQueue (p. 690) q = new SomeQueueImplementation();
    Producer p( &q );
    Consumer c1( &q );
    Consumer c2( &q );
    Thread t1( &p ).start();
    Thread t2( &c1 ).start();
    Thread t3( &c2 ).start();
}
```

Memory consistency effects: As with other **concurrent** (p. 130) collections, actions in a thread prior to placing an object into a **BlockingQueue** (p. 690) *happen-before* actions subsequent to the access or removal of that element from the **BlockingQueue** (p. 690) in another thread.

Since:

1.0

6.89.2 Constructor & Destructor Documentation

6.89.2.1 template<typename E> virtual decaf::util::concurrent::BlockingQueue< E >::~BlockingQueue () [inline, virtual]

6.89.3 Member Function Documentation

6.89.3.1 template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::drainTo (Collection< E > & *c*, int *maxElements*) [pure virtual]

Removes at most the given number of available elements from this queue and adds them to the given collection. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters:

c the collection to transfer elements into

maxElements the maximum number of elements to transfer

Returns:

the number of elements transferred

Exceptions:

UnsupportedOperationException if addition of elements is not supported by the specified collection

IllegalArgumentException if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1868), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2972), and **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1868).

6.89.3.2 template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::drainTo (Collection< E > & *c*) [pure virtual]

Removes all available elements from this queue and adds them to the given collection. This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters:

c the collection to transfer elements into

Returns:

the number of elements transferred

Exceptions:

UnsupportedOperationException if addition of elements is not supported by the specified collection

IllegalArgumentException if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1868), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2972), and **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1868).

6.89.3.3 template<typename E> virtual bool decaf::util::concurrent::BlockingQueue< E >::offer (const E & *e*, long long *timeout*, const TimeUnit & *unit*) [pure virtual]

Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Parameters:

e the element to add

timeout how long to wait before giving up, in units of `unit`

unit a `TimeUnit` (p. 3088) determining how to interpret the `timeout` parameter

Returns:

`true` if successful, or `false` if the specified waiting time elapses before space is available

Exceptions:

InterruptedException if interrupted while waiting

NullPointerException if the specified element is null

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1870), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2974), and **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1870).

6.89.3.4 template<typename E> virtual bool decaf::util::concurrent::BlockingQueue< E >::poll (E & *result*, long long *timeout*, const TimeUnit & *unit*) [pure virtual]

Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

Parameters:

result the referenced value that will be assigned the value retrieved from the **Queue** (p. 2515). Undefined if this methods returned false.

timeout how long to wait before giving up, in units of `unit`

unit a `TimeUnit` (p. 3088) determining how to interpret the `timeout` parameter.

Returns:

`true` if successful or `false` if the specified waiting time elapses before an element is available.

Exceptions:

InterruptedException if interrupted while waiting

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1871), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2975), and **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1871).

6.89.3.5 template<typename E> virtual void decaf::util::concurrent::BlockingQueue< E >::put (const E & *value*) [pure virtual]

Inserts the specified element into this queue, waiting if necessary for space to become available.

Parameters:

value the element to add

Exceptions:

InterruptedException if interrupted while waiting

NullPointerException if the specified element is null

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1872), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2976), and **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1872).

6.89.3.6 template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::remainingCapacity () const [pure virtual]

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit. Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns:

the remaining capacity

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1872), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2976), and **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1872).

6.89.3.7 template<typename E> virtual E decaf::util::concurrent::BlockingQueue< E >::take () [pure virtual]

Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Returns:

the head of this queue

Exceptions:

InterruptedException if interrupted while waiting

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1873), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2977), and **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1873).

Static Public Attributes

- static const **Boolean** _**FALSE**

  The Class object representing the primitive false boolean.

- static const **Boolean** _**TRUE**

  The Class object representing the primitive type boolean.

6.90.1 Constructor & Destructor Documentation

6.90.1.1 decaf::lang::Boolean::Boolean (bool *value*)

Parameters:

value - primitive boolean to wrap.

6.90.1.2 decaf::lang::Boolean::Boolean (const std::string & *value*)

Parameters:

value - **String** (p. 2935) value to convert to a boolean.

6.90.1.3 virtual decaf::lang::Boolean::~Boolean () [inline, virtual]

6.90.2 Member Function Documentation

6.90.2.1 bool decaf::lang::Boolean::booleanValue () const [inline]

Returns:

the primitive boolean value of this object

6.90.2.2 virtual int decaf::lang::Boolean::compareTo (const bool & *b*) const [virtual]

Compares this **Boolean** (p. 696) instance with another.

Parameters:

b - the **Boolean** (p. 696) instance to be compared

Returns:

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

Implements **decaf::lang::Comparable< bool >** (p. 1037).

6.90.2.3 virtual int decaf::lang::Boolean::compareTo (const Boolean & *b*) const [virtual]

Compares this **Boolean** (p. 696) instance with another.

Parameters:

b - the **Boolean** (p. 696) instance to be compared

Returns:

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

6.90.2.4 bool decaf::lang::Boolean::equals (const bool & *b*) const [inline, virtual]

Returns:

true if the two **Boolean** (p. 696) Objects have the same value.

Implements **decaf::lang::Comparable< bool >** (p. 1038).

6.90.2.5 bool decaf::lang::Boolean::equals (const Boolean & *b*) const [inline]

Returns:

true if the two **Boolean** (p. 696) Objects have the same value.

6.90.2.6 virtual bool decaf::lang::Boolean::operator< (const bool & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< bool >** (p. 1038).

6.90.2.7 virtual bool decaf::lang::Boolean::operator< (const Boolean & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.90.2.8 virtual bool decaf::lang::Boolean::operator== (const bool & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< bool >** (p. 1038).

6.90.2.9 virtual bool decaf::lang::Boolean::operator== (const Boolean & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.90.2.10 static bool decaf::lang::Boolean::parseBoolean (const std::string & *value*) [static]

Parses the **String** (p. 2935) passed and extracts an bool.

Parameters:

value The std::string value to parse

Returns:

bool value

6.90.2.11 static std::string decaf::lang::Boolean::toString (bool *value*) [static]

Converts the bool to a **String** (p. 2935) representation.

Parameters:

value The bool value to convert.

Returns:

std::string representation of the bool value passed.

6.90.2.12 std::string decaf::lang::Boolean::toString () const

Returns:

the string representation of this Booleans value.

6.90.2.13 static Boolean decaf::lang::Boolean::valueOf (const std::string & *value*) [static]

Parameters:

value The std::string value to convert to a `Boolean (p. 696)` instance.

Returns:

a **Boolean** (p. 696) instance of the string value

6.90.2.14 static Boolean decaf::lang::Boolean::valueOf (bool *value*) [static]

Parameters:

value The bool value to convert to a `Boolean (p. 696)` instance.

Returns:

a **Boolean** (p. 696) instance of the primitive boolean value

6.90.3 Field Documentation

6.90.3.1 const Boolean decaf::lang::Boolean::_FALSE [static]

The Class object representing the primitive false boolean.

6.90.3.2 const Boolean decaf::lang::Boolean::_TRUE [static]

The Class object representing the primitive type boolean.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Boolean.h**

6.91 activemq::commands::BooleanExpression Class Reference

`#include <src/main/activemq/commands/BooleanExpression.h>`Inheritance diagram for activemq::commands::BooleanExpression:

Public Member Functions

- **BooleanExpression** ()
- virtual ~**BooleanExpression** () throw ()
- virtual **DataStructure** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src AMQCPP_UNUSED)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1299*) *such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

6.91.1 Constructor & Destructor Documentation

6.91.1.1 activemq::commands::BooleanExpression::BooleanExpression () [inline]

6.91.1.2 virtual activemq::commands::BooleanExpression::~BooleanExpression () throw () [inline, virtual]

6.91.2 Member Function Documentation

6.91.2.1 virtual DataStructure* activemq::commands::BooleanExpression::cloneDataStructure () const [inline, virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

References NULL.

6.91.2.2 virtual void activemq::commands::BooleanExpression::copyDataStructure (const DataStructure *src *AMQCPP_UNUSED*) [inline, virtual]

Reimplemented from **activemq::commands::BaseDataStructure** (p. 670).

6.91.2.3 virtual bool activemq::commands::BooleanExpression::equals (const DataStructure * *value*) const [inline, virtual]

References activemq::commands::BaseDataStructure::equals().

6.91.2.4 virtual std::string activemq::commands::BooleanExpression::toString () const [inline, virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

References activemq::commands::BaseDataStructure::toString().

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**BooleanExpression.h**

6.92 activemq::wireformat::openwire::utils::BooleanStream Class Reference

Manages the writing and reading of boolean data streams to and from a data source such as a DataInputStream or DataOutputStream.

`#include <src/main/activemq/wireformat/openwire/utils/BooleanStream.h>`

Public Member Functions

- **BooleanStream** ()
- virtual ~**BooleanStream** ()
- bool **readBoolean** ()

  Read a boolean data element from the internal data buffer.

- void **writeBoolean** (bool value)

  Writes a Boolean value to the internal data buffer.

- void **marshal** (**decaf::io::DataOutputStream** *dataOut)

  Marshal the data to a DataOutputStream.

- void **marshal** (std::vector< unsigned char > &dataOut)

  Marshal the data to a STL vector of unsigned chars.

- void **unmarshal** (**decaf::io::DataInputStream** *dataIn)

  Unmarshal a Boolean data stream from the Input Stream.

- void **clear** ()

  Clears to old position markers, data starts at the beginning.

- int **marshalledSize** ()

  Calc the size that data is marshalled to.

6.92.1 Detailed Description

Manages the writing and reading of boolean data streams to and from a data source such as a DataInputStream or DataOutputStream. The booleans are stored as single bits in the stream, with the stream size pre-pended to the stream when the data is marshalled.

The serialized form of the size field can be between 1 and 3 bytes. If the number of used bytes < 64, size=1 byte If the number of used bytes >=64 and < 256 (size of an unsigned byte), size=2 bytes If the number of used bytes >=256, size=3 bytes

The high-order 2 bits (128 and 64) of the first byte of the size field are used to encode the information about the number of bytes in the size field. The only time the first byte will contain a value >=64 is if there are more bytes in the size field. If the first byte < 64, the value of the byte is simply the size value. If the first byte = 0xC0, the following unsigned byte is the size field. If the first byte = 0x80, the following short (two bytes) are the size field.

6.92.2 Constructor & Destructor Documentation

6.92.2.1 activemq::wireformat::openwire::utils::BooleanStream::BooleanStream ()

6.92.2.2 virtual activemq::wireformat::openwire::utils::BooleanStream::~BooleanStream () [virtual]

6.92.3 Member Function Documentation

6.92.3.1 void activemq::wireformat::openwire::utils::BooleanStream::clear ()

Clears to old position markers, data starts at the beginning.

6.92.3.2 void activemq::wireformat::openwire::utils::BooleanStream::marshal (std::vector< unsigned char > & *dataOut*)

Marshal the data to a STL vector of unsigned chars.

Parameters:

dataOut - reference to a vector to write the data to.

Exceptions:

IOException if an I/O error occurs during this operation.

6.92.3.3 void activemq::wireformat::openwire::utils::BooleanStream::marshal (decaf::io::DataOutputStream * *dataOut*)

Marshal the data to a DataOutputStream.

Parameters:

dataOut - Stream to write the data to.

Exceptions:

IOException if an I/O error occurs during this operation.

6.92.3.4 int activemq::wireformat::openwire::utils::BooleanStream::marshalledSize ()

Calc the size that data is marshalled to.

Returns:

int size of marshalled data.

6.92.3.5 bool activemq::wireformat::openwire::utils::BooleanStream::readBoolean ()

Read a boolean data element from the internal data buffer.

Returns:

boolean from the stream

Exceptions:

IOException if an I/O error occurs during this operation.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

6.92.3.6 void activemq::wireformat::openwire::utils::BooleanStream::unmarshal (decaf::io::DataInputStream * *dataIn*)

Unmarshal a Boolean data stream from the Input Stream.

Parameters:

dataIn - Input Stream to read data from.

Exceptions:

IOException if an I/O error occurs during this operation.

6.92.3.7 void activemq::wireformat::openwire::utils::BooleanStream::writeBoolean (bool *value*)

Writes a Boolean value to the internal data buffer.

Parameters:

value - boolean data to write.

Exceptions:

IOException if an I/O error occurs during this operation.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1().

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/utils/**BooleanStream.h**

6.93 decaf::util::concurrent::BrokenBarrierException Class Reference

`#include <src/main/decaf/util/concurrent/BrokenBarrierException.h>`Inheritance diagram for decaf::util::concurrent::BrokenBarrierException:

Public Member Functions

- **BrokenBarrierException** ()
  Default Constructor.
- **BrokenBarrierException** (const **decaf::lang::Exception** &ex)
  Conversion Constructor from some other Exception.
- **BrokenBarrierException** (const **BrokenBarrierException** &ex)
  Copy Constructor.
- **BrokenBarrierException** (const std::exception *cause)
  Constructor.
- **BrokenBarrierException** (const char *file, const int lineNumber, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- **BrokenBarrierException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **BrokenBarrierException** * **clone** () const
  Clones this exception.
- virtual ~**BrokenBarrierException** () throw ()

6.93.1 Constructor & Destructor Documentation

6.93.1.1 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException () `[inline]`

Default Constructor.

6.93.1.2 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const decaf::lang::Exception & *ex*) `[inline]`

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.93.1.3 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const BrokenBarrierException & *ex*) [inline]

Copy Constructor.

Parameters:

ex The Exception to copy in this new instance.

6.93.1.4 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const std::exception * *cause*) [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.93.1.5 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - list of primitives that are formatted into the message

6.93.1.6 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.93.1.7 virtual decaf::util::concurrent::BrokenBarrierException::~BrokenBarrierException () throw () [virtual]

6.93.2 Member Function Documentation

6.93.2.1 virtual BrokenBarrierException* decaf::util::concurrent::BrokenBarrierException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**BrokenBarrierException.h**

6.94 activemq::commands::BrokerError Class Reference

This class represents an Exception sent from the Broker.

`#include <src/main/activemq/commands/BrokerError.h>`Inheritance diagram for activemq::commands::BrokerError:

Data Structures

- struct **StackTraceElement**

Public Member Functions

- **BrokerError** ()
- **BrokerError** (**decaf::lang::Pointer**< **decaf::lang::Exception** > exCause)
- virtual ~**BrokerError** ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **BrokerError** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual **decaf::lang::Pointer**< **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

- virtual const std::string & **getMessage** () const

  Gets the string holding the error message.

- virtual void **setMessage** (const std::string &message)

  *Sets the string that contains the error **Message** (p. 2072).*

- virtual const std::string & **getExceptionClass** () const

  Gets the string holding the Exception Class name.

- virtual void **setExceptionClass** (const std::string &exceptionClass)

  Sets the string that contains the Exception Class name.

- virtual const **decaf::lang::Pointer**< **BrokerError** > & **getCause** () const

  Gets the Broker Error that caused this exception.

- virtual void **setCause** (const **decaf::lang::Pointer**< **BrokerError** > &cause)

  Sets the Broker Error that caused this exception.

- virtual const std::vector< **decaf::lang::Pointer**< **StackTraceElement** > > & **getStackTraceElements** () const

  Gets the Stack Trace Elements for the Exception.

- virtual void **setStackTraceElements** (const std::vector< **decaf::lang::Pointer**< **StackTraceElement** > > &stackTraceElements)

  Sets the Stack Trace Elements for this Exception.

- **decaf::lang::Pointer**< **decaf::lang::Exception** > **getLocalException** () const
- void **setLocalException** (**decaf::lang::Pointer**< **decaf::lang::Exception** > exCause)

  Sets the Pointer to the local exception that is the source of this Error.

- **exceptions::ActiveMQException createExceptionObject** ()

  Creates and returns a ActiveMQException object that contains the error data from the Broker.

6.94.1 Detailed Description

This class represents an Exception sent from the Broker. The Broker sends a java Throwable structure, so we must mimic its structure here. We provide a means in this class to create a Decaf Exception that represents the error from the broker.

6.94.2 Constructor & Destructor Documentation

6.94.2.1 activemq::commands::BrokerError::BrokerError ()

6.94.2.2 activemq::commands::BrokerError::BrokerError (decaf::lang::Pointer< decaf::lang::Exception > *exCause*)

6.94.2.3 virtual activemq::commands::BrokerError::~BrokerError () [virtual]

6.94.3 Member Function Documentation

6.94.3.1 virtual BrokerError* activemq::commands::BrokerError::cloneDataStructure () const [inline, virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

References copyDataStructure().

6.94.3.2 virtual void activemq::commands::BrokerError::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

Referenced by cloneDataStructure().

6.94.3.3 exceptions::ActiveMQException activemq::commands::BrokerError::createExceptionObject ()

Creates and returns a ActiveMQException object that contains the error data from the Broker. The returned exception will if possible contain a **cms::CMSException** (p. 979) pointer that represents the actual JMS exception that was forwarded from the broker.

Returns:

a new instance of an ActiveMQException

6.94.3.4 virtual const decaf::lang::Pointer<BrokerError>& activemq::commands::BrokerError::getCause () const [inline, virtual]

Gets the Broker Error that caused this exception.

Returns:

Broker Error Pointer

6.94.3.5 virtual unsigned char activemq::commands::BrokerError::getDataStructureType () const [inline, virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.94.3.6 virtual const std::string& activemq::commands::BrokerError::getExceptionClass () const [inline, virtual]

Gets the string holding the Exception Class name.

Returns:

Exception Class name

6.94.3.7 decaf::lang::Pointer<decaf::lang::Exception> activemq::commands::BrokerError::getLocalException () const [inline]

Returns:

the local Exception that was the source of this **BrokerError** (p. 709) instance

6.94.3.8 virtual const std::string& activemq::commands::BrokerError::getMessage () const [inline, virtual]

Gets the string holding the error message.

Returns:

String **Message** (p. 2072)

6.94.3.9 virtual const std::vector<decaf::lang::Pointer<StackTraceElement> >& activemq::commands::BrokerError::getStackTraceElements () const [inline, virtual]

Gets the Stack Trace Elements for the Exception.

Returns:

Stack Trace Elements

6.94.3.10 virtual void activemq::commands::BrokerError::setCause (const decaf::lang::Pointer< BrokerError > & *cause*) [inline, virtual]

Sets the Broker Error that caused this exception.

Parameters:

cause - Broker Error

6.94.3.11 virtual void activemq::commands::BrokerError::setExceptionClass (const std::string & *exceptionClass*) [inline, virtual]

Sets the string that contains the Exception Class name.

Parameters:

exceptionClass - String Exception Class name

6.94.3.12 void activemq::commands::BrokerError::setLocalException (decaf::lang::Pointer< decaf::lang::Exception > *exCause*) [inline]

Sets the Pointer to the local exception that is the source of this Error.

Parameters:

exCause The Exception that originated this **BrokerError** (p. 709).

6.94.3.13 virtual void activemq::commands::BrokerError::setMessage (const std::string & *message*) [inline, virtual]

Sets the string that contains the error **Message** (p. 2072).

Parameters:

message - String Error **Message** (p. 2072)

6.94.3.14 virtual void activemq::commands::BrokerError::setStackTraceElements (const std::vector< decaf::lang::Pointer< StackTraceElement > > & *stackTraceElements*) [inline, virtual]

Sets the Stack Trace Elements for this Exception.

Parameters:

stackTraceElements - Stack Trace Elements

6.94.3.15 virtual decaf::lang::Pointer<commands::Command> activemq::commands::BrokerError::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**BrokerError.h**

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.97.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **BrokerIdMarshaller** (p. 719). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.97.2 Constructor & Destructor Documentation

6.97.2.1 activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::BrokerIdMarshal () [inline]

6.97.2.2 virtual activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::~BrokerIdMarsh () [inline, virtual]

6.97.3 Member Function Documentation

6.97.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.97.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::getDataStructureT () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.97.3.3 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.97.3.4 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.97.3.5 virtual int activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.97.3.6 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.97.3.7 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

6.98.2.35 virtual void activemq::commands::BrokerInfo::setSlaveBroker (bool *slaveBroker*) [virtual]

6.98.2.36 virtual std::string activemq::commands::BrokerInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.98.2.37 virtual Pointer<Command> activemq::commands::BrokerInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.99.3.5 virtual int activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.99.3.6 virtual void activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.99.3.7 virtual void activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.100.1 Detailed Description

A container for data of a specific primitive type. A buffer is a linear, finite sequence of elements of a specific primitive type. Aside from its content, the essential properties of a buffer are its capacity, limit, and position:

A buffer's capacity is the number of elements it contains. The capacity of a buffer is never negative and never changes.

A buffer's limit is the index of the first element that should not be read or written. A buffer's limit is never negative and is never greater than its capacity.

A buffer's position is the index of the next element to be read or written. A buffer's position is never negative and is never greater than its limit.

There is one subclass of this class for each non-boolean primitive type.

Transferring data: Each subclass of this class defines two categories of get and put operations: * Relative operations read or write one or more elements starting at the current position and then increment the position by the number of elements transferred. If the requested transfer exceeds the limit then a relative get operation throws a **BufferUnderflowException** (p. 763) and a relative put operation throws a **BufferOverflowException** (p. 760); in either case, no data is transferred. * Absolute operations take an explicit element index and do not affect the position. Absolute get and put operations throw an IndexOutOfBoundsException if the index argument exceeds the limit.

Data may also, of course, be transferred in to or out of a buffer by the I/O operations of an appropriate channel, which are always relative to the current position.

Marking and resetting:

A buffer's mark is the index to which its position will be reset when the reset method is invoked. The mark is not always defined, but when it is defined it is never negative and is never greater than the position. If the mark is defined then it is discarded when the position or the limit is adjusted to a value smaller than the mark. If the mark is not defined then invoking the reset method causes an **InvalidMarkException** (p. 1779) to be thrown.

Invariants:

The following invariant holds for the mark, position, limit, and capacity values: 0 <= mark <= position <= limit <= capacity

A newly-created buffer always has a position of zero and a mark that is undefined. The initial limit may be zero, or it may be some other value that depends upon the type of the buffer and the manner in which it is constructed. The initial content of a buffer is, in general, undefined.

Clearing, flipping, and rewinding:

In addition to methods for accessing the position, limit, and capacity values and for marking and resetting, this class also defines the following operations upon buffers:

clear() (p. 737) makes a buffer ready for a new sequence of channel-read or relative put operations: It sets the limit to the capacity and the position to zero.

flip() (p. 738) makes a buffer ready for a new sequence of channel-write or relative get operations: It sets the limit to the current position and then sets the position to zero.

rewind() (p. 740) makes a buffer ready for re-reading the data that it already contains: It leaves the limit unchanged and sets the position to zero.

Read-only buffers:

Every buffer is readable, but not every buffer is writable. The mutation methods of each buffer class are specified as optional operations that will throw a **ReadOnlyBufferException** (p. 2535) when invoked upon a read-only buffer. A read-only buffer does not allow its content to be changed, but its mark, position, and limit values are mutable. Whether or not a buffer is read-only may be determined by invoking its isReadOnly method.

Thread safety:

Buffers are not safe for use by multiple concurrent threads. If a buffer is to be used by more than one thread then access to the buffer should be controlled by appropriate synchronization.

Invocation chaining:

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained; for example, the sequence of statements

b.flip(); b.position(23); b.limit(42);

can be replaced by the single, more compact statement b.flip().position(23).limit(42);

6.100.2 Constructor & Destructor Documentation

6.100.2.1 decaf::nio::Buffer::Buffer (int *capactiy*)

6.100.2.2 decaf::nio::Buffer::Buffer (const Buffer & *other*)

6.100.2.3 virtual decaf::nio::Buffer::~Buffer () [inline, virtual]

6.100.3 Member Function Documentation

6.100.3.1 virtual int decaf::nio::Buffer::capacity () const [inline, virtual]

Returns:

this buffer's capacity.

6.100.3.2 virtual Buffer& decaf::nio::Buffer::clear () [virtual]

Clears this buffer. The position is set to zero, the limit is set to the capacity, and the mark is discarded.

Invoke this method before using a sequence of channel-read or put operations to fill this buffer. For example:

buf.clear(); // Prepare buffer for reading in.read(buf); // Read data

This method does not actually erase the data in the buffer, but it is named as if it did because it will most often be used in situations in which that might as well be the case.

Returns:

a reference to this buffer.

6.100.3.3 virtual Buffer& decaf::nio::Buffer::flip () [virtual]

Flips this buffer. The limit is set to the current position and then the position is set to zero. If the mark is defined then it is discarded.

After a sequence of channel-read or put operations, invoke this method to prepare for a sequence of channel-write or relative get operations. For example:

buf.put(magic); // Prepend header in.read(buf); // Read data into rest of buffer buf.flip(); // Flip buffer out.write(buf); // Write header + data to channel

This method is often used in conjunction with the compact method when transferring data from one place to another.

Returns:

a reference to this buffer.

6.100.3.4 virtual bool decaf::nio::Buffer::hasRemaining () const [inline, virtual]

Tells whether there are any elements between the current position and the limit.

Returns:

true if, and only if, there is at least one element remaining in this buffer.

6.100.3.5 virtual bool decaf::nio::Buffer::isReadOnly () const [pure virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 816), **decaf::internal::nio::CharArrayBuffer** (p. 930), **decaf::internal::nio::DoubleArrayBuffer** (p. 1433), **decaf::internal::nio::FloatArrayBuffer** (p. 1549), **decaf::internal::nio::IntArrayBuffer** (p. 1726), **decaf::internal::nio::LongArrayBuffer** (p. 1988), **decaf::internal::nio::ShortArrayBuffer** (p. 2737), and **decaf::nio::ByteBuffer** (p. 847).

6.100.3.6 virtual Buffer& decaf::nio::Buffer::limit (int *newLimit*) [virtual]

Sets this buffer's limit. If the position is larger than the new limit then it is set to the new limit. If the mark is defined and larger than the new limit then it is discarded.

Parameters:

newLimit The new limit value; must be no larger than this buffer's capacity.

Returns:

A reference to This buffer

Exceptions:

IllegalArgumentException if preconditions on the new pos don't hold.

6.100.3.7 virtual int decaf::nio::Buffer::limit () const [inline, virtual]

Returns:

this buffers Limit

6.100.3.8 virtual Buffer& decaf::nio::Buffer::mark () [virtual]

Sets this buffer's mark at its position.

Returns:

a reference to this buffer.

6.100.3.9 virtual Buffer& decaf::nio::Buffer::position (int *newPosition*) [virtual]

Sets this buffer's position. If the mark is defined and larger than the new position then it is discarded.

Parameters:

newPosition The new postion in the buffer to set.

Returns:

a reference to This buffer.

Exceptions:

IllegalArgumentException if preconditions on the new pos don't hold.

6.100.3.10 virtual int decaf::nio::Buffer::position () const [inline, virtual]

Returns:

the current position in the buffer

6.100.3.11 virtual int decaf::nio::Buffer::remaining () const [inline, virtual]

Returns the number of elements between the current position and the limit.

Returns:

The number of elements remaining in this buffer

6.100.3.12 virtual Buffer& decaf::nio::Buffer::reset () [virtual]

Resets this buffer's position to the previously-marked position.

Returns:

a reference to this buffer.

Exceptions:

InvalidMarkException *(*p. ***1779****)* - If the mark has not been set

6.100.3.13 virtual Buffer& decaf::nio::Buffer::rewind () [virtual]

Rewinds this buffer. The position is set to zero and the mark is discarded.

Invoke this method before a sequence of channel-write or get operations, assuming that the limit has already been set appropriately. For example:

out.write(buf); // Write remaining data buf.rewind(); // Rewind buffer buf.get(array); // Copy data into array

Returns:

a reference to this buffer.

6.101 decaf::io::BufferedInputStream Class Reference

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of **io** (p. 110) operations on the input stream.

`#include <src/main/decaf/io/BufferedInputStream.h>`Inheritance diagram for decaf::io::BufferedInputStream:

Public Member Functions

- **BufferedInputStream** (**InputStream** *stream, bool **own**=false)

  Constructor.

- **BufferedInputStream** (**InputStream** *stream, int bufferSize, bool **own**=false)

  Constructor.

- virtual ~**BufferedInputStream** ()
- virtual int **available** () const

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.
  Returns:

  the number of bytes available on this input stream.
  Exceptions:

  IOException *(p. **1787**) if an I/O error occurs.*

- virtual void **close** ()

  *Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.*
  The default implementation of this method does nothing.
  Exceptions:

  IOException *(p. **1787**) if an I/O error occurs while closing the **InputStream** (p. 1707).*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  *The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*
  Parameters:

  num *The number of bytes to skip.*
  Returns:

  total bytes skipped

Exceptions:

IOException *(p. **1787**) if an I/O error occurs.*
UnsupportedOperationException *if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
  If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.
  Calling mark on a closed stream instance should have no effect.
  The default implementation of this method does nothing.
  Parameters:

  readLimit *The max bytes read before marked position is invalid.*

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.
  If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an ***IOException*** *(p. 1787) might be thrown. ∗ If such an* ***IOException*** *(p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*
  If the method markSupported returns false, then: ∗ The call to reset may throw an ***IOException*** *(p. 1787). ∗ If an* ***IOException*** *(p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*
  The default implementation of this method throws an ***IOException*** *(p. 1787).*
  Exceptions:

  IOException *(p. **1787**) if an I/O error occurs.*

- virtual bool **markSupported** () const

  Determines if this input stream supports the mark and reset methods.
  Whether or not mark and reset are supported is an invariant property of a particular input stream instance.
  The default implementation of this method returns false.
  Returns:

  true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char ∗buffer, int size, int offset, int length)

6.101.1 Detailed Description

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of **io** (p. 110) operations on the input stream.

6.101.2 Constructor & Destructor Documentation

6.101.2.1 decaf::io::BufferedInputStream::BufferedInputStream (InputStream * *stream*, bool *own* = `false`)

Constructor.

Parameters:

stream The target input stream to buffer.

own Indicates if we own the stream object, defaults to false.

6.101.2.2 decaf::io::BufferedInputStream::BufferedInputStream (InputStream * *stream*, int *bufferSize*, bool *own* = `false`)

Constructor.

Parameters:

stream The target input stream to buffer.

bufferSize The size in bytes to allocate for the **internal** (p. 97) buffer.

own Indicates if we own the stream object, defaults to false.

Exceptions:

IllegalArgumentException is the size is zero or negative.

6.101.2.3 virtual decaf::io::BufferedInputStream::~BufferedInputStream () `[virtual]`

6.101.3 Member Function Documentation

6.101.3.1 virtual int decaf::io::BufferedInputStream::available () const `[virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1523).

6.101.3.2 virtual void decaf::io::BufferedInputStream::close () [virtual]

Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs while closing the **InputStream** (p. 1707).

Reimplemented from **decaf::io::FilterInputStream** (p. 1523).

6.101.3.3 virtual int decaf::io::BufferedInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.101.3.4 virtual int decaf::io::BufferedInputStream::doReadByte () [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.101.3.5 virtual void decaf::io::BufferedInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters:

readLimit The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.101.3.6 virtual bool decaf::io::BufferedInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns:

true if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1525).

6.101.3.7 virtual void decaf::io::BufferedInputStream::reset () [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1787) might be thrown. * If such an **IOException** (p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1787). * If an **IOException** (p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1787).

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1525).

6.101.3.8 virtual long long decaf::io::BufferedInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::FilterInputStream** (p. 1526).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**BufferedInputStream.h**

6.102 decaf::io::BufferedOutputStream Class Reference

Wrapper around another output stream that buffers output before writing to the target output stream.

6.102.1 Detailed Description

Wrapper around another output stream that buffers output before writing to the target output stream.

6.102.2 Constructor & Destructor Documentation

6.102.2.1 decaf::io::BufferedOutputStream::BufferedOutputStream (OutputStream * *stream*, bool *own* = `false`)

Constructor.

Parameters:

stream The target output stream.

own Indicates if this class owns the stream pointer.

6.102.2.2 decaf::io::BufferedOutputStream::BufferedOutputStream (OutputStream * *stream*, int *bufferSize*, bool *own* = false)

Constructor.

Parameters:

stream The target output stream.

bufferSize The size for the **internal** (p. 97) buffer.

own Indicates if this class owns the stream pointer.

Exceptions:

IllegalArgumentException if the bufferSize given is negative.

6.102.2.3 virtual decaf::io::BufferedOutputStream::~BufferedOutputStream () [virtual]

6.102.3 Member Function Documentation

6.102.3.1 virtual void decaf::io::BufferedOutputStream::doWriteArray (const unsigned char * *buffer*, int *size*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1528).

6.102.3.2 virtual void decaf::io::BufferedOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

6.102.3.3 virtual void decaf::io::BufferedOutputStream::doWriteByte (unsigned char *c*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

6.102.3.4 virtual void decaf::io::BufferedOutputStream::flush () [virtual]

inheritDoc}

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

  Wraps the passed STL Long Vector in a LongBuffer.

- static **decaf::nio::IntBuffer** * **createIntBuffer** (int capacity)

  Allocates a new int buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::IntBuffer** * **createIntBuffer** (int *buffer, int size, int offset, int length)

  Wraps the passed buffer with a new IntBuffer.

- static **decaf::nio::IntBuffer** * **createIntBuffer** (std::vector< int > &buffer)

  Wraps the passed STL int Vector in a IntBuffer.

- static **decaf::nio::ShortBuffer** * **createShortBuffer** (int capacity)

  Allocates a new short buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::ShortBuffer** * **createShortBuffer** (short *buffer, int size, int offset, int length)

  Wraps the passed buffer with a new ShortBuffer.

- static **decaf::nio::ShortBuffer** * **createShortBuffer** (std::vector< short > &buffer)

  Wraps the passed STL Short Vector in a ShortBuffer.

6.103.1 Detailed Description

Factory class used by static methods in the **decaf::nio** (p. 120) package to create the various default version of the NIO interfaces.

Since:

1.0

6.103.2 Constructor & Destructor Documentation

6.103.2.1 virtual decaf::internal::nio::BufferFactory::~BufferFactory () [inline, virtual]

6.103.3 Member Function Documentation

6.103.3.1 static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (std::vector< unsigned char > & *buffer*) [static]

Wraps the passed STL Byte Vector in a ByteBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new ByteBuffer that is backed by buffer, caller owns.

6.103.3.2 static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new ByteBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The array that will back the new buffer.

size The size of the specified buffer.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new ByteBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions:

NullPointerException if the buffer given in Null.

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.3 static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (int *capacity*) [static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity The **internal** (p. 97) buffer's capacity.

Returns:

a newly allocated ByteBuffer which the caller owns.

Exceptions:

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.4 static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (std::vector< char > & *buffer*) [static]

Wraps the passed STL Byte Vector in a CharBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new CharBuffer that is backed by buffer, caller owns.

6.103.3.5 static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (char * *buffer*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new CharBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The array that will back the new buffer.

size The size of the specified buffer.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new CharBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions:

NullPointerException if the buffer given in Null.
IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.6 static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (int *capacity*) [static]

Allocates a new char buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity The **internal** (p. 97) buffer's capacity.

Returns:

a newly allocated CharBuffer which the caller owns.

Exceptions:

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.7 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (std::vector< double > & *buffer*) [static]

Wraps the passed STL Double Vector in a DoubleBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new DoubleBuffer that is backed by buffer, caller owns.

6.103.3.8 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (double * *buffer*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new DoubleBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The array that will back the new buffer.

size The size of the specified buffer.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new DoubleBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions:

NullPointerException if the buffer given in Null.

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.9 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (int *capacity*) [static]

Allocates a new double buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity The **internal** (p. 97) buffer's capacity.

Returns:

a newly allocated DoubleBuffer which the caller owns.

Exceptions:

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.10 static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (std::vector< float > & *buffer*) [static]

Wraps the passed STL Float Vector in a FloatBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new FloatBuffer that is backed by buffer, caller owns.

6.103.3.11 static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (float * *buffer*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new FloatBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The array that will back the new buffer.

size The size of the specified buffer.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new FloatBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions:

NullPointerException if the buffer given in Null.

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.12 static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (int *capacity*) [static]

Allocates a new float buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity The **internal** (p. 97) buffer's capacity.

Returns:

a newly allocated FloatBuffer which the caller owns.

Exceptions:

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.13 static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (std::vector< int > & *buffer*) [static]

Wraps the passed STL int Vector in a IntBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new IntBuffer that is backed by buffer, caller owns.

6.103.3.14 static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (int * *buffer*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new IntBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The array that will back the new buffer.

size The size of the specified buffer.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new IntBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions:

NullPointerException if the buffer given in Null.

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.15 static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (int *capacity*) [static]

Allocates a new int buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity The **internal** (p. 97) buffer's capacity.

Returns:

a newly allocated IntBuffer which the caller owns.

Exceptions:

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.16 static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (std::vector< long long > & *buffer*) [static]

Wraps the passed STL Long Vector in a LongBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new LongBuffer that is backed by buffer, caller owns.

6.103.3.17 static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (long long * *buffer*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new LongBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The array that will back the new buffer.

size The size of the specified buffer.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new LongBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions:

NullPointerException if the buffer given in Null.

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.18 static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (int *capacity*) [static]

Allocates a new long long buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 97) buffer's capacity.

Returns:

a newly allocated DoubleBuffer which the caller owns.

Exceptions:

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.19 static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (std::vector< short > & *buffer*) [static]

Wraps the passed STL Short Vector in a ShortBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new DoubleBuffer that is backed by buffer, caller owns.

6.103.3.20 static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (short * *buffer*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new ShortBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The array that will back the new buffer.

size The size of the specified buffer.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new ShortBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions:

NullPointerException if the buffer given in Null.

IndexOutOfBoundsException if the capacity specified is negative.

6.103.3.21 static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (int *capacity*) [static]

Allocates a new short buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity The **internal** (p. 97) buffer's capacity.

Returns:

a newly allocated ShortBuffer which the caller owns.

Exceptions:

IndexOutOfBoundsException if the capacity specified is negative.

6.104.1 Constructor & Destructor Documentation

6.104.1.1 decaf::nio::BufferOverflowException::BufferOverflowException ()

Default Constructor.

6.104.1.2 decaf::nio::BufferOverflowException::BufferOverflowException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.104.1.3 decaf::nio::BufferOverflowException::BufferOverflowException (const BufferOverflowException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.104.1.4 decaf::nio::BufferOverflowException::BufferOverflowException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.104.1.5 decaf::nio::BufferOverflowException::BufferOverflowException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.104.1.6 decaf::nio::BufferOverflowException::BufferOverflowException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.104.1.7 virtual decaf::nio::BufferOverflowException::~BufferOverflowException () throw () [virtual]

6.104.2 Member Function Documentation

6.104.2.1 virtual BufferOverflowException* decaf::nio::BufferOverflowException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**BufferOverflowException.h**

6.105.1.1 decaf::nio::BufferUnderflowException::BufferUnderflowException ()

Default Constructor.

6.105.1.2 decaf::nio::BufferUnderflowException::BufferUnderflowException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.105.1.3 decaf::nio::BufferUnderflowException::BufferUnderflowException (const BufferUnderflowException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.105.1.4 decaf::nio::BufferUnderflowException::BufferUnderflowException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.105.1.5 decaf::nio::BufferUnderflowException::BufferUnderflowException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.105.1.6 decaf::nio::BufferUnderflowException::BufferUnderflowException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.105.1.7 virtual decaf::nio::BufferUnderflowException::~BufferUnderflowException () throw () [virtual]

6.106 decaf::lang::Byte Class Reference

`#include <src/main/decaf/lang/Byte.h>`Inheritance diagram for decaf::lang::Byte:

Public Member Functions

- **Byte** (unsigned char value)
- **Byte** (const std::string &value)

  *Creates a new **Byte** (p. 766) instance from the given string.*

- virtual ~**Byte** ()
- virtual int **compareTo** (const **Byte** &c) const

  *Compares this **Byte** (p. 766) instance with another.*

- virtual bool **operator==** (const **Byte** &c) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Byte** &c) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const unsigned char &c) const

  *Compares this **Byte** (p. 766) instance with a char type.*

- virtual bool **operator==** (const unsigned char &c) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const unsigned char &c) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- bool **equals** (const **Byte** &c) const
- bool **equals** (const unsigned char &c) const
- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (unsigned char value)
- static **Byte decode** (const std::string &value)

  *Decodes a **String** (p. 2935) into a **Byte** (p. 766).*

- static unsigned char **parseByte** (const std::string &s, int radix)

  Parses the string argument as a signed unsigned char in the radix specified by the second argument.

- static unsigned char **parseByte** (const std::string &s)

  Parses the string argument as a signed decimal unsigned char.

- static **Byte valueOf** (unsigned char value)

  *Returns a **Character** (p. 914) instance representing the specified char value.*

- static **Byte valueOf** (const std::string &value)

  *Returns a **Byte** (p. 766) object holding the value given by the specified std::string.*

- static **Byte valueOf** (const std::string &value, int radix)

  *Returns a **Byte** (p. 766) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const unsigned char **MIN_VALUE**

  The minimum value that a unsigned char can take on.

- static const unsigned char **MAX_VALUE**

  The maximum value that a unsigned char can take on.

- static const int **SIZE**

  The size of the primitive character in bits.

6.106.1 Constructor & Destructor Documentation

6.106.1.1 decaf::lang::Byte::Byte (unsigned char *value*)

Parameters:

value - the primitive value to wrap

6.106.1.2 decaf::lang::Byte::Byte (const std::string & *value*)

Creates a new **Byte** (p. 766) instance from the given string.

Parameters:

value The string to convert to an unsigned char

Exceptions:

NumberFormatException if the string is not a valid byte.

6.106.1.3 virtual decaf::lang::Byte::~Byte () [inline, virtual]

6.106.2 Member Function Documentation

6.106.2.1 virtual unsigned char decaf::lang::Byte::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2269).

6.106.2.2 virtual int decaf::lang::Byte::compareTo (const unsigned char & *c*) const [inline, virtual]

Compares this **Byte** (p. 766) instance with a char type.

Parameters:

c - the char instance to be compared

Returns:

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< unsigned char >** (p. 1037).

6.106.2.3 virtual int decaf::lang::Byte::compareTo (const Byte & *c*) const [inline, virtual]

Compares this **Byte** (p. 766) instance with another.

Parameters:

c - the **Byte** (p. 766) instance to be compared

Returns:

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

6.106.2.4 static Byte decaf::lang::Byte::decode (const std::string & *value*) [static]

Decodes a **String** (p. 2935) into a **Byte** (p. 766). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Byte::parseByte** (p. 772) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 2935) is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Byte** (p. 766) object containing the decoded value

Exceptions:

NumberFomatException if the string is not formatted correctly.

6.106.2.5 virtual double decaf::lang::Byte::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.106.2.6 bool decaf::lang::Byte::equals (const unsigned char & *c*) const [inline, virtual]

Returns:

true if the two Bytes have the same value.

Implements **decaf::lang::Comparable< unsigned char >** (p. 1038).

6.106.2.7 bool decaf::lang::Byte::equals (const Byte & *c*) const [inline]

Returns:

true if the two **Byte** (p. 766) Objects have the same value.

6.106.2.8 virtual float decaf::lang::Byte::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.106.2.9 virtual int decaf::lang::Byte::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.106.2.10 virtual long long decaf::lang::Byte::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long long the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.106.2.11 virtual bool decaf::lang::Byte::operator< (const unsigned char & *c*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< unsigned char >** (p. 1038).

6.106.2.12 virtual bool decaf::lang::Byte::operator< (const Byte & *c*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.106.2.13 virtual bool decaf::lang::Byte::operator== (const unsigned char & *c*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< unsigned char >** (p. 1038).

6.106.2.14 virtual bool decaf::lang::Byte::operator== (const Byte & *c*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.106.2.15 static unsigned char decaf::lang::Byte::parseByte (const std::string & *s*) [static]

Parses the string argument as a signed decimal unsigned char. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting unsigned char value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseByte(const std::string, int) method.

Parameters:

s - **String** (p. 2935) to convert to a unsigned char

Returns:

the converted unsigned char value

Exceptions:

NumberFormatException if the string is not a unsigned char.

6.106.2.16 static unsigned char decaf::lang::Byte::parseByte (const std::string & *s*, int *radix*) [static]

Parses the string argument as a signed unsigned char in the radix specified by the second argument. The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 917) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type NumberFormatException is thrown if any of the following situations occurs: * The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p. 921) or larger than **Character::MAX_RADIX** (p. 921). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type unsigned char.

Parameters:

s - the **String** (p. 2935) containing the unsigned char to be parsed

radix - the radix to be used while parsing s

Returns:

the unsigned char represented by the string argument in the specified radix.

Exceptions:

NumberFormatException - If **String** (p. 2935) does not contain a parsable unsigned char.

6.106.2.17 virtual short decaf::lang::Byte::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2271).

6.106.2.18 static std::string decaf::lang::Byte::toString (unsigned char *value*) [static]

Returns:

a string representing the primitive value as Base 10

6.106.2.19 std::string decaf::lang::Byte::toString () const

Returns:

this **Byte** (p. 766) Object as a **String** (p. 2935) Representation

6.106.2.20 static Byte decaf::lang::Byte::valueOf (const std::string & *value*, int *radix*) [static]

Returns a **Byte** (p. 766) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed unsigned char in the radix specified by the second argument, exactly as if the argument were given to the parseByte(std::string, int) method. The result is a **Byte** (p. 766) object that represents the unsigned char value specified by the string.

Parameters:

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Byte** (p. 766) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid unsigned char.

6.106.2.21 static Byte decaf::lang::Byte::valueOf (const std::string & *value*) [static]

Returns a **Byte** (p. 766) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal unsigned char, exactly as if the argument were given to the parseByte(std::string) method. The result is a **Byte** (p. 766) object that represents the unsigned char value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Byte** (p. 766) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal unsigned char.

6.106.2.22 static Byte decaf::lang::Byte::valueOf (unsigned char *value*) [inline, static]

Returns a **Character** (p. 914) instance representing the specified char value.

Parameters:

value - the primitive char to wrap.

Returns:

a new **Character** (p. 914) instance that wraps this value.

6.106.3 Field Documentation

6.106.3.1 const unsigned char decaf::lang::Byte::MAX_VALUE [static]

The maximum value that a unsigned char can take on.

6.106.3.2 const unsigned char decaf::lang::Byte::MIN_VALUE [static]

The minimum value that a unsigned char can take on.

6.106.3.3 const int decaf::lang::Byte::SIZE [static]

The size of the primitive character in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Byte.h**

6.107 decaf::internal::util::ByteArrayAdapter Class Reference

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

`#include <src/main/decaf/internal/util/ByteArrayAdapter.h>`

Data Structures

- union **Array**

Public Member Functions

- **ByteArrayAdapter** (int size)

  Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.

- **ByteArrayAdapter** (unsigned char *array, int size, bool own=false)

  Creates a byte array object that wraps the given array.

- **ByteArrayAdapter** (char *array, int size, bool own=false)

  Creates a byte array object that wraps the given array.

- **ByteArrayAdapter** (double *array, int size, bool own=false)

  Creates a byte array object that wraps the given array.

- **ByteArrayAdapter** (float *array, int size, bool own=false)

  Creates a byte array object that wraps the given array.

- **ByteArrayAdapter** (long long *array, int size, bool own=false)

  Creates a byte array object that wraps the given array.

- **ByteArrayAdapter** (int *array, int size, bool own=false)

  Creates a byte array object that wraps the given array.

- **ByteArrayAdapter** (short *array, int size, bool own=false)

  Creates a byte array object that wraps the given array.

- virtual ~**ByteArrayAdapter** ()
- virtual int **getCapacity** () const

  Gets the size of the underlying array.

- virtual int **getCharCapacity** () const

  Gets the size of the underlying array as if it contains chars.

- virtual int **getDoubleCapacity** () const

  Gets the size of the underlying array as if it contains doubles.

- virtual int **getFloatCapacity** () const

Gets the size of the underlying array as if it contains doubles.

- virtual int **getLongCapacity** () const

  Gets the size of the underlying array as if it contains doubles.

- virtual int **getIntCapacity** () const

  Gets the size of the underlying array as if it contains ints.

- virtual int **getShortCapacity** () const

  Gets the size of the underlying array as if it contains shorts.

- virtual unsigned char * **getByteArray** ()

  Gets the pointer to the array we are wrapping.

- virtual char * **getCharArray** ()

  Gets the pointer to the array we are wrapping.

- virtual short * **getShortArray** ()

  Gets the pointer to the array we are wrapping.

- virtual int * **getIntArray** ()

  Gets the pointer to the array we are wrapping.

- virtual long long * **getLongArray** ()

  Gets the pointer to the array we are wrapping.

- virtual double * **getDoubleArray** ()

  Gets the pointer to the array we are wrapping.

- virtual float * **getFloatArray** ()

  Gets the pointer to the array we are wrapping.

- virtual void **read** (unsigned char *buffer, int size, int offset, int length) const

  Reads from the Byte array starting at the specified offset and reading the specified length.

- virtual void **write** (unsigned char *buffer, int size, int offset, int length)

  *Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects **internal** (p. 97) array.*

- virtual void **resize** (int size)

  Resizes the underlying array to the new given size, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved.

- virtual void **clear** ()

  Clear all data from that Array, setting the underlying bytes to zero.

- unsigned char & **operator[]** (int index)

  *Allows the **ByteArrayAdapter** (p. 775) to be indexed as a standard array.*

- const unsigned char & **operator[ ]** (int index) const
- virtual unsigned char **get** (int index) const

  Absolute get method.

- virtual char **getChar** (int index) const

  Reads one byte at the given index and returns it.

- virtual double **getDouble** (int index) const

  Reads eight bytes at the given index and returns it.

- virtual double **getDoubleAt** (int index) const

  Reads eight bytes at the given byte index and returns it.

- virtual float **getFloat** (int index) const

  Reads four bytes at the given index and returns it.

- virtual float **getFloatAt** (int index) const

  Reads four bytes at the given byte index and returns it.

- virtual long long **getLong** (int index) const

  Reads eight bytes at the given index and returns it.

- virtual long long **getLongAt** (int index) const

  Reads eight bytes at the given byte index and returns it.

- virtual int **getInt** (int index) const

  Reads four bytes at the given index and returns it.

- virtual int **getIntAt** (int index) const

  Reads four bytes at the given byte index and returns it.

- virtual short **getShort** (int index) const

  Reads two bytes at the given index and returns it.

- virtual short **getShortAt** (int index) const

  Reads two bytes at the given byte index and returns it.

- virtual **ByteArrayAdapter** & **put** (int index, unsigned char value)

  Writes the given byte into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putChar** (int index, char value)

  Writes one byte containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putDouble** (int index, double value)

  Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putDoubleAt** (int index, double value)

  Writes eight bytes containing the given value, into this buffer at the given byte index.

- virtual **ByteArrayAdapter** & **putFloat** (int index, float value)

Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putFloatAt** (int index, float value)
  Writes four bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putLong** (int index, long long value)
  Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putLongAt** (int index, long long value)
  Writes eight bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putInt** (int index, int value)
  Writes four bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putIntAt** (int index, int value)
  Writes four bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putShort** (int index, short value)
  Writes two bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putShortAt** (int index, short value)
  Writes two bytes containing the given value, into this buffer at the given byte index.

6.107.1 Detailed Description

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data. All the array types are mapped down to a byte array and methods are supplied for accessing the data in any of the primitive type forms.

Methods in this class that do not return a specific value return a reference to this object so that calls can be chained.

Since:

1.0

6.107.2 Constructor & Destructor Documentation

6.107.2.1 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int *size*)

Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

size The size of the array, this is the limit we read and write to.

Exceptions:

IllegalArgumentException if size is negative.

6.107.2.2 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (unsigned char * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The physical array to wrap.

size The size of the array, this is the limit we read and write to.

own Indicates if this class is now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if the size is negative.

6.107.2.3 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (char * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The physical array to wrap.

size The size of the array, this is the limit we read and write to.

own Indicates if this class is now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if the size is negative.

6.107.2.4 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (double * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The physical array to wrap.

size The size of the array, this is the limit we read and write to.

own Indicates if this class is now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if the size is negative.

6.107.2.5 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (float * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The physical array to wrap.

size The size of the array, this is the limit we read and write to.

own Indicates if this class is now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if the size is negative.

