6.504.1 Constructor & Destructor Documentation

6.504.1.1 decaf::io::Reader::Reader () [protected]

6.504.1.2 virtual decaf::io::Reader::~Reader () [virtual]

6.504.2 Member Function Documentation

6.504.2.1 virtual int decaf::io::Reader::doReadArray (char * *buffer*, int *length*) [protected, virtual]

Override this method to customize the functionality of the method read(char* buffer, std::size_t length).

6.504.2.2 virtual int decaf::io::Reader::doReadArrayBounded (char * *buffer*, int *size*, int *offset*, int *length*) [protected, pure virtual]

Override this method to customize the functionality of the method read(unsigned char* buffer, int size, int offset, int length). All subclasses must override this method to provide the basic **Reader** (p. 2529) functionality.

Implemented in **decaf::io::InputStreamReader** (p. 1718).

6.504.2.3 virtual int decaf::io::Reader::doReadChar () [protected, virtual]

Override this method to customize the functionality of the method **read()** (p. 2532).

6.504.2.4 virtual int decaf::io::Reader::doReadCharBuffer (decaf::nio::CharBuffer * *charBuffer*) [protected, virtual]

Override this method to customize the functionality of the method read(CharBuffer* charBuffer).

6.504.2.5 virtual int decaf::io::Reader::doReadVector (std::vector< char > & *buffer*) [protected, virtual]

Override this method to customize the functionality of the method **read(std::vector<char>& buffer)** (p. 2533).

6.504.2.6 virtual void decaf::io::Reader::mark (int *readAheadLimit*) [virtual]

Marks the present position in the stream. Subsequent calls to **reset()** (p. 2533) will attempt to reposition the stream to this point. Not all character-input streams support the **mark()** (p. 2531) operation.

Parameters:

readAheadLimit Limit on the number of characters that may be read while still preserving the mark. After reading this many characters, attempting to reset the stream may fail.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs, or the stream does not support mark.

6.504.2.7 virtual bool decaf::io::Reader::markSupported () const [inline, virtual]

Tells whether this stream supports the **mark()** (p. 2531) operation. The default implementation always returns false. Subclasses should override this method.

Returns:

true if and only if this stream supports the mark operation.

6.504.2.8 virtual int decaf::io::Reader::read (decaf::nio::CharBuffer * *charBuffer*) [virtual]

Attempts to read characters into the specified character buffer. The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters:

charBuffer The Buffer to read Characters into.

Returns:

The number of char values added to the buffer, or -1 if this source of characters is at its end

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

NullPointerException if buffer is NULL.

ReadOnlyBufferException if charBuffer is a read only buffer.

Implements **decaf::lang::Readable** (p. 2526).

6.504.2.9 virtual int decaf::io::Reader::read () [virtual]

Reads a single character. This method will block until a character is available, an I/O error occurs, or the end of the stream is reached.

Subclasses that intend to support efficient single-character input should override this method.

Returns:

The character read, as an integer in the range 0 to 65535 (0x00-0xffff), or -1 if the end of the stream has been reached.

Exceptions:

IOException *(*p. *1787)* thrown if an I/O error occurs.

6.504.2.10 virtual int decaf::io::Reader::read (char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Reads characters into a portion of an array. This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters:

buffer The target char buffer.

size The size in bytes of the target buffer.

offset The position in the buffer to start filling.

length The maximum number of bytes to read.

Returns:

The number of bytes read or -1 if the end of stream is reached.

Exceptions:

IOException *(*p. *1787)* thrown if an I/O error occurs.

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length is greater than the array size.

6.504.2.11 virtual int decaf::io::Reader::read (char * *buffer*, int *size*) [virtual]

Reads characters into an array, the method will attempt to read as much data as the size of the array. This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters:

buffer The target char buffer.

size The size in bytes of the target buffer.

Returns:

The number of bytes read or -1 if the end of stream is reached.

Exceptions:

IOException *(*p. ***1787)*** thrown if an I/O error occurs.

NullPointerException if buffer is NULL.

6.504.2.12 virtual int decaf::io::Reader::read (std::vector< char > & *buffer*) [virtual]

Reads characters into an array. This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters:

buffer The buffer to read characters into.

Returns:

The number of characters read, or -1 if the end of the stream has been reached

Exceptions:

IOException *(*p. ***1787)*** thrown if an I/O error occurs.

6.504.2.13 virtual bool decaf::io::Reader::ready () const [virtual]

Tells whether this stream is ready to be read.

Returns:

True if the next **read()** (p. 2532) is guaranteed not to block for input, false otherwise. Note that returning false does not guarantee that the next read will block.

Exceptions:

IOException *(*p. ***1787)*** if an I/O error occurs.

Reimplemented in **decaf::io::InputStreamReader** (p. 1718).

6.504.2.14 virtual void decaf::io::Reader::reset () [virtual]

Resets the stream. If the stream has been marked, then attempt to reposition it at the mark. If the stream has not been marked, then attempt to reset it in some way appropriate to the particular stream, for example by repositioning it to its starting point. Not all character-input streams support the **reset()** (p. 2533) operation, and some support **reset()** (p. 2533) without supporting **mark()** (p. 2531).

Exceptions:

IOException *(*p. ***1787)*** if an I/O error occurs.

6.504.2.15 virtual long long decaf::io::Reader::skip (long long *count*) [virtual]

Skips characters. This method will block until some characters are available, an I/O error occurs, or the end of the stream is reached.

Parameters:

count The number of character to skip.

Returns:

the number of Character actually skipped.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error occurs.

6.505.1 Constructor & Destructor Documentation

6.505.1.1 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ()

Default Constructor.

6.505.1.2 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.505.1.3 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const ReadOnlyBufferException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.505.1.4 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.505.1.5 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.505.1.6 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.505.1.7 virtual decaf::nio::ReadOnlyBufferException::~ReadOnlyBufferException () throw () [virtual]

6.505.2 Member Function Documentation

6.505.2.1 virtual ReadOnlyBufferException* decaf::nio::ReadOnlyBufferException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::UnsupportedOperationException** (p. 3165).

The documentation for this class was generated from the following file:

6.506 decaf::util::concurrent::locks::ReadWriteLock Class Reference

A **ReadWriteLock** (p. 2538) maintains a pair of associated **locks** (p. 134), one for read-only operations and one for writing.

`#include <src/main/decaf/util/concurrent/locks/ReadWriteLock.h>`Inheritance diagram for decaf::util::concurrent::locks::ReadWriteLock:

Public Member Functions

- virtual ~**ReadWriteLock** ()
- virtual **Lock** & **readLock** ()=0

  Returns the lock used for reading.

- virtual **Lock** & **writeLock** ()=0

  Returns the lock used for writing.

6.506.1 Detailed Description

A **ReadWriteLock** (p. 2538) maintains a pair of associated **locks** (p. 134), one for read-only operations and one for writing. The read lock may be held simultaneously by multiple reader threads, so long as there are no writers. The write lock is exclusive.

All **ReadWriteLock** (p. 2538) implementations must guarantee that the memory synchronization effects of writeLock operations (as specified in the **Lock** (p. 1926) interface) also hold with respect to the associated readLock. That is, a thread successfully acquiring the read lock will see all updates made upon previous release of the write lock.

A read-write lock allows for a greater level of concurrency in accessing shared data than that permitted by a mutual exclusion lock. It exploits the fact that while only a single thread at a time (a writer thread) can modify the shared data, in many cases any number of threads can concurrently read the data (hence reader threads). In theory, the increase in concurrency permitted by the use of a read-write lock will lead to performance improvements over the use of a mutual exclusion lock. In practice this increase in concurrency will only be fully realized on a multi-processor, and then only if the access patterns for the shared data are suitable.

Whether or not a read-write lock will improve performance over the use of a mutual exclusion lock depends on the frequency that the data is read compared to being modified, the duration of the read and write operations, and the contention for the data - that is, the number of threads that will try to read or write the data at the same time. For example, a collection that is initially populated with data and thereafter infrequently modified, while being frequently searched (such as a directory of some kind) is an ideal candidate for the use of a read-write lock. However, if updates become frequent then the data spends most of its time being exclusively locked and there is little, if any increase in concurrency. Further, if the read operations are too short the overhead of the read-write lock implementation (which is inherently more complex than a mutual exclusion lock) can dominate the execution cost, particularly as many read-write lock implementations still serialize all threads through a small section of **code** (p. 1005). Ultimately, only profiling and measurement will establish whether the use of a read-write lock is suitable for your application.

Although the basic operation of a read-write lock is straight-forward, there are many policy decisions that an implementation must make, which may affect the effectiveness of the read-write lock in a given application. Examples of these policies include:

* Determining whether to grant the read lock or the write lock, when both readers and writers are waiting, at the time that a writer releases the write lock. Writer preference is common, as writes are expected to be short and infrequent. Reader preference is less common as it can lead to lengthy delays for a write if the readers are frequent and long-lived as expected. Fair, or "in-order" implementations are also possible. * Determining whether readers that request the read lock while a reader is active and a writer is waiting, are granted the read lock. Preference to the reader can delay the writer indefinitely, while preference to the writer can reduce the potential for concurrency. * Determining whether the **locks** (p. 134) are reentrant: can a thread with the write lock reacquire it? Can it acquire a read lock while holding the write lock? Is the read lock itself reentrant? * Can the write lock be downgraded to a read lock without allowing an intervening writer? Can a read lock be upgraded to a write lock, in preference to other waiting readers or writers?

You should consider all of these things when evaluating the suitability of a given implementation for your application.

Since:

6.508.1 Detailed Description

Interface for a **RedeliveryPolicy** (p. 2542) object that controls how message Redelivery is handled in ActiveMQ-CPP when a transaction is rolled back.

Since:

3.2.0

6.508.2 Constructor & Destructor Documentation

6.508.2.1 activemq::core::RedeliveryPolicy::RedeliveryPolicy () [protected]

6.508.2.2 virtual activemq::core::RedeliveryPolicy::~RedeliveryPolicy () [virtual]

6.508.3 Member Function Documentation

6.508.3.1 virtual RedeliveryPolicy* activemq::core::RedeliveryPolicy::clone () const [pure virtual]

Create a copy of this Policy and return it.

Returns:

pointer to a new **RedeliveryPolicy** (p. 2542) that is a copy of this one.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1321).

6.508.3.2 virtual void activemq::core::RedeliveryPolicy::configure (const decaf::util::Properties & *properties*) [virtual]

Checks the supplied properties object for properties matching the configurable settings of this class. The default implementation looks for properties named with the prefix cms.RedeliveryPolicy.XXX where XXX is the name of a property with a public setter method. For instance cms.RedeliveryPolicy.useExponentialBackOff will be used to set the value of the use exponential back off toggle.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

Parameters:

properties The Properties object used to configure this object.

Exceptions:

NumberFormatException if a property that is numeric cannot be converted

IllegalArgumentException if a property can't be converted to the correct type.

6.508.3.3 virtual double activemq::core::RedeliveryPolicy::getBackOffMultiplier () const [pure virtual]

Returns:

The value of the Back-Off Multiplier for Message Redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1321).

6.508.3.4 virtual short activemq::core::RedeliveryPolicy::getCollisionAvoidancePercent () const [pure virtual]

Returns:

the currently set Collision Avoidance percentage.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1321).

6.508.3.5 virtual long long activemq::core::RedeliveryPolicy::getInitialRedeliveryDelay () const [pure virtual]

Gets the initial time that redelivery of messages is delayed.

Returns:

the time in milliseconds that redelivery is delayed initially.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1321).

6.508.3.6 virtual int activemq::core::RedeliveryPolicy::getMaximumRedeliveries () const [pure virtual]

Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

Returns:

maximum allowed redeliveries for a message.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1322).

6.508.3.7 virtual long long activemq::core::RedeliveryPolicy::getNextRedeliveryDelay (long long *previousDelay*) [pure virtual]

Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

Parameters:

previousDelay The last delay that was used between message redeliveries.

Returns:

the new delay to use before attempting another redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1322).

6.508.3.8 virtual long long activemq::core::RedeliveryPolicy::getRedeliveryDelay () const [pure virtual]

Gets the time that redelivery of messages is delayed.

Returns:

the time in milliseconds that redelivery is delayed.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1322).

6.508.3.9 virtual bool activemq::core::RedeliveryPolicy::isUseCollisionAvoidance () const [pure virtual]

Returns:

whether or not collision avoidance is enabled for this Policy.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1322).

6.508.3.10 virtual bool activemq::core::RedeliveryPolicy::isUseExponentialBackOff () const [pure virtual]

Returns:

whether or not the exponential back off option is enabled.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1323).

6.508.3.11 virtual void activemq::core::RedeliveryPolicy::setBackOffMultiplier (double *value*) [pure virtual]

Sets the Back-Off Multiplier for Message Redelivery.

Parameters:

value The new value for the back-off multiplier.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1323).

6.508.3.12 virtual void activemq::core::RedeliveryPolicy::setCollisionAvoidancePercent (short *value*) [pure virtual]

Parameters:

value The collision avoidance percentage setting.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1323).

6.508.3.13 virtual void activemq::core::RedeliveryPolicy::setInitialRedeliveryDelay (long long *value*) [pure virtual]

Sets the initial time that redelivery will be delayed.

Parameters:

value Time in Milliseconds to wait before starting redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1323).

6.508.3.14 virtual void activemq::core::RedeliveryPolicy::setMaximumRedeliveries (int *maximumRedeliveries*) [pure virtual]

Sets the Maximum allowable redeliveries for a Message.

Parameters:

maximumRedeliveries The maximum number of times that a message will be redelivered.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1323).

6.508.3.15 virtual void activemq::core::RedeliveryPolicy::setRedeliveryDelay (long long *value*) [pure virtual]

Sets the time that redelivery will be delayed.

Parameters:

value Time in Milliseconds to wait before the next redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1324).

6.508.3.16 virtual void activemq::core::RedeliveryPolicy::setUseCollisionAvoidance (bool *value*) [pure virtual]

Parameters:

value Enable or Disable collision avoidance for this Policy.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1324).

6.508.3.17 virtual void activemq::core::RedeliveryPolicy::setUseExponentialBackOff (bool *value*) [pure virtual]

Parameters:

value Enable or Disable the exponential back off multiplier option.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1324).

  Queries if this lock is held by the current thread.

- bool **isLocked** () const

  Queries if this lock is held by any thread.