6.107.2.6 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (long long * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The physical array to wrap.

size The size of the array, this is the limit we read and write to.

own Indicates if this class is now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if the size is negative.

6.107.2.7 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The physical array to wrap.

size The size of the array, this is the limit we read and write to.

own Indicates if this class is now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if the size is negative.

6.107.2.8 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (short * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The physical array to wrap.

size The size of the array, this is the limit we read and write to.

own Indicates if this class is now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if the size is negative.

6.107.2.9 virtual decaf::internal::util::ByteArrayAdapter::~ByteArrayAdapter () `[virtual]`

6.107.3 Member Function Documentation

6.107.3.1 virtual void decaf::internal::util::ByteArrayAdapter::clear () `[virtual]`

Clear all data from that Array, setting the underlying bytes to zero.

6.107.3.2 virtual unsigned char decaf::internal::util::ByteArrayAdapter::get (int *index*) const `[virtual]`

Absolute get method. Reads the byte at the given index.

Parameters:

index The index in the Buffer where the byte is to be read.

Returns:

the byte that is located at the given index.

Exceptions:

IndexOutOfBoundsException If index is not smaller than the buffer's limit or is negative.

6.107.3.3 virtual unsigned char* decaf::internal::util::ByteArrayAdapter::getByteArray () `[inline, virtual]`

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 775) objects that point to this array.

Returns:

an unsigned char* pointer to the array this object wraps.

6.107.3.4 virtual int decaf::internal::util::ByteArrayAdapter::getCapacity () const [inline, virtual]

Gets the size of the underlying array.

Returns:

the size the array.

6.107.3.5 virtual char decaf::internal::util::ByteArrayAdapter::getChar (int *index*) const [virtual]

Reads one byte at the given index and returns it.

Parameters:

index The index in the Buffer where the byte is to be read.

Returns:

the byte that is located at the given index.

Exceptions:

IndexOutOfBoundsException If index is not smaller than the buffer's limit or is negative.

6.107.3.6 virtual char* decaf::internal::util::ByteArrayAdapter::getCharArray () [inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 775) objects that point to this array.

Returns:

an char* pointer to the array this object wraps.

6.107.3.7 virtual int decaf::internal::util::ByteArrayAdapter::getCharCapacity () const [inline, virtual]

Gets the size of the underlying array as if it contains chars.

Returns:

the size the array.

6.107.3.8 virtual double decaf::internal::util::ByteArrayAdapter::getDouble (int *index*) const [virtual]

Reads eight bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The index in the Buffer where the bytes are to be read.

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.9 virtual double* decaf::internal::util::ByteArrayAdapter::getDoubleArray () [inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 775) objects that point to this array.

Returns:

an double* pointer to the array this object wraps.

6.107.3.10 virtual double decaf::internal::util::ByteArrayAdapter::getDoubleAt (int *index*) const [virtual]

Reads eight bytes at the given byte index and returns it.

Parameters:

index The index in the Buffer where the bytes are to be read

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.11 virtual int decaf::internal::util::ByteArrayAdapter::getDoubleCapacity () const [inline, virtual]

Gets the size of the underlying array as if it contains doubles.

Returns:

the size the array.

6.107.3.12 virtual float decaf::internal::util::ByteArrayAdapter::getFloat (int *index*) const [virtual]

Reads four bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The index in the Buffer where the bytes are to be read.

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.13 virtual float* decaf::internal::util::ByteArrayAdapter::getFloatArray () [inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 775) objects that point to this array.

Returns:

an float* pointer to the array this object wraps.

6.107.3.14 virtual float decaf::internal::util::ByteArrayAdapter::getFloatAt (int *index*) const [virtual]

Reads four bytes at the given byte index and returns it.

Parameters:

index The index in the Buffer where the bytes are to be read

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.15 virtual int decaf::internal::util::ByteArrayAdapter::getFloatCapacity () const [inline, virtual]

Gets the size of the underlying array as if it contains doubles.

Returns:

the size the array.

6.107.3.16 virtual int decaf::internal::util::ByteArrayAdapter::getInt (int *index*) const [virtual]

Reads four bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The index in the Buffer where the bytes are to be read.

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.17 virtual int* decaf::internal::util::ByteArrayAdapter::getIntArray () [inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 775) objects that point to this array.

Returns:

an int* pointer to the array this object wraps.

6.107.3.18 virtual int decaf::internal::util::ByteArrayAdapter::getIntAt (int *index*) const [virtual]

Reads four bytes at the given byte index and returns it.

Parameters:

index The index in the Buffer where the bytes are to be read

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.19 virtual int decaf::internal::util::ByteArrayAdapter::getIntCapacity () const [inline, virtual]

Gets the size of the underlying array as if it contains ints.

Returns:

the size the array.

6.107.3.20 virtual long long decaf::internal::util::ByteArrayAdapter::getLong (int *index*) const [virtual]

Reads eight bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The index in the Buffer where the bytes are to be read.

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.21 virtual long long* decaf::internal::util::ByteArrayAdapter::getLongArray () [inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 775) objects that point to this array.

Returns:

an long long* pointer to the array this object wraps.

6.107.3.22 virtual long long decaf::internal::util::ByteArrayAdapter::getLongAt (int *index*) const [virtual]

Reads eight bytes at the given byte index and returns it.

Parameters:

index The index in the Buffer where the bytes are to be read

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.23 virtual int decaf::internal::util::ByteArrayAdapter::getLongCapacity () const [inline, virtual]

Gets the size of the underlying array as if it contains doubles.

Returns:

the size the array.

6.107.3.24 virtual short decaf::internal::util::ByteArrayAdapter::getShort (int *index*) const [virtual]

Reads two bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The index in the Buffer where the bytes are to be read.

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.25 virtual short* decaf::internal::util::ByteArrayAdapter::getShortArray () [inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 775) objects that point to this array.

Returns:

an short* pointer to the array this object wraps.

6.107.3.26 virtual short decaf::internal::util::ByteArrayAdapter::getShortAt (int *index*) const [virtual]

Reads two bytes at the given byte index and returns it.

Parameters:

index The index in the Buffer where the bytes are to be read

Returns:

the value at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.107.3.27 virtual int decaf::internal::util::ByteArrayAdapter::getShortCapacity () const [inline, virtual]

Gets the size of the underlying array as if it contains shorts.

Returns:

the size the array.

6.107.3.28 const unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (int *index*) const

6.107.3.29 unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (int *index*)

Allows the **ByteArrayAdapter** (p. 775) to be indexed as a standard array. calling the non constant version allows the user to change the value at index

Parameters:

index The position in the array to access, if the value is negative or greater than the size of the underlying array an IndexOutOfBoundsException is thrown.

Exceptions:

IndexOutOfBoundsException if the preconditions of index are not met.

6.107.3.30 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::put (int *index*, unsigned char *value*) [virtual]

Writes the given byte into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The position in the Buffer to write the data.

value The value to write to the array.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.31 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putChar (int *index*, char *value*) [virtual]

Writes one byte containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The position in the Buffer to write the data.

value The value to write to the array.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.32 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putDouble (int *index*, double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The position in the Buffer to write the data.

value The value to write to the array.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.33 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putDoubleAt (int *index*, double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters:

index The position in the Buffer to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.34 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloat (int *index*, float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The position in the Buffer to write the data.

value The value to write to the array.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.35 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloatAt (int *index*, float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters:

index The position in the Buffer to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.36 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putInt (int *index*, int *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The position in the Buffer to write the data.

value The value to write to the array.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.37 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putIntAt (int *index*, int *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters:

index The position in the Buffer to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.38 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putLong (int *index*, long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The position in the Buffer to write the data.

value The value to write to the array.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.39 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putLongAt (int *index*, long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters:

index The position in the Buffer to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.40 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putShort (int *index*, short *value*) [virtual]

Writes two bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index The position in the Buffer to write the data.

value The value to write to the array.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.41 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putShortAt (int *index*, short *value*) [virtual]

Writes two bytes containing the given value, into this buffer at the given byte index.

Parameters:

index The position in the Buffer to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.107.3.42 virtual void decaf::internal::util::ByteArrayAdapter::read (unsigned char * *buffer*, int *size*, int *offset*, int *length*) const [virtual]

Reads from the Byte array starting at the specified offset and reading the specified length. If the length is greater than the size of this underlying byte array then an BufferUnderflowException is thrown.

Parameters:

buffer The buffer to read data from this array into.

size The size of the buffer passed.

offset The position in this array to start reading from.

length The amount of data to read from this array.

Exceptions:

IndexOutOfBoundsException if the offset + length exceeds the size.

NullPointerException if buffer is null

BufferUnderflowException if there is not enough data to read because the offset or the length is greater than the size of this array.

6.107.3.43 virtual void decaf::internal::util::ByteArrayAdapter::resize (int *size*) [virtual]

Resizes the underlying array to the new given size, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved. A **ByteArrayAdapter** (p. 775) can only be resized when it owns the underlying array, if it does not then it will throw an InvalidStateException.

Parameters:

size The new size of the array.

Exceptions:

IllegalArgumentException if the size parameter is negative.

InvalidStateException if this object does not own the buffer.

6.107.3.44 virtual void decaf::internal::util::ByteArrayAdapter::write (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects **internal** (p. 97) array. . If the length is greater than the size of this underlying byte array then an BufferOverflowException is thrown.

Parameters:

buffer The buffer to read data from this array into.

size The size of the buffer passed.

offset The position in this array to start reading from.

length The amount of data to read from this array.

Exceptions:

IndexOutOfBoundsException if the offset + length exceeds the size.

NullPointerException if buffer is null

BufferOverflowException if the amount of data to be written to this array or the offset given are larger than this array's size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/**ByteArrayAdapter.h**

6.108 decaf::internal::nio::ByteArrayBuffer Class Reference

This class defines six categories of operations upon byte buffers:.

`#include <src/main/decaf/internal/nio/ByteArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::ByteArrayBuffer:

Public Member Functions

- **ByteArrayBuffer** (int capacity, bool readOnly=false)

  *Creates a **ByteArrayBuffer** (p. 795) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **ByteArrayBuffer** (unsigned char *array, int size, int offset, int length, bool readOnly=false)

  *Creates a **ByteArrayBuffer** (p. 795) object that wraps the given array.*

- **ByteArrayBuffer** (const **decaf::lang::Pointer**< **ByteArrayAdapter** > &array, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **ByteArrayBuffer** (const **ByteArrayBuffer** &other)

  *Create a **ByteArrayBuffer** (p. 795) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**ByteArrayBuffer** ()
- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.
  Returns:

  true if, and only if, this buffer is read-only

- virtual unsigned char * **array** ()

  Returns the byte array that backs this buffer.
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.
  Returns:

  The array that backs this buffer
  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this buffer is backed by an array but is read-only*
  ***UnsupportedOperationException** if this buffer is not backed by an accessible array*

- virtual int **arrayOffset** () const

  Returns the offset within this buffer's backing array of the first element of the buffer.
  *If this buffer is backed by an array then buffer position p corresponds to array index p + **arrayOffset()** (p. 838).*
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset within this buffer's array of the first element of the buffer.

Exceptions:

ReadOnlyBufferException (p. *2535*) *if this buffer is backed by an array but is read-only.*
UnsupportedOperationException *if this buffer is not backed by an accessible array.*

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible byte array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.
  Returns:

  true if, and only if, this buffer is backed by an array and is not read-only.

- virtual **decaf::nio::CharBuffer** * **asCharBuffer** () const

  Creates a view of this byte buffer as a char buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the new Char ***Buffer*** (p. *735*)*, which the caller then owns.*

- virtual **decaf::nio::DoubleBuffer** * **asDoubleBuffer** () const

  Creates a view of this byte buffer as a double buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the new double ***Buffer*** (p. *735*)*, which the caller then owns.*

- virtual **decaf::nio::FloatBuffer** * **asFloatBuffer** () const

  Creates a view of this byte buffer as a float buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the new float ***Buffer*** (p. *735*)*, which the caller then owns.*

- virtual **decaf::nio::IntBuffer** * **asIntBuffer** () const

  Creates a view of this byte buffer as a int buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new int ***Buffer*** *(p. 735), which the caller then owns.*

- virtual **decaf::nio::LongBuffer** * **asLongBuffer** () const

  Creates a view of this byte buffer as a long buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns:

  the new long ***Buffer*** *(p. 735), which the caller then owns.*

- virtual **decaf::nio::ShortBuffer** * **asShortBuffer** () const

  Creates a view of this byte buffer as a short buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns:

  the new short ***Buffer*** *(p. 735), which the caller then owns.*

- virtual **ByteArrayBuffer** * **asReadOnlyBuffer** () const

  Creates a new, read-only byte buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
  If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

  Returns:

  The new, read-only byte buffer which the caller then owns.

- virtual **ByteArrayBuffer** & **compact** ()

  Compacts this buffer.
  The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = ***position()*** *(p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index* ***limit()*** *(p. 739) - 1 is copied to index n =* ***limit()*** *(p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
  The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

  Returns:

  a reference to this ***ByteBuffer*** *(p. 833).*

  Exceptions:

  ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual **ByteArrayBuffer** * **duplicate** ()

  Creates a new byte buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
  The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  a new Byte ***Buffer*** *(p. 735) which the caller owns.*

- virtual unsigned char **get** () const

  Relative get method.
  Reads the byte at this buffer's current position, and then increments the position.
  Returns:

  The byte at the buffer's current position.
  Exceptions:

  BufferUnderflowException *(p. 763) if the buffer's current position is not smaller than its limit.*

- virtual unsigned char **get** (int index) const

  Absolute get method.
  Reads the byte at the given index.
  Parameters:

  index *The index in the* ***Buffer*** *(p. 735) where the byte is to be read.*
  Returns:

  the byte that is located at the given index.
  Exceptions:

  IndexOutOfBoundsException *if index is not smaller than the buffer's limit, or index is negative.*

- virtual char **getChar** ()

  Reads the next byte at this buffer's current position, and then increments the position by one.
  Returns:

  the next char in the buffer.
  Exceptions:

  BufferUnderflowException *(p. 763) if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual char **getChar** (int index) const

  Reads one byte at the given index and returns it.
  Parameters:

  index *The index in the* ***Buffer*** *(p. 735) where the byte is to be read.*
  Returns:

  the char at the given index in the buffer
  Exceptions:

  IndexOutOfBoundsException *if index is not smaller than the buffer's limit, or index is negative.*

- virtual double **getDouble** ()

  Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

  Returns:

  the next double in the buffer.

  Exceptions:

  BufferUnderflowException *(p. **763**) if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual double **getDouble** (int index) const

  Reads eight bytes at the given index and returns it.

  Parameters:

  index *The index in the **Buffer** (p. 735) where the bytes are to be read.*

  Returns:

  the double at the given index in the buffer.

  Exceptions:

  IndexOutOfBoundsException *if index is not smaller than the buffer's limit, or index is negative.*

- virtual float **getFloat** ()

  Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

  Returns:

  the next float in the buffer.

  Exceptions:

  BufferUnderflowException *(p. **763**) if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual float **getFloat** (int index) const

  Reads four bytes at the given index and returns it.

  Parameters:

  index *The index in the **Buffer** (p. 735) where the bytes are to be read.*

  Returns:

  the float at the given index in the buffer.

  Exceptions:

  IndexOutOfBoundsException *if there are not enough bytes remaining to fill the requested Data Type, or index is negative.*

- virtual long long **getLong** ()

  Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

  Returns:

  the next long long in the buffer.

  Exceptions:

  BufferUnderflowException *(p. **763**) if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual long long **getLong** (int index) const

  Reads eight bytes at the given index and returns it.
  Parameters:

  index *The index in the* ***Buffer*** *(p. 735) where the bytes are to be read.*
  Returns:

  the long long at the given index in the buffer.
  Exceptions:

  IndexOutOfBoundsException *if there are not enough bytes remaining to fill the requested Data Type, or index is negative.*

- virtual int **getInt** ()

  Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
  Returns:

  the next int in the buffer.
  Exceptions:

  BufferUnderflowException *(p. 763) if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual int **getInt** (int index) const

  Reads four bytes at the given index and returns it.
  Parameters:

  index *The index in the* ***Buffer*** *(p. 735) where the bytes are to be read.*
  Returns:

  the int at the given index in the buffer.
  Exceptions:

  IndexOutOfBoundsException *if there are not enough bytes remaining to fill the requested Data Type, or index is negative.*

- virtual short **getShort** ()

  Reads the next two bytes at this buffer's current position, and then increments the position by that amount.
  Returns:

  the next short in the buffer.
  Exceptions:

  BufferUnderflowException *(p. 763) if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual short **getShort** (int index) const

  Reads two bytes at the given index and returns it.
  Parameters:

  index *The index in the* ***Buffer*** *(p. 735) where the bytes are to be read.*
  Returns:

  the short at the given index in the buffer.
  Exceptions:

  IndexOutOfBoundsException *if there are not enough bytes remaining to fill the requested Data Type, or index is negative.*

- virtual **ByteArrayBuffer** & **put** (unsigned char value)

  Writes the given byte into this buffer at the current position, and then increments the position.

  Parameters:

  value *- the byte value to be written.*

  Returns:

  a reference to this buffer.

  Exceptions:

  BufferOverflowException *(p. **760**) if this buffer's current position is not smaller than its limit.*
  ReadOnlyBufferException *(p. **2535**) if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **put** (int index, unsigned char value)

  Writes the given byte into this buffer at the given index.

  Parameters:

  index *- position in the **Buffer*** *(p. 735) to write the data*
  value *- the byte to write.*

  Returns:

  a reference to this buffer.

  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
  ReadOnlyBufferException *(p. **2535**) if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putChar** (char value)

  Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

  Parameters:

  value *The value to be written.*

  Returns:

  a reference to this buffer.

  Exceptions:

  BufferOverflowException *(p. **760**) if there are fewer than bytes remaining in this buffer than the size of the data to be written*
  ReadOnlyBufferException *(p. **2535**) if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putChar** (int index, char value)

  Writes one byte containing the given value, into this buffer at the given index.

  Parameters:

  index *The position in the **Buffer*** *(p. 735) to write the data.*
  value *The value to write.*

  Returns:

  a reference to this buffer.

  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
  ReadOnlyBufferException *(p. **2535**) if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putDouble** (double value)

  Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value *The value to be written.*

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. **760**) if there are fewer than bytes remaining in this buffer than the size of the data to be written*
ReadOnlyBufferException *(p. **2535**) if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putDouble** (int index, double value)

  Writes eight bytes containing the given value, into this buffer at the given index.

  Parameters:

  index *The position in the **Buffer*** *(p. 735) to write the data*
  value *The value to write.*

  Returns:

  a reference to this buffer.

  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
  ReadOnlyBufferException *(p. **2535**) if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putFloat** (float value)

  Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

  Parameters:

  value *The value to be written.*

  Returns:

  a reference to this buffer.

  Exceptions:

  BufferOverflowException *(p. **760**) if there are fewer than bytes remaining in this buffer than the size of the data to be written.*
  ReadOnlyBufferException *(p. **2535**) if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putFloat** (int index, float value)

  Writes four bytes containing the given value, into this buffer at the given index.

  Parameters:

  index *The position in the **Buffer*** *(p. 735) to write the data*
  value *The value to write.*

  Returns:

  a reference to this buffer.

  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
  ReadOnlyBufferException *(p. **2535**) if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putLong** (long long value)

  Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

  Parameters:

  value *The value to be written.*

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760) if there are fewer than bytes remaining in this buffer than the size of the data to be written.*
ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putLong** (int index, long long value)

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index *The position in the* ***Buffer*** *(p. 735) to write the data.*
value *The value to write.*

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putInt** (int value)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value *The value to be written.*

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760) if there are fewer than bytes remaining in this buffer than the size of the data to be written*
ReadOnlyBufferException *(p. 2535) if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putInt** (int index, int value)

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index *The position in the* ***Buffer*** *(p. 735) to write the data.*
value *The value to write.*

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException *(p. 2535) if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putShort** (short value)

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value *The value to be written.*

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760) if there are fewer than bytes remaining in this buffer than the size of the data to be written.*
ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putShort** (int index, short value)

  Writes two bytes containing the given value, into this buffer at the given index.
  Parameters:

  index *The position in the* ***Buffer*** *(p. 735) to write the data*
  value *The value to write.*
  Returns:

  a reference to this buffer
  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
  ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual **ByteArrayBuffer** ∗ **slice** () const

  Creates a new byte buffer whose content is a shared subsequence of this buffer's content.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the newly create ***ByteBuffer*** *(p. 833) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  Sets this ***ByteArrayBuffer*** *(p. 795) as Read-Only or not Read-Only.*

6.108.1 Detailed Description

This class defines six categories of operations upon byte buffers:. 1. Absolute and relative get and put methods that read and write single bytes; 2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array; 3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer; 4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order; 5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 813) float getFloat(int index) void **putFloat(float f)** (p. 819) void **putFloat(int index, float f)** (p. 818)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The asFloatBuffer method, for example, creates an instance of the FloatBuffer class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

Since:

1.0

6.108.2 Constructor & Destructor Documentation

6.108.2.1 decaf::internal::nio::ByteArrayBuffer::ByteArrayBuffer (int *capacity*, bool *readOnly* = `false`)

Creates a **ByteArrayBuffer** (p. 795) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity The size of the array, this is the limit we read and write to.

readOnly Should this buffer be read-only, default as false

Exceptions:

IllegalArguementException if the capacity value is negative.

6.108.2.2 decaf::internal::nio::ByteArrayBuffer::ByteArrayBuffer (unsigned char * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **ByteArrayBuffer** (p. 795) object that wraps the given array.

Parameters:

array The array to wrap.

size The size of the array passed.

offset The position that is this buffers start position.

length The size of the sub-array, this is the limit we read and write to.

readOnly Should this buffer be read-only, default as false.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if the preconditions of size, offset and length are violated.

6.108.2.3 decaf::internal::nio::ByteArrayBuffer::ByteArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset. The capacity and limit of the new **ByteArrayBuffer** (p. 795) will be that of the remaining capacity of the passed buffer.

Parameters:

array The ByteArrayAdapter to wrap

offset The offset into array where the buffer starts

length The length of the array we are wrapping or limit.

readOnly Boolean indicating if this a readOnly buffer.

Exceptions:

NullPointerException if array is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.108.2.4 decaf::internal::nio::ByteArrayBuffer::ByteArrayBuffer (const ByteArrayBuffer & *other*)

Create a **ByteArrayBuffer** (p. 795) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters:

other The **ByteArrayBuffer** (p. 795) this one is to mirror.

6.108.2.5 virtual decaf::internal::nio::ByteArrayBuffer::~ByteArrayBuffer () `[virtual]`

6.108.3 Member Function Documentation

6.108.3.1 virtual unsigned char* decaf::internal::nio::ByteArrayBuffer::array () `[virtual]`

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The array that backs this buffer

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is backed by an array but is read-only

UnsupportedOperationException if this buffer is not backed by an accessible array

Implements **decaf::nio::ByteBuffer** (p. 838).

6.108.3.2 virtual int decaf::internal::nio::ByteArrayBuffer::arrayOffset () const [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position p corresponds to array index p + **arrayOffset()** (p. 838).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset within this buffer's array of the first element of the buffer.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is backed by an array but is read-only.

UnsupportedOperationException if this buffer is not backed by an accessible array.

Implements **decaf::nio::ByteBuffer** (p. 838).

6.108.3.3 virtual decaf::nio::CharBuffer* decaf::internal::nio::ByteArrayBuffer::asCharBuffer () const [inline, virtual]

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new Char **Buffer** (p. 735), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 839).

References NULL.

6.108.3.4 virtual decaf::nio::DoubleBuffer* decaf::internal::nio::ByteArrayBuffer::asDoubleBuffer () const [inline, virtual]

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new double **Buffer** (p. 735), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 839).

References NULL.

6.108.3.5 virtual decaf::nio::FloatBuffer* decaf::internal::nio::ByteArrayBuffer::asFloatBuffer () const [inline, virtual]

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new float **Buffer** (p. 735), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 839).

References NULL.

6.108.3.6 virtual decaf::nio::IntBuffer* decaf::internal::nio::ByteArrayBuffer::asIntBuffer () const [inline, virtual]

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new int **Buffer** (p. 735), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 840).

References NULL.

6.108.3.7 virtual decaf::nio::LongBuffer* decaf::internal::nio::ByteArrayBuffer::asLongBuffer () const [inline, virtual]

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new long **Buffer** (p. 735), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 840).

References NULL.

6.108.3.8 virtual ByteArrayBuffer* decaf::internal::nio::ByteArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only byte buffer which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 840).

6.108.3.9 virtual decaf::nio::ShortBuffer* decaf::internal::nio::ByteArrayBuffer::asShortBuffer () const [inline, virtual]

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new short **Buffer** (p. 735), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 841).

References NULL.

6.108.3.10 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::compact () [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **ByteBuffer** (p. 833).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 841).

6.108.3.11 virtual ByteArrayBuffer* decaf::internal::nio::ByteArrayBuffer::duplicate () [virtual]

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new Byte **Buffer** (p. 735) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 841).

6.108.3.12 virtual unsigned char decaf::internal::nio::ByteArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the byte at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the byte is to be read.

Returns:

the byte that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 842).

6.108.3.13 virtual unsigned char decaf::internal::nio::ByteArrayBuffer::get () const [virtual]

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns:

The byte at the buffer's current position.

Exceptions:

BufferUnderflowException *(p. 763)* if the buffer's current position is not smaller than its limit.

Implements **decaf::nio::ByteBuffer** (p. 842).

6.108.3.14 virtual char decaf::internal::nio::ByteArrayBuffer::getChar (int *index*) const [inline, virtual]

Reads one byte at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the byte is to be read.

Returns:

the char at the given index in the buffer

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 843).

6.108.3.15 virtual char decaf::internal::nio::ByteArrayBuffer::getChar () [inline, virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns:

the next char in the buffer.

Exceptions:

BufferUnderflowException *(p. 763)* if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 844).

6.108.3.16 virtual double decaf::internal::nio::ByteArrayBuffer::getDouble (int *index*) const [virtual]

Reads eight bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the double at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 844).

6.108.3.17 virtual double decaf::internal::nio::ByteArrayBuffer::getDouble () [virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next double in the buffer.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 844).

6.108.3.18 virtual float decaf::internal::nio::ByteArrayBuffer::getFloat (int *index*) const [virtual]

Reads four bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the float at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 844).

6.108.3.19 virtual float decaf::internal::nio::ByteArrayBuffer::getFloat () [virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next float in the buffer.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 845).

6.108.3.20 virtual int decaf::internal::nio::ByteArrayBuffer::getInt (int *index*) const [virtual]

Reads four bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the int at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 845).

6.108.3.21 virtual int decaf::internal::nio::ByteArrayBuffer::getInt () [virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next int in the buffer.

Exceptions:

BufferUnderflowException *(p. 763)* if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 845).

6.108.3.22 virtual long long decaf::internal::nio::ByteArrayBuffer::getLong (int *index*) const [virtual]

Reads eight bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the long long at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 846).

6.108.3.23 virtual long long decaf::internal::nio::ByteArrayBuffer::getLong () [virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next long long in the buffer.

Exceptions:

BufferUnderflowException *(*p. *763)* if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 846).

6.108.3.24 virtual short decaf::internal::nio::ByteArrayBuffer::getShort (int *index*) const [virtual]

Reads two bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the short at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 846).

6.108.3.25 virtual short decaf::internal::nio::ByteArrayBuffer::getShort () [virtual]

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next short in the buffer.

Exceptions:

BufferUnderflowException *(*p. *763)* if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 847).

6.108.3.26 virtual bool decaf::internal::nio::ByteArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::ByteBuffer** (p. 847).

6.108.3.27 virtual bool decaf::internal::nio::ByteArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 847).

6.108.3.28 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::put (int *index*, unsigned char *value*) [virtual]

Writes the given byte into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 735) to write the data

value - the byte to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 848).

6.108.3.29 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::put (unsigned char *value*) [virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters:

value - the byte value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 848).

6.108.3.30 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putChar (int *index*, char *value*) [virtual]

Writes one byte containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 850).

6.108.3.31 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putChar (char *value*) [virtual]

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 850).

6.108.3.32 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putDouble (int *index*, double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 851).

6.108.3.33 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putDouble (double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 851).

6.108.3.34 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putFloat (int *index*, float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 851).

6.108.3.35 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putFloat (float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if there are fewer than bytes remaining in this buffer than the size of the data to be written.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 852).

6.108.3.36 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putInt (int *index*, int *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 852).

6.108.3.37 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putInt (int *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 853).

6.108.3.38 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putLong (int *index*, long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 853).

6.108.3.39 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putLong (long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 853).

6.108.3.40 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putShort (int *index*, short *value*) [virtual]

Writes two bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data

value The value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 854).

6.108.3.41 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putShort (short *value*) [virtual]

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 854).

6.108.3.42 virtual void decaf::internal::nio::ByteArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ByteArrayBuffer** (p. 795) as Read-Only or not Read-Only.

Parameters:

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.108.3.43 virtual ByteArrayBuffer* decaf::internal::nio::ByteArrayBuffer::slice () const [virtual]

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ByteBuffer** (p. 833) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 855).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**ByteArrayBuffer.h**

6.109 decaf::io::ByteArrayInputStream Class Reference

A **ByteArrayInputStream** (p. 823) contains an **internal** (p. 97) buffer that contains bytes that may be read from the stream.

`#include <src/main/decaf/io/ByteArrayInputStream.h>`Inheritance diagram for decaf::io::ByteArrayInputStream:

Public Member Functions

- **ByteArrayInputStream** ()

  *Creates an **ByteArrayInputStream** (p. 823) with an empty input buffer, the buffer can be initialized with a call to setByteArray.*

- **ByteArrayInputStream** (const std::vector< unsigned char > &buffer)

  Creates the input stream and calls setBuffer with the specified buffer object.

- **ByteArrayInputStream** (const unsigned char *buffer, int bufferSize, bool own=false)

  *Create an instance of the **ByteArrayInputStream** (p. 823) with the given buffer as the source of input for all read operations.*

- **ByteArrayInputStream** (const unsigned char *buffer, int bufferSize, int offset, int length, bool own=false)

  *Create an instance of the **ByteArrayInputStream** (p. 823) with the given buffer as the source of input for all read operations.*

- virtual ~**ByteArrayInputStream** ()
- virtual void **setByteArray** (const std::vector< unsigned char > &buffer)

  *Sets the **internal** (p. 97) buffer.*

- virtual void **setByteArray** (const unsigned char *buffer, int bufferSize)

  Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

- virtual void **setByteArray** (const unsigned char *buffer, int bufferSize, int offset, int length)

  Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

- virtual int **available** () const

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.
  Returns:

  the number of bytes available on this input stream.

  Exceptions:

  ***IOException** (p. **1787**) if an I/O error occurs.*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. The skip method of ***InputStream*** *(p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*
  Parameters:

  num *The number of bytes to skip.*
  Returns:

  total bytes skipped
  Exceptions:

  IOException *(p. **1787**) if an I/O error occurs.*
  UnsupportedOperationException *if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
  If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.
  Calling mark on a closed stream instance should have no effect.
  The default implementation of this method does nothing.
  Parameters:

  readLimit *The max bytes read before marked position is invalid.*

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.
  If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an ***IOException*** *(p. 1787) might be thrown. ∗ If such an* ***IOException*** *(p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*
  If the method markSupported returns false, then: ∗ The call to reset may throw an ***IOException*** *(p. 1787). ∗ If an* ***IOException*** *(p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*
  The default implementation of this method throws an ***IOException*** *(p. 1787).*
  Exceptions:

  IOException *(p. **1787**) if an I/O error occurs.*

- virtual bool **markSupported** () const

  Determines if this input stream supports the mark and reset methods.
  Whether or not mark and reset are supported is an invariant property of a particular input stream instance.
  The default implementation of this method returns false.
  Returns:

  true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.109.1 Detailed Description

A **ByteArrayInputStream** (p. 823) contains an **internal** (p. 97) buffer that contains bytes that may be read from the stream. An **internal** (p. 97) counter keeps track of the next byte to be supplied by the read method. The **ByteArrayInputStream** (p. 823) never copies the supplied buffers, only points to them, therefore the caller must ensure that the supplied buffer remain in scope, or is not deleted before this **ByteArrayInputStream** (p. 823) is freed. If the own argument of one of the constructors that accepts an array pointer is set to true than the **ByteArrayInputStream** (p. 823) instance will take ownership of the supplied pointer and delete it when that instance is destroyed.

Closing a **ByteArrayInputStream** (p. 823) has no effect. The methods in this class can be called after the stream has been closed without generating an **IOException** (p. 1787).

Since:

1.0

6.109.2 Constructor & Destructor Documentation

6.109.2.1 decaf::io::ByteArrayInputStream::ByteArrayInputStream ()

Creates an **ByteArrayInputStream** (p. 823) with an empty input buffer, the buffer can be initialized with a call to setByteArray.

6.109.2.2 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const std::vector< unsigned char > & *buffer*)

Creates the input stream and calls setBuffer with the specified buffer object.

Parameters:

buffer The buffer to be used.

6.109.2.3 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * *buffer*, int *bufferSize*, bool *own* = `false`)

Create an instance of the **ByteArrayInputStream** (p. 823) with the given buffer as the source of input for all read operations.

Parameters:

buffer The initial byte array to use to read from.

bufferSize The size of the buffer.

own Indicates if this object should take ownership of the array, default is false.

Exceptions:

NullPointerException if the buffer is Null.

IllegalArguementException if the bufferSize is negative.

6.109.2.4 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * *buffer*, int *bufferSize*, int *offset*, int *length*, bool *own* = `false`)

Create an instance of the **ByteArrayInputStream** (p. 823) with the given buffer as the source of input for all read operations.

Parameters:

buffer The initial byte array to use to read from.

bufferSize The size of the buffer.

offset The offset into the buffer to begin reading from.

length The number of bytes to read past the offset.

own Indicates if this object should take ownership of the array, default is false.

Exceptions:

NullPointerException if the buffer is Null.

IllegalArguementException if the bufferSize is negative.

6.109.2.5 virtual decaf::io::ByteArrayInputStream::~ByteArrayInputStream () `[virtual]`

6.109.3 Member Function Documentation

6.109.3.1 virtual int decaf::io::ByteArrayInputStream::available () const `[virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(p. **1787**)* if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1708).

6.109.3.2 virtual int decaf::io::ByteArrayInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1709).

6.109.3.3 virtual int decaf::io::ByteArrayInputStream::doReadByte () [protected, virtual]

Implements **decaf::io::InputStream** (p. 1710).

6.109.3.4 virtual void decaf::io::ByteArrayInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters:

readLimit The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::InputStream** (p. 1710).

6.109.3.5 virtual bool decaf::io::ByteArrayInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns:

true if this stream instance supports marks

Reimplemented from **decaf::io::InputStream** (p. 1710).

6.109.3.6 virtual void decaf::io::ByteArrayInputStream::reset () [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1787) might be thrown. * If such an **IOException** (p. 1787) is not thrown, then the stream is reset to a state

such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1787). * If an **IOException** (p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1787).

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1713).

6.109.3.7 virtual void decaf::io::ByteArrayInputStream::setByteArray (const unsigned char * *buffer*, int *bufferSize*, int *offset*, int *length*) [virtual]

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters:

buffer The initial byte array to use to read from.

bufferSize The size of the buffer.

offset The offset into the buffer to begin reading from.

length The number of bytes to read past the offset.

Exceptions:

NullPointerException if the buffer is Null.

IllegalArguementException if the bufferSize is negative.

6.109.3.8 virtual void decaf::io::ByteArrayInputStream::setByteArray (const unsigned char * *buffer*, int *bufferSize*) [virtual]

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters:

buffer The initial byte array to use to read from.

bufferSize The size of the buffer.

Exceptions:

NullPointerException if the buffer is Null.

IllegalArguementException if the bufferSize is negative.

6.109.3.9 virtual void decaf::io::ByteArrayInputStream::setByteArray (const std::vector< unsigned char > & *buffer*) [virtual]

Sets the **internal** (p. 97) buffer. The input stream will wrap around this buffer and will perform all read operations on it. The position will be reinitialized to the beginning of the specified buffer. This class will not own the given buffer - it is the caller's responsibility to free the memory of the given buffer as appropriate.

Parameters:

buffer The buffer to be used.

6.109.3.10 virtual long long decaf::io::ByteArrayInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1713).

6.110.1 Constructor & Destructor Documentation

6.110.1.1 decaf::io::ByteArrayOutputStream::ByteArrayOutputStream ()

Default Constructor - uses a default **internal** (p. 97) buffer of 32 bytes, the size increases as the need for more room arises.

6.110.1.2 decaf::io::ByteArrayOutputStream::ByteArrayOutputStream (int *bufferSize*)

Creates a **ByteArrayOutputStream** (p. 830) with an **internal** (p. 97) buffer allocated with the given size.

Parameters:

bufferSize The size to use for the **internal** (p. 97) buffer.

Exceptions:

IllegalArgumentException if the size is less than or equal to zero.

6.110.1.3 virtual decaf::io::ByteArrayOutputStream::~ByteArrayOutputStream () [virtual]

6.110.2 Member Function Documentation

6.110.2.1 virtual void decaf::io::ByteArrayOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2350).

6.110.2.2 virtual void decaf::io::ByteArrayOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2350).

6.110.2.3 virtual void decaf::io::ByteArrayOutputStream::reset () [virtual]

Clear current Stream contents.

Exceptions:

IOException *(* p. *1787)*

6.110.2.4 long long decaf::io::ByteArrayOutputStream::size () const

Gets the current count of bytes written into this **ByteArrayOutputStream** (p. 830).

Returns:

the number of valid bytes contained in the **ByteArrayOutputStream** (p. 830).

6.110.2.5 std::pair<unsigned char*, int> decaf::io::ByteArrayOutputStream::toByteArray () const

Creates a newly allocated byte array. Its size is the current size of this output stream and the valid contents of the buffer have been copied into it. The newly allocated array and its size are

returned inside an STL pair structure, the caller is responsible for freeing the returned array.

Returns:

an STL pair containing the copied array and its size.

6.110.2.6 virtual std::string decaf::io::ByteArrayOutputStream::toString () const [virtual]

Converts the bytes in the buffer into a standard C++ string.

Returns:

a string containing the bytes in the buffer

Reimplemented from **decaf::io::OutputStream** (p. 2351).

6.110.2.7 void decaf::io::ByteArrayOutputStream::writeTo (OutputStream * *out*) const

Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using out.write(buf, 0, count).

  Creates a view of this byte buffer as a double buffer.
- virtual **FloatBuffer** * **asFloatBuffer** () const =0

  Creates a view of this byte buffer as a float buffer.
- virtual **IntBuffer** * **asIntBuffer** () const =0

Creates a view of this byte buffer as a int buffer.

- virtual **LongBuffer** * **asLongBuffer** () const =0

  Creates a view of this byte buffer as a long buffer.

- virtual **ShortBuffer** * **asShortBuffer** () const =0

  Creates a view of this byte buffer as a short buffer.

- virtual **ByteBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only byte buffer that shares this buffer's content.

- virtual **ByteBuffer** & **compact** ()=0

  Compacts this buffer.

- virtual **ByteBuffer** * **duplicate** ()=0

  Creates a new byte buffer that shares this buffer's content.

- virtual unsigned char **get** () const =0

  Relative get method.

- virtual unsigned char **get** (int index) const =0

  Absolute get method.

- virtual char **getChar** ()=0

  Reads the next byte at this buffer's current position, and then increments the position by one.

- virtual char **getChar** (int index) const =0

  Reads one byte at the given index and returns it.

- virtual double **getDouble** ()=0

  Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

- virtual double **getDouble** (int index) const =0

  Reads eight bytes at the given index and returns it.

- virtual float **getFloat** ()=0

  Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

- virtual float **getFloat** (int index) const =0

  Reads four bytes at the given index and returns it.

- virtual long long **getLong** ()=0

  Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

- virtual long long **getLong** (int index) const =0

  Reads eight bytes at the given index and returns it.

- virtual int **getInt** ()=0

  Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

- virtual int **getInt** (int index) const =0

  Reads four bytes at the given index and returns it.

- virtual short **getShort** ()=0

  Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

- virtual short **getShort** (int index) const =0

  Reads two bytes at the given index and returns it.

- virtual **ByteBuffer** & **put** (unsigned char value)=0

  Writes the given byte into this buffer at the current position, and then increments the position.

- virtual **ByteBuffer** & **put** (int index, unsigned char value)=0

  Writes the given byte into this buffer at the given index.

- virtual **ByteBuffer** & **putChar** (char value)=0

  Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

- virtual **ByteBuffer** & **putChar** (int index, char value)=0

  Writes one byte containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putDouble** (double value)=0

  Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putDouble** (int index, double value)=0

  Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putFloat** (float value)=0

  Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putFloat** (int index, float value)=0

  Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putLong** (long long value)=0

  Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putLong** (int index, long long value)=0

  Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putInt** (int value)=0

  Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putInt** (int index, int value)=0

  Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putShort** (short value)=0

  Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putShort** (int index, short value)=0

  Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** * **slice** () const =0

  Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

- virtual int **compareTo** (const **ByteBuffer** &value) const

- virtual bool **equals** (const **ByteBuffer** &value) const

- virtual bool **operator==** (const **ByteBuffer** &value) const

- virtual bool **operator<** (const **ByteBuffer** &value) const

Static Public Member Functions

- static **ByteBuffer** * **allocate** (int capacity)

  Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **ByteBuffer** * **wrap** (unsigned char *array, int size, int offset, int length)

  Wraps the passed buffer with a new ***ByteBuffer*** *(*p. 833*).*

- static **ByteBuffer** * **wrap** (std::vector< unsigned char > &buffer)

  Wraps the passed STL Byte Vector in a ***ByteBuffer*** *(*p. 833*).*

Protected Member Functions

- **ByteBuffer** (int capacity)

  Creates a ***ByteBuffer*** *(*p. 833*) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.111.1 Detailed Description

This class defines six categories of operations upon byte buffers:. 1. Absolute and relative get and put methods that read and write single bytes; 2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array; 3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer; 4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order; 5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 845) float getFloat(int index) void **putFloat(float f)** (p. 852) void **putFloat(int index, float f)** (p. 851)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The asFloatBuffer method, for example, creates an instance of the **FloatBuffer** (p. 1551) class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

6.111.2 Constructor & Destructor Documentation

6.111.2.1 decaf::nio::ByteBuffer::ByteBuffer (int *capacity*) [protected]

Creates a **ByteBuffer** (p. 833) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity The size of the array, this is the limit we read and write to.

Exceptions:

IllegalArgumentException if capacity is negative.

6.111.2.2 virtual decaf::nio::ByteBuffer::~ByteBuffer () [inline, virtual]

6.111.3 Member Function Documentation

6.111.3.1 static ByteBuffer* decaf::nio::ByteBuffer::allocate (int *capacity*) [static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity The **internal** (p. 97) buffer's capacity.

Returns:

a newly allocated **ByteBuffer** (p. 833) which the caller owns.

Exceptions:

IllegalArgumentException if capacity is negative.

6.111.3.2 virtual unsigned char* decaf::nio::ByteBuffer::array () [pure virtual]

Returns the byte array that backs this buffer. Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The array that backs this buffer

Exceptions:

ReadOnlyBufferException *(*p. *2535)* if this buffer is backed by an array but is read-only

UnsupportedOperationException if this buffer is not backed by an accessible array

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 806).

6.111.3.3 virtual int decaf::nio::ByteBuffer::arrayOffset () const [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer. If this buffer is backed by an array then buffer position p corresponds to array index p + **arrayOffset()** (p. 838).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset within this buffer's array of the first element of the buffer.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is backed by an array but is read-only.

UnsupportedOperationException if this buffer is not backed by an accessible array.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 807).

6.111.3.4 virtual CharBuffer* decaf::nio::ByteBuffer::asCharBuffer () const [pure virtual]

Creates a view of this byte buffer as a char buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new Char **Buffer** (p. 735), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 807).

6.111.3.5 virtual DoubleBuffer* decaf::nio::ByteBuffer::asDoubleBuffer () const [pure virtual]

Creates a view of this byte buffer as a double buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new double **Buffer** (p. 735), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 808).

6.111.3.6 virtual FloatBuffer* decaf::nio::ByteBuffer::asFloatBuffer () const [pure virtual]

Creates a view of this byte buffer as a float buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new float **Buffer** (p. 735), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 808).

6.111.3.7 virtual IntBuffer* decaf::nio::ByteBuffer::asIntBuffer () const [pure virtual]

Creates a view of this byte buffer as a int buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new int **Buffer** (p. 735), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 808).

6.111.3.8 virtual LongBuffer* decaf::nio::ByteBuffer::asLongBuffer () const [pure virtual]

Creates a view of this byte buffer as a long buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new long **Buffer** (p. 735), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 809).

6.111.3.9 virtual ByteBuffer* decaf::nio::ByteBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only byte buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only byte buffer which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 809).

6.111.3.10 virtual ShortBuffer* decaf::nio::ByteBuffer::asShortBuffer () const [pure virtual]

Creates a view of this byte buffer as a short buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new short **Buffer** (p. 735), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 810).

6.111.3.11 virtual ByteBuffer& decaf::nio::ByteBuffer::compact () [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **ByteBuffer** (p. 833).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 810).

6.111.3.12 virtual int decaf::nio::ByteBuffer::compareTo (const ByteBuffer & *value*) const [virtual]

6.111.3.13 virtual ByteBuffer* decaf::nio::ByteBuffer::duplicate () [pure virtual]

Creates a new byte buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new Byte **Buffer** (p. 735) which the caller owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 810).

6.111.3.14 virtual bool decaf::nio::ByteBuffer::equals (const ByteBuffer & *value*) const [virtual]

6.111.3.15 virtual unsigned char decaf::nio::ByteBuffer::get (int *index*) const [pure virtual]

Absolute get method. Reads the byte at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the byte is to be read.

Returns:

the byte that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 811).

6.111.3.16 virtual unsigned char decaf::nio::ByteBuffer::get () const [pure virtual]

Relative get method. Reads the byte at this buffer's current position, and then increments the position.

Returns:

The byte at the buffer's current position.

Exceptions:

BufferUnderflowException *(p. 763)* if the buffer's current position is not smaller than its limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 811).

6.111.3.17 ByteBuffer& decaf::nio::ByteBuffer::get (unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method. This method transfers bytes from this buffer into the given destination array. If there are fewer bytes remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 740), then no bytes are transferred and a **BufferUnderflowException** (p. 763) is thrown.

Otherwise, this method copies length bytes from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer The pointer to an allocated buffer to fill.

size The size of the passed in **Buffer** (p. 735).

offset The position in the buffer to start filling.

length The amount of data to put in the passed buffer.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

BufferUnderflowException *(p. 763)* if there are fewer than length bytes remaining in this buffer.

NullPointerException if the passed buffer is null.

6.111.3.18 ByteBuffer& decaf::nio::ByteBuffer::get (std::vector< unsigned char > *buffer*)

Relative bulk get method. This method transfers bytes from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this Byte **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(p. 763)* if there are fewer than length bytes remaining in this buffer

6.111.3.19 virtual char decaf::nio::ByteBuffer::getChar (int *index*) const [pure virtual]

Reads one byte at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the byte is to be read.

Returns:

the char at the given index in the buffer

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 811).

6.111.3.20 virtual char decaf::nio::ByteBuffer::getChar () [pure virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns:

the next char in the buffer.

Exceptions:

BufferUnderflowException *(*p. *763)* if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 812).

6.111.3.21 virtual double decaf::nio::ByteBuffer::getDouble (int *index*) const [pure virtual]

Reads eight bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the double at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 812).

6.111.3.22 virtual double decaf::nio::ByteBuffer::getDouble () [pure virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next double in the buffer.

Exceptions:

BufferUnderflowException *(*p. *763)* if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 812).

6.111.3.23 virtual float decaf::nio::ByteBuffer::getFloat (int *index*) const [pure virtual]

Reads four bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the float at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 813).

6.111.3.24 virtual float decaf::nio::ByteBuffer::getFloat () [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next float in the buffer.

Exceptions:

BufferUnderflowException *(*p. *763)* if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 813).

6.111.3.25 virtual int decaf::nio::ByteBuffer::getInt (int *index*) const [pure virtual]

Reads four bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the int at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 813).

6.111.3.26 virtual int decaf::nio::ByteBuffer::getInt () [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next int in the buffer.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 814).

6.111.3.27 virtual long long decaf::nio::ByteBuffer::getLong (int *index*) const [pure virtual]

Reads eight bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the long long at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 814).

6.111.3.28 virtual long long decaf::nio::ByteBuffer::getLong () [pure virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next long long in the buffer.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 814).

6.111.3.29 virtual short decaf::nio::ByteBuffer::getShort (int *index*) const [pure virtual]

Reads two bytes at the given index and returns it.

Parameters:

index The index in the **Buffer** (p. 735) where the bytes are to be read.

Returns:

the short at the given index in the buffer.

Exceptions:

IndexOutOfBoundsException if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 815).

6.111.3.30 virtual short decaf::nio::ByteBuffer::getShort () [pure virtual]

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next short in the buffer.

Exceptions:

BufferUnderflowException *(*p. *763)* if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 815).

6.111.3.31 virtual bool decaf::nio::ByteBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible byte array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 815).

6.111.3.32 virtual bool decaf::nio::ByteBuffer::isReadOnly () const [pure virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 738).

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 816).

6.111.3.33 virtual bool decaf::nio::ByteBuffer::operator< (const ByteBuffer & *value*) const [virtual]

6.111.3.34 virtual bool decaf::nio::ByteBuffer::operator== (const ByteBuffer & *value*) const [virtual]

6.111.3.35 virtual ByteBuffer& decaf::nio::ByteBuffer::put (int *index*, unsigned char *value*) [pure virtual]

Writes the given byte into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 735) to write the data

value - the byte to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException (p. ***2535***) if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 816).

6.111.3.36 virtual ByteBuffer& decaf::nio::ByteBuffer::put (unsigned char *value*) [pure virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters:

value - the byte value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException (p. ***760***) if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException (p. ***2535***) if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 816).

6.111.3.37 ByteBuffer& decaf::nio::ByteBuffer::put (std::vector< unsigned char > & *buffer*)

This method transfers the entire content of the given source byte array into this buffer. This is the same as calling put(&buffer[0], buffer.size(), 0, buffer.size())

Parameters:

buffer The buffer whose contents are copied to this **ByteBuffer** (p. 833).

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if there is insufficient space in this buffer.

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only.

6.111.3.38 ByteBuffer& decaf::nio::ByteBuffer::put (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

This method transfers bytes into this buffer from the given source array. If there are more bytes to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 740), then no bytes are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer The array from which bytes are to be read.

size The size of the given array.

offset The offset within the array of the first byte to be read.

length The number of bytes to be read from the given array.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if there is insufficient space in this buffer.

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only.

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.111.3.39 ByteBuffer& decaf::nio::ByteBuffer::put (ByteBuffer & *src*)

This method transfers the bytes remaining in the given source buffer into this buffer. If there are more bytes remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 740), then no bytes are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies n = src.remaining() bytes from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src The buffer to take bytes from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer for the remaining bytes in the source buffer

IllegalArgumentException if the source buffer is this buffer

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

6.111.3.40 virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (int *index*, char *value*) [pure virtual]

Writes one byte containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 817).

6.111.3.41 virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (char *value*) [pure virtual]

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 817).

6.111.3.42 virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (int *index*, double *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 817).

6.111.3.43 virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (double *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 818).

6.111.3.44 virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (int *index*, float *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 818).

6.111.3.45 virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (float *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 819).

6.111.3.46 virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int *index*, int *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 819).

6.111.3.47 virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 819).

6.111.3.48 virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (int *index*, long long *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The value to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 820).

6.111.3.49 virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (long long *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 820).

6.111.3.50 virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (int *index*, short *value*) [pure virtual]

Writes two bytes containing the given value, into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data

value The value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 821).

6.111.3.51 virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (short *value*) [pure virtual]

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value The value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there are fewer than bytes remaining in this buffer than the size of the data to be written.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 821).

6.111.3.52 virtual ByteBuffer* decaf::nio::ByteBuffer::slice () const [pure virtual]

Creates a new byte buffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ByteBuffer** (p. 833) which the caller owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 822).

6.111.3.53 virtual std::string decaf::nio::ByteBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.111.3.54 static ByteBuffer* decaf::nio::ByteBuffer::wrap (std::vector< unsigned char > & *buffer*) [static]

Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 833). The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **ByteBuffer** (p. 833) that is backed by buffer, caller owns.

6.111.3.55 static ByteBuffer* decaf::nio::ByteBuffer::wrap (unsigned char * *array*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new **ByteBuffer** (p. 833). The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array The array that will back the new buffer.

size The size of the provided array.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new **ByteBuffer** (p. 833) that is backed by buffer, caller owns.

Exceptions:

NullPointerException if the array passed in is NULL.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

The documentation for this class was generated from the following file:

6.112 cms::BytesMessage Class Reference

A **BytesMessage** (p. 857) object is used to send a message containing a stream of unsigned bytes.

`#include <src/main/cms/BytesMessage.h>`Inheritance diagram for cms::BytesMessage:

Public Member Functions

- virtual ~**BytesMessage** ()
- virtual void **setBodyBytes** (const unsigned char *buffer, int numBytes)=0

  sets the bytes given to the message body.

- virtual unsigned char * **getBodyBytes** () const =0

  Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.

- virtual int **getBodyLength** () const =0

  Returns the number of bytes contained in the body of this message.

- virtual void **reset** ()=0

  Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

- virtual bool **readBoolean** () const =0

  Reads a Boolean from the Bytes message stream.

- virtual void **writeBoolean** (bool value)=0

  Writes a boolean to the bytes message stream as a 1-byte value.

- virtual unsigned char **readByte** () const =0

  Reads a Byte from the Bytes message stream.

- virtual void **writeByte** (unsigned char value)=0

  Writes a byte to the bytes message stream as a 1-byte value.

- virtual int **readBytes** (std::vector< unsigned char > &value) const =0

  Reads a byte array from the bytes message stream.

- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0

  Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

- virtual int **readBytes** (unsigned char *buffer, int length) const =0

  Reads a portion of the bytes message stream.

- virtual void **writeBytes** (const unsigned char *value, int offset, int length)=0

  Writes a portion of a byte array to the bytes message stream.

- virtual char **readChar** () const =0

Reads a Char from the Bytes message stream.

- virtual void **writeChar** (char value)=0

  Writes a char to the bytes message stream as a 1-byte value.

- virtual float **readFloat** () const =0

  Reads a 32 bit float from the Bytes message stream.

- virtual void **writeFloat** (float value)=0

  Writes a float to the bytes message stream as a 4 byte value.

- virtual double **readDouble** () const =0

  Reads a 64 bit double from the Bytes message stream.

- virtual void **writeDouble** (double value)=0

  Writes a double to the bytes message stream as a 8 byte value.

- virtual short **readShort** () const =0

  Reads a 16 bit signed short from the Bytes message stream.

- virtual void **writeShort** (short value)=0

  Writes a signed short to the bytes message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const =0

  Reads a 16 bit unsigned short from the Bytes message stream.

- virtual void **writeUnsignedShort** (unsigned short value)=0

  Writes a unsigned short to the bytes message stream as a 2 byte value.

- virtual int **readInt** () const =0

  Reads a 32 bit signed integer from the Bytes message stream.

- virtual void **writeInt** (int value)=0

  Writes a signed int to the bytes message stream as a 4 byte value.

- virtual long long **readLong** () const =0

  Reads a 64 bit long from the Bytes message stream.

- virtual void **writeLong** (long long value)=0

  Writes a long long to the bytes message stream as a 8 byte value.

- virtual std::string **readString** () const =0

  Reads an ASCII String from the Bytes message stream.

- virtual void **writeString** (const std::string &value)=0

  Writes an ASCII String to the Bytes message stream.

- virtual std::string **readUTF** () const =0

  *Reads an UTF String from the **BytesMessage** (p. 857) stream.*

- virtual void **writeUTF** (const std::string &value)=0
  *Writes an UTF String to the **BytesMessage** (p. 857) stream.*

- virtual **BytesMessage** * **clone** () const =0
  Clones this message.

6.112.1 Detailed Description

A **BytesMessage** (p. 857) object is used to send a message containing a stream of unsigned bytes. It inherits from the **Message** (p. 2090) interface and adds a bytes message body. The receiver of the message supplies the interpretation of the bytes using the methods added by the **BytesMessage** (p. 857) interface.

The **BytesMessage** (p. 857) methods are based largely on those found in **decaf.io.DataInputStream** (p. 1263) and **decaf.io.DataOutputStream** (p. 1276).

Although the CMS API allows the use of message properties with byte messages, they are typically not used, since the inclusion of properties may affect the format.

The primitive types can be written explicitly using methods for each type. Because the C++ language is more limited when dealing with primitive types the JMS equivalent generic read and write methods that take Java objects cannot be provided in the CMS API.

When the message is first created, and when clearBody is called, the body of the message is in write-only mode. After the first call to reset has been made, the message body is in read-only mode. After a message has been sent, the client that sent it can retain and modify it without affecting the message that has been sent. The same message object can be sent multiple times. When a message has been received, the provider has called reset so that the message body is in read-only mode for the client.

If clearBody is called on a message in read-only mode, the message body is cleared and the message is in write-only mode.

If a client attempts to read a message in write-only mode, a **MessageNotReadableException** (p. 2188) is thrown.

If a client attempts to write a message in read-only mode, a **MessageNotWriteableException** (p. 2190) is thrown.

Since:

1.0

6.112.2 Constructor & Destructor Documentation

6.112.2.1 virtual cms::BytesMessage::~BytesMessage () [virtual]

6.112.3 Member Function Documentation

6.112.3.1 virtual BytesMessage* cms::BytesMessage::clone () const [pure virtual]

Clones this message.

Returns:

a deep copy of this message.

Exceptions:

CMSException *(*p. ***979****)* - if an internal error occurs while cloning the **Message** (p. 2090).

Implements **cms::Message** (p. 2096).

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 216).

6.112.3.2 virtual unsigned char* cms::BytesMessage::getBodyBytes () const [pure virtual]

Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller. This is a copy of the data contained in this message, changing the value contained in this array has no effect on the data contained in this message.

Returns:

pointer to a byte buffer that the call owns upon completion of this method.

Exceptions:

CMSException *(*p. ***979****)* - If an internal error occurs.
MessageNotReadableException *(*p. ***2188****)* - If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 217).

6.112.3.3 virtual int cms::BytesMessage::getBodyLength () const [pure virtual]

Returns the number of bytes contained in the body of this message.

Returns:

number of bytes.

Exceptions:

CMSException *(*p. ***979****)* - If an internal error occurs.
MessageNotReadableException *(*p. ***2188****)* - If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 217).

6.112.3.4 virtual bool cms::BytesMessage::readBoolean () const [pure virtual]

Reads a Boolean from the Bytes message stream.

Returns:

boolean value from stream

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(*p. ***2170****)* - if unexpected end of bytes stream has been reached.
MessageNotReadableException *(*p. ***2188****)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 218).

6.112.3.5 virtual unsigned char cms::BytesMessage::readByte () const [pure virtual]

Reads a Byte from the Bytes message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 218).

6.112.3.6 virtual int cms::BytesMessage::readBytes (unsigned char * *buffer*, int *length*) const [pure virtual]

Reads a portion of the bytes message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an IndexOutOfBoundsException is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 218).

6.112.3.7 virtual int cms::BytesMessage::readBytes (std::vector< unsigned char > & *value*) const [pure virtual]

Reads a byte array from the bytes message stream. If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 219).

6.112.3.8 virtual char cms::BytesMessage::readChar () const [pure virtual]

Reads a Char from the Bytes message stream.

Returns:

char value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 219).

6.112.3.9 virtual double cms::BytesMessage::readDouble () const [pure virtual]

Reads a 64 bit double from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 220).

6.112.3.10 virtual float cms::BytesMessage::readFloat () const [pure virtual]

Reads a 32 bit float from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 220).

6.112.3.11 virtual int cms::BytesMessage::readInt () const [pure virtual]

Reads a 32 bit signed integer from the Bytes message stream.

Returns:

int value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 220).

6.112.3.12 virtual long long cms::BytesMessage::readLong () const [pure virtual]

Reads a 64 bit long from the Bytes message stream.

Returns:

long long value from stream

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. ***2170****)* - if unexpected end of bytes stream has been reached.

MessageNotReadableException *(*p. ***2188****)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 221).

6.112.3.13 virtual short cms::BytesMessage::readShort () const [pure virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns:

short value from stream

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. ***2170****)* - if unexpected end of bytes stream has been reached.

MessageNotReadableException *(*p. ***2188****)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 221).

6.112.3.14 virtual std::string cms::BytesMessage::readString () const [pure virtual]

Reads an ASCII String from the Bytes message stream.

Returns:

String from stream

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. ***2170****)* - if unexpected end of bytes stream has been reached.

MessageNotReadableException *(*p. ***2188****)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 221).

6.112.3.15 virtual unsigned short cms::BytesMessage::readUnsignedShort () const [pure virtual]

Reads a 16 bit unsigned short from the Bytes message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 222).

6.112.3.16 virtual std::string cms::BytesMessage::readUTF () const [pure virtual]

Reads an UTF String from the **BytesMessage** (p. 857) stream.

Returns:

String from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 222).

6.112.3.17 virtual void cms::BytesMessage::reset () [pure virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions:

CMSException (p. ***979***) - If the provider fails to perform the reset operation.

MessageFormatException (p. ***2172***) - If the **Message** (p. 2090) has an invalid format.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 222).

6.112.3.18 virtual void cms::BytesMessage::setBodyBytes (const unsigned char * *buffer*, int *numBytes*) [pure virtual]

sets the bytes given to the message body.

Parameters:

buffer Byte Buffer to copy

numBytes Number of bytes in Buffer to copy

Exceptions:

CMSException (p. ***979***) - If an internal error occurs.

MessageNotWriteableException (p. ***2190***) - if in Read Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 222).

6.112.3.19 virtual void cms::BytesMessage::writeBoolean (bool *value*) [pure virtual]

Writes a boolean to the bytes message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value boolean to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 223).

6.112.3.20 virtual void cms::BytesMessage::writeByte (unsigned char *value*) [pure virtual]

Writes a byte to the bytes message stream as a 1-byte value.

Parameters:

value byte to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 223).

6.112.3.21 virtual void cms::BytesMessage::writeBytes (const unsigned char * *value*, int *offset*, int *length*) [pure virtual]

Writes a portion of a byte array to the bytes message stream. size as the number of bytes to write.

Parameters:

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 224).

6.112.3.22 virtual void cms::BytesMessage::writeBytes (const std::vector< unsigned char > & *value*) [pure virtual]

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters:

value bytes to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 224).

6.112.3.23 virtual void cms::BytesMessage::writeChar (char *value*) [pure virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters:

value char to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 224).

6.112.3.24 virtual void cms::BytesMessage::writeDouble (double *value*) [pure virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters:

value double to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 225).

6.112.3.25 virtual void cms::BytesMessage::writeFloat (float *value*) [pure virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters:

value float to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 225).

6.112.3.26 virtual void cms::BytesMessage::writeInt (int *value*) [pure virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters:

value signed int to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 225).

6.112.3.27 virtual void cms::BytesMessage::writeLong (long long *value*) [pure virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters:

value signed long long to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 225).

6.112.3.28 virtual void cms::BytesMessage::writeShort (short *value*) [pure virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters:

value signed short to write to the stream

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(*p. ***2190****)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 226).

6.112.3.29 virtual void cms::BytesMessage::writeString (const std::string & *value*) [pure virtual]

Writes an ASCII String to the Bytes message stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(*p. ***2190****)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 226).

6.112.3.30 virtual void cms::BytesMessage::writeUnsignedShort (unsigned short *value*) [pure virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters:

value unsigned short to write to the stream

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(*p. ***2190****)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 226).

6.112.3.31 virtual void cms::BytesMessage::writeUTF (const std::string & *value*) [pure virtual]

Writes an UTF String to the **BytesMessage** (p. 857) stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 227).

The documentation for this class was generated from the following file:

6.113 activemq::cmsutil::CachedConsumer Class Reference

A cached message consumer contained within a pooled session.

`#include <src/main/activemq/cmsutil/CachedConsumer.h>`Inheritance diagram for activemq::cmsutil::CachedConsumer:

Public Member Functions

- **CachedConsumer** (**cms::MessageConsumer** *consumer)
- virtual ~**CachedConsumer** ()
- virtual void **close** ()

  Does nothing - the real producer resource will be closed by the lifecycle manager.

- virtual void **start** ()

  Starts the service.

- virtual void **stop** ()

  Stops this service.

- virtual **cms::Message** * **receive** ()

  Synchronously Receive a Message.

- virtual **cms::Message** * **receive** (int millisecs)

  Synchronously Receive a Message, time out after defined interval.

- virtual **cms::Message** * **receiveNoWait** ()

  Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

- virtual void **setMessageListener** (**cms::MessageListener** *listener)

  Sets the MessageListener that this class will send notifs on.

- virtual **cms::MessageListener** * **getMessageListener** () const

  Gets the MessageListener that this class will send mew Message notification events to.

- virtual std::string **getMessageSelector** () const

  Gets this message consumer's message selector expression.

- virtual void **setMessageAvailableListener** (**cms::MessageAvailableListener** *listener)

  Sets the MessageAvailableListener that this class will send events to if the consumer is in synchronous consumption mode and a new Message has arrived.

- virtual **cms::MessageAvailableListener** * **getMessageAvailableListener** () const

  Gets the MessageAvailableListener that this class will send mew Message notification events to.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

Set an MessageTransformer instance that is applied to all ***cms::Message*** *(p. 2090) objects before they are dispatched to client* ***code*** *(p. 1005).*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this MessageConsumer.

6.113.1 Detailed Description

A cached message consumer contained within a pooled session.

6.113.2 Constructor & Destructor Documentation

6.113.2.1 activemq::cmsutil::CachedConsumer::CachedConsumer (cms::MessageConsumer * *consumer*)

6.113.2.2 virtual activemq::cmsutil::CachedConsumer::~CachedConsumer () [virtual]

6.113.3 Member Function Documentation

6.113.3.1 virtual void activemq::cmsutil::CachedConsumer::close () [inline, virtual]

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements **cms::Closeable** (p. 965).

6.113.3.2 virtual cms::MessageAvailableListener* activemq::cmsutil::CachedConsumer::getMessageAvailableListener () const [inline, virtual]

Gets the MessageAvailableListener that this class will send mew Message notification events to.

Returns:

The listener of message events received by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2128).

References cms::MessageConsumer::getMessageAvailableListener().

6.113.3.3 virtual cms::MessageListener* activemq::cmsutil::CachedConsumer::getMessageListener () const [inline, virtual]

Gets the MessageListener that this class will send mew Message notification events to.

Returns:

The listener of messages received by this consumer

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2129).

References cms::MessageConsumer::getMessageListener().

6.113.3.4 virtual std::string activemq::cmsutil::CachedConsumer::getMessageSelector () const [inline, virtual]

Gets this message consumer's message selector expression.

Returns:

This Consumer's selector expression or "".

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2129).

References cms::MessageConsumer::getMessageSelector().

6.113.3.5 virtual cms::MessageTransformer* activemq::cmsutil::CachedConsumer::getMessageTransformer () const [inline, virtual]

Gets the currently configured MessageTransformer for this MessageConsumer.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::MessageConsumer** (p. 2129).

References cms::MessageConsumer::getMessageTransformer().

6.113.3.6 virtual cms::Message* activemq::cmsutil::CachedConsumer::receive (int *millisecs*) [inline, virtual]

Synchronously Receive a Message, time out after defined interval. Returns null if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

References cms::MessageConsumer::receive().

6.113.3.7 virtual cms::Message* activemq::cmsutil::CachedConsumer::receive () [inline, virtual]

Synchronously Receive a Message.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

References cms::MessageConsumer::receive().

6.113.3.8 virtual cms::Message* activemq::cmsutil::CachedConsumer::receiveNoWait () [inline, virtual]

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2130).

References cms::MessageConsumer::receiveNoWait().

6.113.3.9 virtual void activemq::cmsutil::CachedConsumer::setMessageAvailableListener (cms::MessageAvailableListener * *listener*) [inline, virtual]

Sets the MessageAvailableListener that this class will send events to if the consumer is in synchronous consumption mode and a new Message has arrived.

Parameters:

listener The listener of new message events fired by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2131).

References cms::MessageConsumer::setMessageAvailableListener().

6.113.3.10 virtual void activemq::cmsutil::CachedConsumer::setMessageListener (cms::MessageListener * *listener*) [inline, virtual]

Sets the MessageListener that this class will send notifs on.

Parameters:

listener The listener of messages received by this consumer.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2131).

References cms::MessageConsumer::setMessageListener().

6.113.3.11 virtual void activemq::cmsutil::CachedConsumer::setMessageTransformer (cms::MessageTransformer * *transformer*) [inline, virtual]

Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are dispatched to client **code** (p. 1005). The CMS **code** (p. 1005) never takes ownership of the MessageTransformer pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the MessageTransformer has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to apply on each **cms** (p. 91)::;Message dispatch.

Implements **cms::MessageConsumer** (p. 2131).

References cms::MessageConsumer::setMessageTransformer().

6.113.3.12 virtual void activemq::cmsutil::CachedConsumer::start () [inline, virtual]

Starts the service.

Exceptions:

CMSException if an internal error occurs while starting.

Implements **cms::Startable** (p. 2852).

References cms::Startable::start().

6.113.3.13 virtual void activemq::cmsutil::CachedConsumer::stop () [inline, virtual]

Stops this service.

Exceptions:

CMSException - if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2919).

References cms::Stoppable::stop().

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**CachedConsumer.h**

6.114 activemq::cmsutil::CachedProducer Class Reference

A cached message producer contained within a pooled session.

`#include <src/main/activemq/cmsutil/CachedProducer.h>`Inheritance diagram for activemq::cmsutil::CachedProducer:

Public Member Functions

- **CachedProducer** (**cms::MessageProducer** *producer)
- virtual ~**CachedProducer** ()
- virtual void **close** ()

  Does nothing - the real producer resource will be closed by the lifecycle manager.

- virtual void **send** (**cms::Message** *message)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, **cms::AsyncCallback** *onComplete)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive, **cms::AsyncCallback** *onComplete)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, **cms::AsyncCallback** *onComplete)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive, **cms::AsyncCallback** *onComplete)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **setDeliveryMode** (int mode)

  Sets the delivery mode for this Producer.

- virtual int **getDeliveryMode** () const

  Gets the delivery mode for this Producer.

- virtual void **setDisableMessageID** (bool value)

  Sets if Message Ids are disabled for this Producer.

- virtual bool **getDisableMessageID** () const

  Gets if Message Ids are disabled for this Producer.

- virtual void **setDisableMessageTimeStamp** (bool value)

  Sets if Message Time Stamps are disabled for this Producer.

- virtual bool **getDisableMessageTimeStamp** () const

  Gets if Message Time Stamps are disabled for this Producer.

- virtual void **setPriority** (int priority)

  Sets the Priority that this Producers sends messages at.

- virtual int **getPriority** () const

  Gets the Priority level that this producer sends messages at.

- virtual void **setTimeToLive** (long long time)

  Sets the Time to Live that this Producers sends messages with.

- virtual long long **getTimeToLive** () const

  Gets the Time to Live that this producer sends messages with.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)

  *Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are sent on to the CMS bus.*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const

  Gets the currently configured MessageTransformer for this MessageProducer.

6.114.1 Detailed Description

A cached message producer contained within a pooled session.

6.114.2 Constructor & Destructor Documentation

6.114.2.1 activemq::cmsutil::CachedProducer::CachedProducer (cms::MessageProducer * *producer*)

6.114.2.2 virtual activemq::cmsutil::CachedProducer::~CachedProducer () [virtual]

6.114.3 Member Function Documentation

6.114.3.1 virtual void activemq::cmsutil::CachedProducer::close () [inline, virtual]

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements **cms::Closeable** (p. 965).

6.114.3.2 virtual int activemq::cmsutil::CachedProducer::getDeliveryMode () const [inline, virtual]

Gets the delivery mode for this Producer.

Returns:

The DeliveryMode

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2194).

References cms::MessageProducer::getDeliveryMode().

6.114.3.3 virtual bool activemq::cmsutil::CachedProducer::getDisableMessageID () const [inline, virtual]

Gets if Message Ids are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2194).

References cms::MessageProducer::getDisableMessageID().

6.114.3.4 virtual bool activemq::cmsutil::CachedProducer::getDisableMessageTimeStamp () const [inline, virtual]

Gets if Message Time Stamps are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2194).

References cms::MessageProducer::getDisableMessageTimeStamp().

6.114.3.5 virtual cms::MessageTransformer* activemq::cmsutil::CachedProducer::getMessageTransformer () const [inline, virtual]

Gets the currently configured MessageTransformer for this MessageProducer.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::MessageProducer** (p. 2195).

References cms::MessageProducer::getMessageTransformer().

6.114.3.6 virtual int activemq::cmsutil::CachedProducer::getPriority () const [inline, virtual]

Gets the Priority level that this producer sends messages at.

Returns:

int based priority level

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2195).

References cms::MessageProducer::getPriority().

6.114.3.7 virtual long long activemq::cmsutil::CachedProducer::getTimeToLive () const [inline, virtual]

Gets the Time to Live that this producer sends messages with.

Returns:

Time to live value in milliseconds

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2195).

References cms::MessageProducer::getTimeToLive().

6.114.3.8 virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, cms::AsyncCallback * *onComplete*) [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2196).

References cms::MessageProducer::send().

6.114.3.9 virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2196).

References cms::MessageProducer::send().

6.114.3.10 virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * *destination*, cms::Message * *message*, cms::AsyncCallback * *onComplete*) [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

destination The destination on which to send the message

message the message to be sent.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2197).

References cms::MessageProducer::send().

6.114.3.11 virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * *destination*, cms::Message * *message*) [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

destination The destination on which to send the message

message the message to be sent.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2198).

References cms::MessageProducer::send().

6.114.3.12 virtual void activemq::cmsutil::CachedProducer::send (cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, cms::AsyncCallback * *onComplete*) [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2198).

References cms::MessageProducer::send().

6.114.3.13 virtual void activemq::cmsutil::CachedProducer::send (cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2199).

References cms::MessageProducer::send().

6.114.3.14 virtual void activemq::cmsutil::CachedProducer::send (cms::Message * *message*, cms::AsyncCallback * *onComplete*) [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live. If the AsyncCallback parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the Message or an Error occurs.

Parameters:

message The message to be sent.

onComplete The AsyncCallback instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2199).

References cms::MessageProducer::send().

6.114.3.15 virtual void activemq::cmsutil::CachedProducer::send (cms::Message * *message*) [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

message The message to be sent.

Exceptions:

CMSException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2200).

References cms::MessageProducer::send().

6.114.3.16 virtual void activemq::cmsutil::CachedProducer::setDeliveryMode (int *mode*) [inline, virtual]

Sets the delivery mode for this Producer.

Parameters:

mode The DeliveryMode

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2200).

References cms::MessageProducer::setDeliveryMode().

6.114.3.17 virtual void activemq::cmsutil::CachedProducer::setDisableMessageID (bool *value*) [inline, virtual]

Sets if Message Ids are disabled for this Producer.

Parameters:

value boolean indicating enable / disable (true / false)

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2201).

References cms::MessageProducer::setDisableMessageID().

6.114.3.18 virtual void activemq::cmsutil::CachedProducer::setDisableMessageTimeStamp (bool *value*) [inline, virtual]

Sets if Message Time Stamps are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2201).

References cms::MessageProducer::setDisableMessageTimeStamp().

6.114.3.19 virtual void activemq::cmsutil::CachedProducer::setMessageTransformer (cms::MessageTransformer * *transformer*) [inline, virtual]

Set an MessageTransformer instance that is applied to all **cms::Message** (p. 2090) objects before they are sent on to the CMS bus. The CMS **code** (p. 1005) never takes ownership of the MessageTransformer pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the MessageTransformer has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to apply on each **cms** (p. 91)::MessageSend.

Implements **cms::MessageProducer** (p. 2201).

References cms::MessageProducer::setMessageTransformer().

6.114.3.20 virtual void activemq::cmsutil::CachedProducer::setPriority (int *priority*) [inline, virtual]

Sets the Priority that this Producers sends messages at.

Parameters:

priority int value for Priority level

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2202).

References cms::MessageProducer::setPriority().

6.114.3.21 virtual void activemq::cmsutil::CachedProducer::setTimeToLive (long long *time*) [inline, virtual]

Sets the Time to Live that this Producers sends messages with. This value will be used if the time to live is not specified via the send method.

Parameters:

time default time to live value in milliseconds

Exceptions:

CMSException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2202).

References cms::MessageProducer::setTimeToLive().

6.115 decaf::util::concurrent::Callable< V > Class Template Reference

A task that returns a result and may throw an exception.

`#include <src/main/decaf/util/concurrent/Callable.h>`Inheritance diagram for decaf::util::concurrent::Callable< V >:

Public Member Functions

- virtual ~**Callable** ()
- virtual V **call** ()=0

  Computes a result, or throws an exception if unable to do so.

6.115.1 Detailed Description

template<typename V> class decaf::util::concurrent::Callable< V >

A task that returns a result and may throw an exception. Implementors define a single method with no arguments called call. This interface differs from the Runnable interface in that a **Callable** (p. 888) object can return a result and is allowed to throw an exceptions from its call method.

The **Executors** (p. 1479) class contains utility methods to convert from other common forms to **Callable** (p. 888) classes.

Since:

1.0

6.115.2 Constructor & Destructor Documentation

6.115.2.1 template<typename V> virtual decaf::util::concurrent::Callable< V >::~Callable () [inline, virtual]

6.115.3 Member Function Documentation

6.115.3.1 template<typename V> virtual V decaf::util::concurrent::Callable< V >::call () [pure virtual]

Computes a result, or throws an exception if unable to do so.

Returns:

Computed Result.

Exceptions:

Exception If unable to compute a result.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Callable.h**

6.116 decaf::util::concurrent::CallableType Class Reference

Base class of all **Callable<T>** (p. 888) objects, used to allow identification via type casting.

`#include <src/main/decaf/util/concurrent/Callable.h>`Inheritance diagram for decaf::util::concurrent::CallableType:

Public Member Functions

- virtual ~**CallableType** ()

6.116.1 Detailed Description

Base class of all **Callable<T>** (p. 888) objects, used to allow identification via type casting.

6.116.2 Constructor & Destructor Documentation

6.116.2.1 virtual decaf::util::concurrent::CallableType::~CallableType () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Callable.h**

6.117 decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy Class Reference

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 3055) this class will attempt to run the task in the Thread that called the execute method unless the executor is shutdown in which case the task is not run and is destroyed.

6.118 decaf::util::concurrent::CancellationException Class Reference

`#include <src/main/decaf/util/concurrent/CancellationException.h>`Inheritance diagram for decaf::util::concurrent::CancellationException:

Public Member Functions

- **CancellationException** ()

  Default Constructor.

- **CancellationException** (const **decaf::lang::Exception** &ex)

  Conversion Constructor from some other Exception.

- **CancellationException** (const **CancellationException** &ex)

  Copy Constructor.

- **CancellationException** (const std::exception *cause)

  Constructor.

- **CancellationException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **CancellationException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **CancellationException** * **clone** () const

  Clones this exception.

- virtual ~**CancellationException** () throw ()

6.118.1 Constructor & Destructor Documentation

6.118.1.1 decaf::util::concurrent::CancellationException::CancellationException ()

Default Constructor.

6.118.1.2 decaf::util::concurrent::CancellationException::CancellationException (const decaf::lang::Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.118.1.3 decaf::util::concurrent::CancellationException::CancellationException (const CancellationException & *ex*)

Copy Constructor.

Parameters:

ex - The Exception to copy in this new instance.

6.118.1.4 decaf::util::concurrent::CancellationException::CancellationException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.118.1.5 decaf::util::concurrent::CancellationException::CancellationException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - list of primitives that are formatted into the message

6.118.1.6 decaf::util::concurrent::CancellationException::CancellationException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.118.1.7 virtual decaf::util::concurrent::CancellationException::~CancellationException () throw () [virtual]

6.118.2 Member Function Documentation

6.118.2.1 virtual CancellationException* decaf::util::concurrent::CancellationException::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CancellationException.h**

6.119 decaf::security::cert::Certificate Class Reference

Base interface for all identity certificates.

`#include <src/main/decaf/security/cert/Certificate.h>`Inheritance diagram for decaf::security::cert::Certificate:

Public Member Functions

- virtual ~**Certificate** ()
- virtual bool **equals** (const **Certificate** &cert) const =0

  Compares the encoded form of the two certificates.

- virtual void **getEncoded** (std::vector< unsigned char > &output) const =0

  Provides the encoded form of this certificate.

- virtual std::string **getType** () const =0

  Returns the type of this certificate.

- virtual **PublicKey** * **getPublicKey** ()=0

  Gets the public key of this certificate.

- virtual const **PublicKey** * **getPublicKey** () const =0

  Gets the public key of this certificate.

- virtual void **verify** (const **PublicKey** &publicKey) const =0

  Verifies that this certificate was signed with the private key that corresponds to the specified public key.

- virtual void **verify** (const **PublicKey** &publicKey, const std::string &sigProvider) const =0

  Verifies that this certificate was signed with the private key that corresponds to the specified public key.

- virtual std::string **toString** () const =0

  Returns a string representation of this certificate.

6.119.1 Detailed Description

Base interface for all identity certificates.

6.119.2 Constructor & Destructor Documentation

6.119.2.1 virtual decaf::security::cert::Certificate::~Certificate () [inline, virtual]

6.119.3 Member Function Documentation

6.119.3.1 virtual bool decaf::security::cert::Certificate::equals (const Certificate & *cert*) const [pure virtual]

Compares the encoded form of the two certificates.

Parameters:

cert *(p. 124)* The certificate to be tested for equality with this certificate.

Returns:

true if the given certificate is equal to this certificate.

6.119.3.2 virtual void decaf::security::cert::Certificate::getEncoded (std::vector< unsigned char > & *output*) const [pure virtual]

Provides the encoded form of this certificate.

Parameters:

output Receives the encoded form of this certificate.

Exceptions:

CertificateEncodingException *(p. 899)* if an encoding error occurs

6.119.3.3 virtual const PublicKey* decaf::security::cert::Certificate::getPublicKey () const [pure virtual]

Gets the public key of this certificate.

Returns:

the public key

6.119.3.4 virtual PublicKey* decaf::security::cert::Certificate::getPublicKey () [pure virtual]

Gets the public key of this certificate.

Returns:

the public key

6.119.3.5 virtual std::string decaf::security::cert::Certificate::getType () const [pure virtual]

Returns the type of this certificate.

Returns:

the type of this certificate

6.119.3.6 virtual std::string decaf::security::cert::Certificate::toString () const [pure virtual]

Returns a string representation of this certificate.

Returns:

a string representation of this certificate

6.119.3.7 virtual void decaf::security::cert::Certificate::verify (const PublicKey & *publicKey*, const std::string & *sigProvider*) const [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key. Uses the verification engine of the specified provider.

Parameters:

publicKey The public key used to carry out the validation.

sigProvider The name of the signature provider

Exceptions:

NoSuchAlgorithmException (p. ***2257***) - on unsupported signature algorithms.

InvalidKeyException (p. ***1776***) - on incorrect key.

NoSuchProviderException (p. ***2263***) - if there's no default provider.

SignatureException (p. ***2756***) - on signature errors.

CertificateException (p. ***902***) - on encoding errors.

6.119.3.8 virtual void decaf::security::cert::Certificate::verify (const PublicKey & *publicKey*) const [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters:

publicKey The public key used to carry out the validation.

Exceptions:

NoSuchAlgorithmException (p. ***2257***) - on unsupported signature algorithms.

InvalidKeyException (p. ***1776***) - on incorrect key.

NoSuchProviderException *(*p. *2263)* - if there's no default provider.
SignatureException *(*p. *2756)* - on signature errors.
CertificateException *(*p. *902)* - on encoding errors.

The documentation for this class was generated from the following file:

- virtual ~**CertificateEncodingException** () throw ()

6.120.1 Constructor & Destructor Documentation

6.120.1.1 decaf::security::cert::CertificateEncodingException::CertificateEncodingException ()

Default Constructor.

6.120.1.2 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.120.1.3 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const CertificateEncodingException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.120.1.4 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.120.1.5 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.120.1.6 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.120.1.7 virtual decaf::security::cert::CertificateEncodingException::~CertificateEncodingException () throw () [virtual]

6.120.2 Member Function Documentation

6.120.2.1 virtual CertificateEncodingException* decaf::security::cert::CertificateEncodingException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::cert::CertificateException** (p. 904).

The documentation for this class was generated from the following file:

- **CertificateException** (const **CertificateException** &ex)

  Copy Constructor.

- **CertificateException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **CertificateException** (const std::exception *cause)

  Constructor.

- **CertificateException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occured.

- virtual **CertificateException** * **clone** () const

  Clones this exception.

- virtual ~**CertificateException** () throw ()

6.121.1 Constructor & Destructor Documentation

6.121.1.1 decaf::security::cert::CertificateException::CertificateException ()

Default Constructor.

6.121.1.2 decaf::security::cert::CertificateException::CertificateException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.121.1.3 decaf::security::cert::CertificateException::CertificateException (const CertificateException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.121.1.4 decaf::security::cert::CertificateException::CertificateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.121.1.5 decaf::security::cert::CertificateException::CertificateException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.121.1.6 decaf::security::cert::CertificateException::CertificateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.121.1.7 virtual decaf::security::cert::CertificateException::~CertificateException () throw () [virtual]

6.121.2 Member Function Documentation

6.121.2.1 virtual CertificateException* decaf::security::cert::CertificateException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1585).

Reimplemented in **decaf::security::cert::CertificateEncodingException** (p. 901), **decaf::security::cert::CertificateExpiredException** (p. 907), **decaf::security::cert::CertificateNotYetValidException** (p. 910), and **decaf::security::cert::CertificateParsingException** (p. 913).

The documentation for this class was generated from the following file:

- src/main/decaf/security/cert/**CertificateException.h**

6.122.1 Constructor & Destructor Documentation

6.122.1.1 decaf::security::cert::CertificateExpiredException::CertificateExpiredException ()

Default Constructor.

6.122.1.2 decaf::security::cert::CertificateExpiredException::CertificateExpiredException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.122.1.3 decaf::security::cert::CertificateExpiredException::CertificateExpiredException (const CertificateExpiredException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.122.1.4 decaf::security::cert::CertificateExpiredException::CertificateExpiredException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.122.1.5 decaf::security::cert::CertificateExpiredException::CertificateExpiredException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.122.1.6 decaf::security::cert::CertificateExpiredException::CertificateExpiredException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.122.1.7 virtual decaf::security::cert::CertificateExpiredException::~CertificateExpiredException () throw () [virtual]

6.122.2 Member Function Documentation

6.122.2.1 virtual CertificateExpiredException* decaf::security::cert::CertificateExpiredException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::cert::CertificateException** (p. 904).

6.124.1 Constructor & Destructor Documentation

6.124.1.1 decaf::security::cert::CertificateParsingException::CertificateParsingException ()

Default Constructor.

6.124.1.2 decaf::security::cert::CertificateParsingException::CertificateParsingException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.124.1.3 decaf::security::cert::CertificateParsingException::CertificateParsingException (const CertificateParsingException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.124.1.4 decaf::security::cert::CertificateParsingException::CertificateParsingException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.124.1.5 decaf::security::cert::CertificateParsingException::CertificateParsingException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.124.1.6 decaf::security::cert::CertificateParsingException::CertificateParsingException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.124.1.7 virtual decaf::security::cert::CertificateParsingException::~CertificateParsingException () throw () [virtual]

6.124.2 Member Function Documentation

6.124.2.1 virtual CertificateParsingException* decaf::security::cert::CertificateParsingException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::cert::CertificateException** (p. 904).

The documentation for this class was generated from the following file:

- src/main/decaf/security/cert/**CertificateParsingException.h**

6.125 decaf::lang::Character Class Reference

`#include <src/main/decaf/lang/Character.h>`Inheritance diagram for decaf::lang::Character:

Public Member Functions

- **Character** (char value)
- virtual int **compareTo** (const **Character** &c) const

  *Compares this **Character** (p. 914) instance with another.*

- virtual bool **operator==** (const **Character** &c) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Character** &c) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const char &c) const

  *Compares this **Character** (p. 914) instance with a char type.*

- virtual bool **operator==** (const char &c) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const char &c) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- bool **equals** (const **Character** &c) const
- bool **equals** (const char &c) const
- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

Static Public Member Functions

- static **Character valueOf** (char value)

  *Returns a **Character** (p. 914) instance representing the specified char value.*

- static bool **isWhitespace** (char c)

  Indicates whether or not the given character is considered whitespace.

- static bool **isDigit** (char c)

  Indicates whether or not the given character is a digit.

- static bool **isLowerCase** (char c)

  Indicates whether or not the given character is a lower case character.

- static bool **isUpperCase** (char c)

  Indicates whether or not the given character is a upper case character.

- static bool **isLetter** (char c)

  Indicates whether or not the given character is a letter.

- static bool **isLetterOrDigit** (char c)

  Indicates whether or not the given character is either a letter or a digit.

- static bool **isISOControl** (char c)

  Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.

- static int **digit** (char c, int radix)

  Returns the numeric value of the character ch in the specified radix.

- static char **toLowerCase** (char value)

  Returns the lower case equivalent for the specified character if the character is an upper case letter.

- static char **toUpperCase** (char value)

  Returns the upper case equivalent for the specified character if the character is a lower case letter.

Static Public Attributes

- static const int **MIN_RADIX** = 2

  The minimum radix available for conversion to and from strings.

- static const int **MAX_RADIX** = 36

  The maximum radix available for conversion to and from strings.

- static const char **MIN_VALUE** = (char)0x7F

  The minimum value that a signed char can take on.

- static const char **MAX_VALUE** = (char)0x80

The maximum value that a signed char can take on.

- static const int **SIZE** = 8

  The size of the primitive charactor in bits.

6.125.1 Constructor & Destructor Documentation

6.125.1.1 decaf::lang::Character::Character (char *value*)

Parameters:

value - char to wrap.

6.125.2 Member Function Documentation

6.125.2.1 virtual unsigned char decaf::lang::Character::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2269).

6.125.2.2 virtual int decaf::lang::Character::compareTo (const char & *c*) const [inline, virtual]

Compares this **Character** (p. 914) instance with a char type.

Parameters:

c - the char instance to be compared

Returns:

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< char >** (p. 1037).

6.125.2.3 virtual int decaf::lang::Character::compareTo (const Character & *c*) const [inline, virtual]

Compares this **Character** (p. 914) instance with another.

Parameters:

c - the **Character** (p. 914) instance to be compared

Returns:

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

6.125.2.4 static int decaf::lang::Character::digit (char *c*, int *radix*) [static]

Returns the numeric value of the character ch in the specified radix. If the radix is not in the range MIN_RADIX <= radix <= MAX_RADIX or if the value of ch is not a valid digit in the specified radix, -1 is returned. A character is a valid digit if at least one of the following is true:

* The method isDigit is true of the character and the single-character decomposition is less than the specified radix. In this case the decimal digit value is returned. * The character is one of the uppercase Latin letters 'A' through 'Z' and its **code** (p. 1005) is less than radix + 'A' - 10. In this case, ch - 'A' + 10 is returned. * The character is one of the lowercase Latin letters 'a' through 'z' and its **code** (p. 1005) is less than radix + 'a' - 10. In this case, ch - 'a' + 10 is returned.

Parameters:

c - the char to be converted

radix - the radix of the number

Returns:

the numeric value of the number represented in the given radix

6.125.2.5 virtual double decaf::lang::Character::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.125.2.6 bool decaf::lang::Character::equals (const char & *c*) const [inline, virtual]

Returns:

true if the two Characters have the same value.

Implements **decaf::lang::Comparable< char >** (p. 1038).

6.125.2.7 bool decaf::lang::Character::equals (const Character & *c*) const [inline]

Returns:

true if the two **Character** (p. 914) Objects have the same value.

6.125.2.8 virtual float decaf::lang::Character::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.125.2.9 virtual int decaf::lang::Character::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.125.2.10 static bool decaf::lang::Character::isDigit (char *c*) [inline, static]

Indicates whether or not the given character is a digit.

6.125.2.11 static bool decaf::lang::Character::isISOControl (char *c*) [inline, static]

Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.

Parameters:

c - the character, including supplementary characters

Returns:

true if the char is an ISO control character

6.125.2.12 static bool decaf::lang::Character::isLetter (char *c*) [inline, static]

Indicates whether or not the given character is a letter.

6.125.2.13 static bool decaf::lang::Character::isLetterOrDigit (char *c*) [inline, static]

Indicates whether or not the given character is either a letter or a digit.

6.125.2.14 static bool decaf::lang::Character::isLowerCase (char *c*) [inline, static]

Indicates whether or not the given character is a lower case character.

6.125.2.15 static bool decaf::lang::Character::isUpperCase (char *c*) [inline, static]

Indicates whether or not the given character is a upper case character.

6.125.2.16 static bool decaf::lang::Character::isWhitespace (char *c*) [inline, static]

Indicates whether or not the given character is considered whitespace.

6.125.2.17 virtual long long decaf::lang::Character::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.125.2.18 virtual bool decaf::lang::Character::operator< (const char & *c*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< char >** (p. 1038).

6.125.2.19 virtual bool decaf::lang::Character::operator< (const Character & *c*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.125.2.20 virtual bool decaf::lang::Character::operator== (const char & *c*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< char >** (p. 1038).

6.125.2.21 virtual bool decaf::lang::Character::operator== (const Character & *c*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.125.2.22 virtual short decaf::lang::Character::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2271).

6.125.2.23 static char decaf::lang::Character::toLowerCase (char *value*) [inline, static]

Returns the lower case equivalent for the specified character if the character is an upper case letter. Otherwise, the specified character is returned unchanged.

Parameters:

value the character to convert if needed.

Returns:

if value is an upper case character then its lower case counterpart, otherwise just returns value unchanged.

6.125.2.24 std::string decaf::lang::Character::toString () const

Returns:

this **Character** (p. 914) Object as a **String** (p. 2935) Representation

6.125.2.25 static char decaf::lang::Character::toUpperCase (char *value*) [inline, static]

Returns the upper case equivalent for the specified character if the character is a lower case letter. Otherwise, the specified character is returned unchanged.

Parameters:

value the character to convert to upper case if needed.

Returns:

if value is a lower case character then its upper case counterpart, otherwise just returns value unchanged.

6.125.2.26 static Character decaf::lang::Character::valueOf (char *value*) [inline, static]

Returns a **Character** (p. 914) instance representing the specified char value.

Parameters:

value - the primitive char to wrap.

Returns:

a new Charactor instance that wraps this value.

6.125.3 Field Documentation

6.125.3.1 const int decaf::lang::Character::MAX_RADIX = 36 [static]

The maximum radix available for conversion to and from strings.

6.125.3.2 const char decaf::lang::Character::MAX_VALUE = (char)0x80 [static]

The maximum value that a signed char can take on.

6.125.3.3 const int decaf::lang::Character::MIN_RADIX = 2 [static]

The minimum radix available for conversion to and from strings.

6.125.3.4 const char decaf::lang::Character::MIN_VALUE = (char)0x7F [static]

The minimum value that a signed char can take on.

6.125.3.5 const int decaf::lang::Character::SIZE = 8 [static]

The size of the primitive charactor in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Character.h**

6.126 decaf::internal::nio::CharArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/CharArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::CharArrayBuffer:

Public Member Functions

- **CharArrayBuffer** (int size, bool **readOnly**=false)

  *Creates a **CharArrayBuffer** (p. 923) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **CharArrayBuffer** (char *array, int size, int **offset**, int **length**, bool **readOnly**=false)

  *Creates a **CharArrayBuffer** (p. 923) object that wraps the given array.*

- **CharArrayBuffer** (const **decaf::lang::Pointer< ByteArrayAdapter >** &array, int **offset**, int **length**, bool **readOnly**=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **CharArrayBuffer** (const **CharArrayBuffer** &other)

  *Create a **CharArrayBuffer** (p. 923) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**CharArrayBuffer** ()
- virtual char * **array** ()

  Returns the character array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  *the array that backs this **Buffer** (p. 735).*

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  The offset into the backing array where index zero starts.

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual CharBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only char buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
Returns:

The new, read-only char buffer which the caller then owns.

- virtual CharBuffer & **compact** ()

Compacts this buffer.
*The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.
Returns:

*a reference to this **CharBuffer** (p. 934).*
Exceptions:

***ReadOnlyBufferException** (p. 2535) - If this buffer is read-only*

- virtual CharBuffer * **duplicate** ()

Creates a new char buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
The new buffer will be read-only if, and only if, this buffer is read-only.
Returns:

*a new char **Buffer** (p. 735) which the caller owns.*

- virtual char **get** ()

Relative get method.
Reads the character at this buffer's current position, and then increments the position.
Returns:

the char at the current position.
Exceptions:

***BufferUnderflowException** (p. 763) if there no more data to return*

- virtual char **get** (int index) const

Absolute get method.
Reads the char at the given index.
Parameters:

***index** The index in the **Buffer** (p. 735) where the char is to be read.*
Returns:

the char that is located at the given index.

Exceptions:

IndexOutOfBoundsException *if index is not smaller than the buffer's limit or is negative.*

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible char array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.
  Returns:

  true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.
  Returns:

  true if, and only if, this buffer is read-only.

- virtual CharBuffer & **put** (char value)

  Writes the given char into this buffer at the current position, and then increments the position.
  Parameters:

  value *The char value to be written.*
  Returns:

  a reference to this buffer.
  Exceptions:

  BufferOverflowException *(p. 760) if this buffer's current position is not smaller than its limit*
  ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual CharBuffer & **put** (int index, char value)

  Writes the given char into this buffer at the given index.
  Parameters:

  index *The position in the* ***Buffer*** *(p. 735) to write the data.*
  value *The char to write.*
  Returns:

  a reference to this buffer.
  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
  ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual CharBuffer * **slice** () const

  Creates a new ***CharBuffer*** *(p. 934) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the newly create ***CharBuffer*** *(p. 934) which the caller owns.*

- virtual **lang::CharSequence** * **subSequence** (int start, int end) const

  Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.
  The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be ***position()*** *(p. 739) + start, and its limit will be* ***position()*** *(p. 739) + end. The new* ***Buffer*** *(p. 735) will be read-only if, and only if, this buffer is read-only.*

  Parameters:

  start *The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than* ***remaining()*** *(p. 740).*

  end *The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than* ***remaining()*** *(p. 740).*

  Returns:

  The new character buffer, caller owns.

  Exceptions:

  IndexOutOfBoundsException *if the preconditions on start and end fail.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  Sets this ***CharArrayBuffer*** *(p. 923) as Read-Only.*

Protected Attributes

- **decaf::lang::Pointer< ByteArrayAdapter > _array**
- int **offset**
- int **length**
- bool **readOnly**

6.126.1 Constructor & Destructor Documentation

6.126.1.1 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **CharArrayBuffer** (p. 923) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

IllegalArguementException if the capacity value is negative.

6.126.1.2 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (char * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **CharArrayBuffer** (p. 923) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.126.1.3 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset. The capacity and limit of the new **CharArrayBuffer** (p. 923) will be that of the remaining capacity of the passed buffer.

Parameters:

array The ByteArrayAdapter to wrap.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if array is NULL

IndexOutOfBoundsException if offset + length is greater than array size.

6.126.1.4 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const CharArrayBuffer & *other*)

Create a **CharArrayBuffer** (p. 923) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters:

other The **CharArrayBuffer** (p. 923) this one is to mirror.

6.126.1.5 virtual decaf::internal::nio::CharArrayBuffer::~CharArrayBuffer () [virtual]

6.126.2 Member Function Documentation

6.126.2.1 virtual char* decaf::internal::nio::CharArrayBuffer::array () [virtual]

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 938).

6.126.2.2 virtual int decaf::internal::nio::CharArrayBuffer::arrayOffset () [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 939).

6.126.2.3 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow

the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only char buffer which the caller then owns.

Implements **decaf::nio::CharBuffer** (p. 939).

6.126.2.4 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::compact () [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **CharBuffer** (p. 934).

Exceptions:

ReadOnlyBufferException *(p. 2535)* - If this buffer is read-only

Implements **decaf::nio::CharBuffer** (p. 940).

6.126.2.5 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::duplicate () [virtual]

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new char **Buffer** (p. 735) which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 940).

6.126.2.6 virtual char decaf::internal::nio::CharArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the char at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the char is to be read.

Returns:

the char that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit or is negative.

Implements **decaf::nio::CharBuffer** (p. 941).

6.126.2.7 virtual char decaf::internal::nio::CharArrayBuffer::get () [virtual]

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns:

the char at the current position.

Exceptions:

BufferUnderflowException *(p. 763)* if there no more data to return

Implements **decaf::nio::CharBuffer** (p. 942).

6.126.2.8 virtual bool decaf::internal::nio::CharArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::CharBuffer** (p. 942).

6.126.2.9 virtual bool decaf::internal::nio::CharArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 738).

6.126.2.10 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (int *index*, char *value*) [virtual]

Writes the given char into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The char to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException (p. *2535*) if this buffer is read-only.

Implements **decaf::nio::CharBuffer** (p. 943).

6.126.2.11 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (char *value*) [virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters:

value The char value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException (p. *760*) if this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. *2535*) if this buffer is read-only.

Implements **decaf::nio::CharBuffer** (p. 944).

6.126.2.12 virtual void decaf::internal::nio::CharArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **CharArrayBuffer** (p. 923) as Read-Only.

Parameters:

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.126.2.13 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::slice () const [virtual]

Creates a new **CharBuffer** (p. 934) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **CharBuffer** (p. 934) which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 946).

6.126.2.14 virtual lang::CharSequence* decaf::internal::nio::CharArrayBuffer::subSequence (int *start*, int *end*) const [virtual]

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 739) + start, and its limit will be **position()** (p. 739) + end. The new **Buffer** (p. 735) will be read-only if, and only if, this buffer is read-only.

Parameters:

start The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 740).

end The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 740).

Returns:

The new character buffer, caller owns.

Exceptions:

IndexOutOfBoundsException if the preconditions on start and end fail.

Implements **decaf::nio::CharBuffer** (p. 946).

6.126.3 Field Documentation

6.127 decaf::nio::CharBuffer Class Reference

This class defines four categories of operations upon character buffers:.

`#include <src/main/decaf/nio/CharBuffer.h>`Inheritance diagram for decaf::nio::CharBuffer:

Public Member Functions

- virtual ~**CharBuffer** ()
- virtual std::string **toString** () const
- **CharBuffer** & **append** (char value)

  Appends the specified character to this buffer.

- **CharBuffer** & **append** (const **lang::CharSequence** *value)

  Appends the specified character sequence to this buffer.

- **CharBuffer** & **append** (const **lang::CharSequence** *value, int start, int end)

  Appends a subsequence of the specified character sequence to this buffer If value is Null the the string "null" is appended to the buffer.

- virtual char * **array** ()=0

  Returns the character array that backs this buffer (optional operation).

- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **CharBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only char buffer that shares this buffer's content.

- char **charAt** (int index) const

  Reads the character at the given index relative to the current position.

- virtual **CharBuffer** & **compact** ()=0

  Compacts this buffer.

- virtual **CharBuffer** * **duplicate** ()=0

  Creates a new char buffer that shares this buffer's content.

- virtual char **get** ()=0

  Relative get method.

- virtual char **get** (int index) const =0

  Absolute get method.

- **CharBuffer** & **get** (std::vector< char > buffer)

  Relative bulk get method.

- **CharBuffer** & **get** (char *buffer, int size, int offset, int length)

  Relative bulk get method.

- virtual bool **hasArray** () const =0

  Tells whether or not this buffer is backed by an accessible char array.

- int **length** () const

  Returns the length of this character buffer.

- **CharBuffer** & **put** (**CharBuffer** &src)

  This method transfers the chars remaining in the given source buffer into this buffer.

- **CharBuffer** & **put** (const char *buffer, int size, int offset, int length)

  This method transfers chars into this buffer from the given source array.

- **CharBuffer** & **put** (std::vector< char > &buffer)

  This method transfers the entire content of the given source char array into this buffer.

- virtual **CharBuffer** & **put** (char value)=0

  Writes the given char into this buffer at the current position, and then increments the position.

- virtual **CharBuffer** & **put** (int index, char value)=0

  Writes the given char into this buffer at the given index.

- **CharBuffer** & **put** (std::string &src, int start, int end)

  Relative bulk put method (optional operation).

- **CharBuffer** & **put** (const std::string &src)

  Relative bulk put method (optional operation).

- virtual int **read** (**CharBuffer** *target)

  Attempts to read characters into the specified character buffer.

- virtual **lang::CharSequence** * **subSequence** (int start, int end) const =0

  Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

- virtual **CharBuffer** * **slice** () const =0

  *Creates a new **CharBuffer** (p. 934) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **CharBuffer** &value) const

- virtual bool **equals** (const **CharBuffer** &value) const

- virtual bool **operator==** (const **CharBuffer** &value) const

- virtual bool **operator<** (const **CharBuffer** &value) const

Static Public Member Functions

- static **CharBuffer** * **allocate** (int capacity)

  Allocates a new character buffer.

- static **CharBuffer** * **wrap** (char *array, int size, int offset, int length)

  *Wraps the passed buffer with a new **CharBuffer** (p. 934).*

- static **CharBuffer** * **wrap** (std::vector< char > &buffer)

  *Wraps the passed STL char Vector in a **CharBuffer** (p. 934).*

Protected Member Functions

- **CharBuffer** (int capacity)

  *Creates a **CharBuffer** (p. 934) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.127.1 Detailed Description

This class defines four categories of operations upon character buffers:. o Absolute and relative get and put methods that read and write single characters; o Relative bulk get methods that transfer contiguous sequences of characters from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of characters from a character array, a string, or some other character buffer into this buffer. o Methods for compacting, duplicating, and slicing a character buffer.

Character buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing character array or string into a buffer, or by creating a view of an existing byte buffer

This class implements the CharSequence interface so that character buffers may be used wherever character sequences are accepted, for example in the regular-expression package decaf.util.regex.

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained. The sequence of statements

cb.put("text/"); cb.put(subtype); cb.put("; charset="); cb.put(enc);

can, for example, be replaced by the single statement

cb.put("text/").put(subtype).put("; charset=").put(enc);

6.127.2 Constructor & Destructor Documentation

6.127.2.1 decaf::nio::CharBuffer::CharBuffer (int *capacity*) [protected]

Creates a **CharBuffer** (p. 934) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity The size of the array, this is the limit we read and write to.

Exceptions:

IllegalArguementException if capacity is negative.

6.127.2.2 virtual decaf::nio::CharBuffer::~CharBuffer () [inline, virtual]

6.127.3 Member Function Documentation

6.127.3.1 static CharBuffer* decaf::nio::CharBuffer::allocate (int *capacity*) [static]

Allocates a new character buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity The size of the Char buffer in chars (1 byte).

Returns:

the **CharBuffer** (p. 934) that was allocated, caller owns.

Exceptions:

IndexOutOfBoundsException if capacity is negative.

6.127.3.2 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * *value*, int *start*, int *end*) [virtual]

Appends a subsequence of the specified character sequence to this buffer If value is Null the the string "null" is appended to the buffer.

Parameters:

value The CharSequence to append.

start The index to start appending from.

end The index to append to.

Returns:

a reference to this modified **CharBuffer** (p. 934).

Exceptions:

BufferOverflowException *(p. 760)* if there is no more space
ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.
IndexOutOfBoundsException if start > end, or > length of sequence.

Implements **decaf::lang::Appendable** (p. 580).

6.127.3.3 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * *value*) [virtual]

Appends the specified character sequence to this buffer. If value is Null the the string "null" is appended to the buffer.

Parameters:

value The CharSequence to append.

Returns:

a reference to this modified **CharBuffer** (p. 934)

Exceptions:

BufferOverflowException *(p. 760)* if there is no more space
ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

Implements **decaf::lang::Appendable** (p. 581).

6.127.3.4 CharBuffer& decaf::nio::CharBuffer::append (char *value*) [virtual]

Appends the specified character to this buffer.

Parameters:

value The char to append.

Returns:

a reference to this modified **CharBuffer** (p. 934).

Exceptions:

BufferOverflowException *(p. 760)* if there is no more space
ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

Implements **decaf::lang::Appendable** (p. 581).

6.127.3.5 virtual char* decaf::nio::CharBuffer::array () [pure virtual]

Returns the character array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 928).

6.127.3.6 virtual int decaf::nio::CharBuffer::arrayOffset () [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 928).

6.127.3.7 virtual CharBuffer* decaf::nio::CharBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only char buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only char buffer which the caller then owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 928).

6.127.3.8 char decaf::nio::CharBuffer::charAt (int *index*) const [virtual]

Reads the character at the given index relative to the current position.

Parameters:

index - The index of the character to be read relative to position

Returns:

The character at index **position()** (p. 739) + index.

Exceptions:

IndexOutOfBoundsException if the index + the current position exceeds the size of the buffer or the index is negative.

Implements **decaf::lang::CharSequence** (p. 949).

6.127.3.9 virtual CharBuffer& decaf::nio::CharBuffer::compact () [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **CharBuffer** (p. 934).

Exceptions:

ReadOnlyBufferException *(p. 2535)* - If this buffer is read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 929).

6.127.3.10 virtual int decaf::nio::CharBuffer::compareTo (const CharBuffer & *value*) const [virtual]

6.127.3.11 virtual CharBuffer* decaf::nio::CharBuffer::duplicate () [pure virtual]

Creates a new char buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new char **Buffer** (p. 735) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 929).

6.127.3.12 virtual bool decaf::nio::CharBuffer::equals (const CharBuffer & *value*) const [virtual]

6.127.3.13 CharBuffer& decaf::nio::CharBuffer::get (char * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method. This method transfers chars from this buffer into the given destination array. If there are fewer chars remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 740), then no bytes are transferred and a **BufferUnderflowException** (p. 763) is thrown.

Otherwise, this method copies length chars from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer The pointer to an allocated buffer to fill.

size The size of the buffer passed.

offset The position in the buffer to start filling.

length The amount of data to put in the passed buffer.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are fewer than length chars remaining in this buffer

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.127.3.14 CharBuffer& decaf::nio::CharBuffer::get (std::vector< char > *buffer*)

Relative bulk get method. This method transfers chars from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **CharBuffer** (p. 934).

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are fewer than length chars remaining in this buffer.

6.127.3.15 virtual char decaf::nio::CharBuffer::get (int *index*) const [pure virtual]

Absolute get method. Reads the char at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the char is to be read.

Returns:

the char that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit or is negative.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 930).

6.127.3.16 virtual char decaf::nio::CharBuffer::get () [pure virtual]

Relative get method. Reads the character at this buffer's current position, and then increments the position.

Returns:

the char at the current position.

Exceptions:

BufferUnderflowException *(p. 763)* if there no more data to return

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 930).

6.127.3.17 virtual bool decaf::nio::CharBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible char array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 930).

6.127.3.18 int decaf::nio::CharBuffer::length () const [inline, virtual]

Returns the length of this character buffer.

Returns:

the length of this buffer from the position to the limit.

Implements **decaf::lang::CharSequence** (p. 950).

6.127.3.19 virtual bool decaf::nio::CharBuffer::operator< (const CharBuffer & *value*) const [virtual]

6.127.3.20 virtual bool decaf::nio::CharBuffer::operator== (const CharBuffer & *value*) const [virtual]

6.127.3.21 CharBuffer& decaf::nio::CharBuffer::put (const std::string & *src*)

Relative bulk put method (optional operation). This method transfers the entire content of the given source string into this buffer. An invocation of this method of the form dst.put(s) behaves in exactly the same way as the invocation.

Parameters:

src The string to copy from.

Returns:

a reference to this **CharBuffer** (p. 934).

Exceptions:

BufferOverflowException *(p. 760)* if this buffer's current position is not.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

6.127.3.22 CharBuffer& decaf::nio::CharBuffer::put (std::string & *src*, int *start*, int *end*)

Relative bulk put method (optional operation). This method transfers characters from the given string into this buffer. If there are more characters to be copied from the string than remain in this buffer, that is, if end - start > **remaining()** (p. 740), then no characters are transferred and a **BufferOverflowException** (p. 760) is thrown.

Returns:

a reference to this buffer

Otherwise, this method copies n = end - start characters from the given string into this buffer, starting at the given start index and at the current position of this buffer. The position of this buffer is then incremented by n.

Parameters:

src The string to copy from.

start The position in src to start from.

end The position in src to stop at.

Returns:

a reference to this **CharBuffer** (p. 934).

Exceptions:

BufferOverflowException *(p. 760)* if this buffer's current position is not

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

6.127.3.23 virtual CharBuffer& decaf::nio::CharBuffer::put (int *index*, char *value*) [pure virtual]

Writes the given char into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The char to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 931).

6.127.3.24 virtual CharBuffer& decaf::nio::CharBuffer::put (char *value*) [pure virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters:

value The char value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 931).

6.127.3.25 CharBuffer& decaf::nio::CharBuffer::put (std::vector< char > & *buffer*)

This method transfers the entire content of the given source char array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters:

buffer The buffer whose contents are copied to this **CharBuffer** (p. 934).

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

6.127.3.26 CharBuffer& decaf::nio::CharBuffer::put (const char * *buffer*, int *size*, int *offset*, int *length*)

This method transfers chars into this buffer from the given source array. If there are more chars to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 740), then no chars are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer The array from which chars are to be read.

size The size of the buffer passed.

offset The offset within the array of the first char to be read.

length The number of chars to be read from the given array.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.127.3.27 CharBuffer& decaf::nio::CharBuffer::put (CharBuffer & *src*)

This method transfers the chars remaining in the given source buffer into this buffer. If there are more chars remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 740), then no chars are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies n = src.remaining() chars from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src - the buffer to take chars from an place in this one.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer for the remaining chars in the source buffer.

IllegalArgumentException if the source buffer is this buffer.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

6.127.3.28 virtual int decaf::nio::CharBuffer::read (CharBuffer * *target*) [virtual]

Attempts to read characters into the specified character buffer. The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters:

target The buffer to read characters into

Returns:

The number of characters added to the buffer, or string::npos if this source of characters is at its end

Exceptions:

NullPointerException if target is Null.

IllegalArgumentException if target is this **CharBuffer** (p. 934).

ReadOnlyBufferException *(p. 2535)* if this buffer is in read-only mode.

6.127.3.29 virtual CharBuffer* decaf::nio::CharBuffer::slice () const [pure virtual]

Creates a new **CharBuffer** (p. 934) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **CharBuffer** (p. 934) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 932).

6.127.3.30 virtual lang::CharSequence* decaf::nio::CharBuffer::subSequence (int *start*, int *end*) const [pure virtual]

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position. The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 739) + start, and its limit will be **position()** (p. 739) + end. The new **Buffer** (p. 735) will be read-only if, and only if, this buffer is read-only.

Parameters:

start The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 740).

end The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 740).

Returns:

The new character buffer, caller owns.

Exceptions:

IndexOutOfBoundsException if the preconditions on start and end fail.

Implements **decaf::lang::CharSequence** (p. 950).

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 932).

6.127.3.31 virtual std::string decaf::nio::CharBuffer::toString () const [virtual]

Returns:

a std::string describing this object

Implements **decaf::lang::CharSequence** (p. 950).

6.127.3.32 static CharBuffer* decaf::nio::CharBuffer::wrap (std::vector< char > & *buffer*) [static]

Wraps the passed STL char Vector in a **CharBuffer** (p. 934). The new buffer will be backed by the given char array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **CharBuffer** (p. 934) that is backed by buffer, caller owns.

6.127.3.33 static CharBuffer* decaf::nio::CharBuffer::wrap (char * *array*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new **CharBuffer** (p. 934). The new buffer will be backed by the given char array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array The array that will back the new buffer.

size The size of the array passed in.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new **CharBuffer** (p. 934) that is backed by buffer, caller owns.

Exceptions:

NullPointerException if the array pointer is Null.

IndexOutOfBoundsException if capacity is negative.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**CharBuffer.h**

6.128 decaf::lang::CharSequence Class Reference

A **CharSequence** (p. 949) is a readable sequence of char values.

`#include <src/main/decaf/lang/CharSequence.h>`Inheritance diagram for decaf::lang::CharSequence:

Public Member Functions

- virtual ~**CharSequence** ()
- virtual int **length** () const =0
- virtual char **charAt** (int index) const =0

  Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

- virtual **CharSequence** * **subSequence** (int start, int end) const =0

  *Returns a new **CharSequence** (p. 949) that is a subsequence of this sequence.*

- virtual std::string **toString** () const =0

6.128.1 Detailed Description

A **CharSequence** (p. 949) is a readable sequence of char values. This interface provides uniform, read-only access to many different kinds of char sequences.

This interface does not define that a **CharSequence** (p. 949) should implement comparable, it is therefore up to the dervied classes that implement this interface to define equality, which implies that comparison of two CharSequences does not have a contract on equality.

6.128.2 Constructor & Destructor Documentation

6.128.2.1 virtual decaf::lang::CharSequence::~CharSequence () [virtual]

6.128.3 Member Function Documentation

6.128.3.1 virtual char decaf::lang::CharSequence::charAt (int *index*) const [pure virtual]

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters:

index The position to return the char at.

Returns:

the char at the given position.

Exceptions:

IndexOutOfBoundsException if index is > than **length()** (p. 950) or negative

Implemented in **decaf::lang::String** (p. 2938), and **decaf::nio::CharBuffer** (p. 939).

6.128.3.2 virtual int decaf::lang::CharSequence::length () const [pure virtual]

Returns:

the length of the underlying character sequence.

Implemented in **decaf::lang::String** (p. 2938), and **decaf::nio::CharBuffer** (p. 942).

6.128.3.3 virtual CharSequence* decaf::lang::CharSequence::subSequence (int *start*, int *end*) const [pure virtual]

Returns a new **CharSequence** (p. 949) that is a subsequence of this sequence. The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters:

start The start index, inclusive.

end The end index, exclusive.

Returns:

a new **CharSequence** (p. 949)

Exceptions:

IndexOutOfBoundsException if start or end > **length()** (p. 950) or start or end are negative.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 932), **decaf::lang::String** (p. 2938), and **decaf::nio::CharBuffer** (p. 946).

6.128.3.4 virtual std::string decaf::lang::CharSequence::toString () const [pure virtual]

Returns:

the string representation of this **CharSequence** (p. 949)

Implemented in **decaf::lang::String** (p. 2939), and **decaf::nio::CharBuffer** (p. 947).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**CharSequence.h**

6.129 decaf::util::zip::CheckedInputStream Class Reference

An implementation of a FilterInputStream that will maintain a **Checksum** (p. 956) of the bytes read, the **Checksum** (p. 956) can then be used to verify the integrity of the input stream.

`#include <src/main/decaf/util/zip/CheckedInputStream.h>`Inheritance diagram for decaf::util::zip::CheckedInputStream:

Public Member Functions

- **CheckedInputStream** (InputStream *__inputStream__, **Checksum** *sum, bool **own**=false)

  *Create a new instance of a **CheckedInputStream** (p. 951).*

- virtual ~**CheckedInputStream** ()
- **Checksum** * **getChecksum** () const

  *Returns a Pointer to the **Checksum** (p. 956) that is in use by this **CheckedInputStream** (p. 951).*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  *The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*
  Parameters:

  num *The number of bytes to skip.*
  Returns:

  total bytes skipped
  Exceptions:

  ***IOException** (p. **1787**) if an I/O error occurs.*
  ***UnsupportedOperationException** if the concrete stream class does not support skipping bytes.*

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.129.1 Detailed Description

An implementation of a FilterInputStream that will maintain a **Checksum** (p. 956) of the bytes read, the **Checksum** (p. 956) can then be used to verify the integrity of the input stream.

Since:

1.0

6.129.2 Constructor & Destructor Documentation

6.129.2.1 decaf::util::zip::CheckedInputStream::CheckedInputStream (InputStream * *inputStream*, Checksum * *sum*, bool *own* = false)

Create a new instance of a **CheckedInputStream** (p. 951).

Parameters:

inputStream The InputStream instance to Wrap.

sum The **Checksum** (p. 956) instance to use (does not take ownership of the Pointer).

own Indicates if this filer should take ownership of the InputStream.

Exceptions:

NullPointerException if the **Checksum** (p. 956) pointer is NULL.

6.129.2.2 virtual decaf::util::zip::CheckedInputStream::~CheckedInputStream () [virtual]

6.129.3 Member Function Documentation

6.129.3.1 virtual int decaf::util::zip::CheckedInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.129.3.2 virtual int decaf::util::zip::CheckedInputStream::doReadByte () [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.129.3.3 Checksum* decaf::util::zip::CheckedInputStream::getChecksum () const [inline]

Returns a Pointer to the **Checksum** (p. 956) that is in use by this **CheckedInputStream** (p. 951).

Returns:

the pointer to the **Checksum** (p. 956) instance that is in use by this object.

6.129.3.4 virtual long long decaf::util::zip::CheckedInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Adds the skipped bytes into the **Checksum** (p. 956).

Reimplemented from **decaf::io::FilterInputStream** (p. 1526).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**CheckedInputStream.h**

6.130 decaf::util::zip::CheckedOutputStream Class Reference

An implementation of a FilterOutputStream that will maintain a **Checksum** (p. 956) of the bytes written, the **Checksum** (p. 956) can then be used to verify the integrity of the output stream.

`#include <src/main/decaf/util/zip/CheckedOutputStream.h>`Inheritance diagram for decaf::util::zip::CheckedOutputStream:

Public Member Functions

- **CheckedOutputStream** (**decaf::io::OutputStream** *outputStream, **Checksum** *sum, bool **own**=false)

  *Create a new instance of a **CheckedOutputStream** (p. 954).*

- virtual ~**CheckedOutputStream** ()
- **Checksum** * **getChecksum** () const

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.130.1 Detailed Description

An implementation of a FilterOutputStream that will maintain a **Checksum** (p. 956) of the bytes written, the **Checksum** (p. 956) can then be used to verify the integrity of the output stream.

Since:

1.0

6.130.2 Constructor & Destructor Documentation

6.130.2.1 decaf::util::zip::CheckedOutputStream::CheckedOutputStream (decaf::io::OutputStream * *outputStream*, Checksum * *sum*, bool *own* = false)

Create a new instance of a **CheckedOutputStream** (p. 954).

Parameters:

outputStream The OutputStream instance to Wrap.

sum The **Checksum** (p. 956) instance to use (does not take ownership of the Pointer).

own Indicates if this filer should take ownership of the InputStream.

Exceptions:

NullPointerException if the **Checksum** (p. 956) pointer is NULL.

6.130.2.2 virtual decaf::util::zip::CheckedOutputStream::~CheckedOutputStream () [virtual]

6.130.3 Member Function Documentation

6.130.3.1 virtual void decaf::util::zip::CheckedOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

6.130.3.2 virtual void decaf::util::zip::CheckedOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

6.130.3.3 Checksum* decaf::util::zip::CheckedOutputStream::getChecksum () const [inline]

Returns:

a pointer to the **Checksum** (p. 956) instance in use by this object.

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**CheckedOutputStream.h**

6.131 decaf::util::zip::Checksum Class Reference

An interface used to represent **Checksum** (p. 956) values in the Zip package.

`#include <src/main/decaf/util/zip/Checksum.h>`Inheritance diagram for decaf::util::zip::Checksum:

Public Member Functions

- virtual ~**Checksum** ()
- virtual long long **getValue** () const =0
- virtual void **reset** ()=0

  Reset the checksum to its initial value.

- virtual void **update** (const std::vector< unsigned char > &buffer)=0

  Updates the current checksum with the specified vector of bytes.

- virtual void **update** (const std::vector< unsigned char > &buffer, int offset, int length)=0

  Updates the current checksum with the specified array of bytes.

- virtual void **update** (const unsigned char *buffer, int size, int offset, int length)=0

  Updates the current checksum with the specified array of bytes.

- virtual void **update** (int byte)=0

  Updates the current checksum with the specified byte value.

6.131.1 Detailed Description

An interface used to represent **Checksum** (p. 956) values in the Zip package.

Since:

1.0

6.131.2 Constructor & Destructor Documentation

6.131.2.1 virtual decaf::util::zip::Checksum::~Checksum () [virtual]

6.131.3 Member Function Documentation

6.131.3.1 virtual long long decaf::util::zip::Checksum::getValue () const [pure virtual]

Returns:

the current checksum value.

Implemented in **decaf::util::zip::Adler32** (p. 553), and **decaf::util::zip::CRC32** (p. 1234).

6.131.3.2 virtual void decaf::util::zip::Checksum::reset () [pure virtual]

Reset the checksum to its initial value.

Implemented in **decaf::util::zip::Adler32** (p. 554), and **decaf::util::zip::CRC32** (p. 1235).

6.131.3.3 virtual void decaf::util::zip::Checksum::update (int *byte*) [pure virtual]

Updates the current checksum with the specified byte value.

Parameters:

byte The byte value to update the current **Checksum** (p. 956) with (0..255).

Implemented in **decaf::util::zip::Adler32** (p. 554), and **decaf::util::zip::CRC32** (p. 1235).

6.131.3.4 virtual void decaf::util::zip::Checksum::update (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [pure virtual]

Updates the current checksum with the specified array of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

size The size of the passed buffer.

offset The position in the buffer to start reading.

length The amount of data to read from the byte buffer.

Exceptions:

NullPointerException if the passed buffer is NULL.

IndexOutOfBoundsException if offset + length > size of the buffer.

Implemented in **decaf::util::zip::Adler32** (p. 554), and **decaf::util::zip::CRC32** (p. 1235).

6.131.3.5 virtual void decaf::util::zip::Checksum::update (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*) [pure virtual]

Updates the current checksum with the specified array of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

offset The position in the buffer to start reading.

length The amount of data to read from the byte buffer.

Exceptions:

IndexOutOfBoundsException if offset + length > size of the buffer.

Implemented in **decaf::util::zip::Adler32** (p. 554), and **decaf::util::zip::CRC32** (p. 1235).

6.131.3.6 virtual void decaf::util::zip::Checksum::update (const std::vector< unsigned char > & *buffer*) [pure virtual]

Updates the current checksum with the specified vector of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

Implemented in **decaf::util::zip::Adler32** (p. 555), and **decaf::util::zip::CRC32** (p. 1236).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**Checksum.h**

6.132 decaf::lang::exceptions::ClassCastException Class Reference

`#include <src/main/decaf/lang/exceptions/ClassCastException.h>`Inheritance diagram for decaf::lang::exceptions::ClassCastException:

Public Member Functions

- **ClassCastException** ()

  Default Constructor.

- **ClassCastException** (const **Exception** &ex)

  Conversion Constructor from some other ***Exception*** *(*p. *1458).*

- **ClassCastException** (const **ClassCastException** &ex)

  Copy Constructor.

- **ClassCastException** (const std::exception *cause)

  Constructor.

- **ClassCastException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **ClassCastException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **ClassCastException** * **clone** () const

  Clones this exception.

- virtual ~**ClassCastException** () throw ()

6.132.1 Constructor & Destructor Documentation

6.132.1.1 decaf::lang::exceptions::ClassCastException::ClassCastException ()

Default Constructor.

6.132.1.2 decaf::lang::exceptions::ClassCastException::ClassCastException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.132.1.3 decaf::lang::exceptions::ClassCastException::ClassCastException (const ClassCastException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.132.1.4 decaf::lang::exceptions::ClassCastException::ClassCastException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.132.1.5 decaf::lang::exceptions::ClassCastException::ClassCastException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.132.1.6 decaf::lang::exceptions::ClassCastException::ClassCastException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.132.1.7 virtual decaf::lang::exceptions::ClassCastException::~ClassCastException () throw () [virtual]

6.132.2 Member Function Documentation

6.132.2.1 virtual ClassCastException* decaf::lang::exceptions::ClassCastException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**ClassCastException.h**

6.133 decaf::lang::exceptions::CloneNotSupportedException Class Reference

`#include <src/main/decaf/lang/exceptions/CloneNotSupportedException.h>`Inheritance diagram for decaf::lang::exceptions::CloneNotSupportedException:

Public Member Functions

- **CloneNotSupportedException** ()
  Default Constructor.
- **CloneNotSupportedException** (const **Exception** &ex)
  Conversion Constructor from some other ***Exception*** *(p. 1458).*
- **CloneNotSupportedException** (const **CloneNotSupportedException** &ex)
  Copy Constructor.
- **CloneNotSupportedException** (const std::exception *cause)
  Constructor.
- **CloneNotSupportedException** (const char *file, const int lineNumber, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- **CloneNotSupportedException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **CloneNotSupportedException** * **clone** () const
  Clones this exception.
- virtual ~**CloneNotSupportedException** () throw ()

6.133.1 Constructor & Destructor Documentation

6.133.1.1 decaf::lang::exceptions::CloneNotSupportedException::CloneNotSupportedException ()

Default Constructor.

6.133.1.2 decaf::lang::exceptions::CloneNotSupportedException::CloneNotSupportedException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.133.1.3 decaf::lang::exceptions::CloneNotSupportedException::CloneNotSupportedException (const CloneNotSupportedException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.133.1.4 decaf::lang::exceptions::CloneNotSupportedException::CloneNotSupportedException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.133.1.5 decaf::lang::exceptions::CloneNotSupportedException::CloneNotSupportedException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.133.1.6 decaf::lang::exceptions::CloneNotSupportedException::CloneNotSupportedException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.133.1.7 virtual decaf::lang::exceptions::CloneNotSupportedException::~CloneNotSupportedException () throw () [virtual]

6.133.2 Member Function Documentation

6.133.2.1 virtual CloneNotSupportedException* decaf::lang::exceptions::CloneNotSupportedException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**CloneNotSupportedException.h**

6.134 cms::Closeable Class Reference

Interface for a class that implements the close method.

`#include <src/main/cms/Closeable.h>`Inheritance diagram for cms::Closeable:

Public Member Functions

- virtual ~**Closeable** ()
- virtual void **close** ()=0

  Closes this object and deallocates the appropriate resources.

6.134.1 Detailed Description

Interface for a class that implements the close method. A class that implements this interface should release all resources upon the close call and should throw an exception from any methods that require those resources after they have been closed.

Since:

1.0

6.134.2 Constructor & Destructor Documentation

6.134.2.1 virtual cms::Closeable::~Closeable () [virtual]

6.134.3 Member Function Documentation

6.134.3.1 virtual void cms::Closeable::close () [pure virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSException *(*p. ***979****)* - If an error occurs while the resource is being closed.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 872), **activemq::cmsutil::CachedProducer** (p. 879), **activemq::cmsutil::PooledSession** (p. 2382), **activemq::commands::ActiveMQTempDestination** (p. 494), **activemq::core::ActiveMQConnection** (p. 244), **activemq::core::ActiveMQConsumer** (p. 297), **activemq::core::ActiveMQProducer** (p. 395), **activemq::core::ActiveMQQueueBrowser** (p. 426), **activemq::core::ActiveMQSession** (p. 435), **activemq::core::kernels::ActiveMQConsumerKernel** (p. 308), **activemq::core::kernels::ActiveMQProducerKernel** (p. 406), **activemq::core::kernels::ActiveMQSessionKernel** (p. 456), **cms::Connection** (p. 1090), and **cms::Session** (p. 2683).

The documentation for this class was generated from the following file:

- src/main/cms/**Closeable.h**

6.135 decaf::io::Closeable Class Reference

Interface for a class that implements the close method.

`#include <src/main/decaf/io/Closeable.h>`Inheritance diagram for decaf::io::Closeable:

Public Member Functions

- virtual ~**Closeable** ()
- virtual void **close** ()=0

  Closes this object and deallocates the appropriate resources.

6.135.1 Detailed Description

Interface for a class that implements the close method.

6.135.2 Constructor & Destructor Documentation

6.135.2.1 virtual decaf::io::Closeable::~Closeable () [virtual]

6.135.3 Member Function Documentation

6.135.3.1 virtual void decaf::io::Closeable::close () [pure virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

IOException *(*p. *1787**)* if an error occurs while closing.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1494), **activemq::transport::IOTransport** (p. 1793), **activemq::transport::mock::MockTransport** (p. 2224), **activemq::transport::TransportFilter** (p. 3139), **decaf::internal::io::StandardErrorOutputStream** (p. 2846), **decaf::internal::io::StandardOutputStream** (p. 2850), **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2299), **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 2320), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 2323), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 3001), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 3004), **decaf::io::BlockingByteArrayInputStream** (p. 688), **decaf::io::BufferedInputStream** (p. 744), **decaf::io::FilterInputStream** (p. 1523), **decaf::io::FilterOutputStream** (p. 1528), **decaf::io::InputStream** (p. 1709), **decaf::io::InputStreamReader** (p. 1718), **decaf::io::OutputStream** (p. 2349), **decaf::io::OutputStreamWriter** (p. 2356), **decaf::net::Socket** (p. 2775), **decaf::util::logging::ConsoleHandler** (p. 1153), **decaf::util::logging::StreamHandler** (p. 2921), **decaf::util::zip::DeflaterOutputStream** (p. 1361), and **decaf::util::zip::InflaterInputStream** (p. 1703).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**Closeable.h**

6.136 activemq::transport::failover::CloseTransportsTask Class Reference

`#include <src/main/activemq/transport/failover/CloseTransportsTask.h>`Inheritance diagram for activemq::transport::failover::CloseTransportsTask:

Public Member Functions

- **CloseTransportsTask** ()
- virtual ~**CloseTransportsTask** ()
- void **add** (const **Pointer**< **Transport** > transport)

  *Add a new **Transport** (p. 3125) to close.*

- virtual bool **isPending** () const

  This Task is pending if there are transports in the Queue that need to be closed.

- virtual bool **iterate** ()

  Return true until all transports have been closed and removed from the queue.

6.136.1 Constructor & Destructor Documentation

6.136.1.1 activemq::transport::failover::CloseTransportsTask::CloseTransportsTask ()

6.136.1.2 virtual activemq::transport::failover::CloseTransportsTask::~CloseTransportsTask () `[virtual]`

6.136.2 Member Function Documentation

6.136.2.1 void activemq::transport::failover::CloseTransportsTask::add (const Pointer< Transport > *transport*)

Add a new **Transport** (p. 3125) to close.

6.136.2.2 virtual bool activemq::transport::failover::CloseTransportsTask::isPending () const `[virtual]`

This Task is pending if there are transports in the Queue that need to be closed.

Returns:

true if there is a **transport** (p. 72) in the queue that needs closed.

Implements **activemq::threads::CompositeTask** (p. 1045).

6.136.2.3 virtual bool activemq::transport::failover::CloseTransportsTask::iterate () [virtual]

Return true until all transports have been closed and removed from the queue.

Implements **activemq::threads::Task** (p. 2989).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**CloseTransportsTask.h**

6.137 activemq::cmsutil::CmsAccessor Class Reference

Base class for **activemq.cmsutil.CmsTemplate** (p. 992) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 1114) to operate on.

`#include <src/main/activemq/cmsutil/CmsAccessor.h>`Inheritance diagram for activemq::cmsutil::CmsAccessor:

Public Member Functions

- **CmsAccessor** ()
- virtual ~**CmsAccessor** ()
- virtual **ResourceLifecycleManager** * **getResourceLifecycleManager** ()
- virtual const **ResourceLifecycleManager** * **getResourceLifecycleManager** () const
- virtual void **setConnectionFactory** (**cms::ConnectionFactory** *connectionFactory)

  Set the ConnectionFactory to use for obtaining CMS Connections.

- virtual const **cms::ConnectionFactory** * **getConnectionFactory** () const

  Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

- virtual **cms::ConnectionFactory** * **getConnectionFactory** ()

  Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

- virtual void **setSessionAcknowledgeMode** (**cms::Session::AcknowledgeMode** sessionAcknowledgeMode)

  Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.

- virtual **cms::Session::AcknowledgeMode** **getSessionAcknowledgeMode** () const

  Return the acknowledgment mode for CMS sessions.

Protected Member Functions

- **CmsAccessor** (const **CmsAccessor** &)
- **CmsAccessor** & **operator**= (const **CmsAccessor** &)
- virtual void **init** ()

  Initializes this object and prepares it for use.

- virtual void **destroy** ()

  Shuts down this object and destroys any allocated resources.

- virtual **cms::Connection** * **createConnection** ()

  Create a CMS Connection via this template's ConnectionFactory.

- virtual **cms::Session** * **createSession** (**cms::Connection** *con)

  Create a CMS Session for the given Connection.

- virtual void **checkConnectionFactory** ()
  Verifies that the connection factory is valid.

6.137.1 Detailed Description

Base class for **activemq.cmsutil.CmsTemplate** (p. 992) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 1114) to operate on. The subclass **activemq.cmsutil.CmsDestinationAccessor** (p. 976) adds further, destination-related properties.

Not intended to be used directly.

See also:

activemq.cmsutil.CmsDestinationAccessor (p. 976)
activemq.cmsutil.CmsTemplate (p. 992)

6.137.2 Constructor & Destructor Documentation

6.137.2.1 activemq::cmsutil::CmsAccessor::CmsAccessor (const CmsAccessor &) [protected]

6.137.2.2 activemq::cmsutil::CmsAccessor::CmsAccessor ()

6.137.2.3 virtual activemq::cmsutil::CmsAccessor::~CmsAccessor () [virtual]

6.137.3 Member Function Documentation

6.137.3.1 virtual void activemq::cmsutil::CmsAccessor::checkConnectionFactory () [protected, virtual]

Verifies that the connection factory is valid.

Exceptions:

IllegalStateException if this object has not been initialized.

6.137.3.2 virtual cms::Connection* activemq::cmsutil::CmsAccessor::createConnection () [protected, virtual]

Create a CMS Connection via this template's ConnectionFactory.

Returns:

the new CMS Connection

Exceptions:

CMSException if thrown by CMS API methods

IllegalStateException if this object has not been initialized.

6.137.3.3 virtual cms::Session* activemq::cmsutil::CmsAccessor::createSession (cms::Connection * *con*) [protected, virtual]

Create a CMS Session for the given Connection.

Parameters:

con The CMS Connection to create a Session for

Returns:

the new CMS Session

Exceptions:

CMSException if thrown by CMS API methods

IllegalStateException if this object has not been initialized.

6.137.3.4 virtual void activemq::cmsutil::CmsAccessor::destroy () [inline, protected, virtual]

Shuts down this object and destroys any allocated resources.

Exceptions:

CMSException if an error occurs during destruction.

IllegalStateException if this object has already been destroyed.

Reimplemented in **activemq::cmsutil::CmsDestinationAccessor** (p. 977), and **activemq::cmsutil::CmsTemplate** (p. 995).

6.137.3.5 virtual cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () [inline, virtual]

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.137.3.6 virtual const cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () const [inline, virtual]

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.137.3.7 virtual const ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () const [inline, virtual]

6.137.3.8 virtual ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () [inline, virtual]

6.137.3.9 virtual cms::Session::AcknowledgeMode activemq::cmsutil::CmsAccessor::getSessionAcknowledgeMode () const [inline, virtual]

Return the acknowledgment mode for CMS sessions.

Returns:

the acknowledgment mode applied by this accessor

6.137.3.10 virtual void activemq::cmsutil::CmsAccessor::init () [protected, virtual]

Initializes this object and prepares it for use. This should be called before any other methods are called. This version does nothing.

Exceptions:

CMSException if an error occurs during initialization.

IllegalStateException if this object has already been initialized.

Reimplemented in **activemq::cmsutil::CmsDestinationAccessor** (p. 977), and **activemq::cmsutil::CmsTemplate** (p. 998).

6.137.3.11 CmsAccessor& activemq::cmsutil::CmsAccessor::operator= (const CmsAccessor &) [protected]

6.137.3.12 virtual void activemq::cmsutil::CmsAccessor::setConnectionFactory (cms::ConnectionFactory * *connectionFactory*) [inline, virtual]

Set the ConnectionFactory to use for obtaining CMS Connections.

6.137.3.13 virtual void activemq::cmsutil::CmsAccessor::setSessionAcknowledgeMode (cms::Session::AcknowledgeMode *sessionAcknowledgeMode*) [inline, virtual]

Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message. Default is `AUTO_ACKNOWLEDGE`.

Parameters:

sessionAcknowledgeMode The acknowledgment mode to assign to the Session.

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**CmsAccessor.h**

6.138 activemq::cmsutil::CmsDestinationAccessor Class Reference

Extends the `CmsAccessor` (p. 971) to add support for resolving destination names.

6.139 cms::CMSException Class Reference

CMS API Exception that is the base for all exceptions thrown from CMS classes.

`#include <src/main/cms/CMSException.h>`Inheritance diagram for cms::CMSException:

Public Member Functions

- **CMSException** ()
- **CMSException** (const **CMSException** &ex)
- **CMSException** (const std::string &message)
- **CMSException** (const std::string &message, const std::exception *cause)
- **CMSException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**CMSException** () throw ()
- virtual std::string **getMessage** () const

  Gets the cause of the error.

- virtual const std::exception * **getCause** () const

  Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const

  Provides the stack trace for every point where this exception was caught, marked, and rethrown.

- virtual void **setMark** (const char *file, const int lineNumber)

  Adds a file/line number to the stack trace.

- virtual void **printStackTrace** () const

  Prints the stack trace to std::err.

- virtual void **printStackTrace** (std::ostream &stream) const

  Prints the stack trace to the given output stream.

- virtual std::string **getStackTraceString** () const

  Gets the stack trace as one contiguous string.

- virtual const char * **what** () const throw ()

  *Overloads the std::exception **what()** (p. 982) function to return the cause of the exception.*

- virtual **CMSException** * **clone** ()

  *Creates a cloned version of this **CMSException** (p. 979) instance.*

6.139.1 Detailed Description

CMS API Exception that is the base for all exceptions thrown from CMS classes. This class represents an error that has occurred in CMS, providers can wrap provider specific exceptions in this class by setting the cause to an instance of a provider specific exception provided it can be cast to an std::exception.

Since the contained cause exception is of type std::exception and the C++ exception class has no clone or copy method defined the contained exception can only be owned by one instance of an **CMSException** (p. 979). To that end the class hands off the exception to each successive copy or clone so care must be taken when handling **CMSException** (p. 979) instances.

Since:

1.0

6.139.2 Constructor & Destructor Documentation

6.139.2.1 cms::CMSException::CMSException ()

6.139.2.2 cms::CMSException::CMSException (const CMSException & *ex*)

6.139.2.3 cms::CMSException::CMSException (const std::string & *message*)

6.139.2.4 cms::CMSException::CMSException (const std::string & *message*, const std::exception * *cause*)

6.139.2.5 cms::CMSException::CMSException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.139.2.6 virtual cms::CMSException::~CMSException () throw () [virtual]

6.139.3 Member Function Documentation

6.139.3.1 virtual CMSException* cms::CMSException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented in **cms::CMSSecurityException** (p. 991), **cms::IllegalStateException** (p. 1659), **cms::InvalidClientIdException** (p. 1773), **cms::InvalidDestinationException** (p. 1775), **cms::InvalidSelectorException** (p. 1783), **cms::MessageEOFException** (p. 2171), **cms::MessageFormatException** (p. 2173), **cms::MessageNotReadableException** (p. 2189), **cms::MessageNotWriteableException** (p. 2191), **cms::ResourceAllocationException** (p. 2601), **cms::TransactionInProgressException** (p. 3115), **cms::TransactionRolledBackException** (p. 3117), **cms::UnsupportedOperationException** (p. 3167), and **cms::XAException** (p. 3267).

6.139.3.2 virtual const std::exception* cms::CMSException::getCause () const [virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns:

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

6.139.3.3 virtual std::string cms::CMSException::getMessage () const [virtual]

Gets the cause of the error.

Returns:

string errors message

6.139.3.4 virtual std::vector< std::pair< std::string, int> > cms::CMSException::getStackTrace () const [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns:

vector containing stack trace strings

6.139.3.5 virtual std::string cms::CMSException::getStackTraceString () const [virtual]

Gets the stack trace as one contiguous string.

Returns:

string with formatted stack trace data

6.139.3.6 virtual void cms::CMSException::printStackTrace (std::ostream & *stream*) const [virtual]

Prints the stack trace to the given output stream.

Parameters:

stream the target output stream.

6.139.3.7 virtual void cms::CMSException::printStackTrace () const [virtual]

Prints the stack trace to std::err.

6.139.3.8 virtual void cms::CMSException::setMark (const char * *file*, const int *lineNumber*) [virtual]

Adds a file/line number to the stack trace.

Parameters:

file The name of the file calling this method (use __FILE__).

lineNumber The line number in the calling file (use __LINE__).

6.139.3.9 virtual const char* cms::CMSException::what () const throw () [virtual]

Overloads the std::exception **what()** (p. 982) function to return the cause of the exception.

Returns:

const char pointer to error message

6.141 cms::CMSProperties Class Reference

Interface for a Java-like properties object.

`#include <src/main/cms/CMSProperties.h>`Inheritance diagram for cms::CMSProperties:

Public Member Functions

- virtual ~**CMSProperties** ()
- virtual int **size** () const =0

  Returns the current count of all the Properties that are currently stored in the Properties object.

- virtual bool **isEmpty** () const =0

  Returns true if the properties object is empty.

- virtual const char * **getProperty** (const std::string &name) const =0

  Looks up the value for the given property.

- virtual std::string **getProperty** (const std::string &name, const std::string &defaultValue) const =0

  Looks up the value for the given property.

- virtual void **setProperty** (const std::string &name, const std::string &value)=0

  Sets the value for a given property.

- virtual bool **hasProperty** (const std::string &name) const =0

  Check to see if the Property exists in the set.

- virtual std::string **remove** (const std::string &name)=0

  Removes the property with the given name.

- virtual std::vector< std::string > **propertyNames** () const =0

  Returns a vector containing all the names of the properties currently stored in the Properties object.

- virtual std::vector< std::pair< std::string, std::string > > **toArray** () const =0

  Method that serializes the contents of the property map to an array.

- virtual void **copy** (const **CMSProperties** *source)=0

  Copies the contents of the given properties object to this one.

- virtual **CMSProperties** * **clone** () const =0

  Clones this object.

- virtual void **clear** ()=0

  Clears all properties from the map.

- virtual std::string **toString** () const =0

  Formats the contents of the Properties Object into a string that can be logged, etc.

6.141.1 Detailed Description

Interface for a Java-like properties object. This is essentially a map of key-value string pairs.

Since:

1.1

6.141.2 Constructor & Destructor Documentation

6.141.2.1 virtual cms::CMSProperties::~CMSProperties () [virtual]

6.141.3 Member Function Documentation

6.141.3.1 virtual void cms::CMSProperties::clear () [pure virtual]

Clears all properties from the map.

Implemented in **activemq::util::ActiveMQProperties** (p. 417).

6.141.3.2 virtual CMSProperties* cms::CMSProperties::clone () const [pure virtual]

Clones this object.

Returns:

a replica of this object.

Implemented in **activemq::util::ActiveMQProperties** (p. 417).

6.141.3.3 virtual void cms::CMSProperties::copy (const CMSProperties * *source*) [pure virtual]

Copies the contents of the given properties object to this one.

Parameters:

source The source properties object.

6.141.3.4 virtual std::string cms::CMSProperties::getProperty (const std::string & *name*, const std::string & *defaultValue*) const [pure virtual]

Looks up the value for the given property.

Parameters:

name the name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns:

The value of the property specified by `name`, if it exists, otherwise the `defaultValue`.

Implemented in **activemq::util::ActiveMQProperties** (p. 418).

6.141.3.5 virtual const char* cms::CMSProperties::getProperty (const std::string & *name*) const [pure virtual]

Looks up the value for the given property.

Parameters:

name The name of the property to be looked up.

Returns:

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implemented in **activemq::util::ActiveMQProperties** (p. 418).

6.141.3.6 virtual bool cms::CMSProperties::hasProperty (const std::string & *name*) const [pure virtual]

Check to see if the Property exists in the set.

Parameters:

name the name of the property to check

Returns:

true if property exists, false otherwise.

Implemented in **activemq::util::ActiveMQProperties** (p. 418).

6.141.3.7 virtual bool cms::CMSProperties::isEmpty () const [pure virtual]

Returns true if the properties object is empty.

Returns:

true if empty

Implemented in **activemq::util::ActiveMQProperties** (p. 419).

6.141.3.8 virtual std::vector<std::string> cms::CMSProperties::propertyNames () const [pure virtual]

Returns a vector containing all the names of the properties currently stored in the Properties object.

Returns:

an STL std::vector<std::string> with all the currently stored property names.

Implemented in **activemq::util::ActiveMQProperties** (p. 419).

6.141.3.9 virtual std::string cms::CMSProperties::remove (const std::string & *name*) [pure virtual]

Removes the property with the given name. If the property existed in the collection then it is removed and returned, otherwise an empty string is returned.

Parameters:

name the name of the property to be removed.

Returns:

the value that was removed from the Properties, or empty string.

Implemented in **activemq::util::ActiveMQProperties** (p. 419).

6.141.3.10 virtual void cms::CMSProperties::setProperty (const std::string & *name*, const std::string & *value*) [pure virtual]

Sets the value for a given property. If the property already exists, overwrites the value.

Parameters:

name The name of the value to be written.

value The value to be written.

Implemented in **activemq::util::ActiveMQProperties** (p. 419).

6.141.3.11 virtual int cms::CMSProperties::size () const [pure virtual]

Returns the current count of all the Properties that are currently stored in the Properties object.

Returns:

the number of properties currently stored.

Implemented in **activemq::util::ActiveMQProperties** (p. 420).

6.141.3.12 virtual std::vector< std::pair< std::string, std::string > > cms::CMSProperties::toArray () const [pure virtual]

Method that serializes the contents of the property map to an array.

Returns:

list of pairs where the first is the name and the second is the value.

Implemented in **activemq::util::ActiveMQProperties** (p. 420).

6.141.3.13 virtual std::string cms::CMSProperties::toString () const [pure virtual]

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns:

string value of this object.

Implemented in **activemq::util::ActiveMQProperties** (p. 420).

6.142.2.6 virtual cms::CMSSecurityException::~CMSSecurityException () throw () [virtual]

6.142.3 Member Function Documentation

6.142.3.1 virtual CMSSecurityException* cms::CMSSecurityException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

The documentation for this class was generated from the following file:

  Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.

- virtual bool **isExplicitQosEnabled** () const

  If "true", then the values of deliveryMode, priority, and timeToLive will be used when sending a message.

- virtual void **setDeliveryPersistent** (bool deliveryPersistent)

  Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false").

- virtual void **setDeliveryMode** (int deliveryMode)

  Set the delivery mode to use when sending a message.

- virtual int **getDeliveryMode** () const

  Return the delivery mode to use when sending a message.

- virtual void **setPriority** (int priority)

  Set the priority of a message when sending.

- virtual int **getPriority** () const

  Return the priority of a message when sending.

- virtual void **setTimeToLive** (long long timeToLive)

  Set the time-to-live of the message when sending.

- virtual long long **getTimeToLive** () const

  Return the time-to-live of the message when sending.

- virtual void **execute** (**SessionCallback** *action)

  Executes the given action within a CMS Session.

- virtual void **execute** (**ProducerCallback** *action)

  Executes the given action and provides it with a CMS Session and producer.

- virtual void **execute** (**cms::Destination** *dest, **ProducerCallback** *action)

  Executes the given action and provides it with a CMS Session and producer.

- virtual void **execute** (const std::string &destinationName, **ProducerCallback** *action)

  Executes the given action and provides it with a CMS Session and producer.

- virtual void **send** (**MessageCreator** *messageCreator)

  Convenience method for sending a message to the default destination.

- virtual void **send** (**cms::Destination** *dest, **MessageCreator** *messageCreator)

  Convenience method for sending a message to the specified destination.

- virtual void **send** (const std::string &destinationName, **MessageCreator** *messageCreator)

  Convenience method for sending a message to the specified destination.

- virtual **cms::Message** * **receive** ()

Performs a synchronous read from the default destination.

- virtual **cms::Message** * **receive** (**cms::Destination** *destination)

  Performs a synchronous read from the specified destination.

- virtual **cms::Message** * **receive** (const std::string &destinationName)

  Performs a synchronous read from the specified destination.

- virtual **cms::Message** * **receiveSelected** (const std::string &selector)

  Performs a synchronous read consuming only messages identified by the given selector.

- virtual **cms::Message** * **receiveSelected** (**cms::Destination** *destination, const std::string &selector)

  Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

- virtual **cms::Message** * **receiveSelected** (const std::string &destinationName, const std::string &selector)

  Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Static Public Attributes

- static const long long **RECEIVE_TIMEOUT_NO_WAIT**

  Timeout value indicating that a receive operation should check if a message is immediately available without blocking.

- static const long long **RECEIVE_TIMEOUT_INDEFINITE_WAIT**

  Timeout value indicating a blocking receive without timeout.

- static const int **DEFAULT_PRIORITY**

  Default message priority.

- static const long long **DEFAULT_TIME_TO_LIVE**

  My default, messages should live forever.

Protected Member Functions

- void **init** ()

  Initializes this object and prepares it for use.

- void **destroy** ()

  Shuts down this object and destroys any allocated resources.

- class **ReceiveExecutor**
- class **ResolveReceiveExecutor**

6.143.1 Detailed Description

`CmsTemplate` (p. 992) simplifies performing synchronous CMS operations. This class is intended to be for CMS what Spring's `JmsTemplate` is for JMS. Provided with a CMS `ConnectionFactory`, creates and manages all other CMS resources internally.

Before using `CmsTemplate` (p. 992) the user must first set the destination (either by name or by setting the destination object directly) and then call `init` to initialize the object for use.

`CmsTemplate` (p. 992) allows the user to get access to a CMS `Session` through a user-defined `SessionCallback` (p. 2694). Similarly, if the user wants direct access to a CMS `MessageProducer`, it can provide a `ProducerCallback` (p. 2464). As a convenience, the user can bypass having to provide callbacks altogether for sending messages, by calling one of the `send` methods.

See also:

SessionCallback (p. 2694)
ProducerCallback (p. 2464)
MessageCreator (p. 2133)

6.143.2 Constructor & Destructor Documentation

6.143.2.1 activemq::cmsutil::CmsTemplate::CmsTemplate ()

6.143.2.2 activemq::cmsutil::CmsTemplate::CmsTemplate (cms::ConnectionFactory * *connectionFactory*)

6.143.2.3 virtual activemq::cmsutil::CmsTemplate::~CmsTemplate () [virtual]

6.143.3 Member Function Documentation

6.143.3.1 void activemq::cmsutil::CmsTemplate::destroy () [protected, virtual]

Shuts down this object and destroys any allocated resources.

Exceptions:

CMSException if an error occurs during destruction.

IllegalStateException if this object has already been destroyed.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 977).

6.143.3.2 virtual void activemq::cmsutil::CmsTemplate::execute (const std::string & *destinationName*, ProducerCallback * *action*) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters:

destinationName the name of the destination to send messages to (to internally be resolved to an actual destination)

action the action to perform

Exceptions:

cms::CMSException (p. ***979***) thrown if an error occurs.

6.143.3.3 virtual void activemq::cmsutil::CmsTemplate::execute (cms::Destination * *dest*, ProducerCallback * *action*) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters:

dest the destination to send messages to

action the action to perform

Exceptions:

cms::CMSException (p. ***979***) thrown if an error occurs.

6.143.3.4 virtual void activemq::cmsutil::CmsTemplate::execute (ProducerCallback * *action*) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters:

action the action to perform

Exceptions:

cms::CMSException (p. ***979***) thrown if an error occurs.

6.143.3.5 virtual void activemq::cmsutil::CmsTemplate::execute (SessionCallback * *action*) [virtual]

Executes the given action within a CMS Session.

Parameters:

action the action to perform within a CMS Session

Exceptions:

cms::CMSException (p. ***979***) thrown if an error occurs.

6.143.3.6 virtual cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination () [inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns:

the default destination. Non-const version of this method.

6.143.3.7 virtual const cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination () const [inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns:

the default destination. Const version of this method.

6.143.3.8 virtual const std::string activemq::cmsutil::CmsTemplate::getDefaultDestinationName () const [inline, virtual]

Gets the name of the default destination to be used for send/receive operations. The destination type (topic/queue) is determined by the `pubSubDomain` property.

Returns:

the default name of the destination for send/receive operations.

6.143.3.9 virtual int activemq::cmsutil::CmsTemplate::getDeliveryMode () const [inline, virtual]

Return the delivery mode to use when sending a message.

6.143.3.10 virtual int activemq::cmsutil::CmsTemplate::getPriority () const [inline, virtual]