- bool **isFair** () const

  Returns true if this lock has fairness set true.

- std::string **toString** () const

  Returns a string identifying this lock, as well as its lock state.

- int **getQueueLength** () const

  Gets an estimated count of the number of threads that are currently waiting to acquire, this value changes dynamically so the result of this method can be invalid immediately after it is called.

- int **getWaitQueueLength** (**Condition** *condition) const

  *Gets an estimated count of the number of threads that are currently waiting on the given **Condition** (p. 1077) object, this value changes dynamically so the result of this method can be invalid immediately after it is called.*

- bool **hasWaiters** (**Condition** *condition) const

  *Returns true if there are any threads that are currently waiting on the given **Condition** (p. 1077) object, the condition must be associated with this **Lock** (p. 1926) instance.*

- bool **hasQueuedThreads** () const
- bool **hasQueuedThread** (**decaf::lang::Thread** *thread) const

Protected Member Functions

- **decaf::util::Collection< decaf::lang::Thread * > * getWaitingThreads** (**Condition** *condition) const

  *Creates and returns a new **Collection** (p. 1006) object that contains all the threads that may be waiting on the given **Condition** (p. 1077) object instance at the time this method is called.*

- **decaf::lang::Thread** * **getOwner** () const

  Returns the thread that currently owns this lock, or NULL if not owned.

- **decaf::util::Collection< decaf::lang::Thread * > * getQueuedThreads** () const

  *Creates and returns a new **Collection** (p. 1006) object that contains a best effort snapshot of the threads that are currently waiting to acquire.*

6.509.1 Detailed Description

A reentrant mutual exclusion **Lock** (p. 1926) with extended capabilities. A **ReentrantLock** (p. 2548) is owned by the thread last successfully locking, but not yet unlocking it. A thread invoking lock will return, successfully acquiring the lock, when the lock is not owned by another thread. The method will return immediately if the current thread already owns the lock. This can be checked using methods **isHeldByCurrentThread()** (p. 2553), and **getHoldCount()** (p. 2550).

The constructor for this class accepts an optional fairness parameter. When set true, under contention, **locks** (p. 134) favor granting access to the longest-waiting thread. Otherwise this lock does not guarantee any particular access order. Programs using fair **locks** (p. 134) accessed by many threads may display lower overall throughput (i.e., are slower; often much slower) than those using the default setting, but have smaller variances in times to obtain **locks** (p. 134) and guarantee lack of starvation. Note however, that fairness of **locks** (p. 134) does not guarantee fairness of thread scheduling. Thus, one of many threads using a fair lock may obtain it multiple times in succession while other active threads are not progressing and not currently holding the

lock. Also note that the untimed tryLock method does not honor the fairness setting. It will succeed if the lock is available even if other threads are waiting.

It is recommended practice to always immediately follow a call to lock with a try block, most typically in a before/after construction such as:

class X { private:

ReentrantLock (p. 2548) lock; // ...

public:

void m() { lock.lock(); // block until condition holds

try { // ... method body } finally { lock.unlock() } } }

In addition to implementing the **Lock** (p. 1926) interface, this class defines methods isLocked and getLockQueueLength, as well as some associated protected access methods that may be useful for instrumentation and monitoring.

Since:

1.0

6.509.2 Constructor & Destructor Documentation

6.509.2.1 decaf::util::concurrent::locks::ReentrantLock::ReentrantLock ()

Create a new **ReentrantLock** (p. 2548) instance with unfair locking semantics.

6.509.2.2 decaf::util::concurrent::locks::ReentrantLock::ReentrantLock (bool *fair*)

Create a new **ReentrantLock** (p. 2548) instance with the specified locking semantics.

Parameters:

fair Boolean value indicating if the lock should be fair or not.

6.509.2.3 virtual decaf::util::concurrent::locks::ReentrantLock::~ReentrantLock () [virtual]

6.509.3 Member Function Documentation

6.509.3.1 int decaf::util::concurrent::locks::ReentrantLock::getHoldCount () const

Queries the number of holds on this lock by the current thread. A thread has a hold on a lock for each lock action that is not matched by an unlock action.

The hold count information is typically only used for testing and debugging purposes. For example, if a certain section of **code** (p. 1005) should not be entered with the lock already held then we can assert that fact:

class X { private:

ReentrantLock (p. 2548) lock; // ...

public:

void m() { assert(lock.getHoldCount() == 0); lock.lock(); try { // ... method body } catch(...) { lock.unlock(); } } }

Returns:

the number of holds on this lock by the current thread, or zero if this lock is not held by the current thread

6.509.3.2 decaf::lang::Thread* decaf::util::concurrent::locks::ReentrantLock::getOwner () const [protected]

Returns the thread that currently owns this lock, or NULL if not owned. When this method is called by a thread that is not the owner, the return value reflects a best-effort approximation of current lock status. For example, the owner may be momentarily NULL even if there are threads trying to acquire the lock but have not yet done so. This method is designed to facilitate construction of subclasses that provide more extensive lock monitoring facilities.

Returns:

pointer to the Thread that owns this lock, or NULL if not owned.

6.509.3.3 decaf::util::Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::ReentrantLock::getQueuedThreads () const [protected]

Creates and returns a new **Collection** (p. 1006) object that contains a best effort snapshot of the threads that are currently waiting to acquire.

Returns:

a **Collection** (p. 1006) pointer that contains waiting threads for lock acquisition. The caller owns the returned pointer.

6.509.3.4 int decaf::util::concurrent::locks::ReentrantLock::getQueueLength () const

Gets an estimated count of the number of threads that are currently waiting to acquire, this value changes dynamically so the result of this method can be invalid immediately after it is called.

Returns:

an estimate of the number of waiting threads.

6.509.3.5 decaf::util::Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::ReentrantLock::getWaitingThreads (Condition * *condition*) const [protected]

Creates and returns a new **Collection** (p. 1006) object that contains all the threads that may be waiting on the given **Condition** (p. 1077) object instance at the time this method is called.

Returns:

a **Collection** (p. 1006) pointer that contains waiting threads on given **Condition** (p. 1077) object. The caller owns the returned pointer.

Exceptions:

NullPointerException if the ConditionObject pointer is NULL.

IllegalArgumentException if the ConditionObject is not associated with this Synchronizer.

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.509.3.6 int decaf::util::concurrent::locks::ReentrantLock::getWaitQueueLength (Condition * *condition*) const

Gets an estimated count of the number of threads that are currently waiting on the given **Condition** (p. 1077) object, this value changes dynamically so the result of this method can be invalid immediately after it is called. The **Condition** (p. 1077) object must be associated with this **Lock** (p. 1926) or an exception will be thrown.

Returns:

an estimate of the number of waiting threads.

Exceptions:

NullPointerException if the ConditionObject pointer is NULL.

IllegalArgumentException if the ConditionObject is not associated with this Synchronizer.

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.509.3.7 bool decaf::util::concurrent::locks::ReentrantLock::hasQueuedThread (decaf::lang::Thread * *thread*) const

Returns:

true if the given Thread is waiting to acquire this **Lock** (p. 1926) object. Because of cancellations this method can return true but the given Thread is not in the **Queue** (p. 2515) afterwards.

Exceptions:

NullPointerException if the given thread is NULL.

6.509.3.8 bool decaf::util::concurrent::locks::ReentrantLock::hasQueuedThreads () const

Returns:

true if there are threads that are currently waiting to acquire this **Lock** (p. 1926).

6.509.3.9 bool decaf::util::concurrent::locks::ReentrantLock::hasWaiters (Condition * *condition*) const

Returns true if there are any threads that are currently waiting on the given **Condition** (p. 1077) object, the condition must be associated with this **Lock** (p. 1926) instance.

Returns:

true if the condition object has waiting threads.

Exceptions:

NullPointerException if the ConditionObject pointer is NULL.

IllegalArgumentException if the ConditionObject is not associated with this **Lock** (p. 1926).

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.509.3.10 bool decaf::util::concurrent::locks::ReentrantLock::isFair () const

Returns true if this lock has fairness set true.

Returns:

true if this lock has fairness set true

6.509.3.11 bool decaf::util::concurrent::locks::ReentrantLock::isHeldByCurrentThread () const

Queries if this lock is held by the current thread. This method is typically used for debugging and testing. For example, a method that should only be called while a lock is held can assert that this is the case:

class X { private: **ReentrantLock** (p. 2548) lock; // ...

public: void m() { assert(lock.isHeldByCurrentThread()); // ... method body } }

It can also be used to ensure that a reentrant lock is used in a non-reentrant manner, for example:

class X { private: **ReentrantLock** (p. 2548) lock; // ...

public: void m() { assert !lock.**isHeldByCurrentThread()** (p. 2553); lock.lock(); try { // ... method body } finally { lock.unlock(); } } }

Returns:

true if current thread holds this lock and false otherwise

6.509.3.12 bool decaf::util::concurrent::locks::ReentrantLock::isLocked () const

Queries if this lock is held by any thread. This method is designed for use in monitoring of the system state, not for synchronization control.

Returns:

true if any thread holds this lock and false otherwise

6.509.3.13 virtual void decaf::util::concurrent::locks::ReentrantLock::lock () [virtual]

Acquires the lock. Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds the lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired, at which time the lock hold count is set to one.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 1927).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::drainTo(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::peek(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::poll().

6.509.3.14 virtual void decaf::util::concurrent::locks::ReentrantLock::lockInterruptibly () [virtual]

Acquires the lock unless the current thread is interrupted. Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds this lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

∗ The lock is acquired by the current thread; or ∗ Some other thread interrupts the current thread.

If the lock is acquired by the current thread then the lock hold count is set to one.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implements **decaf::util::concurrent::locks::Lock** (p. 1928).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::offer(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::poll(),

decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::put(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::take().

6.509.3.15 virtual Condition* decaf::util::concurrent::locks::ReentrantLock::newCondition () [virtual]

Returns a **Condition** (p. 1077) instance for use with this **Lock** (p. 1926) instance. The returned **Condition** (p. 1077) instance supports the same usages as do the **Mutex** (p. 2236) Class' methods (wait, notify, and notifyAll).

* If this lock is not held when any of the **Condition** (p. 1077) waiting or signalling methods are called, then an IllegalMonitorStateException is thrown. * When the condition waiting methods are called the lock is released and, before they return, the lock is reacquired and the lock hold count restored to what it was when the method was called. * If a thread is interrupted while waiting then the wait will terminate, an InterruptedException will be thrown, and the thread's interrupted status will be cleared. * Waiting threads are signaled in FIFO order. * The ordering of lock reacquisition for threads returning from waiting methods is the same as for threads initially acquiring the lock, which is in the default case not specified, but for fair **locks** (p. 134) favors those threads that have been waiting the longest.

Exceptions:

RuntimeException if an error occurs while creating the **Condition** (p. 1077).

UnsupportedOperationException if this **Lock** (p. 1926) implementation does not support conditions

Implements **decaf::util::concurrent::locks::Lock** (p. 1929).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::LinkedBlockingQueue().

6.509.3.16 std::string decaf::util::concurrent::locks::ReentrantLock::toString () const [virtual]

Returns a string identifying this lock, as well as its lock state. The state, in brackets, includes either the String "Unlocked" or the String "Locked by" followed by the name of the owning thread.

Returns:

a string identifying this lock, as well as its lock state

Implements **decaf::util::concurrent::locks::Lock** (p. 1929).

6.509.3.17 virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock (long long *time*, const TimeUnit & *unit*) [virtual]

Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted. Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. If this lock has been set to use a fair ordering policy then an available lock will not be acquired if any other threads are waiting for the lock. This is in contrast to the **tryLock()** (p. 2556) method. If you want a timed tryLock that does permit barging on a fair lock then combine the timed and un-timed forms together:

if (lock.tryLock() || lock.tryLock(timeout, unit)) { ... }

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

∗ The lock is acquired by the current thread; or ∗ Some other thread interrupts the current thread; or ∗ The specified waiting time elapses

If the lock is acquired then the value true is returned and the lock hold count is set to one.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock, and over reporting the elapse of the waiting time.

Parameters:

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns:

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implements **decaf::util::concurrent::locks::Lock** (p. 1929).

6.509.3.18 virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock () [virtual]

Acquires the lock only if it is not held by another thread at the time of invocation. Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. Even when this lock has been set to use a fair ordering policy, a call to **tryLock()** (p. 2556) will immediately acquire the lock if it is available, whether or not other threads are currently waiting for the lock. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting for this lock, then use tryLock(0, **TimeUnit.SECONDS** (p. 3095)) which is almost equivalent (it also detects interruption).

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then this method will return immediately with the value false.

Returns:

true if the lock was acquired and false otherwise

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 1930).

6.509.3.19 virtual void decaf::util::concurrent::locks::ReentrantLock::unlock () [virtual]

Attempts to release this lock. If the current thread is the holder of this lock then the hold count is decremented. If the hold count is now zero then the lock is released. If the current thread is not the holder of this lock then IllegalMonitorStateException is thrown.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 1931).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::drainTo(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::offer(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::peek(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::poll(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::put(), and decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::take().

  Returns a collection containing threads that may be waiting to acquire the write lock.

- **decaf::util::Collection< decaf::lang::Thread * > * getQueuedReaderThreads** () const

  Returns a collection containing threads that may be waiting to acquire the read lock.

- **decaf::lang::Thread** * **getOwner** () const

  Returns the thread that currently owns the write lock, or NULL if not owned.

6.510.1 Detailed Description

Since:

1.0

6.510.2 Constructor & Destructor Documentation

6.510.2.1 decaf::util::concurrent::locks::ReentrantReadWriteLock::ReentrantReadWriteLock ()

Creates a new **ReentrantReadWriteLock** (p. 2558) with the default ordering property of Not-Fair.

6.510.2.2 decaf::util::concurrent::locks::ReentrantReadWriteLock::ReentrantReadWriteLock (bool *fair*)

Creates a new **ReentrantReadWriteLock** (p. 2558) with the given fairness policy.

Parameters:

fair Boolean value indicating whether this lock uses a fair or non-fair policy.

6.510.2.3 virtual decaf::util::concurrent::locks::ReentrantReadWriteLock::~ReentrantReadWriteLock () [virtual]

6.510.3 Member Function Documentation

6.510.3.1 decaf::lang::Thread* decaf::util::concurrent::locks::ReentrantReadWriteLock::getOwner () const [protected]

Returns the thread that currently owns the write lock, or NULL if not owned. When this method is called by a thread that is not the owner, the return value reflects a best-effort approximation of current lock status. For example, the owner may be momentarily NULL even if there are threads trying to acquire the lock but have not yet done so. This method is designed to facilitate construction of subclasses that provide more extensive lock monitoring facilities.