Return the priority of a message when sending.

6.143.3.11 virtual long long activemq::cmsutil::CmsTemplate::getReceiveTimeout () const [inline, virtual]

6.143.3.12 virtual long long activemq::cmsutil::CmsTemplate::getTimeToLive () const [inline, virtual]

Return the time-to-live of the message when sending.

6.143.3.13 void activemq::cmsutil::CmsTemplate::init () [protected, virtual]

Initializes this object and prepares it for use. This should be called before any other methods are called. This version does nothing.

Exceptions:

CMSException if an error occurs during initialization.
IllegalStateException if this object has already been initialized.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 977).

6.143.3.14 virtual bool activemq::cmsutil::CmsTemplate::isExplicitQosEnabled () const [inline, virtual]

If "true", then the values of deliveryMode, priority, and timeToLive will be used when sending a message. Otherwise, the default values, that may be set administratively, will be used.

Returns:

true if overriding default values of QOS parameters (deliveryMode, priority, and timeToLive)

See also:

setDeliveryMode (p. 1002)
setPriority (p. 1003)
setTimeToLive (p. 1003)

6.143.3.15 virtual bool activemq::cmsutil::CmsTemplate::isMessageIdEnabled () const [inline, virtual]

6.143.3.16 virtual bool activemq::cmsutil::CmsTemplate::isMessageTimestampEnabled () const [inline, virtual]

6.143.3.17 virtual bool activemq::cmsutil::CmsTemplate::isNoLocal () const [inline, virtual]

6.143.3.18 virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (const std::string & *destinationName*) [virtual]

Performs a synchronous read from the specified destination.

Parameters:

destinationName the name of the destination to receive on (will be resolved to destination internally).

Returns:

the message

Exceptions:

cms::CMSException *(p. **979**)* thrown if an error occurs

6.143.3.19 virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (cms::Destination * *destination*) [virtual]

Performs a synchronous read from the specified destination.

Parameters:

destination the destination to receive on

Returns:

the message

Exceptions:

cms::CMSException *(*p. ***979)*** thrown if an error occurs

6.143.3.20 virtual cms::Message* activemq::cmsutil::CmsTemplate::receive () [virtual]

Performs a synchronous read from the default destination.

Returns:

the message

Exceptions:

cms::CMSException *(*p. ***979)*** thrown if an error occurs

6.143.3.21 virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & *destinationName*, const std::string & *selector*) [virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters:

destinationName the name of the destination to receive on (will be resolved to destination internally).

selector the selector expression.

Returns:

the message

Exceptions:

cms::CMSException *(*p. ***979)*** thrown if an error occurs

6.143.3.22 virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (cms::Destination * *destination*, const std::string & *selector*) [virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters:

destination the destination to receive on.

selector the selector expression.

Returns:

the message

Exceptions:

cms::CMSException (p. ***979***) thrown if an error occurs

6.143.3.23 virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & *selector*) [virtual]

Performs a synchronous read consuming only messages identified by the given selector.

Parameters:

selector the selector expression.

Returns:

the message

Exceptions:

cms::CMSException (p. ***979***) thrown if an error occurs

6.143.3.24 virtual void activemq::cmsutil::CmsTemplate::send (const std::string & *destinationName*, MessageCreator * *messageCreator*) [virtual]

Convenience method for sending a message to the specified destination.

Parameters:

destinationName The name of the destination to send to.

messageCreator Responsible for creating the message to be sent

Exceptions:

cms::CMSException (p. ***979***) thrown if an error occurs.

6.143.3.25 virtual void activemq::cmsutil::CmsTemplate::send (cms::Destination * *dest*, MessageCreator * *messageCreator*) [virtual]

Convenience method for sending a message to the specified destination.

Parameters:

dest The destination to send to

messageCreator Responsible for creating the message to be sent

Exceptions:

cms::CMSException *(*p. ***979)*** thrown if an error occurs.

6.143.3.26 virtual void activemq::cmsutil::CmsTemplate::send (MessageCreator * *messageCreator*) [virtual]

Convenience method for sending a message to the default destination.

Parameters:

messageCreator Responsible for creating the message to be sent

Exceptions:

cms::CMSException *(*p. ***979)*** thrown if an error occurs.

6.143.3.27 virtual void activemq::cmsutil::CmsTemplate::setDefaultDestination (cms::Destination * *defaultDestination*) [inline, virtual]

Sets the destination object to be used by default for send/receive operations. If no default destination is provided, the `defaultDestinationName` property is used to resolve this default destination for send/receive operations.

Parameters:

defaultDestination the default destination

6.143.3.28 virtual void activemq::cmsutil::CmsTemplate::setDefaultDestinationName (const std::string & *defaultDestinationName*) [inline, virtual]

Sets the name of the default destination to be used from send/receive operations. Calling this method will set the `defaultDestination` property to NULL. The destination type (topic/queue) is determined by the `pubSubDomain` property.

Parameters:

defaultDestinationName the name of the destination for send/receive to by default.

References NULL.

6.143.3.29 virtual void activemq::cmsutil::CmsTemplate::setDeliveryMode (int *deliveryMode*) [inline, virtual]

Set the delivery mode to use when sending a message. Default is the Message default: "PERSISTENT".

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters:

deliveryMode the delivery mode to use

See also:

isExplicitQosEnabled (p. 998)

6.143.3.30 virtual void activemq::cmsutil::CmsTemplate::setDeliveryPersistent (bool *deliveryPersistent*) [inline, virtual]

Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false"). This will set the delivery mode accordingly, to either "PERSISTENT" or "NON_PERSISTENT".

Default it "true" aka delivery mode "PERSISTENT".

See also:

setDeliveryMode(int) (p. 1002)

6.143.3.31 virtual void activemq::cmsutil::CmsTemplate::setExplicitQosEnabled (bool *explicitQosEnabled*) [inline, virtual]

Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.

See also:

setDeliveryMode (p. 1002)
setPriority (p. 1003)
setTimeToLive (p. 1003)

6.143.3.32 virtual void activemq::cmsutil::CmsTemplate::setMessageIdEnabled (bool *messageIdEnabled*) [inline, virtual]

6.143.3.33 virtual void activemq::cmsutil::CmsTemplate::setMessageTimestampEnabled (bool *messageTimestampEnabled*) [inline, virtual]

6.143.3.34 virtual void activemq::cmsutil::CmsTemplate::setNoLocal (bool *noLocal*) [inline, virtual]

6.143.3.35 virtual void activemq::cmsutil::CmsTemplate::setPriority (int *priority*) [inline, virtual]

Set the priority of a message when sending. Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

See also:

isExplicitQosEnabled (p. 998)

6.143.3.36 virtual void activemq::cmsutil::CmsTemplate::setPubSubDomain (bool *pubSubDomain*) [inline, virtual]

Indicates whether the default destination is a topic (true) or a queue (false). Calling this method will set the `defaultDestination` property to NULL.

Parameters:

pubSubDomain indicates whether to use pub-sub messaging (topics).

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 978).

References NULL, and activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain().

6.143.3.37 virtual void activemq::cmsutil::CmsTemplate::setReceiveTimeout (long long *receiveTimeout*) [inline, virtual]

6.143.3.38 virtual void activemq::cmsutil::CmsTemplate::setTimeToLive (long long *timeToLive*) [inline, virtual]

Set the time-to-live of the message when sending. Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters:

timeToLive the message's lifetime (in milliseconds)

See also:

isExplicitQosEnabled (p. 998)

  Returns the number of elements in this collection.

- virtual std::vector< E > **toArray** () const =0

  Returns an array containing all of the elements in this collection.

6.145.1 Detailed Description

template<typename E> class decaf::util::Collection< E >

The root interface in the collection hierarchy. A collection represents a group of objects, known as its elements. Some collections allow duplicate elements and others do not. Some are ordered and others unordered. This interface is typically used to pass collections around and manipulate them where maximum generality is desired.

All general-purpose **Collection** (p. 1006) implementation classes (which typically implement **Collection** (p. 1006) indirectly through one of its subinterfaces) should provide two "standard" constructors: a void (no arguments) constructor, which creates an empty collection, and a constructor with a single argument of type **Collection** (p. 1006), which creates a new collection with the same elements as its argument. In effect, the latter constructor allows the user to copy any collection, producing an equivalent collection of the desired implementation type. There is no way to enforce this convention (as interfaces cannot contain constructors) but all of the general-purpose **Collection** (p. 1006) implementations in the Decaf platform libraries comply.

The "destructive" methods contained in this interface, that is, the methods that modify the collection on which they operate, are specified to throw UnsupportedOperationException if this collection does not support the operation. If this is the case, these methods may, but are not required to, throw an UnsupportedOperationException if the invocation would have no effect on the collection. For example, invoking the addAll(Collection) method on an unmodifiable collection may, but is not required to, throw the exception if the collection to be added is empty.

Many methods in **Collections** (p. 1018) Framework interfaces are defined in terms of the equals method. For example, the specification for the contains(Object o) method says: returns true if and only if this collection contains at least one element e such that (o==null ? e==null : o.equals(e)).

Since:

1.0

6.145.2 Constructor & Destructor Documentation

6.145.2.1 template<typename E> virtual decaf::util::Collection< E >::~Collection () [inline, virtual]

6.145.3 Member Function Documentation

6.145.3.1 template<typename E> virtual bool decaf::util::Collection< E >::add (const E & *value*) [pure virtual]

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::AbstractList< E >** (p. 158), **decaf::util::AbstractQueue< E >** (p. 176), **decaf::util::ArrayList< E >** (p. 588), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1206), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1223), **decaf::util::LinkedList< E >** (p. 1886), **decaf::util::PriorityQueue< E >** (p. 2449), **decaf::util::StlList< E >** (p. 2859), **decaf::util::StlSet< E >** (p. 2895), **decaf::util::AbstractList< ServiceListener * >** (p. 158), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 158), **decaf::util::AbstractList< CompositeTask * >** (p. 158), **decaf::util::AbstractList< URI >** (p. 158), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 158), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 158), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 158), **decaf::util::AbstractList< decaf::net::URI >** (p. 158), **decaf::util::AbstractList< Pointer< Command > >** (p. 158), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 158), **decaf::util::AbstractList< cms::Destination * >** (p. 158), **decaf::util::AbstractList< cms::Session * >** (p. 158), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 158), **decaf::util::AbstractList< cms::Connection * >** (p. 158), **decaf::util::AbstractQueue< Pointer< Transport > >** (p. 176), **decaf::util::ArrayList< ServiceListener * >** (p. 588), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 588), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1886), **decaf::util::LinkedList< CompositeTask * >** (p. 1886), **decaf::util::LinkedList< URI >** (p. 1886), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1886), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1886), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1886), **decaf::util::LinkedList< decaf::net::URI >** (p. 1886), **decaf::util::LinkedList< Pointer< Command > >** (p. 1886), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1886), **decaf::util::LinkedList< cms::Destination * >** (p. 1886), **decaf::util::LinkedList< cms::Session * >** (p. 1886), **decaf::util::LinkedList< cms::Connection * >** (p. 1886), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2895), and **decaf::util::StlSet< Resource * >** (p. 2895).

Referenced by decaf::util::concurrent::SynchronousQueue< E >::drainTo(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::drainTo().

6.145.3.2 template<typename E> virtual bool decaf::util::Collection< E >::addAll (const Collection< E > & *collection*) [pure virtual]

Adds all of the elements in the specified collection to this collection. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters:

collection The **Collection** (p. 1006) whose elements are added to this one.

Returns:

true if this collection changed as a result of the call

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of an element prevents it from being added to this collection

IllegalStateException if an element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 143).

6.145.3.3 template<typename E> virtual void decaf::util::Collection< E >::clear () [pure virtual]

Removes all of the elements from this collection (optional operation). This collection will be empty after this method returns unless it throws an exception.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

Implemented in **decaf::util::AbstractCollection< E >** (p. 144), **decaf::util::AbstractList< E >** (p. 160), **decaf::util::AbstractQueue< E >** (p. 177), **decaf::util::ArrayList< E >** (p. 589), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1209), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1224), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1867), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2971), **decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet** (p. 1631), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet** (p. 1155), **decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet** (p. 1635), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet** (p. 1159), **decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection** (p. 1639), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection** (p. 1162), **decaf::util::LinkedList< E >** (p. 1888), **decaf::util::PriorityQueue< E >** (p. 2450), **decaf::util::StlList< E >** (p. 2862), **decaf::util::StlSet< E >** (p. 2895), **decaf::util::AbstractCollection< ServiceListener * >** (p. 144), **decaf::util::AbstractCollection< Pointer<**

Transport > > (p. 144), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 144), **decaf::util::AbstractCollection< Resource * >** (p. 144), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 144), **decaf::util::AbstractCollection< CompositeTask * >** (p. 144), **decaf::util::AbstractCollection< URI >** (p. 144), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 144), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 144), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 144), **decaf::util::AbstractCollection< V >** (p. 144), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 144), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 144), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 144), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 144), **decaf::util::AbstractCollection< cms::Destination * >** (p. 144), **decaf::util::AbstractCollection< cms::Session * >** (p. 144), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 144), **decaf::util::AbstractCollection< cms::Connection * >** (p. 144), **decaf::util::AbstractCollection< K >** (p. 144), **decaf::util::AbstractList< ServiceListener * >** (p. 160), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 160), **decaf::util::AbstractList< CompositeTask * >** (p. 160), **decaf::util::AbstractList< URI >** (p. 160), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 160), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 160), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 160), **decaf::util::AbstractList< decaf::net::URI >** (p. 160), **decaf::util::AbstractList< Pointer< Command > >** (p. 160), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 160), **decaf::util::AbstractList< cms::Destination * >** (p. 160), **decaf::util::AbstractList< cms::Session * >** (p. 160), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 160), **decaf::util::AbstractList< cms::Connection * >** (p. 160), **decaf::util::AbstractQueue< Pointer< Transport > >** (p. 177), **decaf::util::ArrayList< ServiceListener * >** (p. 589), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 589), **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1867), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1888), **decaf::util::LinkedList< CompositeTask * >** (p. 1888), **decaf::util::LinkedList< URI >** (p. 1888), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1888), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1888), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1888), **decaf::util::LinkedList< decaf::net::URI >** (p. 1888), **decaf::util::LinkedList< Pointer< Command > >** (p. 1888), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1888), **decaf::util::LinkedList< cms::Destination * >** (p. 1888), **decaf::util::LinkedList< cms::Session * >** (p. 1888), **decaf::util::LinkedList< cms::Connection * >** (p. 1888), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2895), and **decaf::util::StlSet< Resource * >** (p. 2895).

6.145.3.4 template<typename E> virtual bool decaf::util::Collection< E >::contains (const E & *value*) const [pure virtual]

Returns true if this collection contains the specified element. More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

Implemented in **decaf::util::AbstractCollection< E >** (p. 145), **decaf::util::ArrayList< E >** (p. 590), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1209), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1225), **decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet** (p. 1635), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet** (p. 1159), **decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection** (p. 1639), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection** (p. 1162), **decaf::util::LinkedList< E >** (p. 1889), **decaf::util::StlList< E >** (p. 2862), **decaf::util::StlSet< E >** (p. 2896), **decaf::util::AbstractCollection< ServiceListener * >** (p. 145), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 145), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 145), **decaf::util::AbstractCollection< Resource * >** (p. 145), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 145), **decaf::util::AbstractCollection< CompositeTask * >** (p. 145), **decaf::util::AbstractCollection< URI >** (p. 145), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 145), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 145), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 145), **decaf::util::AbstractCollection< V >** (p. 145), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 145), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 145), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 145), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 145), **decaf::util::AbstractCollection< cms::Destination * >** (p. 145), **decaf::util::AbstractCollection< cms::Session * >** (p. 145), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 145), **decaf::util::AbstractCollection< cms::Connection * >** (p. 145), **decaf::util::AbstractCollection< K >** (p. 145), **decaf::util::ArrayList< ServiceListener * >** (p. 590), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 590), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1889), **decaf::util::LinkedList< CompositeTask * >** (p. 1889), **decaf::util::LinkedList< URI >** (p. 1889), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1889), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1889), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1889), **decaf::util::LinkedList< decaf::net::URI >** (p. 1889), **decaf::util::LinkedList< Pointer< Command > >** (p. 1889), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1889), **decaf::util::LinkedList< cms::Destination * >** (p. 1889), **decaf::util::LinkedList< cms::Session * >** (p. 1889), **decaf::util::LinkedList< cms::Connection * >** (p. 1889), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2896), and **decaf::util::StlSet< Resource * >** (p. 2896).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll(), decaf::util::AbstractSet< K >::removeAll(), decaf::util::AbstractCollection< K >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll(), and decaf::util::AbstractCollection< K >::retainAll().

6.145.3.5 template<typename E> virtual bool decaf::util::Collection< E >::containsAll (const Collection< E > & *collection*) const [pure virtual]

Returns true if this collection contains all of the elements in the specified collection.

Parameters:

collection The **Collection** (p. 1006) to compare to this one.

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

Implemented in **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 146).

6.145.3.6 template<typename E> virtual void decaf::util::Collection< E >::copy (const Collection< E > & *collection*) [pure virtual]

Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006).

Parameters:

collection The collection to mirror.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

IllegalStateException if the elements cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 146).

6.145.3.7 template<typename E> virtual bool decaf::util::Collection< E >::equals (const Collection< E > & *value*) const [pure virtual]

Compares the passed collection to this one, if they contain the same elements, i.e. all their elements are equivalent, then it returns true.

Returns:

true if the **Collections** (p. 1018) contain the same elements.

Implemented in **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 147).

6.145.3.8 template<typename E> virtual bool decaf::util::Collection< E >::isEmpty () const [pure virtual]

Returns:

true if this collection contains no elements.

Implemented in **decaf::util::AbstractCollection< E >** (p. 147), **decaf::util::ArrayList< E >** (p. 591), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1212), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1226), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2973), **decaf::util::LinkedList< E >** (p. 1892), **decaf::util::StlList< E >** (p. 2864), **decaf::util::StlSet< E >** (p. 2897), **decaf::util::AbstractCollection< ServiceListener * >** (p. 147), **decaf::util::AbstractCollection< Pointer<**

Transport > > (p. 147), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 147), **decaf::util::AbstractCollection**< **Resource** * > (p. 147), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 147), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 147), **decaf::util::AbstractCollection**< **URI** > (p. 147), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 147), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 147), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 147), **decaf::util::AbstractCollection**< **V** > (p. 147), **decaf::util::AbstractCollection**< **MapEntry**< **K, V** > > (p. 147), **decaf::util::AbstractCollection**< **decaf::net::URI** > (p. 147), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 147), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 147), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 147), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 147), **decaf::util::AbstractCollection**< **Pointer**< **ActiveMQDestination** > > (p. 147), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 147), **decaf::util::AbstractCollection**< **K** > (p. 147), **decaf::util::ArrayList**< **ServiceListener** * > (p. 591), **decaf::util::ArrayList**< **Pointer**< **ActiveMQDestination** > > (p. 591), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1892), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1892), **decaf::util::LinkedList**< **URI** > (p. 1892), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1892), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1892), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1892), **decaf::util::LinkedList**< **decaf::net::URI** > (p. 1892), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1892), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1892), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1892), **decaf::util::LinkedList**< **cms::Session** * > (p. 1892), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1892), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 2897), and **decaf::util::StlSet**< **Resource** * > (p. 2897).

Referenced by decaf::util::StlList< E >::addAll(), decaf::util::AbstractList< cms::Connection * >::addAll(), decaf::util::concurrent::SynchronousQueue< E >::containsAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll().

6.145.3.9 template<typename E> virtual bool decaf::util::Collection< E >::remove (const E & *value*) [pure virtual]

Removes a single instance of the specified element from the collection. More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::AbstractCollection< E >** (p. 149), **decaf::util::ArrayList< E >** (p. 592), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1215), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1227), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1872), **decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet** (p. 1632), **decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet** (p. 1636), **decaf::util::LinkedList< E >** (p. 1897), **decaf::util::PriorityQueue< E >** (p. 2452), **decaf::util::StlList< E >** (p. 2866), **decaf::util::StlSet< E >** (p. 2897), **decaf::util::AbstractCollection< ServiceListener * >** (p. 149), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 149), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 149), **decaf::util::AbstractCollection< Resource * >** (p. 149), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 149), **decaf::util::AbstractCollection< CompositeTask * >** (p. 149), **decaf::util::AbstractCollection< URI >** (p. 149), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 149), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 149), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 149), **decaf::util::AbstractCollection< V >** (p. 149), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 149), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 149), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 149), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 149), **decaf::util::AbstractCollection< cms::Destination * >** (p. 149), **decaf::util::AbstractCollection< cms::Session * >** (p. 149), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 149), **decaf::util::AbstractCollection< cms::Connection * >** (p. 149), **decaf::util::AbstractCollection< K >** (p. 149), **decaf::util::ArrayList< ServiceListener * >** (p. 592), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 592), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1897), **decaf::util::LinkedList< CompositeTask * >** (p. 1897), **decaf::util::LinkedList< URI >** (p. 1897), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1897), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1897), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1897), **decaf::util::LinkedList< decaf::net::URI >** (p. 1897), **decaf::util::LinkedList< Pointer< Command > >** (p. 1897), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1897), **decaf::util::LinkedList< cms::Destination * >** (p. 1897), **decaf::util::LinkedList< cms::Session * >** (p. 1897), **decaf::util::LinkedList< cms::Connection * >** (p. 1897), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2897), and **decaf::util::StlSet< Resource * >** (p. 2897).

6.145.3.10 template<typename E> virtual bool decaf::util::Collection< E >::removeAll (const Collection< E > & *collection*) [pure virtual]

Removes all this collection's elements that are also contained in the specified collection (optional operation). After this call returns, this collection will contain no elements in common with the specified collection.

Parameters:

collection The **Collection** (p. 1006) whose elements are to be removed from this one.

Returns:

true if the collection changed as a result of this call.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 150), and **decaf::util::AbstractSet< MapEntry< K, V > >** (p. 199).

6.145.3.11 template<typename E> virtual bool decaf::util::Collection< E >::retainAll (const Collection< E > & *collection*) [pure virtual]

Retains only the elements in this collection that are contained in the specified collection (optional operation). In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters:

collection The **Collection** (p. 1006) whose elements are to be retained.

Returns:

true if the collection changed as a result of this call.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 150).

6.145.3.12 template<typename E> virtual int decaf::util::Collection< E >::size () const [pure virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implemented in **decaf::util::ArrayList< E >** (p. 594), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1217), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1229), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1873), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2977), **decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet** (p. 1633), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet** (p. 1156), **decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet** (p. 1637), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet** (p. 1160), **decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection** (p. 1640), **decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection** (p. 1163), **decaf::util::LinkedList< E >** (p. 1900), **decaf::util::PriorityQueue< E >** (p. 2453), **decaf::util::StlList< E >** (p. 2867), **decaf::util::StlSet< E >** (p. 2898), **decaf::util::ArrayList< ServiceListener * >** (p. 594), **decaf::util::ArrayList< Pointer< ActiveMQDestination >**

> (p. 594), **decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >** (p. 1873), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1900), **decaf::util::LinkedList< CompositeTask * >** (p. 1900), **decaf::util::LinkedList< URI >** (p. 1900), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1900), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1900), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1900), **decaf::util::LinkedList< decaf::net::URI >** (p. 1900), **decaf::util::LinkedList< Pointer< Command > >** (p. 1900), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1900), **decaf::util::LinkedList< cms::Destination * >** (p. 1900), **decaf::util::LinkedList< cms::Session * >** (p. 1900), **decaf::util::LinkedList< cms::Connection * >** (p. 1900), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2898), and **decaf::util::StlSet< Resource * >** (p. 2898).

Referenced by decaf::util::AbstractList< cms::Connection * >::add(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll(), decaf::util::ArrayList< Pointer< ActiveMQDestination > >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent(), decaf::util::ArrayList< Pointer< ActiveMQDestination > >::ArrayList(), decaf::util::AbstractList< cms::Connection * >::clear(), decaf::util::concurrent::CopyOnWriteArraySet< E >::equals(), decaf::util::concurrent::CopyOnWriteArrayList< E >::equals(), decaf::util::AbstractCollection< K >::equals(), decaf::util::AbstractCollection< K >::isEmpty(), decaf::util::AbstractList< cms::Connection * >::lastIndexOf(), decaf::util::AbstractSet< K >::removeAll(), decaf::util::Collections::reverse(), and decaf::util::AbstractCollection< K >::toArray().

6.145.3.13 template<typename E> virtual std::vector<E> decaf::util::Collection< E >::toArray () const [pure virtual]

Returns an array containing all of the elements in this collection. If the collection makes any guarantees as to what order its elements are returned by its iterator, this method must return the elements in the same order.

This method acts as bridge between array-based and collection-based APIs.

Returns:

an array of the elements in this collection in the form of an STL vector.

Implemented in **decaf::util::AbstractCollection< E >** (p. 150), **decaf::util::ArrayList< E >** (p. 594), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1218), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1229), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1874), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2977), **decaf::util::LinkedList< E >** (p. 1900), **decaf::util::AbstractCollection< ServiceListener * >** (p. 150), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 150), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 150), **decaf::util::AbstractCollection< Resource * >** (p. 150), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 150), **decaf::util::AbstractCollection< CompositeTask * >** (p. 150), **decaf::util::AbstractCollection< URI >** (p. 150), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 150), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 150), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 150), **decaf::util::AbstractCollection< V >** (p. 150), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 150), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 150), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 150), **decaf::util::AbstractCollection< cms::MessageProducer**

Static Public Member Functions

- template<typename E >
  static void **reverse** (**List**< E > &list)

  *Modifies the specified **List** (p. 1902) by reversing the order of the elements.*

6.146.1 Member Function Documentation

6.146.1.1 template<typename E > static void decaf::util::Collections::reverse (List< E > & *list*) [inline, static]

Modifies the specified **List** (p. 1902) by reversing the order of the elements.

Parameters:

list The list to reverse.

Exceptions:

UnsupportedOperationException when replacing an element in the **List** (p. 1902) is not supported.

References decaf::util::List< E >::listIterator(), and decaf::util::Collection< E >::size().

6.147.1 Constructor & Destructor Documentation

6.147.1.1 virtual activemq::commands::Command::~Command () [inline, virtual]

6.147.2 Member Function Documentation

6.147.2.1 virtual int activemq::commands::Command::getCommandId () const [pure virtual]

Gets the **Command** (p. 1019) Id of this **Message** (p. 2072).

Returns:

Command (p. 1019) Id

Implemented in **activemq::commands::BaseCommand** (p. 636).

6.147.2.2 virtual bool activemq::commands::Command::isBrokerInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 637), and **activemq::commands::BrokerInfo** (p. 727).

6.147.2.3 virtual bool activemq::commands::Command::isConnectionControl () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 637), and **activemq::commands::ConnectionControl** (p. 1099).

6.147.2.4 virtual bool activemq::commands::Command::isConnectionError () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 637), and **activemq::commands::ConnectionError** (p. 1108).

6.147.2.5 virtual bool activemq::commands::Command::isConnectionInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 637), and **activemq::commands::ConnectionInfo** (p. 1133).

6.147.2.6 virtual bool activemq::commands::Command::isConsumerControl () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 637), and **activemq::commands::ConsumerControl** (p. 1166).

6.147.2.7 virtual bool activemq::commands::Command::isConsumerInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 637), and **activemq::commands::ConsumerInfo** (p. 1186).

6.147.2.8 virtual bool activemq::commands::Command::isControlCommand () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 637), and **activemq::commands::ControlCommand** (p. 1198).

6.147.2.9 virtual bool activemq::commands::Command::isDestinationInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 638).

6.147.2.10 virtual bool activemq::commands::Command::isFlushCommand () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 638), and **activemq::commands::FlushCommand** (p. 1564).

6.147.2.11 virtual bool activemq::commands::Command::isKeepAliveInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 638), and **activemq::commands::KeepAliveInfo** (p. 1835).

6.147.2.12 virtual bool activemq::commands::Command::isMessage () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 638), and **activemq::commands::Message** (p. 2083).

6.147.2.13 virtual bool activemq::commands::Command::isMessageAck () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 638), and **activemq::commands::MessageAck** (p. 2119).

6.147.2.14 virtual bool activemq::commands::Command::isMessageDispatch () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 638), and **activemq::commands::MessageDispatch** (p. 2147).

6.147.2.15 virtual bool activemq::commands::Command::isMessageDispatchNotification () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 638), and **activemq::commands::MessageDispatchNotification** (p. 2161).

6.147.2.16 virtual bool activemq::commands::Command::isMessagePull () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 638), and **activemq::commands::MessagePull** (p. 2212).

6.147.2.17 virtual bool activemq::commands::Command::isProducerAck () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 639), and **activemq::commands::ProducerAck** (p. 2458).

6.147.2.18 virtual bool activemq::commands::Command::isProducerInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 639), and **activemq::commands::ProducerInfo** (p. 2478).

6.147.2.19 virtual bool activemq::commands::Command::isRemoveInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 639), and **activemq::commands::RemoveInfo** (p. 2574).

6.147.2.20 virtual bool activemq::commands::Command::isRemoveSubscriptionInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 639), and **activemq::commands::RemoveSubscriptionInfo** (p. 2582).

6.147.2.21 virtual bool activemq::commands::Command::isReplayCommand () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 639), and **activemq::commands::ReplayCommand** (p. 2591).

6.147.2.22 virtual bool activemq::commands::Command::isResponse () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 639), and **activemq::commands::Response** (p. 2608).

6.147.2.23 virtual bool activemq::commands::Command::isResponseRequired () const [pure virtual]

Is a **Response** (p. 2606) required for this **Command** (p. 1019).

Returns:

true if a response is required.

Implemented in **activemq::commands::BaseCommand** (p. 639).

6.147.2.24 virtual bool activemq::commands::Command::isSessionInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 640).

6.147.2.25 virtual bool activemq::commands::Command::isShutdownInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 640), and **activemq::commands::ShutdownInfo** (p. 2750).

6.147.2.26 virtual bool activemq::commands::Command::isTransactionInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 640), and **activemq::commands::TransactionInfo** (p. 3108).

6.147.2.27 virtual bool activemq::commands::Command::isWireFormatInfo () const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 640), and **activemq::commands::WireFormatInfo** (p. 3239).

6.147.2.28 virtual void activemq::commands::Command::setCommandId (int *id*) [pure virtual]

Sets the **Command** (p. 1019) Id of this **Message** (p. 2072).

Parameters:

id **Command** (p. 1019) Id

Implemented in **activemq::commands::BaseCommand** (p. 640).

6.147.2.29 virtual void activemq::commands::Command::setResponseRequired (const bool *required*) [pure virtual]

Set if this **Message** (p. 2072) requires a **Response** (p. 2606).

Parameters:

required true if response is required

Implemented in **activemq::commands::BaseCommand** (p. 640).

6.147.2.30 virtual std::string activemq::commands::Command::toString () const [pure virtual]

Returns a provider-specific string that provides information about the contents of the command.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 207), **activemq::commands::ActiveMQBytesMessage** (p. 223), **activemq::commands::ActiveMQMapMessage** (p. 359), **activemq::commands::ActiveMQMessage** (p. 367), **activemq::commands::ActiveMQObjectMessage** (p. 388), **activemq::commands::ActiveMQStreamMessage** (p. 484), **activemq::commands::ActiveMQTextMessage** (p. 522), **activemq::commands::BaseCommand** (p. 641), **activemq::commands::BrokerInfo** (p. 728), **activemq::commands::ConnectionControl** (p. 1100), **activemq::commands::ConnectionError** (p. 1108), **activemq::commands::ConnectionInfo** (p. 1134), **activemq::commands::ConsumerControl** (p. 1167), **activemq::commands::ConsumerInfo** (p. 1187), **activemq::commands::ControlCommand** (p. 1198), **activemq::commands::DataArrayResponse** (p. 1240), **activemq::commands::DataResponse** (p. 1282), **activemq::commands::DestinationInfo** (p. 1386), **activemq::commands::ExceptionResponse** (p. 1468), **activemq::commands::FlushCommand** (p. 1564), **activemq::commands::IntegerResponse** (p. 1755), **activemq::commands::KeepAliveInfo** (p. 1835), **activemq::commands::Message** (p. 2086), **activemq::commands::MessageAck** (p. 2120), **activemq::commands::MessageDispatch** (p. 2148), **activemq::commands::MessageDispatchNotification** (p. 2162), **activemq::commands::MessagePull** (p. 2213), **activemq::commands::ProducerAck** (p. 2458), **activemq::commands::ProducerInfo** (p. 2479), **activemq::commands::RemoveInfo** (p. 2574), **activemq::commands::RemoveSubscriptionInfo** (p. 2583), **activemq::commands::ReplayCommand** (p. 2591), **activemq::commands::Response** (p. 2608), **activemq::commands::SessionInfo** (p. 2705), **activemq::commands::ShutdownInfo** (p. 2750), **activemq::commands::TransactionInfo** (p. 3108), and **activemq::commands::WireFormatInfo** (p. 3241).

6.147.2.31 virtual decaf::lang::Pointer<commands::Command> activemq::commands::Command::visit (activemq::state::CommandVisitor * *visitor*) [pure virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implemented in **activemq::commands::BrokerError** (p. 713), **activemq::commands::BrokerInfo** (p. 729), **activemq::commands::ConnectionControl** (p. 1101), **activemq::commands::ConnectionError** (p. 1108), **activemq::commands::ConnectionInfo** (p. 1135), **activemq::commands::ConsumerControl** (p. 1167), **activemq::commands::ConsumerInfo** (p. 1188), **activemq::commands::ControlCommand** (p. 1198), **activemq::commands::DestinationInfo** (p. 1386), **activemq::commands::FlushCommand** (p. 1564), **activemq::commands::KeepAliveInfo** (p. 1836), **activemq::commands::Message** (p. 2087), **activemq::commands::MessageAck** (p. 2120), **activemq::commands::MessageDispatch** (p. 2148), **activemq::commands::MessageDispatchNotification** (p. 2162), **activemq::commands::MessagePull** (p. 2213), **activemq::commands::ProducerAck** (p. 2458), **activemq::commands::ProducerInfo** (p. 2479), **activemq::commands::RemoveInfo** (p. 2574), **activemq::commands::RemoveSubscriptionInfo** (p. 2583), **activemq::commands::ReplayCommand** (p. 2591), **activemq::commands::Response** (p. 2608), **activemq::commands::SessionInfo** (p. 2705), **activemq::commands::ShutdownInfo** (p. 2751), **activemq::commands::TransactionInfo** (p. 3108), and **activemq::commands::WireFormatInfo** (p. 3242).

6.148.1 Detailed Description

Interface for an Object that can visit the various Command Objects that are sent from and to this client. The Commands themselves implement a `visit` method that is called with an instance of this interface and each one then call the appropriate `processXXX` method.

Since:

3.0

6.148.2 Constructor & Destructor Documentation

6.148.2.1 virtual activemq::state::CommandVisitor::~CommandVisitor () [virtual]

6.148.3 Member Function Documentation

6.148.3.1 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processBeginTransaction (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1149).

6.148.3.2 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processBrokerError (commands::BrokerError * *error*) [pure virtual]

6.148.3.3 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processBrokerInfo (commands::BrokerInfo * *info*) [pure virtual]

6.148.3.4 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processCommitTransactionOnePhase (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1150).

6.148.3.5 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processCommitTransactionTwoPhase (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1150).

6.148.3.6 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConnectionControl (commands::ConnectionControl * *control*) [pure virtual]

6.148.3.7 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConnectionError (commands::ConnectionError * *error*) [pure virtual]

6.148.3.8 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConnectionInfo (commands::ConnectionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1150).

6.148.3.9 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConsumerControl (commands::ConsumerControl * *control*) [pure virtual]

6.148.3.10 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConsumerInfo (commands::ConsumerInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1150).

6.148.3.11 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processControlCommand (commands::ControlCommand * *command*) [pure virtual]

6.148.3.12 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processDestinationInfo (commands::DestinationInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1150).

6.148.3.13 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processEndTransaction (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1150).

6.148.3.14 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processFlushCommand (commands::FlushCommand * *command*) [pure virtual]

6.148.3.15 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processForgetTransaction (commands::TransactionInfo * *info*) [pure virtual]

6.148.3.16 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processKeepAliveInfo (commands::KeepAliveInfo * *info*) [pure virtual]

6.148.3.17 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessage (commands::Message * *send*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1150).

6.148.3.18 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessageAck (commands::MessageAck * *ack*) [pure virtual]

6.148.3.19 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessageDispatch (commands::MessageDispatch * *dispatch*) [pure virtual]

6.148.3.20 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessageDispatchNotification (commands::MessageDispatchNotification * *notification*) [pure virtual]

6.148.3.21 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessagePull (commands::MessagePull * *pull*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1150).

6.148.3.22 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processPrepareTransaction (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1151).

6.148.3.23 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processProducerAck (commands::ProducerAck * *ack*) [pure virtual]

6.148.3.24 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processProducerInfo (commands::ProducerInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1151).

6.148.3.25 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRecoverTransactions (commands::TransactionInfo * *info*) [pure virtual]

6.148.3.26 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveConnection (commands::ConnectionId * *id*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1151).

6.148.3.27 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveConsumer (commands::ConsumerId * *id*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1151).

6.148.3.28 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveDestination (commands::DestinationInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1151).

6.148.3.29 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveInfo (commands::RemoveInfo * *info*) [pure virtual]

Implemented in **activemq::state::CommandVisitorAdapter** (p. 1035).

6.148.3.30 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveProducer (commands::ProducerId * *id*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1151).

6.148.3.31 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveSession (commands::SessionId * *id*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1151).

6.148.3.32 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveSubscriptionInfo (commands::RemoveSubscriptionInfo * *info*) [pure virtual]

6.148.3.33 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processReplayCommand (commands::ReplayCommand * *replay*) [pure virtual]

6.148.3.34 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processResponse (commands::Response * *response*) [pure virtual]

6.148.3.35 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRollbackTransaction (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1151).

6.148.3.36 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processSessionInfo (commands::SessionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 1152).

6.148.3.37 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processShutdownInfo (commands::ShutdownInfo * *info*) [pure virtual]

6.148.3.38 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processTransactionInfo (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::CommandVisitorAdapter** (p. 1036).

6.148.3.39 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processWireFormat (commands::WireFormatInfo * *info*) [pure virtual]

6.150 decaf::lang::Comparable< T > Class Template Reference

This interface imposes a total ordering on the objects of each class that implements it.

`#include <src/main/decaf/lang/Comparable.h>`

Public Member Functions

- virtual ~**Comparable** ()
- virtual int **compareTo** (const T &value) const =0

  Compares this object with the specified object for order.

- virtual bool **equals** (const T &value) const =0
- virtual bool **operator==** (const T &value) const =0

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const T &value) const =0

  Compares this object to another and returns true if this object is considered to be less than the one passed.

6.150.1 Detailed Description

template<typename T> class decaf::lang::Comparable< T >

This interface imposes a total ordering on the objects of each class that implements it. This ordering is referred to as the class's natural ordering, and the class's compareTo method is referred to as its natural comparison method.

6.150.2 Constructor & Destructor Documentation

6.150.2.1 template<typename T> virtual decaf::lang::Comparable< T >::~Comparable () [inline, virtual]

6.150.3 Member Function Documentation

6.150.3.1 template<typename T> virtual int decaf::lang::Comparable< T >::compareTo (const T & *value*) const [pure virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation sgn(expression) designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure sgn(x.compareTo(y)) == -sgn(y.compareTo(x)) for all x and y. (This implies that x.compareTo(y) must throw an exception iff y.compareTo(x) throws an exception.)

The implementor must also ensure that the relation is transitive: (x.compareTo(y)>0 && y.compareTo(z)>0) implies x.compareTo(z)>0.

Finally, the implementer must ensure that x.compareTo(y)==0 implies that sgn(x.compareTo(z)) == sgn(y.compareTo(z)), for all z.

It is strongly recommended, but not strictly required that (x.compareTo(y)==0) == (x.equals(y)). Generally speaking, any class that implements the **Comparable** (p. 1037) interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Implemented in **decaf::lang::Boolean** (p. 697), **decaf::lang::Byte** (p. 768), **decaf::lang::Character** (p. 916), **decaf::lang::Double** (p. 1417), **decaf::lang::Float** (p. 1534), **decaf::lang::Integer** (p. 1741), **decaf::lang::Long** (p. 1970), and **decaf::lang::Short** (p. 2723).

6.150.3.2 template<typename T> virtual bool decaf::lang::Comparable< T >::equals (const T & *value*) const [pure virtual]

Returns:

true if this value is considered equal to the passed value.

Implemented in **decaf::lang::Boolean** (p. 698), **decaf::lang::Byte** (p. 769), **decaf::lang::Character** (p. 917), **decaf::lang::Double** (p. 1419), **decaf::lang::Float** (p. 1535), **decaf::lang::Integer** (p. 1743), **decaf::lang::Long** (p. 1972), and **decaf::lang::Short** (p. 2724).

6.150.3.3 template<typename T> virtual bool decaf::lang::Comparable< T >::operator< (const T & *value*) const [pure virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implemented in **decaf::lang::Boolean** (p. 698), **decaf::lang::Byte** (p. 770), **decaf::lang::Character** (p. 919), **decaf::lang::Double** (p. 1421), **decaf::lang::Float** (p. 1537), **decaf::lang::Integer** (p. 1745), **decaf::lang::Long** (p. 1974), and **decaf::lang::Short** (p. 2725).

6.150.3.4 template<typename T> virtual bool decaf::lang::Comparable< T >::operator== (const T & *value*) const [pure virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implemented in **decaf::lang::Boolean** (p. 699), **decaf::lang::Byte** (p. 771), **decaf::lang::Character** (p. 920), **decaf::lang::Double** (p. 1421), **decaf::lang::Float** (p. 1538), **decaf::lang::Integer** (p. 1745), **decaf::lang::Long** (p. 1974), and **decaf::lang::Short** (p. 2726).

6.151 decaf::util::Comparator< T > Class Template Reference

A comparison function, which imposes a total ordering on some collection of objects.

`#include <src/main/decaf/util/Comparator.h>`

Public Member Functions

- virtual ~**Comparator** ()
- virtual bool **operator()** (const T &left, const T &right) const =0

  Implementation of the Binary function interface as a means of allowing a ***Comparator*** *(p. 1040) to be passed to an STL* ***Map*** *(p. 2008) for use as the sorting criteria.*

- virtual int **compare** (const T &o1, const T &o2) const =0

  Compares its two arguments for order.

6.151.1 Detailed Description

template<typename T> class decaf::util::Comparator< T >

A comparison function, which imposes a total ordering on some collection of objects. Comparators can be passed to a sort method (such as Collections.sort) to allow precise control over the sort order. Comparators can also be used to control the order of certain data structures.

The ordering imposed by a **Comparator** (p. 1040) c on a set of elements S is said to be consistent with equals if and only if (compare(e1, e2) == 0) has the same boolean value as (e1 == e2) for every e1 and e2 in S.

Since:

1.0

6.151.2 Constructor & Destructor Documentation

6.151.2.1 template<typename T> virtual decaf::util::Comparator< T >::~Comparator () [inline, virtual]

6.151.3 Member Function Documentation

6.151.3.1 template<typename T> virtual int decaf::util::Comparator< T >::compare (const T & *o1*, const T & *o2*) const [pure virtual]

Compares its two arguments for order. Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that sgn(compare(x, y)) == -sgn(compare(y, x)) for all x and y. (This implies that compare(x, y) must throw an exception if and only if compare(y, x) throws an exception.)

The implementor must also ensure that the relation is transitive: ((compare(x, y)>0) && (compare(y, z)>0)) implies compare(x, z)>0.

Finally, the implementer must ensure that compare(x, y)==0 implies that sgn(compare(x, z))==sgn(compare(y, z)) for all z.

It is generally the case, but not strictly required that (compare(x, y)==0) == (x == y)). Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters:

o1 The first object to be compared

o2 The second object to be compared

Returns:

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implemented in **decaf::util::comparators::Less< E >** (p. 1855).

6.151.3.2 template<typename T> virtual bool decaf::util::Comparator< T >::operator() (const T & *left*, const T & *right*) const [pure virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1040) to be passed to an STL **Map** (p. 2008) for use as the sorting criteria.

Parameters:

left The Left hand side operand.

right The Right hand side operand.

Returns:

true if the vale of left is less than the value of right.

Implemented in **decaf::util::comparators::Less< E >** (p. 1856).

6.152 decaf::internal::util::concurrent::CompletionCondition Class Reference

`#include <src/main/decaf/internal/util/concurrent/ThreadingTypes.h>`

Public Member Functions

- virtual ~**CompletionCondition** ()
- virtual bool **operator()** (bool timedOut DECAF_UNUSED)

  Called from timed wait condition methods to indicate if the timeout has occurred, allows this method to take other actions based on the timeout having occurred or not.

- virtual bool **operator()** ()

  Called from non-timed wait conditions to determine if the condition necessary to complete the wait has occurred or not.

6.152.1 Constructor & Destructor Documentation

6.152.1.1 virtual decaf::internal::util::concurrent::CompletionCondition::~CompletionCondition () [inline, virtual]

6.152.2 Member Function Documentation

6.152.2.1 virtual bool decaf::internal::util::concurrent::CompletionCondition::operator() () [inline, virtual]

Called from non-timed wait conditions to determine if the condition necessary to complete the wait has occurred or not.

Referenced by operator()().

6.152.2.2 virtual bool decaf::internal::util::concurrent::CompletionCondition::operator() (bool timedOut *DECAF_UNUSED*) [inline, virtual]

Called from timed wait condition methods to indicate if the timeout has occurred, allows this method to take other actions based on the timeout having occurred or not. By default this method just defers to the simple operator() method.

Parameters:

timedOut Indicates that the calling wait condition timed out or not.

References operator()().

6.155 activemq::threads::CompositeTaskRunner Class Reference

A **Task** (p. 2989) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.

`#include <src/main/activemq/threads/CompositeTaskRunner.h>`Inheritance diagram for activemq::threads::CompositeTaskRunner:

Public Member Functions

- **CompositeTaskRunner** ()
- virtual ~**CompositeTaskRunner** ()
- virtual void **start** ()

  Starts the task runner.

- virtual bool **isStarted** () const

  true if the start method has been called.

- void **addTask** (**CompositeTask** *task)

  *Adds a new **CompositeTask** (p. 1045) to the Set of Tasks that this class manages.*

- void **removeTask** (**CompositeTask** *task)

  *Removes a **CompositeTask** (p. 1045) that was added previously.*

- virtual void **shutdown** (long long timeout)

  Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

- virtual void **shutdown** ()

  Shutdown once the task has finished and the TaskRunner's thread has exited.

- virtual void **wakeup** ()

  *Signal the **TaskRunner** (p. 2990) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2989) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.

- virtual bool **iterate** ()

  Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.155.1 Detailed Description

A **Task** (p. 2989) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.

Since:

3.0

6.155.2 Constructor & Destructor Documentation

6.155.2.1 activemq::threads::CompositeTaskRunner::CompositeTaskRunner ()

6.155.2.2 virtual activemq::threads::CompositeTaskRunner::~CompositeTaskRunner () [virtual]

6.155.3 Member Function Documentation

6.155.3.1 void activemq::threads::CompositeTaskRunner::addTask (CompositeTask * *task*)

Adds a new **CompositeTask** (p. 1045) to the Set of Tasks that this class manages.

Parameters:

task - Pointer to a **CompositeTask** (p. 1045) instance.

6.155.3.2 virtual bool activemq::threads::CompositeTaskRunner::isStarted () const [virtual]

true if the start method has been called.

Implements **activemq::threads::TaskRunner** (p. 2990).

6.155.3.3 virtual bool activemq::threads::CompositeTaskRunner::iterate () [protected, virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns:

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implements **activemq::threads::Task** (p. 2989).

6.155.3.4 void activemq::threads::CompositeTaskRunner::removeTask (CompositeTask * *task*)

Removes a **CompositeTask** (p. 1045) that was added previously.

Parameters:

task - Pointer to a **CompositeTask** (p. 1045) instance.

6.155.3.5 virtual void activemq::threads::CompositeTaskRunner::run () [protected, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2622).

6.155.3.6 virtual void activemq::threads::CompositeTaskRunner::shutdown () [virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implements **activemq::threads::TaskRunner** (p. 2990).

6.155.3.7 virtual void activemq::threads::CompositeTaskRunner::shutdown (long long *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters:

timeout - Time in Milliseconds to wait for the task to stop.

Implements **activemq::threads::TaskRunner** (p. 2991).

6.155.3.8 virtual void activemq::threads::CompositeTaskRunner::start () [virtual]

Starts the task runner. Prior to call this method tasks can be added to a Runner, but no executions will occur. The start method will create the background Thread(s) which do the work for this task runner.

Implements **activemq::threads::TaskRunner** (p. 2991).

6.155.3.9 virtual void activemq::threads::CompositeTaskRunner::wakeup () [virtual]

Signal the **TaskRunner** (p. 2990) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2989) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 2991).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**CompositeTaskRunner.h**

6.156 activemq::transport::CompositeTransport Class Reference

A Composite **Transport** (p. 3125) is a **Transport** (p. 3125) implementation that is composed of several Transports.

`#include <src/main/activemq/transport/CompositeTransport.h>`Inheritance diagram for activemq::transport::CompositeTransport:

Public Member Functions

- virtual ~**CompositeTransport** ()
- virtual void **addURI** (bool rebalance, const **List**< **URI** > &uris)=0

  *Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3125) is a composite of.*

- virtual void **removeURI** (bool rebalance, const **List**< **URI** > &uris)=0

  *Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3125) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3125) should result in that **Transport** (p. 3125) being disposed of.*

6.156.1 Detailed Description

A Composite **Transport** (p. 3125) is a **Transport** (p. 3125) implementation that is composed of several Transports. The composition could be such that only one **Transport** (p. 3125) exists for each URI that is composed or there could be many active Transports working at once.

Since:

3.0

6.156.2 Constructor & Destructor Documentation

6.156.2.1 virtual activemq::transport::CompositeTransport::~CompositeTransport () [virtual]

6.156.3 Member Function Documentation

6.156.3.1 virtual void activemq::transport::CompositeTransport::addURI (bool *rebalance*, const List< URI > & *uris*) [pure virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3125) is a composite of.

Parameters:

rebalance Indicates if the addition should cause a forced reconnect or not.

uris The new URI set to add to the set this composite maintains.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1493).

6.156.3.2 virtual void activemq::transport::CompositeTransport::removeURI (bool *rebalance*, const List< URI > & *uris*) [pure virtual]

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3125) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3125) should result in that **Transport** (p. 3125) being disposed of.

Parameters:

rebalance Indicates if the removal should cause a forced reconnect or not.

uris The new URI set to remove to the set this composite maintains.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1500).

Public Member Functions

- virtual ~**ConcurrentMap** ()
- virtual bool **putIfAbsent** (const K &key, const V &value)=0

  If the specified key is not already associated with a value, associate it with the given value.

- virtual bool **remove** (const K &key, const V &value)=0

  Remove entry for key only if currently mapped to given value.

- virtual bool **replace** (const K &key, const V &oldValue, const V &newValue)=0

  Replace entry for key only if currently mapped to given value.

- virtual V **replace** (const K &key, const V &value)=0

  Replace entry for key only if currently mapped to some value.

6.158.1 Detailed Description

template<typename K, typename V> class decaf::util::concurrent::ConcurrentMap< K, V >

Interface for a **Map** (p. 2008) type that provides additional **atomic** (p. 133) putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 2008) interface.

Since:

1.0

6.158.2 Constructor & Destructor Documentation

6.158.2.1 template<typename K, typename V> virtual decaf::util::concurrent::ConcurrentMap< K, V >::~ConcurrentMap () [inline, virtual]

6.158.3 Member Function Documentation

6.158.3.1 template<typename K, typename V> virtual bool decaf::util::concurrent::ConcurrentMap< K, V >::putIfAbsent (const K & *key*, const V & *value*) [pure virtual]

If the specified key is not already associated with a value, associate it with the given value. This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key The key to map the value to.

value The value to map to the given key.

Returns:

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions:

UnsupportedOperationException if the put operation is not supported by this map

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1071), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1071), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1071), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1071), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1071).

6.158.3.2 template<typename K, typename V> virtual bool decaf::util::concurrent::ConcurrentMap< K, V >::remove (const K & *key*, const V & *value*) [pure virtual]

Remove entry for key only if currently mapped to given value. Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == value ) ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

value value associated with the specified key.

Returns:

true if the value was removed, false otherwise

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1072), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1072), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1072), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1072), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1072).

6.158.3.3 template<typename K, typename V> virtual V decaf::util::concurrent::ConcurrentMap< K, V >::replace (const K & *key*, const V & *value*) [pure virtual]

Replace entry for key only if currently mapped to some value. Acts as