Returns:

the owner thread pointer, or NULL if not currently owned.

6.510.3.2 decaf::util::Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::ReentrantReadWriteLock::getQueuedReaderThreads () const [protected]

Returns a collection containing threads that may be waiting to acquire the read lock. Because the actual set of threads may change dynamically while constructing this result, the returned collection is only a best-effort estimate. The elements of the returned collection are in no particular order. This method is designed to facilitate construction of subclasses that provide more extensive lock monitoring facilities.

Returns:

the collection of threads

6.510.3.3 decaf::util::Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::ReentrantReadWriteLock::getQueuedThreads () const [protected]

Returns a collection containing threads that may be waiting to acquire either the read or write lock. Because the actual set of threads may change dynamically while constructing this result, the returned collection is only a best-effort estimate. The elements of the returned collection are in no particular order. This method is designed to facilitate construction of subclasses that provide more extensive monitoring facilities.

Returns:

the collection of threads

6.510.3.4 decaf::util::Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::ReentrantReadWriteLock::getQueuedWriterThreads () const [protected]

Returns a collection containing threads that may be waiting to acquire the write lock. Because the actual set of threads may change dynamically while constructing this result, the returned collection is only a best-effort estimate. The elements of the returned collection are in no particular order. This method is designed to facilitate construction of subclasses that provide more extensive lock monitoring facilities.

Returns:

the collection of threads

6.510.3.5 int decaf::util::concurrent::locks::ReentrantReadWriteLock::getQueueLength () const

Returns an estimate of the number of threads waiting to acquire either the read or write lock. The value is only an estimate because the number of threads may change dynamically while this method traverses **internal** (p. 97) data structures. This method is designed for use in monitoring of the system state, not for synchronization control.

Returns:

the estimated number of threads waiting for this lock

6.510.3.6 int decaf::util::concurrent::locks::ReentrantReadWriteLock::getReadHoldCount () const

Queries the number of reentrant read holds on this lock by the current thread. A reader thread has a hold on a lock for each lock action that is not matched by an unlock action.

Returns:

the number of holds on the read lock by the current thread, or zero if the read lock is not held by the current thread

6.510.3.7 int decaf::util::concurrent::locks::ReentrantReadWriteLock::getReadLockCount () const

Queries the number of read **locks** (p. 134) held for this lock. This method is designed for use in monitoring system state, not for synchronization control.

Returns:

the number of read **locks** (p. 134) held.

6.510.3.8 decaf::util::Collection<decaf::lang::Thread*>* decaf::util::concurrent::locks::ReentrantReadWriteLock::getWaitingThreads (Condition * *condition*) const [protected]

Creates and returns a new **Collection** (p. 1006) object that contains all the threads that may be waiting on the given **Condition** (p. 1077) object instance at the time this method is called.

Returns:

a **Collection** (p. 1006) pointer that contains waiting threads on given **Condition** (p. 1077) object. The caller owns the returned pointer.

Exceptions:

NullPointerException if the ConditionObject pointer is NULL.

IllegalArgumentException if the ConditionObject is not associated with this Synchronizer.

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.510.3.9 int decaf::util::concurrent::locks::ReentrantReadWriteLock::getWaitQueueLength (Condition * *condition*) const

Gets an estimated count of the number of threads that are currently waiting on the given **Condition** (p. 1077) object, this value changes dynamically so the result of this method can be invalid immediately after it is called. The **Condition** (p. 1077) object must be associated with this **Lock** (p. 1926) or an exception will be thrown.

Returns:

an estimate of the number of waiting threads.

Exceptions:

NullPointerException if the ConditionObject pointer is NULL.

IllegalArgumentException if the ConditionObject is not associated with this Synchronizer.

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.510.3.10 int decaf::util::concurrent::locks::ReentrantReadWriteLock::getWriteHoldCount () const

Queries the number of reentrant write holds on this lock by the current thread. A writer thread has a hold on a lock for each lock action that is not matched by an unlock action.

Returns:

the number of holds on the write lock by the current thread, or zero if the write lock is not held by the current thread

6.510.3.11 bool decaf::util::concurrent::locks::ReentrantReadWriteLock::hasQueuedThread (decaf::lang::Thread * *thread*) const

Queries whether the given thread is waiting to acquire either the read or write lock. Note that because cancellations may occur at any time, a true return does not guarantee that this thread will ever acquire a lock. This method is designed primarily for use in monitoring of the system state.

Parameters:

thread The thread that will be queried for.

Returns:

true if the given thread is queued waiting for this lock

Exceptions:

NullPointerException if the thread is NULL.

6.510.3.12 bool decaf::util::concurrent::locks::ReentrantReadWriteLock::hasQueuedThreads () const

Queries whether any threads are waiting to acquire the read or write lock. Note that because cancellations may occur at any time, a true return does not guarantee that any other thread will ever acquire a lock. This method is designed primarily for use in monitoring of the system state.

Returns:

if there may be other threads waiting to acquire the lock

6.510.3.13 bool decaf::util::concurrent::locks::ReentrantReadWriteLock::hasWaiters (Condition * *condition*) const

Queries whether any threads are waiting on the given condition associated with the write lock. Note that because timeouts and interrupts may occur at any time, a true return does not guarantee that a future signal will awaken any threads. This method is designed primarily for use in monitoring of the system state.

Parameters:

condition The condition to be queried for waiters.

Returns:

true if there are any waiting threads

Exceptions:

NullPointerException if the ConditionObject pointer is NULL.

IllegalArgumentException if the ConditionObject is not associated with this **Lock** (p. 1926).

IllegalMonitorStateException if the caller does not hold exclusive synchronization.

6.510.3.14 bool decaf::util::concurrent::locks::ReentrantReadWriteLock::isFair () const

Returns true if this lock has fairness set true.

Returns:

true if the **Lock** (p. 1926) uses a fair policy otherwise false.

6.510.3.15 bool decaf::util::concurrent::locks::ReentrantReadWriteLock::isWriteLocked () const

Queries if the write lock is held by any thread. This method is designed for use in monitoring system state, not for synchronization control.

Returns:

true if any thread holds the write lock and false otherwise

6.510.3.16 bool decaf::util::concurrent::locks::ReentrantReadWriteLock::isWriteLockedByCurrentThread () const

Queries if the write lock is held by the current thread.

Returns:

true if the current thread holds the write lock and false otherwise

6.510.3.17 virtual decaf::util::concurrent::locks::Lock& decaf::util::concurrent::locks::ReentrantReadWriteLock::readLock () [virtual]

Returns the lock used for reading.

Returns:

the lock used for reading.

Implements **decaf::util::concurrent::locks::ReadWriteLock** (p. 2539).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::contains(), decaf::util::concurrent::CopyOnWriteArrayList< E >::get(), decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf(), decaf::util::concurrent::CopyOnWriteArrayList< E >::isEmpty(), decaf::util::concurrent::CopyOnWriteArrayList< E >::iterator(), decaf::util::concurrent::CopyOnWriteArrayList< E >::lastIndexOf(), decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::util::concurrent::CopyOnWriteArrayList< E >::toArray(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::toString().

6.510.3.18 std::string decaf::util::concurrent::locks::ReentrantReadWriteLock::toString () const

Returns a string identifying this lock, as well as its lock state. The state, in brackets, includes the String "Write locks =" followed by the number of reentrantly held write **locks** (p. 134), and the String "Read locks =" followed by the number of held read **locks** (p. 134).

Returns:

a string identifying this lock, as well as its lock state

6.510.3.19 virtual decaf::util::concurrent::locks::Lock& decaf::util::concurrent::locks::ReentrantReadWriteLock::writeLock () [virtual]

Returns the lock used for writing.

Returns:

the lock used for writing.

Implements **decaf::util::concurrent::locks::ReadWriteLock** (p. 2539).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::add(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addIfAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::clear(), decaf::util::concurrent::CopyOnWriteArrayList< E >::copy(), decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList(), decaf::util::concurrent::CopyOnWriteArrayList< E >::lock(), decaf::util::concurrent::CopyOnWriteArrayList< E >::operator=(), decaf::util::concurrent::CopyOnWriteArrayList< E >::remove(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::set(),

decaf::util::concurrent::CopyOnWriteArrayList< E >::tryLock(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::unlock().

6.511 decaf::util::concurrent::RejectedExecutionException Class Reference

`#include <src/main/decaf/util/concurrent/RejectedExecutionException.h>`Inheritance diagram for decaf::util::concurrent::RejectedExecutionException:

Public Member Functions

- **RejectedExecutionException** ()
  Default Constructor.
- **RejectedExecutionException** (const Exception &ex)
  Conversion Constructor from some other Exception.
- **RejectedExecutionException** (const **RejectedExecutionException** &ex)
  Copy Constructor.
- **RejectedExecutionException** (const std::exception *cause)
  Constructor.
- **RejectedExecutionException** (const char *file, const int lineNumber, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- **RejectedExecutionException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **RejectedExecutionException** * **clone** () const
  Clones this exception.
- virtual ~**RejectedExecutionException** () throw ()

6.511.1 Constructor & Destructor Documentation

6.511.1.1 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException ()

Default Constructor.

6.511.1.2 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.511.1.3 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const RejectedExecutionException & *ex*)

Copy Constructor.

Parameters:

ex - The Exception to copy in this new instance.

6.511.1.4 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.511.1.5 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - list of primitives that are formatted into the message

6.511.1.6 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.511.1.7 virtual decaf::util::concurrent::RejectedExecutionException::~RejectedExecutionException () throw () [virtual]

6.511.2 Member Function Documentation

6.511.2.1 virtual RejectedExecutionException* decaf::util::concurrent::RejectedExecutionException::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new instance this exception type with a copy the current state.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**RejectedExecutionException.h**

6.512 decaf::util::concurrent::RejectedExecutionHandler Class Reference

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. 3047).

`#include <src/main/decaf/util/concurrent/RejectedExecutionHandler.h>`Inheritance diagram for decaf::util::concurrent::RejectedExecutionHandler:

Public Member Functions

- **RejectedExecutionHandler** ()
- virtual ~**RejectedExecutionHandler** ()
- virtual void **rejectedExecution** (**decaf::lang::Runnable** *r, **ThreadPoolExecutor** *executer)=0

  *Method that may be invoked by a **ThreadPoolExecutor** (p. 3047) when **execute** (p. 3055) cannot accept a task.*

6.512.1 Detailed Description

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. 3047).

Since:

1.0

6.512.2 Constructor & Destructor Documentation

6.512.2.1 decaf::util::concurrent::RejectedExecutionHandler::RejectedExecutionHandler ()

6.512.2.2 virtual decaf::util::concurrent::RejectedExecutionHandler::~RejectedExecutionHandler () `[virtual]`

6.512.3 Member Function Documentation

6.512.3.1 virtual void decaf::util::concurrent::RejectedExecutionHandler::rejectedExecution (decaf::lang::Runnable * *r*, ThreadPoolExecutor * *executer*) `[pure virtual]`

Method that may be invoked by a **ThreadPoolExecutor** (p. 3047) when **execute** (p. 3055) cannot accept a task. This may occur when no more threads or queue slots are available because their bounds would be exceeded, or upon shutdown of the **Executor** (p. 1476).

In the absence of other alternatives, the method may throw an **RejectedExecutionException** (p. 2567), which will be propagated to the caller of **execute** (p. 3055).

Parameters:

r The pointer to the runnable task requested to be executed.

executor The pointer to the executor attempting to execute this task.

Exceptions:

RejectedExecutionException *(*p. ***2567)*** if there is no remedy.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy** (p. 1401).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**RejectedExecutionHandler.h**

6.513 activemq::commands::RemoveInfo Class Reference

- virtual void **setLastDeliveredSequenceId** (long long **lastDeliveredSequenceId**)
- virtual bool **isRemoveInfo** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REMOVEINFO** = 12

Protected Attributes

- **Pointer**< **DataStructure** > **objectId**
- long long **lastDeliveredSequenceId**

6.513.1 Constructor & Destructor Documentation

6.513.1.1 activemq::commands::RemoveInfo::RemoveInfo ()

6.513.1.2 virtual activemq::commands::RemoveInfo::~RemoveInfo () [virtual]

6.513.2 Member Function Documentation

6.513.2.1 virtual RemoveInfo* activemq::commands::RemoveInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.513.2.2 virtual void activemq::commands::RemoveInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.513.2.3 virtual bool activemq::commands::RemoveInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.513.2.4 virtual unsigned char activemq::commands::RemoveInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.513.2.5 virtual long long activemq::commands::RemoveInfo::getLastDeliveredSequenceId () const [virtual]

6.513.2.6 virtual Pointer<DataStructure>& activemq::commands::RemoveInfo::getObjectId () [virtual]

6.513.2.7 virtual const Pointer<DataStructure>& activemq::commands::RemoveInfo::getObjectId () const [virtual]

6.513.2.8 virtual bool activemq::commands::RemoveInfo::isRemoveInfo () const [inline, virtual]

Returns:

an answer of true to the **isRemoveInfo()** (p. 2574) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 639).