```
if( ( map.containsKey( key ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException (p. 2260)(...);
};
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

value value to be associated with the specified key.

Returns:

copy of the previous value associated with specified key, or throws an **NoSuchElementException** (p. 2260) if there was no mapping for key.

Exceptions:

NoSuchElementException *(*p. *2260)* if there was no previous mapping.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1073), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1073), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1073), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1073), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1073).

6.158.3.4 template<typename K, typename V> virtual bool decaf::util::concurrent::ConcurrentMap< K, V >::replace (const K & *key*, const V & *oldValue*, const V & *newValue*) [pure virtual]

Replace entry for key only if currently mapped to given value. Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == oldValue  ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

oldValue value expected to be associated with the specified key.

newValue value to be associated with the specified key.

Returns:

true if the value was replaced

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1073), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1073), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1073), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1073), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1073).

6.159.1 Constructor & Destructor Documentation

6.159.1.1 decaf::util::ConcurrentModificationException::ConcurrentModificationException ()

Default Constructor.

6.159.1.2 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.159.1.3 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const ConcurrentModificationException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.159.1.4 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.159.1.5 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.159.1.6 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.159.1.7 virtual decaf::util::ConcurrentModificationException::~ConcurrentModificationException () throw () [virtual]

6.159.2 Member Function Documentation

6.159.2.1 virtual ConcurrentModificationException* decaf::util::ConcurrentModificationException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::RuntimeException** (p. 2628).

The documentation for this class was generated from the following file:

Public Member Functions

- **ConcurrentStlMap** ()

  Default constructor - does nothing.

- **ConcurrentStlMap** (const **ConcurrentStlMap** &source)

  Copy constructor - copies the content of the given map into this one.

- **ConcurrentStlMap** (const **Map**< K, V > &source)

  Copy constructor - copies the content of the given map into this one.

- virtual ~**ConcurrentStlMap** ()
- virtual bool **equals** (const **ConcurrentStlMap** &source) const

  Compares the specified object with this map for equality.
  *Returns true if the two maps represent the same mappings. More formally, two maps m1 and m2 represent the same mappings if m1.entrySet().equals(m2.entrySet()). This ensures that the equals method works properly across different implementations of the **Map** (p. 2008) interface.*

  Parameters:

  source *__Map__ (p. 2008) to compare to this one.*

  Returns:

  true if the __Map__ (p. 2008) passed is equal in value to this one.

- virtual bool **equals** (const **Map**< K, V > &source) const
- virtual void **copy** (const **ConcurrentStlMap** &source)

  Copies the content of the source map into this map.
  *Erases all existing mappings in this map. The copy is performed by using the entrySet of the source **Map** (p. 2008) and iterating over those entries, inserting each into the target.*
  Parameters:

  source *The source object to copy from.*

- virtual void **copy** (const **Map**< K, V > &source)
- virtual void **clear** ()

  Removes all of the mappings from this map (optional operation).
  The map will be empty after this call returns.
  Exceptions:

  UnsupportedOperationException *if the clear operation is not supported by this map.*

- virtual bool **containsKey** (const K &key) const

  Returns true if this map contains a mapping for the specified key.
  More formally, returns true if and only if this map contains a mapping for a key k such that (key == k). (There can be at most one such mapping.)
  Parameters:

  key *The key to look up.*
  Returns:

  true if this map contains the key mapping, otherwise false.

- virtual bool **containsValue** (const V &value) const

  Returns true if this map maps one or more keys to the specified value.
  *More formally, returns true if and only if this map contains at least one mapping to a value v such that (value==v). This operation will probably require time linear in the map size for most implementations of the **Map** (p. 2008) interface.*
  Parameters:

  value *The Value to look up in this **Map** (p. 2008).*
  Returns:

  true if this map contains at least one mapping for the value, otherwise false.

- virtual bool **isEmpty** () const

  Returns:

  *if the **Map** (p. 2008) contains any element or not, TRUE or FALSE*

- virtual int **size** () const

  Returns:

  The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key)

  *Gets the value mapped to the specified key in the **Map** (p. 2008).*
  *If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.*
  Parameters:

  key *The search key whose value should be returned if present.*

Returns:

A reference to the value for the given key if present in the ***Map*** *(p. 2008).*

Exceptions:

NoSuchElementException *(p. 2260) if the key requests doesn't exist in the* ***Map*** *(p. 2008).*

- virtual const V & **get** (const K &key) const

Gets the value mapped to the specified key in the ***Map*** *(p. 2008).*
If there is no element in the map whose key is equivalent to the key provided then a ***NoSuchElementException*** *(p. 2260) is thrown.*

Parameters:

key *The search key whose value should be returned if present.*

Returns:

A const reference to the value for the given key if present in the ***Map*** *(p. 2008).*

Exceptions:

NoSuchElementException *(p. 2260) if the key requests doesn't exist in the* ***Map*** *(p. 2008).*

- virtual bool **put** (const K &key, const V &value)

Associates the specified value with the specified key in this map (optional operation).
If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

Parameters:

key *The target key.*
value *The value to be set.*

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException *if this map is unmodifiable.*
IllegalArgumentException *if some property of the specified key or value prevents it from being stored in this map*

- virtual bool **put** (const K &key, const V &value, V &oldValue)

Associates the specified value with the specified key in this map (optional operation).
If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)
This method accepts a reference to a value which will be assigned the previous value for the given key (if any). If there was no previous mapping for the given key the out value is not written to. A return of true indicates that a value was replaced by this put operation.

Parameters:

key *The target key.*
value *The value to be set.*
oldValue *(out) The value previously held in the mapping for this key. .*

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException *if this map is unmodifiable.*

IllegalArgumentException *if some property of the specified key or value prevents it from being stored in this map*

- virtual void **putAll** (const **ConcurrentStlMap**< K, V, COMPARATOR > &other)

  Copies all of the mappings from the specified map to this map (optional operation).
  The effect of this call is equivalent to that of calling put(k, v) on this map once for each mapping from key k to value v in the specified map. The behavior of this operation is undefined if the specified map is modified while the operation is in progress.

  Parameters:

  other *A* ***Map*** (p. *2008*) *instance whose elements are to all be inserted in this* ***Map*** (p. *2008*).

  Exceptions:

  UnsupportedOperationException *If the implementing class does not support the putAll operation.*

- virtual void **putAll** (const **Map**< K, V > &other)

- virtual V **remove** (const K &key)

  Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.
  Care must be taken when using this operation as it will throw an exception if there is no mapping for the given key.

  Parameters:

  key *The search key whose mapping is to be removed.*

  Returns:

  a copy of the element that was previously mapped to the given key.

  Exceptions:

  NoSuchElementException (p. ***2260***) *if this key is not in the* ***Map*** (p. *2008*).
  UnsupportedOperationException *if this map is unmodifiable.*

- bool **putIfAbsent** (const K &key, const V &value)

  If the specified key is not already associated with a value, associate it with the given value.

- bool **remove** (const K &key, const V &value)

  Remove entry for key only if currently mapped to given value.

- bool **replace** (const K &key, const V &oldValue, const V &newValue)

  Replace entry for key only if currently mapped to given value.

- V **replace** (const K &key, const V &value)

  Replace entry for key only if currently mapped to some value.

- virtual **Set**< **MapEntry**< K, V > > & **entrySet** ()

  Returns a ***Set*** (p. *2715*) *view of the mappings contained in this map.*

- virtual const **Set**< **MapEntry**< K, V > > & **entrySet** () const
- virtual **Set**< K > & **keySet** ()

  Returns a ***Set*** (p. *2715*) *view of the keys contained in this map.*

- virtual const **Set**< K > & **keySet** () const
- virtual **Collection**< V > & **values** ()

  *Returns a **Collection** (p. 1006) view of the values contained in this map.*

- virtual const **Collection**< V > & **values** () const
- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  *Attempts to **Lock** (p. 1924) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.160.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>> class decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >

Map (p. 2008) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map. This version of **Map** (p. 2008) extends the **ConcurrentMap** (p. 1052) inteface and implements all the methods defined in that interface. Unlike a Java **ConcurrentHashMap** (p. 1051) this implementations synchronizes all methods such that any call to this class will block if another thread is already holding a lock, much like the Java HashTable.

Since:

1.0

6.160.2 Constructor & Destructor Documentation

6.160.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::ConcurrentStlMap () [inline]

Default constructor - does nothing.

6.160.2.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::ConcurrentStlMap (const ConcurrentStlMap< K, V, COMPARATOR > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source map.

6.160.2.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::ConcurrentStlMap (const Map< K, V > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source map.

6.160.2.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::~ConcurrentStlMap () [inline, virtual]

6.160.3 Member Function Documentation

6.160.3.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::clear () [inline, virtual]

Removes all of the mappings from this map (optional operation).

The map will be empty after this call returns.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this map.

Implements **decaf::util::Map< K, V >** (p. 2010).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy().

6.160.3.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::containsKey (const K & *key*) const [inline, virtual]

Returns true if this map contains a mapping for the specified key.

More formally, returns true if and only if this map contains a mapping for a key k such that (key == k). (There can be at most one such mapping.)

Parameters:

key The key to look up.

Returns:

true if this map contains the key mapping, otherwise false.

Implements **decaf::util::Map< K, V >** (p. 2011).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::put(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::remove(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace().

6.160.3.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::containsValue (const V & *value*) const [inline, virtual]

Returns true if this map maps one or more keys to the specified value.

More formally, returns true if and only if this map contains at least one mapping to a value v such that (value==v). This operation will probably require time linear in the map size for most implementations of the **Map** (p. 2008) interface.

Parameters:

value The Value to look up in this **Map** (p. 2008).

Returns:

true if this map contains at least one mapping for the value, otherwise false.

Implements **decaf::util::Map< K, V >** (p. 2011).

6.160.3.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::copy (const Map< K, V > & *source*) [inline, virtual]

6.160.3.5 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::copy (const ConcurrentStlMap< K, V, COMPARATOR > & *source*) [inline, virtual]

Copies the content of the source map into this map.

Erases all existing mappings in this map. The copy is performed by using the entrySet of the source **Map** (p. 2008) and iterating over those entries, inserting each into the target.

Parameters:

source The source object to copy from.

Implements **decaf::util::Map< K, V >** (p. 2012).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::ConcurrentStlMap().

6.160.3.6 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const Set< MapEntry<K, V> >& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::entrySet () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2012).

6.160.3.7 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual Set< MapEntry<K, V> >& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::entrySet () [inline, virtual]

Returns a **Set** (p. 2715) view of the mappings contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Set.remove** (p. 1013), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns:

a reference to a **Set** (p. 2715)<MapEntry<K,V>> that is backed by this **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2012).

6.160.3.8 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::equals (const Map< K, V > & *source*) const [inline, virtual]

6.160.3.9 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::equals (const ConcurrentStlMap< K, V, COMPARATOR > & *source*) const [inline, virtual]

Compares the specified object with this map for equality.

Returns true if the two maps represent the same mappings. More formally, two maps m1 and m2 represent the same mappings if m1.entrySet().equals(m2.entrySet()). This ensures that the equals method works properly across different implementations of the **Map** (p. 2008) interface.

Parameters:

source **Map** (p. 2008) to compare to this one.

Returns:

true if the **Map** (p. 2008) passed is equal in value to this one.

Implements **decaf::util::Map< K, V >** (p. 2013).

6.160.3.10 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::get (const K & *key*) const [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 2008).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.

Parameters:

key The search key whose value should be returned if present.

Returns:

A const reference to the value for the given key if present in the **Map** (p. 2008).

Exceptions:

NoSuchElementException *(p. 2260)* if the key requests doesn't exist in the **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2014).

6.160.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::get (const K & *key*) [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 2008).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.

Parameters:

key The search key whose value should be returned if present.

Returns:

A reference to the value for the given key if present in the **Map** (p. 2008).

Exceptions:

NoSuchElementException *(p. 2260)* if the key requests doesn't exist in the **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2014).

6.160.3.12 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::isEmpty () const [inline, virtual]

Returns:

if the **Map** (p. 2008) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V >** (p. 2015).

6.160.3.13 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const Set<K>& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::keySet () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2015).

6.160.3.14 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual Set<K>& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::keySet () [inline, virtual]

Returns a **Set** (p. 2715) view of the keys contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation), the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Set.remove** (p. 1013), removeAll, retainAll, and clear operations. It does not support the add or addAll operations.

Returns:

a set view of the keys contained in this map,

Implements **decaf::util::Map< K, V >** (p. 2016).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals().

6.160.3.15 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

6.160.3.16 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.160.3.17 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.160.3.18 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::put (const K & *key*, const V & *value*, V & *oldValue*) [inline, virtual]

Associates the specified value with the specified key in this map (optional operation).

If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

This method accepts a reference to a value which will be assigned the previous value for the given key (if any). If there was no previous mapping for the given key the out value is not written to. A return of true indicates that a value was replaced by this put operation.

Parameters:

key The target key.

value The value to be set.

oldValue (out) The value previously held in the mapping for this key. .

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

IllegalArgumentException if some property of the specified key or value prevents it from being stored in this map

Implements **decaf::util::Map< K, V >** (p. 2017).

6.160.3.19 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::put (const K & *key*, const V & *value*) [inline, virtual]

Associates the specified value with the specified key in this map (optional operation).

If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

Parameters:

key The target key.

value The value to be set.

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

IllegalArgumentException if some property of the specified key or value prevents it from being stored in this map

Implements **decaf::util::Map< K, V >** (p. 2017).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace().

6.160.3.20 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putAll (const Map< K, V > & *other*) [inline, virtual]

6.160.3.21 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putAll (const ConcurrentStlMap< K, V, COMPARATOR > & *other*) [inline, virtual]

Copies all of the mappings from the specified map to this map (optional operation).

The effect of this call is equivalent to that of calling put(k, v) on this map once for each mapping from key k to value v in the specified map. The behavior of this operation is undefined if the specified map is modified while the operation is in progress.

Parameters:

other A **Map** (p. 2008) instance whose elements are to all be inserted in this **Map** (p. 2008).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implements **decaf::util::Map< K, V >** (p. 2018).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy().

6.160.3.22 template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putIfAbsent (const K & *key*, const V & *value*) [inline, virtual]

If the specified key is not already associated with a value, associate it with the given value. This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key The key to map the value to.

value The value to map to the given key.

Returns:

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions:

UnsupportedOperationException if the put operation is not supported by this map

Implements **decaf::util::concurrent::ConcurrentMap< K, V >** (p. 1053).

6.160.3.23 template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::remove (const K & *key*, const V & *value*) [inline, virtual]

Remove entry for key only if currently mapped to given value. Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == value ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

value value associated with the specified key.

Returns:

true if the value was removed, false otherwise

Implements **decaf::util::concurrent::ConcurrentMap< K, V >** (p. 1053).

6.160.3.24 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::remove (const K & *key*) [inline, virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Care must be taken when using this operation as it will throw an exception if there is no mapping for the given key.

Parameters:

key The search key whose mapping is to be removed.

Returns:

a copy of the element that was previously mapped to the given key.

Exceptions:

NoSuchElementException *(p. 2260)* if this key is not in the **Map** (p. 2008).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V >** (p. 2018).

6.160.3.25 template<typename K, typename V, typename COMPARATOR = std::less<K>> V decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::replace (const K & *key*, const V & *value*) [inline, virtual]