6.513.2.9 virtual void activemq::commands::RemoveInfo::setLastDeliveredSequenceId (long long *lastDeliveredSequenceId*) [virtual]

6.513.2.10 virtual void activemq::commands::RemoveInfo::setObjectId (const Pointer< DataStructure > & *objectId*) [virtual]

6.513.2.11 virtual std::string activemq::commands::RemoveInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.513.2.12 virtual Pointer<Command> activemq::commands::RemoveInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.513.3 Field Documentation

6.513.3.1 const unsigned char activemq::commands::RemoveInfo::ID_REMOVEINFO = 12 [static]

6.513.3.2 long long activemq::commands::RemoveInfo::lastDeliveredSequenceId [protected]

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.514.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **RemoveInfoMarshaller** (p. 2576). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.514.2 Constructor & Destructor Documentation

6.514.2.1 activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::RemoveInfoM () [inline]

6.514.2.2 virtual activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::~RemoveInfo () [inline, virtual]

6.514.3 Member Function Documentation

6.514.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.514.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::getDataStructu () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.514.3.3 virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.514.3.4 virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::looseUnmarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.514.3.5 virtual int activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.514.3.6 virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.514.3.7 virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::tightUnmarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

() [inline, virtual]

6.516.3 Member Function Documentation

6.516.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::cre

() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.516.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::get

() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.516.3.3 virtual void activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::loc

(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.516.3.4 virtual void activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::loo (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.516.3.5 virtual int activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.516.3.6 virtual void activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.516.3.7 virtual void activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::tig (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**RemoveSubscriptionInfoMarshaller.h**

6.517 activemq::commands::ReplayCommand Class Reference

`#include <src/main/activemq/commands/ReplayCommand.h>`Inheritance diagram for activemq::commands::ReplayCommand:

Public Member Functions

- **ReplayCommand** ()
- virtual ~**ReplayCommand** ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **ReplayCommand** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual int **getFirstNakNumber** () const
- virtual void **setFirstNakNumber** (int **firstNakNumber**)
- virtual int **getLastNakNumber** () const
- virtual void **setLastNakNumber** (int **lastNakNumber**)
- virtual bool **isReplayCommand** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REPLAYCOMMAND** = 65

Protected Attributes

- int **firstNakNumber**
- int **lastNakNumber**

6.517.1 Constructor & Destructor Documentation

6.517.1.1 activemq::commands::ReplayCommand::ReplayCommand ()

6.517.1.2 virtual activemq::commands::ReplayCommand::~ReplayCommand () [virtual]

6.517.2 Member Function Documentation

6.517.2.1 virtual ReplayCommand* activemq::commands::ReplayCommand::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.517.2.2 virtual void activemq::commands::ReplayCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.517.2.3 virtual bool activemq::commands::ReplayCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.517.2.4 virtual unsigned char activemq::commands::ReplayCommand::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.517.2.5 virtual int activemq::commands::ReplayCommand::getFirstNakNumber () const [virtual]

6.517.2.6 virtual int activemq::commands::ReplayCommand::getLastNakNumber () const [virtual]

6.517.2.7 virtual bool activemq::commands::ReplayCommand::isReplayCommand () const [inline, virtual]

Returns:

an answer of true to the **isReplayCommand()** (p. 2591) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 639).

6.517.2.8 virtual void activemq::commands::ReplayCommand::setFirstNakNumber (int *firstNakNumber*) [virtual]

6.517.2.9 virtual void activemq::commands::ReplayCommand::setLastNakNumber (int *lastNakNumber*) [virtual]

6.517.2.10 virtual std::string activemq::commands::ReplayCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.517.2.11 virtual Pointer<Command> activemq::commands::ReplayCommand::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.517.3 Field Documentation

6.517.3.1 int activemq::commands::ReplayCommand::firstNakNumber [protected]

6.517.3.2 const unsigned char activemq::commands::ReplayCommand::ID_REPLAYCOMMAND = 65 [static]

6.517.3.3 int activemq::commands::ReplayCommand::lastNakNumber [protected]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ReplayCommand.h**

6.518 activemq::wireformat::openwire::marshal::generated::ReplayComm Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ReplayCommandMarshaller** (p. 2593).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ReplayCommandMarshaller.h>`Inhe
diagram for activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller:

Public Member Functions

- **ReplayCommandMarshaller** ()
- virtual ~**ReplayCommandMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.518.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ReplayCommandMarshaller** (p. 2593). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.518.2 Constructor & Destructor Documentation

6.518.2.1 activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::ReplayC () [inline]

6.518.2.2 virtual activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::~Replay () [inline, virtual]

6.518.3 Member Function Documentation

6.518.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::createObj () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.518.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::getDataSt () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.518.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::looseMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.518.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::looseUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.518.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.518.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.518.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::tightUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.522.2.4 cms::ResourceAllocationException::ResourceAllocationException (const std::string & *message*, const std::exception * *cause*)

6.522.2.5 cms::ResourceAllocationException::ResourceAllocationException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.522.2.6 virtual cms::ResourceAllocationException::~ResourceAllocationException () throw () [virtual]

6.522.3 Member Function Documentation

6.522.3.1 virtual ResourceAllocationException* cms::ResourceAllocationException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

The documentation for this class was generated from the following file:

- src/main/cms/**ResourceAllocationException.h**

6.523 activemq::cmsutil::ResourceLifecycleManager Class Reference

Manages the lifecycle of a set of CMS resources.

`#include <src/main/activemq/cmsutil/ResourceLifecycleManager.h>`

Public Member Functions

- **ResourceLifecycleManager** ()
- virtual ~**ResourceLifecycleManager** ()

  Destructor - calls `destroy`.

- void **addConnection** (**cms::Connection** *connection)

  Adds a connection so that its life will be managed by this object.

- void **addSession** (**cms::Session** *session)

  Adds a session so that its life will be managed by this object.

- void **addDestination** (**cms::Destination** *dest)

  Adds a destination so that its life will be managed by this object.

- void **addMessageProducer** (**cms::MessageProducer** *producer)

  Adds a message producer so that its life will be managed by this object.

- void **addMessageConsumer** (**cms::MessageConsumer** *consumer)

  Adds a message consumer so that its life will be managed by this object.

- void **destroy** ()

  Closes and destroys the contained CMS resources.

- void **releaseAll** ()

  Releases all of the contained resources so that this object will no longer control their lifetimes.

Protected Member Functions

- **ResourceLifecycleManager** (const **ResourceLifecycleManager** &)
- **ResourceLifecycleManager** & **operator**= (const **ResourceLifecycleManager** &)

6.523.1 Detailed Description

Manages the lifecycle of a set of CMS resources. A call to `destroy` will close and destroy all of the contained resources in the appropriate manner.

6.523.2 Constructor & Destructor Documentation

6.523.2.1 activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager (const ResourceLifecycleManager &) [protected]

6.523.2.2 activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager ()

6.523.2.3 virtual activemq::cmsutil::ResourceLifecycleManager::~ResourceLifecycleManager () [virtual]

Destructor - calls `destroy`.

6.523.3 Member Function Documentation

6.523.3.1 void activemq::cmsutil::ResourceLifecycleManager::addConnection (cms::Connection * *connection*)

Adds a connection so that its life will be managed by this object.

Parameters:

connection the object to be managed

Exceptions:

CMSException if an error occurs while performing this operation.

6.523.3.2 void activemq::cmsutil::ResourceLifecycleManager::addDestination (cms::Destination * *dest*)

Adds a destination so that its life will be managed by this object.

Parameters:

dest the object to be managed

Exceptions:

CMSException if an error occurs while performing this operation.

6.523.3.3 void activemq::cmsutil::ResourceLifecycleManager::addMessageConsumer (cms::MessageConsumer * *consumer*)

Adds a message consumer so that its life will be managed by this object.

Parameters:

consumer the object to be managed

Exceptions:

CMSException if an error occurs while performing this operation.

6.523.3.4 void activemq::cmsutil::ResourceLifecycleManager::addMessageProducer (cms::MessageProducer * *producer*)

Adds a message producer so that its life will be managed by this object.

Parameters:

producer the object to be managed

Exceptions:

CMSException if an error occurs while performing this operation.