Replace entry for key only if currently mapped to some value. Acts as

```
if( map.containsKey( key ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException (p. 2260)(...);
};
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

value value to be associated with the specified key.

Returns:

copy of the previous value associated with specified key, or throws an **NoSuchElementException** (p. 2260) if there was no mapping for key.

Exceptions:

NoSuchElementException *(p. 2260)* if there was no previous mapping.

Implements **decaf::util::concurrent::ConcurrentMap< K, V >** (p. 1054).

6.160.3.26 template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::replace (const K & *key*, const V & *oldValue*, const V & *newValue*) [inline, virtual]

Replace entry for key only if currently mapped to given value. Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

oldValue value expected to be associated with the specified key.

newValue value to be associated with the specified key.

Returns:

true if the value was replaced

Implements **decaf::util::concurrent::ConcurrentMap< K, V >** (p. 1055).

6.160.3.27 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual int decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::size () const [inline, virtual]

Returns:

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V >** (p. 2019).

6.160.3.28 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::tryLock () [inline, virtual]

Attempts to **Lock** (p. 1924) the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.160.3.29 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.160.3.30 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const Collection<V>& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::values () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2020).

6.160.3.31 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual Collection<V>& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::values () [inline, virtual]

Returns a **Collection** (p. 1006) view of the values contained in this map. The collection is backed by the map, so changes to the map are reflected in the collection, and vice-versa. If the map is modified while an iteration over the collection is in progress (except through the iterator's own remove operation), the results of the iteration are undefined. The collection supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Collection.remove** (p. 1013), removeAll, retainAll and clear operations. It does not support the add or addAll operations. For the const version of this method the **Collection** (p. 1006) can only be used as a view into the **Map** (p. 2008).

Returns:

a collection view of the values contained in this map.

Implements **decaf::util::Map< K, V >** (p. 2020).

6.160.3.32 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.160.3.33 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.160.3.34 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

6.161.1 Detailed Description

Condition (p. 1077) factors out the **Mutex** (p. 2236) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1926) implementations. Where a **Lock** (p. 1926) replaces the use of synchronized statements, a **Condition** (p. 1077) replaces the use of the Object monitor methods.

Conditions (also known as condition queues or condition variables) provide a means for one thread to suspend execution (to "wait") until notified by another thread that some state condition may now be true. Because access to this shared state information occurs in different threads, it must be protected, so a lock of some form is associated with the condition. The key property that waiting for a condition provides is that it atomically releases the associated lock and suspends the current thread.

A **Condition** (p. 1077) instance is intrinsically bound to a lock. To obtain a **Condition** (p. 1077) instance for a particular **Lock** (p. 1926) instance use its newCondition() method.

As an example, suppose we have a bounded buffer which supports put and take methods. If a take is attempted on an empty buffer, then the thread will block until an item becomes available; if a put is attempted on a full buffer, then the thread will block until a space becomes available. We would like to keep waiting put threads and take threads in separate wait-sets so that we can use the optimization of only notifying a single thread at a time when items or spaces become available in the buffer. This can be achieved using two **Condition** (p. 1077) instances.

class BoundedBuffer { Lock* lock = new ReentrantLock(); Condition* notFull = lock->newCondition(); Condition* notEmpty = lock->newCondition();

Object* items = new Object[100]; int putptr, takeptr, count;

public void put(Object* x) { lock->lock(); try { while(count == 100) notFull->**await()** (p. 1079); items[putptr] = x; if (++putptr == 100) putptr = 0; ++count; notEmpty->**signal()** (p. 1082); } catch(...) { lock->unlock(); } }

public Object take() { lock->lock(); try { while(count == 0) notEmpty->**await()** (p. 1079); Object x = items[takeptr]; if (++takeptr == 100) takeptr = 0; --count; notFull->**signal()** (p. 1082); return x; } catch(...) { lock->unlock(); } } }

(The ArrayBlockingQueue class provides this functionality, so there is no reason to implement this sample usage class.)

Implementation Considerations

When waiting upon a **Condition** (p. 1077), a "spurious wakeup" is permitted to occur, in general, as a concession to the underlying platform semantics. This has little practical impact on most application programs as a **Condition** (p. 1077) should always be waited upon in a loop, testing the state predicate that is being waited for. An implementation is free to remove the possibility of spurious wakeups but it is recommended that applications programmers always assume that they can occur and so always wait in a loop.

The three forms of condition waiting (interruptible, non-interruptible, and timed) may differ in their ease of implementation on some platforms and in their performance characteristics. In particular, it may be difficult to provide these features and maintain specific semantics such as ordering guarantees. Further, the ability to interrupt the actual suspension of the thread may not always be feasible to implement on all platforms.

Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of waiting, nor is it required to support interruption of the actual suspension of the thread.

An implementation is required to clearly document the semantics and guarantees provided by each of the waiting methods, and when an implementation does support interruption of thread suspension then it must obey the interruption semantics as defined in this interface.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since:

1.0

6.161.2 Constructor & Destructor Documentation

6.161.2.1 virtual decaf::util::concurrent::locks::Condition::~Condition () [virtual]

6.161.3 Member Function Documentation

6.161.3.1 virtual bool decaf::util::concurrent::locks::Condition::await (long long *time*, const TimeUnit & *unit*) [pure virtual]

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses. This method is behaviorally equivalent to:

awaitNanos(unit.toNanos(time)) > 0

Parameters:

time - the maximum time to wait

unit - the time unit of the time argument

Returns:

false if the waiting time detectably elapsed before return from the method, else true

Exceptions:

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1077).

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

6.161.3.2 virtual void decaf::util::concurrent::locks::Condition::await () [pure virtual]

Causes the current thread to wait until it is signaled or interrupted. The lock associated with this **Condition** (p. 1077) is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

∗ Some other thread invokes the **signal()** (p. 1082) method for this **Condition** (p. 1077) and the current thread happens to be chosen as the thread to be awakened; or ∗ Some other thread invokes the **signalAll()** (p. 1082) method for this **Condition** (p. 1077); or ∗ Some other thread interrupts the current thread, and interruption of thread suspension is supported; or ∗ A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting and interruption of thread suspension is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1077) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as IllegalMonitorStateException) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal. In that case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Exceptions:

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1077).

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

6.161.3.3 virtual long long decaf::util::concurrent::locks::Condition::awaitNanos (long long *nanosTimeout*) [pure virtual]

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses. The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of five things happens:

∗ Some other thread invokes the **signal()** (p. 1082) method for this **Condition** (p. 1077) and the current thread happens to be chosen as the thread to be awakened; or ∗ Some other thread invokes the **signalAll()** (p. 1082) method for this **Condition** (p. 1077); or ∗ Some other thread interrupts the current thread, and interruption of thread suspension is supported; or ∗ The specified waiting time elapses; or ∗ A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting and interruption of thread suspension is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

The method returns an estimate of the number of nanoseconds remaining to wait given the supplied nanosTimeout value upon return, or a value less than or equal to zero if it timed out. This value can be used to determine whether and how long to re-wait in cases where the wait returns but an awaited condition still does not hold. Typical uses of this method take the following form:

synchronized boolean aMethod(long timeout, const TimeUnit& unit) { long nanosTimeout = unit.toNanos(timeout); while (!conditionBeingWaitedFor) { if (nanosTimeout > 0) nanosTimeout = theCondition->awaitNanos(nanosTimeout); else return false; } // ... }

Design note: This method requires a nanosecond argument so as to avoid truncation errors in reporting remaining times. Such precision loss would make it difficult for programmers to ensure that total waiting times are not systematically shorter than specified when re-waits occur.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1077) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as IllegalMonitorStateException) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal, or over indicating the elapse of the specified waiting time. In either case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Parameters:

nanosTimeout - the maximum time to wait, in nanoseconds

Returns:

an estimate of the nanosTimeout value minus the time spent waiting upon return from this method. A positive value may be used as the argument to a subsequent call to this method to finish waiting out the desired time. A value less than or equal to zero indicates that no time remains.

Exceptions:

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1077).

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

6.161.3.4 virtual void decaf::util::concurrent::locks::Condition::awaitUninterruptibly () [pure virtual]

Causes the current thread to wait until it is signalled. The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

∗ Some other thread invokes the **signal()** (p. 1082) method for this **Condition** (p. 1077) and the current thread happens to be chosen as the thread to be awakened; or ∗ Some other thread invokes the **signalAll()** (p. 1082) method for this **Condition** (p. 1077); or ∗ A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread's interrupted status is set when it enters this method, or it is interrupted while waiting, it will continue to wait until signalled. When it finally returns from this method its interrupted status will still be set.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1077) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as IllegalMonitorStateException) and the implementation must document that fact.

Exceptions:

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1077).

IllegalMonitorStateException if the caller is not the lock owner.

6.161.3.5 virtual bool decaf::util::concurrent::locks::Condition::awaitUntil (const Date & *deadline*) [pure virtual]

6.161.3.6 virtual void decaf::util::concurrent::locks::Condition::signal () [pure virtual]

Wakes up one waiting thread. If any threads are waiting on this condition then one is selected for waking up. That thread must then re-acquire the lock before returning from await.

Exceptions:

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1077).

6.161.3.7 virtual void decaf::util::concurrent::locks::Condition::signalAll () [pure virtual]

Wakes up all waiting threads. If any threads are waiting on this condition then they are all woken up. Each thread must re-acquire the lock before it can return from await.

Exceptions:

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1077).

6.162.3 Member Function Documentation

6.162.3.1 virtual Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::AbstractQueuedSynchronizer::ConditionObject::getWaitingTh() const [protected, pure virtual]

Retrieves a new **Collection** (p. 1006) object that contains Threads that may be waiting on this **Condition** (p. 1077) object.

Returns:

new **Collection** (p. 1006) object that holds possible waiters. Caller owns.

6.162.3.2 virtual int decaf::util::concurrent::locks::AbstractQueuedSynchronizer::ConditionObject::getWaitQueue() const [protected, pure virtual]

Calculates and returns an estimate of the number of Threads that are waiting on this **Condition** (p. 1077) object.

Returns:

count of the estimated number of waiting threads.

6.162.3.3 virtual bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::ConditionObject::hasWaiters() const [protected, pure virtual]

Returns true if there are any waiters on this **Condition** (p. 1077) object at the time of its calling.

Returns:

true if there are currently waiters false otherwise.

6.162.3.4 virtual bool decaf::util::concurrent::locks::AbstractQueuedSynchronizer::ConditionObject::isOwnedBy(const AbstractQueuedSynchronizer * *sync*) const [protected, pure virtual]

Used to check on the ownership status of this **ConditionObject** (p. 1083).

Returns:

true if the **ConditionObject** (p. 1083) is owned by the given **AbstractQueuedSynchronizer** (p. 179)

6.162.4 Friends And Related Function Documentation

6.162.4.1 friend class AbstractQueuedSynchronizer [friend]

6.163 decaf::net::ConnectException Class Reference

`#include <src/main/decaf/net/ConnectException.h>`Inheritance diagram for decaf::net::ConnectException:

Public Member Functions

- **ConnectException** ()

  Default Constructor.

- **ConnectException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **ConnectException** (const **ConnectException** &ex)

  Copy Constructor.

- **ConnectException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **ConnectException** (const std::exception *cause)

  Constructor.

- **ConnectException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **ConnectException** * **clone** () const

  Clones this exception.

- virtual ~**ConnectException** () throw ()

6.163.1 Constructor & Destructor Documentation

6.163.1.1 decaf::net::ConnectException::ConnectException ()

Default Constructor.

6.163.1.2 decaf::net::ConnectException::ConnectException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.163.1.3 decaf::net::ConnectException::ConnectException (const ConnectException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.163.1.4 decaf::net::ConnectException::ConnectException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.163.1.5 decaf::net::ConnectException::ConnectException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.163.1.6 decaf::net::ConnectException::ConnectException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.163.1.7 virtual decaf::net::ConnectException::~ConnectException () throw () [virtual]

6.163.2 Member Function Documentation

6.163.2.1 virtual ConnectException* decaf::net::ConnectException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2788).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ConnectException.h**

6.164 cms::Connection Class Reference

The client's connection to its provider.

`#include <src/main/cms/Connection.h>`Inheritance diagram for cms::Connection:

  Set an ***MessageTransformer*** *(p. 2219) instance that is passed on to all* ***Session*** *(p. 2680) objects created from this* ***Connection*** *(p. 1089).*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const =0

  Gets the currently configured ***MessageTransformer*** *(p. 2219) for this* ***Connection*** *(p. 1089).*

6.164.1 Detailed Description

The client's connection to its provider. Connections support concurrent use.

A connection serves several purposes:

- It encapsulates an open connection with a JMS provider. It typically represents an open TCP/IP socket between a client and the service provider software.
- Its creation is where client authentication takes place.
- It can specify a unique client identifier.
- It provides a **ConnectionMetaData** (p. 1140) object.
- It supports an optional **ExceptionListener** (p. 1465) object.

Because the creation of a connection involves setting up authentication and communication, a connection is a relatively heavy-weight object. Most clients will do all their messaging with a single connection. Other more advanced applications may use several connections. The CMS API does not architect a reason for using multiple connections; however, there may be operational reasons for doing so.

A CMS client typically creates a connection, one or more sessions, and a number of message producers and consumers. When a connection is created, it is in stopped mode. That means that no messages are being delivered.

It is typical to leave the connection in stopped mode until setup is complete (that is, until all message consumers have been created). At that point, the client calls the connection's start method, and messages begin arriving at the connection's consumers. This setup convention minimizes any client confusion that may result from asynchronous message delivery while the client is still in the process of setting itself up.

A connection can be started immediately, and the setup can be done afterwards. Clients that do this must be prepared to handle asynchronous message delivery while they are still in the process of setting up.

A message producer can send messages while a connection is stopped.

Since:

1.0

6.164.2 Constructor & Destructor Documentation

6.164.2.1 virtual cms::Connection::~Connection () [virtual]

6.164.3 Member Function Documentation

6.164.3.1 virtual void cms::Connection::close () [pure virtual]

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions:

CMSException (p. ***979***)

Implements **cms::Closeable** (p. 965).

Implemented in **activemq::core::ActiveMQConnection** (p. 244).

6.164.3.2 virtual Session* cms::Connection::createSession (Session::AcknowledgeMode *ackMode*) [pure virtual]

Creates a new **Session** (p. 2680) to work for this **Connection** (p. 1089) using the specified acknowledgment mode.

Parameters:

ackMode the Acknowledgment Mode to use.

Exceptions:

CMSException (p. ***979***)

Implemented in **activemq::core::ActiveMQConnection** (p. 244), and **activemq::core::ActiveMQXAConnection** (p. 543).

6.164.3.3 virtual Session* cms::Connection::createSession () [pure virtual]

Creates an AUTO_ACKNOWLEDGE **Session** (p. 2680).

Exceptions:

CMSException (p. ***979***)

Implemented in **activemq::core::ActiveMQConnection** (p. 244).

6.164.3.4 virtual std::string cms::Connection::getClientID () const [pure virtual]

Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.

Returns:

Client Id String for this **Connection** (p. 1089).

Exceptions:

CMSException (p. ***979***) if the provider fails to return the client id or an internal error occurs.

Implemented in **activemq::core::ActiveMQConnection** (p. 246).

6.164.3.5 virtual ExceptionListener* cms::Connection::getExceptionListener () const [pure virtual]

Gets the registered Exception Listener for this connection.

Returns:

pointer to an exception listener or NULL

Implemented in **activemq::core::ActiveMQConnection** (p. 248).

6.164.3.6 virtual cms::MessageTransformer* cms::Connection::getMessageTransformer () const [pure virtual]

Gets the currently configured **MessageTransformer** (p. 2219) for this **Connection** (p. 1089).

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implemented in **activemq::core::ActiveMQConnection** (p. 249).

6.164.3.7 virtual const ConnectionMetaData* cms::Connection::getMetaData () const [pure virtual]

Gets the metadata for this connection.

Returns:

the connection MetaData pointer (caller does not own it).

Exceptions:

CMSException *(*p. ***979****)* if the provider fails to get the connection metadata for this connection.

See also:

ConnectionMetaData (p. 1140)

Since:

2.0

Implemented in **activemq::core::ActiveMQConnection** (p. 249).

6.164.3.8 virtual void cms::Connection::setClientID (const std::string & *clientID*) [pure virtual]

Sets the client identifier for this connection. The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific **ConnectionFactory** (p. 1114) object and transparently assigned to the **Connection** (p. 1089) object it creates.

If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an **IllegalStateException** (p. 1658).

Parameters:

clientID The unique client identifier to assign to the **Connection** (p. 1089).

Exceptions:

CMSException *(*p. ***979****)* if the provider fails to set the client id due to some internal error.

InvalidClientIDException if the id given is somehow invalid or is a duplicate.

IllegalStateException *(p. **1658**)* if the client tries to set the id after a **Connection** (p. 1089) method has been called.

Implemented in **activemq::core::ActiveMQConnection** (p. 259).

6.164.3.9 virtual void cms::Connection::setExceptionListener (ExceptionListener * *listener*) [pure virtual]

Sets the registered Exception Listener for this connection.

Parameters:

listener pointer to and `ExceptionListener` (p. 1465)

Implemented in **activemq::core::ActiveMQConnection** (p. 261).

6.164.3.10 virtual void cms::Connection::setMessageTransformer (cms::MessageTransformer * *transformer*) [pure virtual]

Set an **MessageTransformer** (p. 2219) instance that is passed on to all **Session** (p. 2680) objects created from this **Connection** (p. 1089). The CMS **code** (p. 1005) never takes ownership of the **MessageTransformer** (p. 2219) pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the **MessageTransformer** (p. 2219) has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to set on all newly created **Session** (p. 2680) objects.

Implemented in **activemq::core::ActiveMQConnection** (p. 261).

The documentation for this class was generated from the following file:

- src/main/cms/**Connection.h**

6.166.1 Constructor & Destructor Documentation

6.166.1.1 activemq::commands::ConnectionControl::ConnectionControl ()

6.166.1.2 virtual activemq::commands::ConnectionControl::~ConnectionControl () [virtual]

6.166.2 Member Function Documentation

6.166.2.1 virtual ConnectionControl* activemq::commands::ConnectionControl::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.166.2.2 virtual void activemq::commands::ConnectionControl::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.166.2.3 virtual bool activemq::commands::ConnectionControl::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.166.2.4 virtual std::string& activemq::commands::ConnectionControl::getConnectedBrokers () [virtual]

6.166.2.5 virtual const std::string& activemq::commands::ConnectionControl::getConnectedBrokers () const [virtual]

6.166.2.6 virtual unsigned char activemq::commands::ConnectionControl::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.166.2.7 virtual std::string& activemq::commands::ConnectionControl::getReconnectTo () [virtual]

6.166.2.8 virtual const std::string& activemq::commands::ConnectionControl::getReconnectTo () const [virtual]

6.166.2.9 virtual std::vector<unsigned char>& activemq::commands::ConnectionControl::getToken () [virtual]

6.166.2.10 virtual const std::vector<unsigned char>& activemq::commands::ConnectionControl::getToken () const [virtual]

6.166.2.11 virtual bool activemq::commands::ConnectionControl::isClose () const [virtual]

6.166.2.12 virtual bool activemq::commands::ConnectionControl::isConnectionControl () const [inline, virtual]

Returns:

an answer of true to the **isConnectionControl()** (p. 1099) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 637).

6.166.2.13 virtual bool activemq::commands::ConnectionControl::isExit () const [virtual]

6.166.2.14 virtual bool activemq::commands::ConnectionControl::isFaultTolerant () const [virtual]

6.166.2.15 virtual bool activemq::commands::ConnectionControl::isRebalanceConnection () const [virtual]

6.166.2.16 virtual bool activemq::commands::ConnectionControl::isResume () const [virtual]

6.166.2.17 virtual bool activemq::commands::ConnectionControl::isSuspend () const [virtual]

6.166.2.18 virtual void activemq::commands::ConnectionControl::setClose (bool *close*) [virtual]

6.166.2.24 virtual void activemq::commands::ConnectionControl::setResume (bool *resume*) [virtual]

6.166.2.25 virtual void activemq::commands::ConnectionControl::setSuspend (bool *suspend*) [virtual]

6.166.2.26 virtual void activemq::commands::ConnectionControl::setToken (const std::vector< unsigned char > & *token*) [virtual]

6.166.2.27 virtual std::string activemq::commands::ConnectionControl::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.166.2.28 virtual Pointer<Command> activemq::commands::ConnectionControl::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

() [inline, virtual]

6.167.3 Member Function Documentation

6.167.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::createO

() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.167.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::getData

() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.167.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::looseMa

(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.167.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::looseUn (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.167.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::tightMa (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.167.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::tightMa (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.167.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::tightUn (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

6.168.1 Constructor & Destructor Documentation

6.168.1.1 activemq::commands::ConnectionError::ConnectionError ()

6.168.1.2 virtual activemq::commands::ConnectionError::~ConnectionError () [virtual]

6.168.2 Member Function Documentation

6.168.2.1 virtual ConnectionError* activemq::commands::ConnectionError::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.168.2.2 virtual void activemq::commands::ConnectionError::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.168.2.3 virtual bool activemq::commands::ConnectionError::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.168.2.4 virtual Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId () [virtual]

6.168.2.5 virtual const Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId () const [virtual]

6.168.2.6 virtual unsigned char activemq::commands::ConnectionError::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.168.2.7 virtual Pointer<BrokerError>& activemq::commands::ConnectionError::getException () [virtual]

6.168.2.8 virtual const Pointer<BrokerError>& activemq::commands::ConnectionError::getException () const [virtual]

6.168.2.9 virtual bool activemq::commands::ConnectionError::isConnectionError () const [inline, virtual]

Returns:

an answer of true to the **isConnectionError()** (p. 1108) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 637).

6.168.2.10 virtual void activemq::commands::ConnectionError::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.168.2.11 virtual void activemq::commands::ConnectionError::setException (const Pointer< BrokerError > & *exception*) [virtual]

6.168.2.12 virtual std::string activemq::commands::ConnectionError::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.168.2.13 virtual Pointer<Command> activemq::commands::ConnectionError::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.168.3 Field Documentation

6.168.3.1 Pointer<ConnectionId> activemq::commands::ConnectionError::connectionId [protected]

6.168.3.2 Pointer<BrokerError> activemq::commands::ConnectionError::exception [protected]

Public Member Functions

- **ConnectionErrorMarshaller** ()
- virtual ~**ConnectionErrorMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.169.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ConnectionErrorMarshaller** (p. 1110). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.169.2 Constructor & Destructor Documentation

6.169.2.1 activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::Connect () [inline]

6.169.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::~Conne () [inline, virtual]

6.169.3 Member Function Documentation

6.169.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::createObj () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.169.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::getDataSt () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.169.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::looseMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.169.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::looseUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.169.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightMarsl (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.169.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightMarsl (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.169.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ConnectionErrorMarshaller.h**

6.170 cms::ConnectionFactory Class Reference

Defines the interface for a factory that creates connection objects, the **Connection** (p. 1089) objects returned implement the CMS **Connection** (p. 1089) interface and hide the CMS Provider specific implementation details behind that interface.

`#include <src/main/cms/ConnectionFactory.h>`Inheritance diagram for cms::ConnectionFactory:

Public Member Functions

- virtual ~**ConnectionFactory** ()
- virtual **cms::Connection** * **createConnection** ()=0

  Creates a connection with the default user identity.

- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password)=0

  Creates a connection with the default specified identity.

- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password, const std::string &clientId)=0

  Creates a connection with the specified user identity.

- virtual void **setExceptionListener** (**cms::ExceptionListener** *listener)=0

  *Set an **ExceptionListener** (p. 1465) instance that is passed on to all **Connection** (p. 1089) objects created from this **ConnectionFactory** (p. 1114).*

- virtual **cms::ExceptionListener** * **getExceptionListener** () const =0

  *Gets the currently configured **ExceptionListener** (p. 1465) for this **ConnectionFactory** (p. 1114).*

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)=0

  *Set an **MessageTransformer** (p. 2219) instance that is passed on to all **Connection** (p. 1089) objects created from this **ConnectionFactory** (p. 1114).*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const =0

  *Gets the currently configured **MessageTransformer** (p. 2219) for this **ConnectionFactory** (p. 1114).*

Static Public Member Functions

- static **cms::ConnectionFactory** * **createCMSConnectionFactory** (const std::string &brokerURI)

  Static method that is used to create a provider specific connection factory.

6.170.1 Detailed Description

Defines the interface for a factory that creates connection objects, the **Connection** (p. 1089) objects returned implement the CMS **Connection** (p. 1089) interface and hide the CMS Provider specific implementation details behind that interface. A Client creates a new **ConnectionFactory** (p. 1114) either directly by instantiating the provider specific implementation of the factory or by using the static method `createCMSConnectionFactory` which all providers are required to implement.

Since:

1.0

6.170.2 Constructor & Destructor Documentation

6.170.2.1 virtual cms::ConnectionFactory::~ConnectionFactory () [virtual]

6.170.3 Member Function Documentation

6.170.3.1 static cms::ConnectionFactory* cms::ConnectionFactory::createCMSConnectionFactory (const std::string & *brokerURI*) [static]

Static method that is used to create a provider specific connection factory. The provider implements this method in their library and returns an instance of a **ConnectionFactory** (p. 1114) derived object. Clients can use this method to remain abstracted from the specific CMS implementation being used.

Parameters:

brokerURI The remote address to use to connect to the Provider.

Returns:

A pointer to a provider specific implementation of the **ConnectionFactory** (p. 1114) interface, the caller is responsible for deleting this resource.

Exceptions:

CMSException *(p. 979)* if an internal error occurs while creating the **ConnectionFactory** (p. 1114).

6.170.3.2 virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & *username*, const std::string & *password*, const std::string & *clientId*) [pure virtual]

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 2852) method is explicitly called. The user name and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters:

username The user name used to authenticate with the Provider.

password The password used to authenticate with the Provider.

clientId The Client Id assigned to connection. If the id is the empty string ("") then a random client Id is created for this connection.

Returns:

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions:

CMSException (p. ***979***) if an internal error occurs while creating the **Connection** (p. 1089).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 273).

6.170.3.3 virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & *username*, const std::string & *password*) [pure virtual]

Creates a connection with the default specified identity. The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 2852) method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters:

username The user name used to authenticate with the Provider.

password The password used to authenticate with the Provider.

Returns:

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions:

CMSException (p. ***979***) if an internal error occurs while creating the **Connection** (p. 1089).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 273).

6.170.3.4 virtual cms::Connection* cms::ConnectionFactory::createConnection () [pure virtual]

Creates a connection with the default user identity. The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 2852) method is explicitly called.

Returns:

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions:

CMSException *(*p. *979**)* if an internal error occurs while creating the **Connection** (p. 1089).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 274).

6.170.3.5 virtual cms::ExceptionListener* cms::ConnectionFactory::getExceptionListener () const [pure virtual]

Gets the currently configured **ExceptionListener** (p. 1465) for this **ConnectionFactory** (p. 1114). The CMS **code** (p. 1005) never takes ownership of the **ExceptionListener** (p. 1465) pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the **ExceptionListener** (p. 1465) has been assigned.

Returns:

the pointer to the currently set **cms::ExceptionListener** (p. 1465).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 276).

6.170.3.6 virtual cms::MessageTransformer* cms::ConnectionFactory::getMessageTransformer () const [pure virtual]

Gets the currently configured **MessageTransformer** (p. 2219) for this **ConnectionFactory** (p. 1114).

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 276).

6.170.3.7 virtual void cms::ConnectionFactory::setExceptionListener (cms::ExceptionListener * *listener*) [pure virtual]

Set an **ExceptionListener** (p. 1465) instance that is passed on to all **Connection** (p. 1089) objects created from this **ConnectionFactory** (p. 1114).

Parameters:

transformer Pointer to the **cms::ExceptionListener** (p. 1465) to set on all newly created **Connection** (p. 1089) objects/

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 282).

6.170.3.8 virtual void cms::ConnectionFactory::setMessageTransformer (cms::MessageTransformer * *transformer*) [pure virtual]

Set an **MessageTransformer** (p. 2219) instance that is passed on to all **Connection** (p. 1089) objects created from this **ConnectionFactory** (p. 1114). The CMS **code** (p. 1005) never takes

ownership of the **MessageTransformer** (p. 2219) pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the **MessageTransformer** (p. 2219) has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to set on all newly created **Connection** (p. 1089) objects.

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 283).

6.173 activemq::wireformat::openwire::marshal::generated::ConnectionId Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ConnectionIdMarshaller** (p. 1125).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ConnectionIdMarshaller.h>` Inheri
diagram for activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller:

Public Member Functions

- **ConnectionIdMarshaller** ()
- virtual ~**ConnectionIdMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.173.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ConnectionIdMarshaller** (p. 1125). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.173.2 Constructor & Destructor Documentation

6.173.2.1 activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::Connection

() [inline]

6.173.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::~Connectio

() [inline, virtual]

6.173.3 Member Function Documentation

6.173.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::createObject

() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.173.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::getDataStruc

() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.173.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::looseMarshal

(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.173.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::looseUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.173.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.173.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.173.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::tightUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

The documentation for this class was generated from the following file:

6.174.1 Constructor & Destructor Documentation

6.174.1.1 activemq::commands::ConnectionInfo::ConnectionInfo ()

6.174.1.2 virtual activemq::commands::ConnectionInfo::~ConnectionInfo () [virtual]

6.174.2 Member Function Documentation

6.174.2.1 virtual ConnectionInfo* activemq::commands::ConnectionInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.174.2.2 virtual void activemq::commands::ConnectionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.174.2.3 Pointer<RemoveInfo> activemq::commands::ConnectionInfo::createRemoveCommand () const

6.174.2.4 virtual bool activemq::commands::ConnectionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.174.2.5 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath () [virtual]

6.174.2.6 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath () const [virtual]

6.174.2.7 virtual std::string& activemq::commands::ConnectionInfo::getClientId () [virtual]

6.174.2.8 virtual const std::string& activemq::commands::ConnectionInfo::getClientId () const [virtual]

6.174.2.9 virtual std::string& activemq::commands::ConnectionInfo::getClientIp () [virtual]

6.174.2.10 virtual const std::string& activemq::commands::ConnectionInfo::getClientIp () const [virtual]

6.174.2.11 virtual Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId () [virtual]

6.174.2.12 virtual const Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId () const [virtual]

6.174.2.13 virtual unsigned char activemq::commands::ConnectionInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.174.2.14 virtual std::string& activemq::commands::ConnectionInfo::getPassword () [virtual]

6.174.2.15 virtual const std::string& activemq::commands::ConnectionInfo::getPassword () const [virtual]

6.174.2.16 virtual std::string& activemq::commands::ConnectionInfo::getUserName () [virtual]

6.174.2.17 virtual const std::string& activemq::commands::ConnectionInfo::getUserName () const [virtual]

6.174.2.18 virtual bool activemq::commands::ConnectionInfo::isBrokerMasterConnector () const [virtual]

6.174.2.19 virtual bool activemq::commands::ConnectionInfo::isClientMaster () const [virtual]

6.174.2.20 virtual bool activemq::commands::ConnectionInfo::isConnectionInfo () const [inline, virtual]

Returns:

an answer of true to the **isConnectionInfo()** (p. 1133) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 637).

6.174.2.21 virtual bool activemq::commands::ConnectionInfo::isFailoverReconnect () const [virtual]

6.174.2.22 virtual bool activemq::commands::ConnectionInfo::isFaultTolerant () const [virtual]

6.174.2.23 virtual bool activemq::commands::ConnectionInfo::isManageable () const [virtual]

6.174.2.24 virtual void activemq::commands::ConnectionInfo::setBrokerMasterConnector (bool *brokerMasterConnector*) [virtual]

6.174.2.25 virtual void activemq::commands::ConnectionInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.174.2.26 virtual void activemq::commands::ConnectionInfo::setClientId (const std::string & *clientId*) [virtual]

6.174.2.27 virtual void activemq::commands::ConnectionInfo::setClientIp (const std::string & *clientIp*) [virtual]

6.174.2.28 virtual void activemq::commands::ConnectionInfo::setClientMaster (bool *clientMaster*) [virtual]

6.174.2.29 virtual void activemq::commands::ConnectionInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.174.2.30 virtual void activemq::commands::ConnectionInfo::setFailoverReconnect (bool *failoverReconnect*) [virtual]

6.174.2.31 virtual void activemq::commands::ConnectionInfo::setFaultTolerant (bool *faultTolerant*) [virtual]

6.174.2.32 virtual void activemq::commands::ConnectionInfo::setManageable (bool *manageable*) [virtual]

6.174.2.33 virtual void activemq::commands::ConnectionInfo::setPassword (const std::string & *password*) [virtual]

6.174.2.34 virtual void activemq::commands::ConnectionInfo::setUserName (const std::string & *userName*) [virtual]

6.174.2.35 virtual std::string activemq::commands::ConnectionInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.174.2.36 virtual Pointer<Command> activemq::commands::ConnectionInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.174.3 Field Documentation

diagram for activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller:

Public Member Functions

- **ConnectionInfoMarshaller** ()
- virtual ~**ConnectionInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.175.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ConnectionInfoMarshaller** (p. 1136). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.175.2 Constructor & Destructor Documentation

6.175.2.1 activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::Connectio () [inline]

6.175.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::~Connect () [inline, virtual]

6.175.3 Member Function Documentation

6.175.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::createObjec () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.175.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::getDataStru () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.175.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::looseMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.175.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::looseUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.175.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::tightMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.175.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::tightMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.175.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::tightUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.176.3 Member Function Documentation

6.176.3.1 virtual int cms::ConnectionMetaData::getCMSMajorVersion () const [pure virtual]

Gets the CMS major version number.

Returns:

the CMS API major version number

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 289).

6.176.3.2 virtual int cms::ConnectionMetaData::getCMSMinorVersion () const [pure virtual]

Gets the CMS minor version number.

Returns:

the CMS API minor version number

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 289).

6.176.3.3 virtual std::string cms::ConnectionMetaData::getCMSProviderName () const [pure virtual]

Gets the CMS provider name.

Returns:

the CMS provider name

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 289).

6.176.3.4 virtual std::string cms::ConnectionMetaData::getCMSVersion () const [pure virtual]

Gets the CMS API version.

Returns:

the CMS API Version in String form.

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 290).

6.176.3.5 virtual std::vector<std::string> cms::ConnectionMetaData::getCMSXPropertyNames () const [pure virtual]

Gets an Vector of the CMSX property names.

Returns:

an Vector of CMSX property names

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 290).

6.176.3.6 virtual int cms::ConnectionMetaData::getProviderMajorVersion () const [pure virtual]

Gets the CMS provider major version number.

Returns:

the CMS provider major version number

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 290).

6.176.3.7 virtual int cms::ConnectionMetaData::getProviderMinorVersion () const [pure virtual]

Gets the CMS provider minor version number.

Returns:

the CMS provider minor version number

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 291).

6.176.3.8 virtual int cms::ConnectionMetaData::getProviderPatchVersion () const [pure virtual]

Gets the CMS provider patch version number.

Returns:

the CMS provider patch version number

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 291).

6.176.3.9 virtual std::string cms::ConnectionMetaData::getProviderVersion () const [pure virtual]

Gets the CMS provider version.

Returns:

the CMS provider version

Exceptions:

CMSException *(*p. ***979****)* If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 291).

6.179 decaf::util::logging::ConsoleHandler Class Reference

This **Handler** (p. 1590) publishes log records to System.err.

`#include <src/main/decaf/util/logging/ConsoleHandler.h>`Inheritance diagram for decaf::util::logging::ConsoleHandler:

Public Member Functions

- **ConsoleHandler** ()
- virtual ~**ConsoleHandler** ()
- virtual void **close** ()

  Close the current output stream.

- virtual void **publish** (const **LogRecord** &record)

  *Publish the Log Record to this **Handler** (p. 1590).*

6.179.1 Detailed Description

This **Handler** (p. 1590) publishes log records to System.err. By default the **SimpleFormatter** (p. 2759) is used to generate brief summaries.

Configuration: By default each **ConsoleHandler** (p. 1153) is initialized using the following **LogManager** (p. 1954) configuration properties. If properties are not defined (or have invalid values) then the specified default values are used.

ConsoleHandler.level specifies the default level for the **Handler** (p. 1590) (defaults to **Level.INFO** (p. 1863)). ConsoleHandler.filter specifies the name of a **Filter** (p. 1520) class to use (defaults to no **Filter** (p. 1520)). ConsoleHandler.formatter specifies the name of a **Formatter** (p. 1569) class to use (defaults to **SimpleFormatter** (p. 2759)).

Since:

1.0

6.179.2 Constructor & Destructor Documentation

6.179.2.1 decaf::util::logging::ConsoleHandler::ConsoleHandler ()

6.179.2.2 virtual decaf::util::logging::ConsoleHandler::~ConsoleHandler () `[inline, virtual]`

6.179.3 Member Function Documentation

6.179.3.1 virtual void decaf::util::logging::ConsoleHandler::close () `[virtual]`

Close the current output stream. Override the **StreamHandler** (p. 2920) close to flush the Std Err stream but doesn't close.

Exceptions:

IOException

Reimplemented from **decaf::util::logging::StreamHandler** (p. 2921).

6.179.3.2 virtual void decaf::util::logging::ConsoleHandler::publish (const LogRecord & *record*) [virtual]

Publish the Log Record to this **Handler** (p. 1590).

Parameters:

record The `LogRecord (p. 1960)` to Publish

Reimplemented from **decaf::util::logging::StreamHandler** (p. 2922).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**ConsoleHandler.h**

6.180.2 Member Function Documentation

6.180.2.1 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual void decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet::clear () `[inline, virtual]`

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 144).

6.180.2.2 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet::contains (const MapEntry< K, V > & *entry*) [inline, virtual]

References decaf::util::HashMap< K, V, HASHCODE >::getEntry(), decaf::util::MapEntry< K, V >::getKey(), decaf::util::MapEntry< K, V >::getValue(), and NULL.

6.180.2.3 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Iterator< MapEntry<K, V> >* decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< MapEntry< K, V > >** (p. 1799).

6.180.2.4 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Iterator< MapEntry<K, V> >* decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< MapEntry< K, V > >** (p. 1800).

6.180.2.5 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet::remove (const MapEntry< K, V > &entry *DECAF_UNUSED*) [inline, virtual]

6.180.2.6 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual int decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< MapEntry< K, V > >** (p. 1015).

References decaf::util::HashMap< K, V, HASHCODE >::elementCount.

6.181 decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet Class Reference

`#include <src/main/decaf/util/HashMap.h>`Inheritance diagram for decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet:

Public Member Functions

- **ConstHashMapKeySet** (const **HashMap** *parent)
- virtual ~**ConstHashMapKeySet** ()
- virtual bool **contains** (const K &key) const

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

  Parameters:

  value *The value to check for presence in the collection.*

  Returns:

  true if there is at least one of the elements in the collection

  Exceptions:

  NullPointerException *if the Collection contains pointers and the Collection does not allow for NULL elements (optional check).*

  This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual int **size** () const

  Returns the number of elements in this collection.

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).

6.182.2.1 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual void decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< V >** (p. 144).

6.182.2.2 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection::contains (const V & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the Collection contains pointers and the Collection does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element. This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< V >** (p. 145).

References decaf::util::HashMap< K, V, HASHCODE >::containsValue().

6.182.2.3 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Iterator<V>* decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< V >** (p. 1799).

6.182.2.4 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Iterator<V>* decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< V >** (p. 1800).

6.182.2.5 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual int decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< V >** (p. 1015).

References decaf::util::HashMap< K, V, HASHCODE >::size().

6.183.1 Constructor & Destructor Documentation

6.183.1.1 activemq::commands::ConsumerControl::ConsumerControl ()

6.183.1.2 virtual activemq::commands::ConsumerControl::~ConsumerControl () [virtual]

6.183.2 Member Function Documentation

6.183.2.1 virtual ConsumerControl* activemq::commands::ConsumerControl::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.183.2.2 virtual void activemq::commands::ConsumerControl::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.183.2.3 virtual bool activemq::commands::ConsumerControl::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.183.2.4 virtual Pointer<ConsumerId>& activemq::commands::ConsumerControl::getConsumerId () [virtual]

6.183.2.5 virtual const Pointer<ConsumerId>& activemq::commands::ConsumerControl::getConsumerId () const [virtual]

6.183.2.6 virtual unsigned char activemq::commands::ConsumerControl::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.183.2.7 virtual Pointer<ActiveMQDestination>& activemq::commands::ConsumerControl::getDestination () [virtual]

6.183.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::ConsumerControl::getDestination () const [virtual]

6.183.2.9 virtual int activemq::commands::ConsumerControl::getPrefetch () const [virtual]

6.183.2.10 virtual bool activemq::commands::ConsumerControl::isClose () const [virtual]

6.183.2.11 virtual bool activemq::commands::ConsumerControl::isConsumerControl () const [inline, virtual]

Returns:

an answer of true to the **isConsumerControl()** (p. 1166) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 637).

6.183.2.12 virtual bool activemq::commands::ConsumerControl::isFlush () const [virtual]

6.183.2.13 virtual bool activemq::commands::ConsumerControl::isStart () const [virtual]

6.183.2.14 virtual bool activemq::commands::ConsumerControl::isStop () const [virtual]

6.183.2.15 virtual void activemq::commands::ConsumerControl::setClose (bool *close*) [virtual]

6.183.2.16 virtual void activemq::commands::ConsumerControl::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.183.2.17 virtual void activemq::commands::ConsumerControl::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.183.2.18 virtual void activemq::commands::ConsumerControl::setFlush (bool *flush*) [virtual]

6.183.2.19 virtual void activemq::commands::ConsumerControl::setPrefetch (int *prefetch*) [virtual]

6.183.2.20 virtual void activemq::commands::ConsumerControl::setStart (bool *start*) [virtual]

6.183.2.21 virtual void activemq::commands::ConsumerControl::setStop (bool *stop*) [virtual]

6.183.2.22 virtual std::string activemq::commands::ConsumerControl::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.183.2.23 virtual Pointer<Command> activemq::commands::ConsumerControl::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.184 activemq::wireformat::openwire::marshal::generated::ConsumerCo Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ConsumerControlMarshaller** (p. 1169).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ConsumerControlMarshaller.h>`In diagram for activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller:

Public Member Functions

- **ConsumerControlMarshaller** ()
- virtual ~**ConsumerControlMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.184.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ConsumerControlMarshaller** (p. 1169). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.184.2 Constructor & Destructor Documentation

6.184.2.1 activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::Consun () [inline]

6.184.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::~Consu () [inline, virtual]

6.184.3 Member Function Documentation

6.184.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::createOb () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.184.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::getDataS () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.184.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::looseMar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.184.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::looseUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.184.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.184.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.184.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::tightUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.186.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ConsumerIdMarshaller** (p. 1178). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.186.2 Constructor & Destructor Documentation

6.186.2.1 activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::ConsumerId() [inline]

6.186.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::~ConsumerI() [inline, virtual]

6.186.3 Member Function Documentation

6.186.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::createObject() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.186.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::getDataStructu() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.186.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::looseMarshal(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.186.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::looseUnmarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.186.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.186.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.186.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::tightUnmarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ConsumerIdMarshaller.h**

6.187.1 Constructor & Destructor Documentation

6.187.1.1 activemq::commands::ConsumerInfo::ConsumerInfo ()

6.187.1.2 virtual activemq::commands::ConsumerInfo::~ConsumerInfo () [virtual]

6.187.2 Member Function Documentation

6.187.2.1 virtual ConsumerInfo* activemq::commands::ConsumerInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.187.2.2 virtual void activemq::commands::ConsumerInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.187.2.3 Pointer<RemoveInfo> activemq::commands::ConsumerInfo::createRemoveCommand () const

6.187.2.4 virtual bool activemq::commands::ConsumerInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.187.2.5 virtual Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () [virtual]

6.187.2.6 virtual const Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () const [virtual]

6.187.2.7 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConsumerInfo::getBrokerPath () [virtual]

6.187.2.8 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConsumerInfo::getBrokerPath () const [virtual]

6.187.2.9 virtual Pointer<ConsumerId>& activemq::commands::ConsumerInfo::getConsumerId () [virtual]

6.187.2.10 virtual const Pointer<ConsumerId>& activemq::commands::ConsumerInfo::getConsumerId () const [virtual]

6.187.2.11 int activemq::commands::ConsumerInfo::getCurrentPrefetchSize () const [inline]

6.187.2.12 virtual unsigned char activemq::commands::ConsumerInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.187.2.13 virtual Pointer<ActiveMQDestination>& activemq::commands::ConsumerInfo::getDestination () [virtual]

6.187.2.14 virtual const Pointer<ActiveMQDestination>& activemq::commands::ConsumerInfo::getDestination () const [virtual]

6.187.2.15 virtual int activemq::commands::ConsumerInfo::getMaximumPendingMessageLimit () const [virtual]

6.187.2.16 virtual std::vector< decaf::lang::Pointer<ConsumerId> >& activemq::commands::ConsumerInfo::getNetworkConsumerPath () [virtual]

6.187.2.17 virtual const std::vector< decaf::lang::Pointer<ConsumerId> >& activemq::commands::ConsumerInfo::getNetworkConsumerPath () const [virtual]

6.187.2.18 virtual int activemq::commands::ConsumerInfo::getPrefetchSize () const [virtual]

6.187.2.19 virtual unsigned char activemq::commands::ConsumerInfo::getPriority () const [virtual]

6.187.2.20 virtual std::string& activemq::commands::ConsumerInfo::getSelector () [virtual]

6.187.2.21 virtual const std::string& activemq::commands::ConsumerInfo::getSelector () const [virtual]

6.187.2.22 virtual std::string& activemq::commands::ConsumerInfo::getSubscriptionName () [virtual]

6.187.2.23 virtual const std::string& activemq::commands::ConsumerInfo::getSubscriptionName () const [virtual]

6.187.2.24 virtual bool activemq::commands::ConsumerInfo::isBrowser () const [virtual]

6.187.2.25 virtual bool activemq::commands::ConsumerInfo::isConsumerInfo () const [inline, virtual]

Returns:

an answer of true to the **isConsumerInfo()** (p. 1186) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 637).

6.187.2.26 virtual bool activemq::commands::ConsumerInfo::isDispatchAsync () const [virtual]

6.187.2.27 virtual bool activemq::commands::ConsumerInfo::isExclusive () const [virtual]

6.187.2.28 virtual bool activemq::commands::ConsumerInfo::isNetworkSubscription () const [virtual]

6.187.2.29 virtual bool activemq::commands::ConsumerInfo::isNoLocal () const [virtual]

6.187.2.30 virtual bool activemq::commands::ConsumerInfo::isNoRangeAcks () const [virtual]

6.187.2.31 virtual bool activemq::commands::ConsumerInfo::isOptimizedAcknowledge () const [virtual]

6.187.2.32 virtual bool activemq::commands::ConsumerInfo::isRetroactive () const [virtual]

6.187.2.33 virtual void activemq::commands::ConsumerInfo::setAdditionalPredicate (const Pointer< BooleanExpression > & *additionalPredicate*) [virtual]

6.187.2.34 virtual void activemq::commands::ConsumerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.187.2.35 virtual void activemq::commands::ConsumerInfo::setBrowser (bool *browser*) [virtual]

6.187.2.36 virtual void activemq::commands::ConsumerInfo::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.187.2.37 void activemq::commands::ConsumerInfo::setCurrentPrefetchSize (int *currentPrefetchSize*) [inline]

6.187.2.38 virtual void activemq::commands::ConsumerInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.187.2.39 virtual void activemq::commands::ConsumerInfo::setDispatchAsync (bool *dispatchAsync*) [virtual]

6.187.2.40 virtual void activemq::commands::ConsumerInfo::setExclusive (bool *exclusive*) [virtual]

6.187.2.41 virtual void activemq::commands::ConsumerInfo::setMaximumPendingMessageLimit (int *maximumPendingMessageLimit*) [virtual]

6.187.2.42 virtual void activemq::commands::ConsumerInfo::setNetworkConsumerPath (const std::vector< decaf::lang::Pointer< ConsumerId > > & *networkConsumerPath*) [virtual]

6.187.2.43 virtual void activemq::commands::ConsumerInfo::setNetworkSubscription (bool *networkSubscription*) [virtual]

6.187.2.44 virtual void activemq::commands::ConsumerInfo::setNoLocal (bool *noLocal*) [virtual]

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.187.2.53 virtual Pointer<Command> activemq::commands::ConsumerInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.188 activemq::wireformat::openwire::marshal::generated::ConsumerInf Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ConsumerInfoMarshaller** (p. 1191).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ConsumerInfoMarshaller.h>`Inheri
diagram for activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller:

Public Member Functions

- **ConsumerInfoMarshaller** ()
- virtual ~**ConsumerInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.188.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ConsumerInfoMarshaller** (p. 1191). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.188.2 Constructor & Destructor Documentation

6.188.2.1 activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::ConsumerI () [inline]

6.188.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::~Consume () [inline, virtual]

6.188.3 Member Function Documentation

6.188.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.188.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::getDataStruc () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.188.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.188.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::looseUnmars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.188.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.188.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.188.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::tightUnmarsl (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.190.1 Constructor & Destructor Documentation

6.190.1.1 activemq::commands::ControlCommand::ControlCommand ()

6.190.1.2 virtual activemq::commands::ControlCommand::~ControlCommand () [virtual]

6.190.2 Member Function Documentation

6.190.2.1 virtual ControlCommand* activemq::commands::ControlCommand::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.190.2.2 virtual void activemq::commands::ControlCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.190.2.3 virtual bool activemq::commands::ControlCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.190.2.4 virtual std::string& activemq::commands::ControlCommand::getCommand () [virtual]

6.190.2.5 virtual const std::string& activemq::commands::ControlCommand::getCommand () const [virtual]

6.190.2.6 virtual unsigned char activemq::commands::ControlCommand::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.190.2.7 virtual bool activemq::commands::ControlCommand::isControlCommand () const [inline, virtual]

Returns:

an answer of true to the **isControlCommand()** (p. 1198) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 637).

6.190.2.8 virtual void activemq::commands::ControlCommand::setCommand (const std::string & *command*) [virtual]

6.190.2.9 virtual std::string activemq::commands::ControlCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.190.2.10 virtual Pointer<Command> activemq::commands::ControlCommand::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.191.2 Constructor & Destructor Documentation

6.191.2.1 activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::Contro () [inline]

6.191.2.2 virtual activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::~Contr () [inline, virtual]

6.191.3 Member Function Documentation

6.191.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::createOb () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.191.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::getDataS () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.191.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::looseMar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.191.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::looseUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.191.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::tightMar (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.191.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::tightMar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.191.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::tightUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

6.192 decaf::util::concurrent::CopyOnWriteArrayList< E > Class Template Reference

`#include <src/main/decaf/util/concurrent/CopyOnWriteArrayList.h>`Inheritance diagram for decaf::util::concurrent::CopyOnWriteArrayList< E >:

Data Structures

- struct **Array**
- class **ArrayListIterator**

Public Member Functions

- **CopyOnWriteArrayList** ()
- **CopyOnWriteArrayList** (const **Collection**< E > &collection)
- **CopyOnWriteArrayList** (const **CopyOnWriteArrayList**< E > &collection)
- **CopyOnWriteArrayList** (const E *array, int size)
- virtual ~**CopyOnWriteArrayList** ()
- **CopyOnWriteArrayList**< E > & **operator**= (const **CopyOnWriteArrayList**< E > &list)
- **CopyOnWriteArrayList**< E > & **operator**= (const **Collection**< E > &list)
- virtual void **copy** (const **Collection**< E > &collection)
- virtual bool **add** (const E &value)

  Returns true if this collection changed as a result of the call.

- virtual bool **addAll** (const **Collection**< E > &collection)
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).

- virtual bool **contains** (const E &value) const

  Returns true if this collection contains the specified element.

- virtual bool **containsAll** (const **Collection**< E > &collection) const
- virtual bool **equals** (const **Collection**< E > &collection) const
- virtual bool **isEmpty** () const
- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.

- virtual bool **removeAll** (const **Collection**< E > &collection)
- virtual bool **retainAll** (const **Collection**< E > &collection)
- virtual int **size** () const

  Returns the number of elements in this collection.

- virtual std::vector< E > **toArray** () const

  Returns an array containing all of the elements in this collection.

- virtual **decaf::util::Iterator**< E > * **iterator** ()

- virtual **decaf::util::Iterator**< E > * **iterator** () const
- virtual **ListIterator**< E > * **listIterator** ()
- virtual **ListIterator**< E > * **listIterator** () const
- virtual **ListIterator**< E > * **listIterator** (int index)
- virtual **ListIterator**< E > * **listIterator** (int index) const
- virtual int **indexOf** (const E &value) const

  Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual int **lastIndexOf** (const E &value) const

  Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual E **get** (int index) const

  Gets the element contained at position passed.

- virtual E **set** (int index, const E &element)

  Replaces the element at the specified position in this list with the specified element.

- virtual void **add** (int index, const E &element)

  Inserts the specified element at the specified position in this list.

- virtual bool **addAll** (int index, const **Collection**< E > &collection)

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

- virtual E **removeAt** (int index)

  Removes the element at the specified position in this list.

- virtual std::string **toString** () const
- bool **addIfAbsent** (const E &value)

  *Adds the given value to the end of this **List** (p. 1902) if it is not already contained in this **List** (p. 1902).*

- int **addAllAbsent** (const **Collection**< E > &collection)

  *Every element in the given collection that is not already contained in this **Collection** (p. 1006) is added to the end of this collection.*

- int **lastIndexOf** (const E &value, int index)

  *Searches backwards through the **List** (p. 1902) for the given element starting at the index specified.*

- int **indexOf** (const E &value, int index) const

  *Searches the **List** (p. 1902) starting from the specified index and returns the index of the first item in the list that is equal to the given value.*

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

*Attempts to **Lock** (p. 1924) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

template<typename E> class decaf::util::concurrent::CopyOnWriteArrayList< E >

6.192.1 Constructor & Destructor Documentation

6.192.1.1 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList () [inline]

References decaf::util::concurrent::locks::Lock::newCondition(), decaf::lang::Pointer< T, REFCOUNTER >::reset(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.1.2 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList (const Collection< E > & *collection*) [inline]

References decaf::util::concurrent::locks::Lock::newCondition(), decaf::lang::Pointer< T, REFCOUNTER >::reset(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.1.3 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList (const CopyOnWriteArrayList< E > & *collection*) [inline]

References decaf::util::concurrent::locks::Lock::newCondition(), decaf::lang::Pointer< T, REFCOUNTER >::reset(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.1.4 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList (const E * *array*, int *size*) [inline]

References decaf::util::concurrent::locks::Lock::newCondition(), decaf::lang::Pointer< T, REFCOUNTER >::reset(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.1.5 template<typename E> virtual decaf::util::concurrent::CopyOnWriteArrayList< E >::~CopyOnWriteArrayList () [inline, virtual]

References NULL, and decaf::lang::Pointer< T, REFCOUNTER >::reset().

6.192.2 Member Function Documentation

6.192.2.1 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::add (int *index*, const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list. Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index The index at which the specified element is to be inserted.

element The element to be inserted in this **List** (p. 1902).

Exceptions:

IndexOutOfBoundsException if the index is greater than size of the **List** (p. 1902).

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1903).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.2 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 1007).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.3 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation). Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1006) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1904).

References decaf::lang::System::arraycopy(), decaf::lang::Iterable< E >::iterator(), decaf::util::concurrent::locks::Lock::lock(), decaf::util::Collection< E >::size(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.4 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

References decaf::lang::Iterable< E >::iterator(), decaf::util::concurrent::locks::Lock::lock(), decaf::util::Collection< E >::size(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.5 template<typename E> int decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent (const Collection< E > & *collection*) [inline]

Every element in the given collection that is not already contained in this **Collection** (p. 1006) is added to the end of this collection. The order that the elements are added is ditacted by the order that the collection's iterator returns them.

Parameters:

collection The collection whose elements are to be added if not already in this **List** (p. 1902).

Returns:

the number of elements that are added to this **List** (p. 1902).

References decaf::lang::System::arraycopy(), decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf(), decaf::lang::Iterable< E >::iterator(), decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::util::Collection< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.6 template<typename E> bool decaf::util::concurrent::CopyOnWriteArrayList< E >::addIfAbsent (const E & *value*) [inline]

Adds the given value to the end of this **List** (p. 1902) if it is not already contained in this **List** (p. 1902).

Parameters:

value The element to be added if not already contained in this **List** (p. 1902).

Returns:

true if the element is added to this **List** (p. 1902).

References decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf(), decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.7 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). This collection will be empty after this method returns unless it throws an exception.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

Implements **decaf::util::Collection< E >** (p. 1009).

References decaf::util::concurrent::locks::Lock::lock(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::copy(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::operator=().

6.192.2.8 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element. More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

Implements **decaf::util::Collection< E >** (p. 1010).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::containsAll().

6.192.2.9 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::containsAll (const Collection< E > & *collection*) const [inline, virtual]

References decaf::util::concurrent::CopyOnWriteArrayList< E >::contains(), and decaf::lang::Iterable< E >::iterator().

6.192.2.10 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::copy (const Collection< E > & *collection*) [inline, virtual]

References decaf::util::concurrent::CopyOnWriteArrayList< E >::clear(), decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.11 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

References decaf::lang::Iterable< E >::iterator(), decaf::util::concurrent::CopyOnWriteArrayList< E >::iterator(), NULL, decaf::util::Collection< E >::size(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::size().

6.192.2.12 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters:

index The position to get.

Returns:

value at index specified.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

Implements **decaf::util::List< E >** (p. 1905).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.13 template<typename E> int decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf (const E & *value*, int *index*) const [inline]

Searches the **List** (p. 1902) starting from the specified index and returns the index of the first item in the list that is equal to the given value.

Parameters:

value The value to search for in the **List** (p. 1902).

index The index in the **List** (p. 1902) to begin the search from.

Returns:

the index in the **List** (p. 1902) that matches the given element or -1 if not found.

Exceptions:

IndexOutOfBoundsException if the given index is negative.

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.14 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implements **decaf::util::List< E >** (p. 1906).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addIfAbsent(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::remove().

6.192.2.15 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::isEmpty () const [inline, virtual]

Returns:

true if this collection contains no elements.

Implements **decaf::util::Collection< E >** (p. 1012).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.16 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1799).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.17 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1800).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::equals().

6.192.2.18 template<typename E> int decaf::util::concurrent::CopyOnWriteArrayList< E >::lastIndexOf (const E & *value*, int *index*) [inline]

Searches backwards through the **List** (p. 1902) for the given element starting at the index specified.

Parameters:

value The value to search for in the **List** (p. 1902).

index The index in the list to begin the search from.

Returns:

the index in the list that matches the value given, or -1 if not found.

Exceptions:

IndexOutOfBoundsException if the given index is greater than or equal to the **List** (p. 1902) size.

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.19 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implements **decaf::util::List< E >** (p. 1907).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.20 template<typename E> virtual ListIterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator (int index) const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1907).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.21 template<typename E> virtual ListIterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator (int *index*) [inline, virtual]

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (index < 0 || index > **size()** (p. 1217))

Implements **decaf::util::List< E >** (p. 1908).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.22 template<typename E> virtual ListIterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator () const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1909).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.23 template<typename E> virtual ListIterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator () [inline, virtual]

Returns:

a list iterator over the elements in this list (in proper sequence).

Implements **decaf::util::List< E >** (p. 1910).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.24 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

References decaf::util::concurrent::locks::Lock::lock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::wr

6.192.2.25 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.192.2.26 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.192.2.27 template<typename E> CopyOnWriteArrayList<E>& decaf::util::concurrent::CopyOnWriteArrayList< E >::operator= (const Collection< E > & *list*) [inline]

References decaf::util::concurrent::CopyOnWriteArrayList< E >::clear(), decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.28 template<typename E> CopyOnWriteArrayList<E>& decaf::util::concurrent::CopyOnWriteArrayList< E >::operator= (const CopyOnWriteArrayList< E > & *list*) [inline]

References decaf::util::concurrent::CopyOnWriteArrayList< E >::clear(), decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.29 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection. More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implements **decaf::util::Collection< E >** (p. 1013).

References decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf(), decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.30 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll (const Collection< E > & *collection*) [inline, virtual]

References decaf::util::Collection< E >::contains(), decaf::util::Collection< E >::isEmpty(), decaf::util::concurrent::locks::Lock::lock(), decaf::lang::Pointer< T, REFCOUNTER >::reset(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.31 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt (int *index*) [inline, virtual]

Removes the element at the specified position in this list. Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

Implements **decaf::util::List< E >** (p. 1910).

References decaf::util::concurrent::locks::Lock::lock(), decaf::lang::Pointer< T, REFCOUNTER >::reset(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::remove().

6.192.2.32 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll (const Collection< E > & *collection*) [inline, virtual]

References decaf::util::Collection< E >::contains(), decaf::util::Collection< E >::isEmpty(), decaf::util::concurrent::locks::Lock::lock(), decaf::lang::Pointer< T, REFCOUNTER >::reset(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.33 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::set (int *index*, const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters:

index The index of the element to replace.

element The element to be stored at the specified position.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1911).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::lang::Pointer< T, REFCOUNTER >::swap(), decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.34 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1015).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::add(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addIfAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::equals(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::set().

6.192.2.35 template<typename E> virtual std::vector<E> decaf::util::concurrent::CopyOnWriteArrayList< E >::toArray () const [inline, virtual]

Returns an array containing all of the elements in this collection. If the collection makes any guarantees as to what order its elements are returned by its iterator, this method must return the elements in the same order.

This method acts as bridge between array-based and collection-based APIs.

Returns:

an array of the elements in this collection in the form of an STL vector.

Implements **decaf::util::Collection< E >** (p. 1016).

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.36 template<typename E> virtual std::string decaf::util::concurrent::CopyOnWriteArrayList< E >::toString () const [inline, virtual]

References decaf::util::concurrent::locks::Lock::lock(), decaf::util::concurrent::locks::ReentrantReadWriteLock::readLo and decaf::util::concurrent::locks::Lock::unlock().

6.192.2.37 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::tryLock () [inline, virtual]

Attempts to **Lock** (p. 1924) the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

References decaf::util::concurrent::locks::Lock::tryLock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.38 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

References decaf::util::concurrent::locks::Lock::unlock(), and decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock().

6.192.2.39 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

References decaf::util::concurrent::TimeUnit::MILLISECONDS, and decaf::util::concurrent::TimeUnit::toNanos().

6.192.2.40 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

References decaf::util::concurrent::TimeUnit::MILLISECONDS.

6.192.2.41 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CopyOnWriteArrayList.h**

6.193 decaf::util::concurrent::CopyOnWriteArraySet< E > Class Template Reference

Since the **CopyOnWriteArraySet** (p. 1221) and the **CopyOnWriteArrayList** (p. 1203) share much of the same operational semantics this class uses the **CopyOnWriteArrayList** (p. 1203) for all its underlying operations.

- virtual **decaf::util::Iterator**< E > * **iterator** ()
- virtual **decaf::util::Iterator**< E > * **iterator** () const
- virtual int **size** () const

  Returns the number of elements in this collection.

- virtual bool **isEmpty** () const

  Returns true if this collection contains no elements.

- virtual bool **add** (const E &value)

  Returns true if this collection changed as a result of the call.

- virtual bool **addAll** (const **Collection**< E > &collection)

  This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
  Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).

- virtual bool **contains** (const E &value) const

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

  Parameters:

  value *The value to check for presence in the collection.*

  Returns:

  true if there is at least one of the elements in the collection

Exceptions:

NullPointerException *if the* ***Collection*** *(p. 1006) contains pointers and the* ***Collection*** *(p. 1006) does not allow for NULL elements (optional check).*

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual bool **containsAll** (const **Collection**< E > &collection) const

  This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters:

  value *The reference to the element to remove from this* ***Collection*** *(p. 1006).*

  Returns:

  true if the collection was changed, false otherwise.

  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual bool **removeAll** (const **Collection**< E > &collection)

  This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.
  This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method.

- virtual bool **retainAll** (const **Collection**< E > &collection)

  This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

- virtual std::vector< E > **toArray** () const

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(*p. *1006**).*

- virtual bool **equals** (const **Collection**< E > &collection) const

  Answers true if this ***Collection*** *(*p. *1006**) and the one given are the same size and if each element contained in the* ***Collection*** *(*p. *1006**) given is equal to an element contained in this collection.*

6.193.1 Detailed Description

template<typename E> class decaf::util::concurrent::CopyOnWriteArraySet< E >

Since the **CopyOnWriteArraySet** (p. 1221) and the **CopyOnWriteArrayList** (p. 1203) share much of the same operational semantics this class uses the **CopyOnWriteArrayList** (p. 1203) for all its underlying operations. This collection is best used in applications where the **Set** (p. 2715) size is usually small and write operations are minimal as they result in a copy of the underlying array being created. Reads are generally fast and the iterators provided by this collection do not block as they operate on a snapshot of the data taken at the time of their creation.

Since:

1.0

6.193.2 Constructor & Destructor Documentation

6.193.2.1 template<typename E > decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet () [inline]

6.193.2.2 template<typename E > decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet (const Collection< E > & *collection*) [inline]

References decaf::util::concurrent::CopyOnWriteArraySet< E >::copy().

6.193.2.3 template<typename E > decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet (const E * *array*, int *size*) [inline]

6.193.2.4 template<typename E > virtual decaf::util::concurrent::CopyOnWriteArraySet< E >::~CopyOnWriteArraySet () [inline, virtual]

6.193.3 Member Function Documentation

6.193.3.1 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 1007).

6.193.3.2 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty). This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 143).

6.193.3.3 template<typename E > virtual void decaf::util::concurrent::CopyOnWriteArraySet< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 144).

6.193.3.4 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element. This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 145).

6.193.3.5 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::containsAll (const Collection< E > & *collection*) const [inline, virtual]

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false. This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 146).

6.193.3.6 template<typename E > virtual void decaf::util::concurrent::CopyOnWriteArraySet< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006). The default implementation iterates over the contents of the given collection adding each to this collection after first calling this Collection's clear method.

Parameters:

collection The collection to mirror.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

IllegalStateException if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 146).

Referenced by decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet().

6.193.3.7 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 1006) and the one given are the same size and if each element contained in the **Collection** (p. 1006) given is equal to an element contained in this collection.

Parameters:

collection - The **Collection** (p. 1006) to be compared to this one.

Returns:

true if this **Collection** (p. 1006) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

References decaf::lang::Iterable< E >::iterator(), NULL, decaf::util::Collection< E >::size(), and decaf::util::concurrent::CopyOnWriteArraySet< E >::size().

6.193.3.8 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::isEmpty () const [inline, virtual]

Returns true if this collection contains no elements. This implementation returns **size()** (p. 1229) == 0.

Returns:

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

6.193.3.9 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::CopyOnWriteArraySet< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1799).

6.193.3.10 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::CopyOnWriteArraySet< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1800).

6.193.3.11 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object. This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 149).

6.193.3.12 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::removeAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method. This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method.

Reimplemented from **decaf::util::AbstractSet< E >** (p. 199).

6.193.3.13 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::retainAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection. This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 150).

6.193.3.14 template<typename E > virtual int decaf::util::concurrent::CopyOnWriteArraySet< E >::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1015).

Referenced by decaf::util::concurrent::CopyOnWriteArraySet< E >::equals().

6.193.3.15 template<typename E > virtual std::vector<E> decaf::util::concurrent::CopyOnWriteArraySet< E >::toArray () const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1006). All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns:

an vector of copies of all the elements from this **Collection** (p. 1006)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 150).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CopyOnWriteArraySet.h**

6.194 decaf::util::concurrent::CountDownLatch Class Reference

`#include <src/main/decaf/util/concurrent/CountDownLatch.h>`

Public Member Functions

- **CountDownLatch** (int count)

  Constructor.

- virtual ~**CountDownLatch** ()
- virtual void **await** ()

  Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted.

- virtual bool **await** (long long timeOut)

  Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.

- virtual bool **await** (long long timeout, const **TimeUnit** &unit)

  Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.

- virtual void **countDown** ()

  Counts down the latch, releasing all waiting threads when the count hits zero.

- virtual int **getCount** () const

  Gets the current count.

- virtual std::string **toString** () const

  Returns the string representation of this latch, includes the current count value at the time of calling.

6.194.1 Constructor & Destructor Documentation

6.194.1.1 decaf::util::concurrent::CountDownLatch::CountDownLatch (int *count*)

Constructor.

Parameters:

count - number to count down from.

6.194.1.2 virtual decaf::util::concurrent::CountDownLatch::~CountDownLatch () [virtual]

6.194.2 Member Function Documentation

6.194.2.1 virtual bool decaf::util::concurrent::CountDownLatch::await (long long *timeout*, const TimeUnit & *unit*) [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses. If the current count is zero then this method returns immediately with the value true.

If the current count is greater than zero then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happen:

∗ The count reaches zero due to invocations of the **countDown()** (p. 1232) method; or ∗ Some other thread interrupts the current thread; or ∗ The specified waiting time elapses.

If the count reaches zero then the method returns with the value true.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters:

timeout - Time to wait for the count to reach zero.

unit - The units that the timeout specifies.

Exceptions:

InterruptedException - if the current thread is interrupted while waiting.

Exception - if any other error occurs.

6.194.2.2 virtual bool decaf::util::concurrent::CountDownLatch::await (long long *timeOut*) [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses. If the current count is zero then this method returns immediately with the value true.

If the current count is greater than zero then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happen:

∗ The count reaches zero due to invocations of the **countDown()** (p. 1232) method; or ∗ Some other thread interrupts the current thread; or ∗ The specified waiting time elapses.

If the count reaches zero then the method returns with the value true.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters:

timeout - Time in milliseconds to wait for the count to reach zero.

Exceptions:

InterruptedException - if the current thread is interrupted while waiting.

Exception - if any other error occurs.

6.194.2.3 virtual void decaf::util::concurrent::CountDownLatch::await () [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted. If the current count is zero then this method returns immediately.

If the current count is greater than zero then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happen:

∗ The count reaches zero due to invocations of the **countDown()** (p. 1232) method; or ∗ Some other thread interrupts the current thread.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Exceptions:

InterruptedException - if the current thread is interrupted while waiting.

Exception - if any other error occurs.

6.194.2.4 virtual void decaf::util::concurrent::CountDownLatch::countDown () [virtual]

Counts down the latch, releasing all waiting threads when the count hits zero.

6.194.2.5 virtual int decaf::util::concurrent::CountDownLatch::getCount () const [virtual]

Gets the current count.

Returns:

int count value

6.194.2.6 virtual std::string decaf::util::concurrent::CountDownLatch::toString () const [virtual]

Returns the string representation of this latch, includes the current count value at the time of calling.

Returns:

string describing this **CountDownLatch** (p. 1230) instance.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CountDownLatch.h**

6.195 decaf::util::zip::CRC32 Class Reference

Class that can be used to compute a CRC-32 checksum for a data stream.

`#include <src/main/decaf/util/zip/CRC32.h>`Inheritance diagram for decaf::util::zip::CRC32:

Public Member Functions

- **CRC32** ()
- virtual ~**CRC32** ()
- virtual long long **getValue** () const
- virtual void **reset** ()
  Reset the checksum to its initial value.
- virtual void **update** (const std::vector< unsigned char > &buffer)
  Updates the current checksum with the specified vector of bytes.
- virtual void **update** (const std::vector< unsigned char > &buffer, int offset, int length)
  Updates the current checksum with the specified array of bytes.
- virtual void **update** (const unsigned char *buffer, int size, int offset, int length)
  Updates the current checksum with the specified array of bytes.
- virtual void **update** (int byte)
  Updates the current checksum with the specified byte value.

6.195.1 Detailed Description

Class that can be used to compute a CRC-32 checksum for a data stream.

Since:

1.0

6.195.2 Constructor & Destructor Documentation

6.195.2.1 decaf::util::zip::CRC32::CRC32 ()

6.195.2.2 virtual decaf::util::zip::CRC32::~CRC32 () [virtual]

6.195.3 Member Function Documentation

6.195.3.1 virtual long long decaf::util::zip::CRC32::getValue () const [virtual]

Returns:

the current checksum value.

Implements **decaf::util::zip::Checksum** (p. 956).

6.195.3.2 virtual void decaf::util::zip::CRC32::reset () [virtual]

Reset the checksum to its initial value.

Implements **decaf::util::zip::Checksum** (p. 957).

6.195.3.3 virtual void decaf::util::zip::CRC32::update (int *byte*) [virtual]

Updates the current checksum with the specified byte value.

Parameters:

byte The byte value to update the current **Checksum** (p. 956) with (0..255).

Implements **decaf::util::zip::Checksum** (p. 957).

6.195.3.4 virtual void decaf::util::zip::CRC32::update (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

size The size of the passed buffer.

offset The position in the buffer to start reading.

length The amount of data to read from the byte buffer.

Exceptions:

NullPointerException if the passed buffer is NULL.

IndexOutOfBoundsException if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 957).

6.195.3.5 virtual void decaf::util::zip::CRC32::update (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

offset The position in the buffer to start reading.

length The amount of data to read from the byte buffer.

Exceptions:

IndexOutOfBoundsException if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 957).

6.195.3.6 virtual void decaf::util::zip::CRC32::update (const std::vector< unsigned char > & *buffer*) [virtual]

Updates the current checksum with the specified vector of bytes.

Parameters:

buffer The buffer to read the updated bytes from.

Implements **decaf::util::zip::Checksum** (p. 958).

6.197 activemq::commands::DataArrayResponse Class Reference

`#include <src/main/activemq/commands/DataArrayResponse.h>`Inheritance diagram for activemq::commands::DataArrayResponse:

Public Member Functions

- **DataArrayResponse** ()
- virtual ~**DataArrayResponse** ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **DataArrayResponse** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual const std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** () const
- virtual std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** ()
- virtual void **setData** (const std::vector< **decaf::lang::Pointer**< **DataStructure** > > &**data**)

Static Public Attributes

- static const unsigned char **ID_DATAARRAYRESPONSE** = 33

Protected Attributes

- std::vector< **decaf::lang::Pointer**< **DataStructure** > > **data**

6.197.1 Constructor & Destructor Documentation

6.197.1.1 activemq::commands::DataArrayResponse::DataArrayResponse ()

6.197.1.2 virtual activemq::commands::DataArrayResponse::~DataArrayResponse () [virtual]

6.197.2 Member Function Documentation

6.197.2.1 virtual DataArrayResponse* activemq::commands::DataArrayResponse::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 2607).

6.197.2.2 virtual void activemq::commands::DataArrayResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Response** (p. 2607).

6.197.2.3 virtual bool activemq::commands::DataArrayResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Response** (p. 2607).

6.197.2.4 virtual std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () [virtual]

6.197.2.5 virtual const std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () const [virtual]

6.197.2.6 virtual unsigned char activemq::commands::DataArrayResponse::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Response** (p. 2608).

6.197.2.7 virtual void activemq::commands::DataArrayResponse::setData (const std::vector< decaf::lang::Pointer< DataStructure > > & *data*) [virtual]

6.197.2.8 virtual std::string activemq::commands::DataArrayResponse::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2608).

6.197.3 Field Documentation

6.197.3.1 std::vector< decaf::lang::Pointer<DataStructure> > activemq::commands::DataArrayResponse::data [protected]

6.197.3.2 const unsigned char activemq::commands::DataArrayResponse::ID_DATAARRAYRESPONSE = 33 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**DataArrayResponse.h**

6.198 activemq::wireformat::openwire::marshal::generated::DataArrayR Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **DataArrayResponseMarshaller** (p. 1241).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/DataArrayResponseMarshaller.h>`
diagram for activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller:

Public Member Functions

- **DataArrayResponseMarshaller** ()
- virtual ~**DataArrayResponseMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.198.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **DataArrayResponseMarshaller** (p. 1241). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.198.2 Constructor & Destructor Documentation

6.198.2.1 activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::Data () [inline]

6.198.2.2 virtual activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::~Dat () [inline, virtual]

6.198.3 Member Function Documentation

6.198.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::create() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.198.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::getDat() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.198.3.3 virtual void activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::looseM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.198.3.4 virtual void activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::looseU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619).

6.198.3.5 virtual int activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619).

6.198.3.6 virtual void activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2620).

6.198.3.7 virtual void activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::tightU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2620).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**DataArrayResponseMarshaller.h**

6.199 decaf::util::zip::DataFormatException Class Reference

`#include <src/main/decaf/util/zip/DataFormatException.h>`Inheritance diagram for decaf::util::zip::DataFormatException:

Public Member Functions

- **DataFormatException** ()

  Default Constructor.

- **DataFormatException** (const **lang::Exception** &ex)

  Copy Constructor.

- **DataFormatException** (const **DataFormatException** &ex)

  Copy Constructor.

- **DataFormatException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **DataFormatException** (const std::exception *cause)

  Constructor.

- **DataFormatException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor.

- virtual **DataFormatException** * **clone** () const

  Clones this exception.

- virtual ~**DataFormatException** () throw ()

6.199.1 Constructor & Destructor Documentation

6.199.1.1 decaf::util::zip::DataFormatException::DataFormatException ()

Default Constructor.

6.199.1.2 decaf::util::zip::DataFormatException::DataFormatException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.199.1.3 decaf::util::zip::DataFormatException::DataFormatException (const DataFormatException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.199.1.4 decaf::util::zip::DataFormatException::DataFormatException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.199.1.5 decaf::util::zip::DataFormatException::DataFormatException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.199.1.6 decaf::util::zip::DataFormatException::DataFormatException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.199.1.7 virtual decaf::util::zip::DataFormatException::~DataFormatException () throw () [virtual]

6.199.2 Member Function Documentation

6.199.2.1 virtual DataFormatException* decaf::util::zip::DataFormatException::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an Exception that is a copy of this instance.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**DataFormatException.h**

6.200 decaf::net::DatagramPacket Class Reference

Class that represents a single datagram packet.

`#include <src/main/decaf/net/DatagramPacket.h>`

Public Member Functions

- **DatagramPacket** (unsigned char *bytes, int size, int length)

  *Creates a new **DatagramPacket** (p. 1248) for use in receiving a packet of the given length.*

- **DatagramPacket** (unsigned char *bytes, int size, int offset, int length)

  *Creates a new **DatagramPacket** (p. 1248) for use in receiving a packet of the given length starting at the specified offset into the buffer.*

- **DatagramPacket** (unsigned char *bytes, int size, int offset, int length, const **InetAddress** &address, int port)

  *Creates a new **DatagramPacket** (p. 1248) for use in sending a packet of the given length starting at the specified offset into the buffer to the specified host on the specified port.*

- **DatagramPacket** (unsigned char *bytes, int size, int length, const **InetAddress** &address, int port)

  *Creates a new **DatagramPacket** (p. 1248) for use in sending a packet of the given length to the specified host on the specified port.*

- **DatagramPacket** (unsigned char *bytes, int size, int length, const **SocketAddress** &address)

  *Creates a new **DatagramPacket** (p. 1248) for use in sending a packet of the given length into the buffer to the specified socket address.*

- **DatagramPacket** (unsigned char *bytes, int size, int offset, int length, const **SocketAddress** &address)

  *Creates a new **DatagramPacket** (p. 1248) for use in sending a packet of the given length starting at the specified offset into the buffer to the specified socket address.*

- virtual ~**DatagramPacket** ()
- **InetAddress** * **getAddress** () const
- void **setAddress** (const **InetAddress** &address)

  Sets the IP address of the machine to which this datagram is being sent.

- **SocketAddress** * **getSocketAddress** () const

  *Gets the **SocketAddress** (p. 2785) (usually IP address + port number) of the remote host that this packet is being sent to or is coming from.*

- void **setSocketAddress** (const **SocketAddress** &address)

  *Sets the **SocketAddress** (p. 2785) (usually IP address + port number) of the remote host to which this datagram is being sent.*

- int **getPort** () const
- void **setPort** (int port)

  Sets the port number on the remote host to which this datagram is being sent.

- int **getOffset** () const
- void **setOffset** (int offset)

  Sets the offset into the data buffer where data to sent is to be read from or where the data that is received should start writing to.

- int **getLength** () const
- void **setLength** (int length)

  Set the length for this packet.

- unsigned char * **getData** () const
- int **getSize** () const
- void **setData** (unsigned char *buffer, int size)

  Set the data buffer for this packet.

- void **setData** (unsigned char *buffer, int size, int offset, int length)

  Set the data buffer for this packet.

6.200.1 Detailed Description

Class that represents a single datagram packet. Datagrams are sent in packets from machine to machine and can each be routed differently and can arrive in any order. Delivery of a packet is not guaranteed.

Since:

1.0

6.200.2 Constructor & Destructor Documentation

6.200.2.1 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *length*)

Creates a new **DatagramPacket** (p. 1248) for use in receiving a packet of the given length.

Parameters:

bytes The array of bytes to hold the incoming datagram buffer.

size The size of the supplied byte array.

length The number of byte to read starting at the supplied offset.

Exceptions:

NullPointerException if the pointer to the buffer is NULL.

IndexOutOfBoundsException if the number of bytes to read exceeds the buffer size.

6.200.2.2 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *offset*, int *length*)

Creates a new **DatagramPacket** (p. 1248) for use in receiving a packet of the given length starting at the specified offset into the buffer.

Parameters:

bytes The array of bytes to hold the incoming datagram buffer.

size The size of the supplied byte array.

offset The position in the array to start writing to.

length The number of byte to read starting at the supplied offset.

Exceptions:

NullPointerException if the pointer to the buffer is NULL.

IndexOutOfBoundsException if the number of bytes to copy exceeds the buffer size.

6.200.2.3 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *offset*, int *length*, const InetAddress & *address*, int *port*)

Creates a new **DatagramPacket** (p. 1248) for use in sending a packet of the given length starting at the specified offset into the buffer to the specified host on the specified port.

Parameters:

bytes The array of bytes to hold the outgoing datagram buffer.

size The size of the supplied byte array.

offset The position in the array to start writing to.

length The number of byte to read starting at the supplied offset.

address The Address to send the packet to

port The port on the destination that is to receive this packet.

Exceptions:

NullPointerException if the pointer to the buffer is NULL.

IndexOutOfBoundsException if the number of bytes to copy exceeds the buffer size.

6.200.2.4 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *length*, const InetAddress & *address*, int *port*)

Creates a new **DatagramPacket** (p. 1248) for use in sending a packet of the given length to the specified host on the specified port.

Parameters:

bytes The array of bytes to hold the outgoing datagram buffer.

size The size of the supplied byte array.

length The number of byte to read starting at the supplied offset.

address The Address to send the packet to

port The port on the destination that is to receive this packet.

Exceptions:

NullPointerException if the pointer to the buffer is NULL.

IndexOutOfBoundsException if the number of bytes to copy exceeds the buffer size.

6.200.2.5 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *length*, const SocketAddress & *address*)

Creates a new **DatagramPacket** (p. 1248) for use in sending a packet of the given length into the buffer to the specified socket address.

Parameters:

bytes The array of bytes to hold the outgoing datagram buffer.

size The size of the supplied byte array.

length The number of byte to read starting at the supplied offset.

address The Address to send the packet to

Exceptions:

NullPointerException if the pointer to the buffer is NULL.

IndexOutOfBoundsException if the number of bytes to copy exceeds the buffer size.

6.200.2.6 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *offset*, int *length*, const SocketAddress & *address*)

Creates a new **DatagramPacket** (p. 1248) for use in sending a packet of the given length starting at the specified offset into the buffer to the specified socket address.

Parameters:

bytes The array of bytes to hold the outgoing datagram buffer.

size The size of the supplied byte array.

offset The position in the array to start writing to.

length The number of byte to read starting at the supplied offset.

address The Address to send the packet to

Exceptions:

NullPointerException if the pointer to the buffer is NULL.

IndexOutOfBoundsException if the number of bytes to copy exceeds the buffer size.

6.200.2.7 virtual decaf::net::DatagramPacket::~DatagramPacket () [virtual]

6.200.3 Member Function Documentation

6.200.3.1 InetAddress* decaf::net::DatagramPacket::getAddress () const

Returns:

the IP address that this datagram packet is being sent to or was received from.

6.200.3.2 unsigned char* decaf::net::DatagramPacket::getData () const

Returns:

the data buffer. The data received or the data to be sent starts from the offset in the buffer, and continues for length bytes.

6.200.3.3 int decaf::net::DatagramPacket::getLength () const

Returns:

the length of the data to be sent or the length of the data received.

6.200.3.4 int decaf::net::DatagramPacket::getOffset () const

Returns:

the offset of the data to be sent or the offset of the data received.

6.200.3.5 int decaf::net::DatagramPacket::getPort () const

Returns:

the port number that this datagram packet is being sent to or was received from.

6.200.3.6 int decaf::net::DatagramPacket::getSize () const

Returns:

the size of the buffer used in this datagram packet.

6.200.3.7 SocketAddress* decaf::net::DatagramPacket::getSocketAddress () const

Gets the **SocketAddress** (p. 2785) (usually IP address + port number) of the remote host that this packet is being sent to or is coming from.

Returns:

the **SocketAddress** (p. 2785) for this datagram packet.

6.200.3.8 void decaf::net::DatagramPacket::setAddress (const InetAddress & *address*)

Sets the IP address of the machine to which this datagram is being sent.

Parameters:

address The IP address.

6.200.3.9 void decaf::net::DatagramPacket::setData (unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Set the data buffer for this packet. With the offset of this **DatagramPacket** (p. 1248) set to 0, and the length set to the size value specified.

Parameters:

buffer The new data buffer to use for this datagram packet.

size The size of the buffer.

offset The position in the buffer to read from or write to.

length The number of bytes that will be read into the buffer or sent from the buffer.

Exceptions:

NullPointerException if the buffer pointer is NULL.

6.200.3.10 void decaf::net::DatagramPacket::setData (unsigned char * *buffer*, int *size*)

Set the data buffer for this packet. With the offset of this **DatagramPacket** (p. 1248) set to 0, and the length set to the size value specified.

Parameters:

buffer The new data buffer to use for this datagram packet.

size The size of the buffer.

Exceptions:

NullPointerException if the buffer pointer is NULL.

6.200.3.11 void decaf::net::DatagramPacket::setLength (int *length*)

Set the length for this packet. The length of the packet is the number of bytes from the packet's data buffer that will be sent, or the number of bytes of the packet's data buffer that will be used for receiving data. The length must be lesser or equal to the offset plus the length of the packet's buffer.

Parameters:

length The length value to set for this packet.

Exceptions:

IllegalArgumentException if the value is negative or exceeds the data buffers length.

6.200.3.12 void decaf::net::DatagramPacket::setOffset (int *offset*)

Sets the offset into the data buffer where data to sent is to be read from or where the data that is received should start writing to.

Parameters:

offset The buffer offset value.

Exceptions:

IllegalArgumentException if the offset value is greater than the buffer size.

6.200.3.13 void decaf::net::DatagramPacket::setPort (int *port*)

Sets the port number on the remote host to which this datagram is being sent.

Parameters:

port The port on the remote host.

Exceptions:

IllegalArgumentException if the port value is not in the range [0..65535].

6.200.3.14 void decaf::net::DatagramPacket::setSocketAddress (const SocketAddress & *address*)

Sets the **SocketAddress** (p. 2785) (usually IP address + port number) of the remote host to which this datagram is being sent.

Parameters:

address The **SocketAddress** (p. 2785) (IP + port) for this datagram packet.

Exceptions:

IllegalArgumentException if the subclass of address is not supported by this **Socket** (p. 2770).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**DatagramPacket.h**

6.201 decaf::io::DataInput Class Reference

The **DataInput** (p. 1255) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.

`#include <src/main/decaf/io/DataInput.h>`

Public Member Functions

- virtual ~**DataInput** ()
- virtual bool **readBoolean** ()=0

  Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.

- virtual char **readByte** ()=0

  Reads and returns one input byte.

- virtual unsigned char **readUnsignedByte** ()=0

  Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

- virtual char **readChar** ()=0

  Reads an input char and returns the char value.

- virtual double **readDouble** ()=0

  Reads eight input bytes and returns a double value.

- virtual float **readFloat** ()=0

  Reads four input bytes and returns a float value.

- virtual int **readInt** ()=0

  Reads four input bytes and returns an int value.

- virtual long long **readLong** ()=0

  Reads eight input bytes and returns a long value.

- virtual short **readShort** ()=0

  Reads two input bytes and returns a short value.

- virtual unsigned short **readUnsignedShort** ()=0

  Reads two input bytes and returns an int value in the range 0 through 65535.

- virtual std::string **readString** ()=0

  Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

- virtual std::string **readLine** ()=0

  Reads the next line of text from the input stream.

- virtual std::string **readUTF** ()=0

  Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.

- virtual void **readFully** (unsigned char *buffer, int size)=0

  Reads some bytes from an input stream and stores them into the buffer array buffer.

- virtual void **readFully** (unsigned char *buffer, int size, int offset, int length)=0

  Reads length bytes from an input stream.

- virtual long long **skipBytes** (long long num)=0

  Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.201.1 Detailed Description

The **DataInput** (p. 1255) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types. There is also a facility for reconstructing Strings from data in the Java standard modified UTF-8 format.

It is generally true of all the reading routines in this interface that if end of file is reached before the desired number of bytes has been read, an **EOFException** (p. 1452) is thrown. If any byte cannot be read for any reason other than end of file, an **IOException** (p. 1787) other than **EOFException** (p. 1452) is thrown. for example, an **IOException** (p. 1787) may be thrown if the underlying input stream has been closed.

1.0

6.201.2 Constructor & Destructor Documentation

6.201.2.1 virtual decaf::io::DataInput::~DataInput () [virtual]

6.201.3 Member Function Documentation

6.201.3.1 virtual bool decaf::io::DataInput::readBoolean () [pure virtual]

Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.

Returns:

the boolean value of the read in byte (0=false, 1=true).

Exceptions:

IOException *(p. **1787**)* if an I/O Error occurs.

EOFException *(p. **1452**)* if the end of input is reached.

6.201.3.2 virtual char decaf::io::DataInput::readByte () [pure virtual]

Reads and returns one input byte. The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns:

the 8-bit value read.

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.201.3.3 virtual char decaf::io::DataInput::readChar () [pure virtual]

Reads an input char and returns the char value. A ascii char is made up of one bytes. This returns the same result as `readByte`

Returns:

the 8 bit char read.

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.201.3.4 virtual double decaf::io::DataInput::readDouble () [pure virtual]

Reads eight input bytes and returns a double value. It does this by first constructing a long long value in exactly the manner of the readlong method, then converting this long value to a double in exactly the manner of the method Double::longBitsToDouble.

Returns:

the double value read.

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.201.3.5 virtual float decaf::io::DataInput::readFloat () [pure virtual]

Reads four input bytes and returns a float value. It does this by first constructing an int value in exactly the manner of the readInt method, then converting this int value to a float in exactly the manner of the method Float::intBitsToFloat.

Returns:

the float value read.

Exceptions:

IOException *(*p. ***1787****)* if an I/O Error occurs.

EOFException *(*p. ***1452****)* if the end of input is reached.

6.201.3.6 virtual void decaf::io::DataInput::readFully (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [pure virtual]

Reads length bytes from an input stream. This method blocks until one of the following conditions occurs: * length bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1452) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1787) other than **EOFException** (p. 1452) is thrown.

If buffer is NULL, a NullPointerException is thrown. If offset+length is greater than the length of the array buffer, then an IndexOutOfBoundsException is thrown. If length is zero, then no bytes are read. Otherwise, the first byte read is stored into element buffer[off], the next one into buffer[offset+1], and so on. The number of bytes read is, at most, equal to length.

Parameters:

buffer The byte array to insert read data into.

size The size in bytes of the given byte buffer.

offset The location in buffer to start writing.

length The number of bytes to read from the buffer.

Exceptions:

IOException *(*p. ***1787****)* if an I/O Error occurs.

EOFException *(*p. ***1452****)* if the end of input is reached.

NullPointerException if the buffer is NULL.

IndexOutOfBoundsException if the offset + length > size, or an int param is negative.

6.201.3.7 virtual void decaf::io::DataInput::readFully (unsigned char * *buffer*, int *size*) [pure virtual]

Reads some bytes from an input stream and stores them into the buffer array buffer. The number of bytes read is equal to the length of buffer.

This method blocks until one of the following conditions occurs: * buffer's size bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1452) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1787) other than **EOFException** (p. 1452) is thrown.

If buffer size is zero, then no bytes are read. Otherwise, the first byte read is stored into element b[0], the next one into buffer[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of buffer have been updated with data from the input stream.

Parameters:

buffer The byte array to insert read data into.

size The size in bytes of the given byte buffer.

Exceptions:

IOException *(*p. ***1787***) if an I/O Error occurs.

EOFException *(*p. ***1452***) if the end of input is reached.

IndexOutOfBoundsException if the size value is negative.

6.201.3.8 virtual int decaf::io::DataInput::readInt () [pure virtual]

Reads four input bytes and returns an int value. Let a be the first byte read, b be the second byte, c be the third byte, and d be the fourth byte. The value returned is:

(((a & 0xff) << 24) | ((b & 0xff) << 16) | ((c & 0xff) << 8) | (d & 0xff))

Returns:

the int value read.

Exceptions:

IOException *(*p. ***1787***) if an I/O Error occurs.

EOFException *(*p. ***1452***) if the end of input is reached.

6.201.3.9 virtual std::string decaf::io::DataInput::readLine () [pure virtual]

Reads the next line of text from the input stream. It reads successive bytes, converting each byte to an ASCII char separately, until it encounters a line terminator or end of file; the characters read are then returned as a standard String. Note that because this method processes bytes, it does not support input of the full Unicode character set.

If end of file is encountered before even one byte can be read, then an empty string is returned. Otherwise, each byte that is read is converted to type char. If the character '

' is encountered, it is discarded and reading ceases. If the character " is encountered, it is discarded and, if the following byte converts to the character '

', then that is discarded also; reading then ceases. If end of file is encountered before either of the characters '

' and " is encountered, reading ceases. Once reading has ceased, a String is returned that contains all the characters read and not discarded, taken in order.

Returns:

the next line of text read from the input stream or empty string if at EOF.

Exceptions:

IOException *(*p. ***1787***) if an I/O Error occurs.

6.201.3.10 virtual long long decaf::io::DataInput::readLong () [pure virtual]

Reads eight input bytes and returns a long value. Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be the sixth byte, g be the seventh byte, and h be the eighth byte. The value returned is:

(((long)(a & 0xff) << 56) | ((long)(b & 0xff) << 48) | ((long)(c & 0xff) << 40) | ((long)(d & 0xff) << 32) | ((long)(e & 0xff) << 24) | ((long)(f & 0xff) << 16) | ((long)(g & 0xff) << 8) | ((long)(h & 0xff)))

Returns:

the 64 bit long long read.

Exceptions:

IOException *(*p. ***1787***) if an I/O Error occurs.
EOFException *(*p. ***1452***) if the end of input is reached.

6.201.3.11 virtual short decaf::io::DataInput::readShort () [pure virtual]

Reads two input bytes and returns a short value. Let a be the first byte read and b be the second byte. The value returned is:

(short)((a << 8) | (b & 0xff))

Returns:

the 16 bit short value read.

Exceptions:

IOException *(*p. ***1787***) if an I/O Error occurs.
EOFException *(*p. ***1452***) if the end of input is reached.

6.201.3.12 virtual std::string decaf::io::DataInput::readString () [pure virtual]

Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

Returns:

string object containing the string read.

Exceptions:

IOException *(*p. ***1787***) if an I/O Error occurs.
EOFException *(*p. ***1452***) if the end of input is reached.

6.201.3.13 virtual unsigned char decaf::io::DataInput::readUnsignedByte () [pure virtual]

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns:

the 8 bit unsigned value read.

Exceptions:

IOException *(*p. ***1787***) if an I/O Error occurs.
EOFException *(*p. ***1452***) if the end of input is reached.

6.201.3.14 virtual unsigned short decaf::io::DataInput::readUnsignedShort () [pure virtual]

Reads two input bytes and returns an int value in the range 0 through 65535. Let a be the first byte read and b be the second byte. The value returned is:

(((a & 0xff) << 8) | (b & 0xff))

Returns:

the 16 bit unsigned short read.

Exceptions:

IOException (p. ***1787***) if an I/O Error occurs.

EOFException (p. ***1452***) if the end of input is reached.

6.201.3.15 virtual std::string decaf::io::DataInput::readUTF () [pure virtual]

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException. This method reads String value written from a Java **DataOutputStream** (p. 1276) and assumes that the length prefix the precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns:

The decoded string read from stream.

Exceptions:

IOException (p. ***1787***) if an I/O Error occurs.

EOFException (p. ***1452***) if the end of input is reached.

UTFDataFormatException (p. ***3216***) if the bytes are not valid modified UTF-8 values.

6.201.3.16 virtual long long decaf::io::DataInput::skipBytes (long long *num*) [pure virtual]

Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes. However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. This method never throws an **EOFException** (p. 1452). The actual number of bytes skipped is returned.

Parameters:

num The number of bytes to skip over.

Returns:

the total number of bytes skipped.

Exceptions:

IOException *(*p. ***1787)*** if an I/O Error occurs.

- virtual long long **skipBytes** (long long num)

  Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.202.1 Detailed Description

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way. An application uses a data output stream to write data that can later be read by a data input stream.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped `InputStream` (p. 1707) is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

DataInputStream (p. 1263) os = new **DataInputStream** (p. 1263)(new **InputStream()** (p. 1708), true)

Since:

1.0

6.202.2 Constructor & Destructor Documentation

6.202.2.1 decaf::io::DataInputStream::DataInputStream (InputStream * *inputStream*, bool *own* = `false`)

Creates a **DataInputStream** (p. 1263) that uses the specified underlying **InputStream** (p. 1707).

Parameters:

inputStream the **InputStream** (p. 1707) instance to wrap.

own indicates if this class owns the wrapped string defaults to false.

6.202.2.2 virtual decaf::io::DataInputStream::~DataInputStream () [virtual]

6.202.3 Member Function Documentation

6.202.3.1 virtual bool decaf::io::DataInputStream::readBoolean () [virtual]

Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.

Returns:

the boolean value of the read in byte (0=false, 1=true).

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.202.3.2 virtual char decaf::io::DataInputStream::readByte () [virtual]

Reads and returns one input byte. The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns:

the 8-bit value read.

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.202.3.3 virtual char decaf::io::DataInputStream::readChar () [virtual]

Reads an input char and returns the char value. A ascii char is made up of one bytes. This returns the same result as `readByte`

Returns:

the 8 bit char read.

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.202.3.4 virtual double decaf::io::DataInputStream::readDouble () [virtual]

Reads eight input bytes and returns a double value. It does this by first constructing a long long value in exactly the manner of the readlong method, then converting this long value to a double in exactly the manner of the method Double::longBitsToDouble.

Returns:

the double value read.

Exceptions:

IOException *(p. 1787)* if an I/O Error occurs.

EOFException *(p. 1452)* if the end of input is reached.

6.202.3.5 virtual float decaf::io::DataInputStream::readFloat () [virtual]

Reads four input bytes and returns a float value. It does this by first constructing an int value in exactly the manner of the readInt method, then converting this int value to a float in exactly the manner of the method Float::intBitsToFloat.

Returns:

the float value read.

Exceptions:

IOException *(p. 1787)* if an I/O Error occurs.

EOFException *(p. 1452)* if the end of input is reached.

6.202.3.6 virtual void decaf::io::DataInputStream::readFully (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Reads length bytes from an input stream. This method blocks until one of the following conditions occurs: * length bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1452) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1787) other than **EOFException** (p. 1452) is thrown.

If buffer is NULL, a NullPointerException is thrown. If offset+length is greater than the length of the array buffer, then an IndexOutOfBoundsException is thrown. If length is zero, then no bytes are read. Otherwise, the first byte read is stored into element buffer[off], the next one into buffer[offset+1], and so on. The number of bytes read is, at most, equal to length.

Parameters:

buffer The byte array to insert read data into.

size The size in bytes of the given byte buffer.

offset The location in buffer to start writing.

length The number of bytes to read from the buffer.

Exceptions:

IOException *(p. 1787)* if an I/O Error occurs.

EOFException *(p. 1452)* if the end of input is reached.

NullPointerException if the buffer is NULL.

IndexOutOfBoundsException if the offset + length > size.

6.202.3.7 virtual void decaf::io::DataInputStream::readFully (unsigned char * *buffer*, int *size*) [virtual]

Reads some bytes from an input stream and stores them into the buffer array buffer. The number of bytes read is equal to the length of buffer.

This method blocks until one of the following conditions occurs: * buffer's size bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1452) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1787) other than **EOFException** (p. 1452) is thrown.

If buffer size is zero, then no bytes are read. Otherwise, the first byte read is stored into element b[0], the next one into buffer[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of buffer have been updated with data from the input stream.

Parameters:

buffer The byte array to insert read data into.

size The size in bytes of the given byte buffer.

Exceptions:

IOException *(p. 1787)* if an I/O Error occurs.

EOFException *(p. 1452)* if the end of input is reached.

IndexOutOfBoundsException if the size value is negative.

6.202.3.8 virtual int decaf::io::DataInputStream::readInt () [virtual]

Reads four input bytes and returns an int value. Let a be the first byte read, b be the second byte, c be the third byte, and d be the fourth byte. The value returned is:

(((a & 0xff) << 24) | ((b & 0xff) << 16) | ((c & 0xff) << 8) | (d & 0xff))

Returns:

the int value read.

Exceptions:

IOException *(p. 1787)* if an I/O Error occurs.

EOFException *(p. 1452)* if the end of input is reached.

6.202.3.9 virtual std::string decaf::io::DataInputStream::readLine () [virtual]

Reads the next line of text from the input stream. It reads successive bytes, converting each byte to an ASCII char separately, until it encounters a line terminator or end of file; the characters read are then returned as a standard String. Note that because this method processes bytes, it does not support input of the full Unicode character set.

If end of file is encountered before even one byte can be read, then an empty string is returned. Otherwise, each byte that is read is converted to type char. If the character '

' is encountered, it is discarded and reading ceases. If the character " is encountered, it is discarded and, if the following byte converts to the character '

', then that is discarded also; reading then ceases. If end of file is encountered before either of the characters '

' and " is encountered, reading ceases. Once reading has ceased, a String is returned that contains all the characters read and not discarded, taken in order.

Returns:

the next line of text read from the input stream or empty string if at EOF.

Exceptions:

IOException *(*p. ***1787****)* if an I/O Error occurs.

6.202.3.10 virtual long long decaf::io::DataInputStream::readLong () [virtual]

Reads eight input bytes and returns a long value. Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be the sixth byte, g be the seventh byte, and h be the eighth byte. The value returned is:

(((long)(a & 0xff) << 56) | ((long)(b & 0xff) << 48) | ((long)(c & 0xff) << 40) | ((long)(d & 0xff) << 32) | ((long)(e & 0xff) << 24) | ((long)(f & 0xff) << 16) | ((long)(g & 0xff) << 8) | ((long)(h & 0xff)))

Returns:

the 64 bit long long read.

Exceptions:

IOException *(*p. ***1787****)* if an I/O Error occurs.

EOFException *(*p. ***1452****)* if the end of input is reached.

6.202.3.11 virtual short decaf::io::DataInputStream::readShort () [virtual]

Reads two input bytes and returns a short value. Let a be the first byte read and b be the second byte. The value returned is:

(short)((a << 8) | (b & 0xff))

Returns:

the 16 bit short value read.

Exceptions:

IOException *(*p. ***1787****)* if an I/O Error occurs.

EOFException *(*p. ***1452****)* if the end of input is reached.

6.202.3.12 virtual std::string decaf::io::DataInputStream::readString () [virtual]

Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

Returns:

string object containing the string read.

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.202.3.13 virtual unsigned char decaf::io::DataInputStream::readUnsignedByte () [virtual]

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns:

the 8 bit unsigned value read.

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.202.3.14 virtual unsigned short decaf::io::DataInputStream::readUnsignedShort () [virtual]

Reads two input bytes and returns an int value in the range 0 through 65535. Let a be the first byte read and b be the second byte. The value returned is:

(((a & 0xff) << 8) | (b & 0xff))

Returns:

the 16 bit unsigned short read.

Exceptions:

IOException *(*p. *1787**)* if an I/O Error occurs.

EOFException *(*p. *1452**)* if the end of input is reached.

6.202.3.15 virtual std::string decaf::io::DataInputStream::readUTF () [virtual]

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException. This method reads String value written from a Java **DataOutputStream** (p. 1276) and assumes that the length prefix the precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns:

The decoded string read from stream.

Exceptions:

IOException *(*p. ***1787****)* if an I/O Error occurs.

EOFException *(*p. ***1452****)* if the end of input is reached.

UTFDataFormatException *(*p. ***3216****)* if the bytes are not valid modified UTF-8 values.

6.202.3.16 virtual long long decaf::io::DataInputStream::skipBytes (long long *num*) [virtual]

Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes. However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. This method never throws an **EOFException** (p. 1452). The actual number of bytes skipped is returned.

Parameters:

num The number of bytes to skip over.

Returns:

the total number of bytes skipped.

Exceptions:

IOException *(*p. ***1787****)* if an I/O Error occurs.

The documentation for this class was generated from the following file:

- src/main/decaf/io/**DataInputStream.h**

6.203 decaf::io::DataOutput Class Reference

The **DataOutput** (p. 1271) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.

`#include <src/main/decaf/io/DataOutput.h>`

Public Member Functions

- virtual ~**DataOutput** ()
- virtual void **writeBoolean** (bool value)=0

  Writes a boolean to the underlying output stream as a 1-byte value.

- virtual void **writeByte** (unsigned char value)=0

  Writes out a byte to the underlying output stream as a 1-byte value.

- virtual void **writeShort** (short value)=0

  Writes a short to the underlying output stream as two bytes, high byte first.

- virtual void **writeUnsignedShort** (unsigned short value)=0

  Writes a unsigned short to the bytes message stream as a 2 byte value.

- virtual void **writeChar** (char value)=0

  Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.

- virtual void **writeInt** (int value)=0

  Writes an int to the underlying output stream as four bytes, high byte first.

- virtual void **writeLong** (long long value)=0

  Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.

- virtual void **writeFloat** (float value)=0

  Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.

- virtual void **writeDouble** (double value)=0

  Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.

- virtual void **writeBytes** (const std::string &value)=0

  Writes out the string to the underlying output stream as a sequence of bytes.

- virtual void **writeChars** (const std::string &value)=0

  Writes a string to the underlying output stream as a sequence of characters.

- virtual void **writeUTF** (const std::string &value)=0

  Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes.

6.203.1 Detailed Description

The **DataOutput** (p. 1271) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream. There is also a facility for converting Strings into the Java standard modified UTF-8 format and writing the resulting series of bytes.

If a method in this interface encounters an error while writing it will throw an **IOException** (p. 1787).

1.0

6.203.2 Constructor & Destructor Documentation

6.203.2.1 virtual decaf::io::DataOutput::~DataOutput () [virtual]

6.203.3 Member Function Documentation

6.203.3.1 virtual void decaf::io::DataOutput::writeBoolean (bool *value*) [pure virtual]

Writes a boolean to the underlying output stream as a 1-byte value. The value true is written out as the value (byte)1; the value false is written out as the value (byte)0. If no exception is thrown, the counter written is incremented by 1.

Parameters:

value The boolean to write as a byte (1=true, 0=false).

Exceptions:

IOException *(p. 1787)* if an I/O error is encountered.

6.203.3.2 virtual void decaf::io::DataOutput::writeByte (unsigned char *value*) [pure virtual]

Writes out a byte to the underlying output stream as a 1-byte value. If no exception is thrown, the counter written is incremented by 1.

Parameters:

value The unsigned char value to write.

Exceptions:

IOException *(p. 1787)* if an I/O error is encountered.

6.203.3.3 virtual void decaf::io::DataOutput::writeBytes (const std::string & *value*) [pure virtual]

Writes out the string to the underlying output stream as a sequence of bytes. Each character in the string is written out, in sequence, by discarding its high eight bits. If no exception is thrown, the counter written is incremented by the length of value. The value written does not include a trailing null as that is not part of the sequence of bytes, if the null is needed, then use the writeChars method.

Parameters:

value The vector of bytes to write.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.4 virtual void decaf::io::DataOutput::writeChar (char *value*) [pure virtual]

Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.

Parameters:

value The signed char value to write.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.5 virtual void decaf::io::DataOutput::writeChars (const std::string & *value*) [pure virtual]

Writes a string to the underlying output stream as a sequence of characters. Each character is written to the data output stream as if by the writeChar method. If no exception is thrown, the counter written is incremented by the length of value. The trailing NULL character is written by this method.

Parameters:

value The string value to write as raw bytes.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.6 virtual void decaf::io::DataOutput::writeDouble (double *value*) [pure virtual]

Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first. If no exception is thrown, the counter written is incremented by 8.

Parameters:

value The 64bit double value to write.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.7 virtual void decaf::io::DataOutput::writeFloat (float *value*) [pure virtual]

Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first. If no exception is thrown, the counter written is incremented by 4.

Parameters:

value The 32bit floating point value to write.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.8 virtual void decaf::io::DataOutput::writeInt (int *value*) [pure virtual]

Writes an int to the underlying output stream as four bytes, high byte first. If no exception is thrown, the counter written is incremented by 4.

Parameters:

value The signed integer value to write.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.9 virtual void decaf::io::DataOutput::writeLong (long long *value*) [pure virtual]

Writes an 64 bit long to the underlying output stream as eight bytes, high byte first. If no exception is thrown, the counter written is incremented by 8.

Parameters:

value The signed 64bit long value to write.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.10 virtual void decaf::io::DataOutput::writeShort (short *value*) [pure virtual]

Writes a short to the underlying output stream as two bytes, high byte first. If no exception is thrown, the counter written is incremented by 2.

Parameters:

value The signed short value to write.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.11 virtual void decaf::io::DataOutput::writeUnsignedShort (unsigned short *value*) [pure virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters:

value The unsigned short to write to the stream.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

6.203.3.12 virtual void decaf::io::DataOutput::writeUTF (const std::string & *value*) [pure virtual]

Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes. The first two bytes written are indicate its encoded length followed by the rest of the string's characters encoded as modified UTF-8. The length represent the encoded length of the data not the actual length of the string.

Parameters:

value The string value value to write as modified UTF-8.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error is encountered.

UTFDataFormatException *(*p. ***3216****)* if the encoded size if greater than 65535

6.204.1 Detailed Description

A data output stream lets an application write primitive Java data types to an output stream in a portable way. An application can then use a data input stream to read the data back in.

6.204.2 Constructor & Destructor Documentation

6.204.2.1 decaf::io::DataOutputStream::DataOutputStream (OutputStream * *outputStream*, bool *own* = `false`)

Creates a new data output stream to write data to the specified underlying output stream.

Parameters:

outputStream a stream to wrap with this one.

own true if this objects owns the stream that it wraps.

6.204.2.2 virtual decaf::io::DataOutputStream::~DataOutputStream () `[virtual]`

6.204.3 Member Function Documentation

6.204.3.1 virtual void decaf::io::DataOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) `[protected, virtual]`

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

6.204.3.2 virtual void decaf::io::DataOutputStream::doWriteByte (unsigned char *value*) `[protected, virtual]`

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

6.204.3.3 virtual long long decaf::io::DataOutputStream::size () const [inline, virtual]

Returns the current value of the counter written, the number of bytes written to this data output stream so far. If the counter overflows, it will be wrapped to **decaf::lang::Long::MAX_VALUE** (p. 1980).

Returns:

the value of the written field.

6.206.3 Member Function Documentation

6.206.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.206.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::getDataStruc () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.206.3.3 virtual void activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.206.3.4 virtual void activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::looseUnmars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619).

6.206.3.5 virtual int activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619).

6.206.3.6 virtual void activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2620).

6.206.3.7 virtual void activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::tightUnmars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2620).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**DataResponseMarshaller.h**

6.207 activemq::wireformat::openwire::marshal::DataStreamMarshaller Class Reference

Base class for all classes that **marshal** (p. 83) **commands** (p. 61) for Openwire.

`#include <src/main/activemq/wireformat/openwire/marshal/DataStreamMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::DataStreamMarshaller:

Public Member Functions

- virtual ~**DataStreamMarshaller** ()
- virtual unsigned char **getDataStructureType** () const =0

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual **commands::DataStructure** * **createObject** () const =0

  Creates a new instance of the class that this class is a marshaling director for.

- virtual int **tightMarshal1** (**OpenWireFormat** *format, **commands::DataStructure** *command, **utils::BooleanStream** *bs)=0

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataOutputStream** *ds, **utils::BooleanStream** *bs)=0

  Tight Marhsal to the given stream.

- virtual void **tightUnmarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataInputStream** *dis, **utils::BooleanStream** *bs)=0

  Tight Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataOutputStream** *ds)=0

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataInputStream** *dis)=0

  Loose Un-marhsal to the given stream.

6.207.1 Detailed Description

Base class for all classes that **marshal** (p. 83) **commands** (p. 61) for Openwire.

6.207.2 Constructor & Destructor Documentation

6.207.2.1 virtual activemq::wireformat::openwire::marshal::DataStreamMarshaller::~DataStreamMarshaller () [virtual]

6.207.3 Member Function Documentation

6.207.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::DataStreamMarshaller::createObject () const [pure virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 210), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 229), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 362), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 373), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 390), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 430), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 490), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 507), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 515), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 524), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 532), **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller** (p. 720), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 732), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 1103), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 1111), **activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller** (p. 1126), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 1137), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1170), **activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller** (p. 1179), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1192), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1200), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1242), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1284), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 1389), **activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller** (p. 1408), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1470), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1566), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1757), **activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller** (p. 1808), **activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller** (p. 1817), **activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller** (p. 1824), **activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller** (p. 1831), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1838), **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1852), **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1921), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller**

(p. 2123), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller**
(p. 2156), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller**
(p. 2165), **activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller**
(p. 2180), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller**
(p. 2216), **activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller**
(p. 2251), **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller**
(p. 2361), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller**
(p. 2461), **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller**
(p. 2473), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller**
(p. 2482), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller**
(p. 2577), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller**
(p. 2586), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller**
(p. 2594), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller**
(p. 2618), **activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller**
(p. 2700), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller**
(p. 2708), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller**
(p. 2753), **activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller**
(p. 2951), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller**
(p. 3111), **activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller**
(p. 3244), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller**
(p. 3287).

6.207.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::DataStreamMarshaller::getDataStructureType () const [pure virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller**
(p. 210), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller**
(p. 229), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller**
(p. 362), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller**
(p. 373), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller**
(p. 390), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller**
(p. 430), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller**
(p. 490), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller**
(p. 507), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller**
(p. 515), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller**
(p. 524), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller**
(p. 532), **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller**
(p. 720), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller**
(p. 732), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller**
(p. 1103), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller**
(p. 1111), **activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller**
(p. 1126), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller**
(p. 1137), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller**
(p. 1170), **activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller**
(p. 1179), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller**
(p. 1192), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller**
(p. 1200), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller**

(p. 1242), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller**
(p. 1284), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller**
(p. 1389), **activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller**
(p. 1408), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller**
(p. 1470), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller**
(p. 1566), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller**
(p. 1757), **activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller**
(p. 1808), **activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller**
(p. 1817), **activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller**
(p. 1824), **activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller**
(p. 1831), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller**
(p. 1838), **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller**
(p. 1852), **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller**
(p. 1921), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller**
(p. 2123), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller**
(p. 2156), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller**
(p. 2165), **activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller**
(p. 2180), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller**
(p. 2216), **activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller**
(p. 2251), **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller**
(p. 2361), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller**
(p. 2461), **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller**
(p. 2473), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller**
(p. 2482), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller**
(p. 2577), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller**
(p. 2586), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller**
(p. 2594), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller**
(p. 2618), **activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller**
(p. 2700), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller**
(p. 2708), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller**
(p. 2753), **activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller**
(p. 2951), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller**
(p. 3111), **activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller**
(p. 3244), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller**
(p. 3287).

6.207.3.3 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [pure virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 210), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 229), **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 334), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 362), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 373), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 390), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 430), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 490), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 499), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 507), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 515), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 524), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 532), **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643), **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller** (p. 720), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 732), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 1103), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 1111), **activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller** (p. 1126), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 1137), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1170), **activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller** (p. 1179), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1192), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1200), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1242), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1284), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 1389), **activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller** (p. 1408), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1470), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1566), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1757), **activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller** (p. 1808), **activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller** (p. 1817), **activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller** (p. 1824), **activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller** (p. 1831), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1838), **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1852), **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1921), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 2123), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 2156), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 2165), **activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller** (p. 2180), **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2185), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 2216), **activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller** (p. 2251), **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2361), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 2461), **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller** (p. 2473), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 2482), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller** (p. 2577), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller** (p. 2586), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller** (p. 2594), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618), **activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller**

(p. 2700), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller**
(p. 2708), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller**
(p. 2753), **activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller**
(p. 2951), **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller**
(p. 3103), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller**
(p. 3111), **activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller**
(p. 3244), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller**
(p. 3287).

6.207.3.4 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [pure virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller**
(p. 211), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller**
(p. 230), **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller**

(p. 3103), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller**
(p. 3112), **activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller**
(p. 3245), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller**
(p. 3288).

6.207.3.5 virtual int activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [pure virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 211), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 230), **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 335), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 363), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 374), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 391), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 431), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 491), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 500), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 508), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 516), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 525), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 533), **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645), **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller** (p. 721), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 733), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 1104), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 1112), **activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller** (p. 1127), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 1138), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1171), **activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller** (p. 1180), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1193), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1201), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1243), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1285), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 1390), **activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller** (p. 1409), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1471), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1567), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1758), **activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller** (p. 1809), **activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller** (p. 1818), **activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller** (p. 1825), **activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller** (p. 1832), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1839), **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1853), **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1922), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 2124), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 2157), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 2166), **activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller** (p. 2181), **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2186), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 2217), **activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller** (p. 2252), **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2362), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 2462), **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller** (p. 2474), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 2483), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller** (p. 2578), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller** (p. 2587), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller** (p. 2595), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619), **activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller**

(p. 2701), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller** (p. 2709), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller** (p. 2754), **activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller** (p. 2952), **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3104), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller** (p. 3112), **activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller** (p. 3245), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 3288).

6.207.3.6 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [pure virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 211), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 230), **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 335), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 363), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 374), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 391), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 431), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 491), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 500), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 508), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 516), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 525), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 533), **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646), **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller** (p. 721), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 733), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 1104), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 1112), **activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller** (p. 1127), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 1138), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1171), **activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller** (p. 1180), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1193), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1201), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller**

(p. 1243), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller**

(p. 3104), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller**
(p. 3112), **activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller**
(p. 3245), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller**
(p. 3288).

6.207.3.7 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [pure virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 212), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 231), **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 336), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 364), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 375), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 432), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 492), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 501), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 509), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 517), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 526), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 534), **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647), **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller** (p. 722), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 734), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 1105), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 1113), **activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller** (p. 1128), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 1139), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1172), **activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller** (p. 1181), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1194), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1202), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1244), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1286), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 1391), **activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller** (p. 1410), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1472), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1568), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1759), **activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller** (p. 1810), **activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller** (p. 1819), **activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller** (p. 1826), **activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller** (p. 1833), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1840), **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1854), **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1923), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 2125), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 2158), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 2167), **activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller** (p. 2182), **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 2187), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 2218), **activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller** (p. 2253), **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2363), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 2463), **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller** (p. 2475), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 2484), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller**

(p. 2579), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller**
(p. 2588), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller**
(p. 2596), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller**
(p. 2620), **activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller**
(p. 2702), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller**
(p. 2710), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller**

6.208 activemq::commands::DataStructure Class Reference

`#include <src/main/activemq/commands/DataStructure.h>`Inheritance diagram for activemq::commands::DataStructure:

Public Member Functions

- virtual ~**DataStructure** ()
- virtual unsigned char **getDataStructureType** () const =0

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **DataStructure** * **cloneDataStructure** () const =0

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)=0

  Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual std::string **toString** () const =0

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const =0

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

6.208.1 Constructor & Destructor Documentation

6.208.1.1 virtual activemq::commands::DataStructure::~DataStructure () [inline, virtual]

6.208.2 Member Function Documentation

6.208.2.1 virtual DataStructure* activemq::commands::DataStructure::cloneDataStructure () const [pure virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 205), **activemq::commands::ActiveMQBytesMessage** (p. 216), **activemq::commands::ActiveMQDestination** (p. 323), **activemq::commands::ActiveMQMapMessage** (p. 350), **activemq::commands::ActiveMQMessage** (p. 366), **activemq::commands::ActiveMQObjectMessage**

(p. 386), **activemq::commands::ActiveMQQueue** (p. 422), **activemq::commands::ActiveMQStreamMessage** (p. 478), **activemq::commands::ActiveMQTempDestination** (p. 494), **activemq::commands::ActiveMQTempQueue** (p. 503), **activemq::commands::ActiveMQTempTopic** (p. 511), **activemq::commands::ActiveMQTextMessage** (p. 520), **activemq::commands::ActiveMQTopic** (p. 528), **activemq::commands::BooleanExpression** (p. 701), **activemq::commands::BrokerError** (p. 710), **activemq::commands::BrokerId** (p. 717), **activemq::commands::BrokerInfo** (p. 724), **activemq::commands::ConnectionControl** (p. 1097), **activemq::commands::ConnectionError** (p. 1107), **activemq::commands::ConnectionId** (p. 1122), **activemq::commands::ConnectionInfo** (p. 1130), **activemq::commands::ConsumerControl** (p. 1165), **activemq::commands::ConsumerId** (p. 1174), **activemq::commands::ConsumerInfo** (p. 1184), **activemq::commands::ControlCommand** (p. 1197), **activemq::commands::DataArrayResponse** (p. 1239), **activemq::commands::DataResponse** (p. 1281), **activemq::commands::DestinationInfo** (p. 1384), **activemq::commands::DiscoveryEvent** (p. 1405), **activemq::commands::ExceptionResponse** (p. 1467), **activemq::commands::FlushCommand** (p. 1563), **activemq::commands::IntegerResponse** (p. 1754), **activemq::commands::JournalQueueAck** (p. 1805), **activemq::commands::JournalTopicAck** (p. 1812), **activemq::commands::JournalTrace** (p. 1820), **activemq::commands::JournalTransaction** (p. 1828), **activemq::commands::KeepAliveInfo** (p. 1834), **activemq::commands::LastPartialCommand** (p. 1849), **activemq::commands::LocalTransactionId** (p. 1917), **activemq::commands::Message** (p. 2076), **activemq::commands::MessageAck** (p. 2117), **activemq::commands::MessageDispatch** (p. 2146), **activemq::commands::MessageDispatchNotification** (p. 2160), **activemq::commands::MessageId** (p. 2175), **activemq::commands::MessagePull** (p. 2211), **activemq::commands::NetworkBridgeFilter** (p. 2248), **activemq::commands::PartialCommand** (p. 2358), **activemq::commands::ProducerAck** (p. 2457), **activemq::commands::ProducerId** (p. 2468), **activemq::commands::ProducerInfo** (p. 2477), **activemq::commands::RemoveInfo** (p. 2573), **activemq::commands::RemoveSubscriptionInfo** (p. 2581), **activemq::commands::ReplayCommand** (p. 2590), **activemq::commands::Response** (p. 2607), **activemq::commands::SessionId** (p. 2696), **activemq::commands::SessionInfo** (p. 2704), **activemq::commands::ShutdownInfo** (p. 2749), **activemq::commands::SubscriptionInfo** (p. 2947), **activemq::commands::TransactionId** (p. 3099), **activemq::commands::TransactionInfo** (p. 3107), **activemq::commands::WireFormatInfo** (p. 3236), and **activemq::commands::XATransactionId** (p. 3282).

6.208.2.2 virtual void activemq::commands::DataStructure::copyDataStructure (const DataStructure * *src*) [pure virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

6.208.2.3 virtual bool activemq::commands::DataStructure::equals (const DataStructure * *value*) const [pure virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.208.2.4 virtual unsigned char activemq::commands::DataStructure::getDataStructureType () const [pure virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 206), **activemq::commands::ActiveMQBytesMessage** (p. 217), **activemq::commands::ActiveMQDestination** (p. 325), **activemq::commands::ActiveMQMapMessage** (p. 352), **activemq::commands::ActiveMQMessage** (p. 366), **activemq::commands::ActiveMQObjectMessage** (p. 387), **activemq::commands::ActiveMQQueue** (p. 423), **activemq::commands::ActiveMQStreamMessage** (p. 478), **activemq::commands::ActiveMQTempDestination** (p. 495), **activemq::commands::ActiveMQTempQueue** (p. 504), **activemq::commands::ActiveMQTempTopic** (p. 512), **activemq::commands::ActiveMQTextMessage** (p. 520), **activemq::commands::ActiveMQTopic** (p. 529), **activemq::commands::BrokerError** (p. 711), **activemq::commands::BrokerId** (p. 717), **activemq::commands::BrokerInfo** (p. 726), **activemq::commands::ConnectionControl** (p. 1098), **activemq::commands::ConnectionError** (p. 1107), **activemq::commands::ConnectionId** (p. 1123), **activemq::commands::ConnectionInfo** (p. 1132), **activemq::commands::ConsumerControl** (p. 1166), **activemq::commands::ConsumerId** (p. 1175), **activemq::commands::ConsumerInfo** (p. 1185), **activemq::commands::ControlCommand** (p. 1197), **activemq::commands::DataArrayResponse** (p. 1239), **activemq::commands::DataResponse** (p. 1281), **activemq::commands::DestinationInfo** (p. 1385), **activemq::commands::DiscoveryEvent** (p. 1405), **activemq::commands::ExceptionResponse** (p. 1467), **activemq::commands::FlushCommand** (p. 1563), **activemq::commands::IntegerResponse** (p. 1754), **activemq::commands::JournalQueueAck** (p. 1805), **activemq::commands::JournalTopicAck** (p. 1812), **activemq::commands::JournalTrace** (p. 1821), **activemq::commands::JournalTransaction** (p. 1828), **activemq::commands::KeepAliveInfo** (p. 1835), **activemq::commands::LastPartialCommand** (p. 1850), **activemq::commands::LocalTransactionId** (p. 1918), **activemq::commands::Message** (p. 2079), **activemq::commands::MessageAck** (p. 2118), **activemq::commands::MessageDispatch** (p. 2147), **activemq::commands::MessageDispatchNotification** (p. 2161), **activemq::commands::MessageId** (p. 2176), **activemq::commands::MessagePull**

(p. 2212), **activemq::commands::NetworkBridgeFilter** (p. 2248), **activemq::commands::PartialCommand** (p. 2358), **activemq::commands::ProducerAck** (p. 2457), **activemq::commands::ProducerId** (p. 2469), **activemq::commands::ProducerInfo** (p. 2478), **activemq::commands::RemoveInfo** (p. 2573), **activemq::commands::RemoveSubscriptionInfo** (p. 2582), **activemq::commands::ReplayCommand** (p. 2590), **activemq::commands::Response** (p. 2608), **activemq::commands::SessionId** (p. 2697), **activemq::commands::SessionInfo** (p. 2704), **activemq::commands::ShutdownInfo** (p. 2750), **activemq::commands::SubscriptionInfo** (p. 2947), **activemq::commands::TransactionId** (p. 3100), **activemq::commands::TransactionInfo** (p. 3107), **activemq::commands::WireFormatInfo** (p. 3236), and **activemq::commands::XATransactionId** (p. 3283).

6.208.2.5 virtual std::string activemq::commands::DataStructure::toString () const [pure virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.