6.523.3.5 void activemq::cmsutil::ResourceLifecycleManager::addSession (cms::Session * *session*)

Adds a session so that its life will be managed by this object.

Parameters:

session the object to be managed

Exceptions:

CMSException if an error occurs while performing this operation.

6.523.3.6 void activemq::cmsutil::ResourceLifecycleManager::destroy ()

Closes and destroys the contained CMS resources.

Exceptions:

cms::CMSException *(*p. *979)* thrown if an error occurs.

6.523.3.7 ResourceLifecycleManager& activemq::cmsutil::ResourceLifecycleManager::operator= (const ResourceLifecycleManager &) [protected]

6.523.3.8 void activemq::cmsutil::ResourceLifecycleManager::releaseAll ()

Releases all of the contained resources so that this object will no longer control their lifetimes.

6.525.1 Constructor & Destructor Documentation

6.525.1.1 activemq::commands::Response::Response ()

6.525.1.2 virtual activemq::commands::Response::~Response () [virtual]

6.525.2 Member Function Documentation

6.525.2.1 virtual Response* activemq::commands::Response::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1239), **activemq::commands::DataResponse** (p. 1281), **activemq::commands::ExceptionResponse** (p. 1467), and **activemq::commands::IntegerResponse** (p. 1754).

6.525.2.2 virtual void activemq::commands::Response::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1239), **activemq::commands::DataResponse** (p. 1281), **activemq::commands::ExceptionResponse** (p. 1467), and **activemq::commands::IntegerResponse** (p. 1754).

6.525.2.3 virtual bool activemq::commands::Response::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1239), **activemq::commands::DataResponse** (p. 1281), **activemq::commands::ExceptionResponse** (p. 1467), and **activemq::commands::IntegerResponse** (p. 1754).

6.525.2.4 virtual int activemq::commands::Response::getCorrelationId () const [virtual]

6.525.2.5 virtual unsigned char activemq::commands::Response::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1239), **activemq::commands::DataResponse** (p. 1281), **activemq::commands::ExceptionResponse** (p. 1467), and **activemq::commands::IntegerResponse** (p. 1754).

6.525.2.6 virtual bool activemq::commands::Response::isResponse () const [inline, virtual]

Returns:

an answer of true to the **isResponse()** (p. 2608) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 639).

6.525.2.7 virtual void activemq::commands::Response::setCorrelationId (int *correlationId*) [virtual]

6.525.2.8 virtual std::string activemq::commands::Response::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1240), **activemq::commands::DataResponse** (p. 1282), **activemq::commands::ExceptionResponse** (p. 1468), and **activemq::commands::IntegerResponse** (p. 1755).

6.525.2.9 virtual Pointer<Command> activemq::commands::Response::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.525.3 Field Documentation

6.525.3.1 int activemq::commands::Response::correlationId [protected]

6.525.3.2 const unsigned char activemq::commands::Response::ID_RESPONSE = 30 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**Response.h**

6.526 activemq::transport::mock::ResponseBuilder Class Reference

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

`#include <src/main/activemq/transport/mock/ResponseBuilder.h>`Inheritance diagram for activemq::transport::mock::ResponseBuilder:

Public Member Functions

- virtual ~**ResponseBuilder** ()
- virtual **Pointer**< **Response** > **buildResponse** (const **Pointer**< **Command** > command)=0

  Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

- virtual void **buildIncomingCommands** (const **Pointer**< **Command** > command, **decaf::util::LinkedList**< **Pointer**< **Command** > > &queue)=0

  *When called the **ResponseBuilder** (p. 2610) must construct all the Responses or Asynchronous **commands** (p. 61) that would be sent to this client by the Broker upon receipt of the passed command.*

6.526.1 Detailed Description

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

6.526.2 Constructor & Destructor Documentation

6.526.2.1 virtual activemq::transport::mock::ResponseBuilder::~ResponseBuilder () [virtual]

6.526.3 Member Function Documentation

6.526.3.1 virtual void activemq::transport::mock::ResponseBuilder::buildIncomingCommands (const Pointer< Command > *command*, decaf::util::LinkedList< Pointer< Command > > & *queue*) [pure virtual]

When called the **ResponseBuilder** (p. 2610) must construct all the Responses or Asynchronous **commands** (p. 61) that would be sent to this client by the Broker upon receipt of the passed command.

Parameters:

command - The Command being sent to the Broker.

queue - Queue of Command sent back from the broker.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2343).

6.526.3.2 virtual Pointer<Response> activemq::transport::mock::ResponseBuilder::buildResponse (const Pointer< Command > *command*) [pure virtual]

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters:

command - The command to build a response for

Returns:

A Response object pointer, or NULL if no response.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2344).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**ResponseBuilder.h**

6.527 activemq::transport::ResponseCallback Class Reference

Allows an async send to complete at a later time via a Response event.

`#include <src/main/activemq/transport/ResponseCallback.h>`

Public Member Functions

- **ResponseCallback** ()
- virtual ~**ResponseCallback** ()
- virtual void **onComplete** (**decaf::lang::Pointer**< **commands::Response** > response)=0

  When an Asynchronous operations completes this event is fired.

6.527.1 Detailed Description

Allows an async send to complete at a later time via a Response event.

6.527.2 Constructor & Destructor Documentation

6.527.2.1 activemq::transport::ResponseCallback::ResponseCallback ()

6.527.2.2 virtual activemq::transport::ResponseCallback::~ResponseCallback () [virtual]

6.527.3 Member Function Documentation

6.527.3.1 virtual void activemq::transport::ResponseCallback::onComplete (decaf::lang::Pointer< commands::Response > *response*) [pure virtual]

When an Asynchronous operations completes this event is fired. The provided **FutureResponse** (p. 1573) can either contain the result of the operation or an exception indicating that the operation failed.

Parameters:

response The result of the asynchronous operation that registered this call-back.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**ResponseCallback.h**

6.528 activemq::transport::correlator::ResponseCorrelator Class Reference

This type of **transport** (p. 72) filter is responsible for correlating asynchronous responses with requests.

`#include <src/main/activemq/transport/correlator/ResponseCorrelator.h>`Inheritance diagram for activemq::transport::correlator::ResponseCorrelator:

Public Member Functions

- **ResponseCorrelator** (**Pointer**< **Transport** > **next**)

  *Creates a new **ResponseCorrelator** (p. 2613) **transport** (p. 72) filter that wraps the given **transport** (p. 72).*

- virtual ~**ResponseCorrelator** ()
- virtual void **oneway** (const **Pointer**< **Command** > command)

  Sends a one-way command.

- virtual **Pointer**< **FutureResponse** > **asyncRequest** (const **Pointer**< **Command** > command, const **Pointer**< **ResponseCallback** > responseCallback)

  *Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.*

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > command)

  Sends the given command to the broker and then waits for the response.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > command, unsigned int timeout)

  Sends the given command to the broker and then waits for the response.

- virtual void **onCommand** (const **Pointer**< **Command** > command)

  This is called in the context of the nested transport's reading thread.

- virtual void **onException** (const **decaf::lang::Exception** &ex)

  *Event handler for an exception from a command **transport** (p. 72).*

Protected Member Functions

- virtual void **doClose** ()

  Subclasses can override this method to do their own close work.

6.528.1 Detailed Description

This type of **transport** (p. 72) filter is responsible for correlating asynchronous responses with requests. Non-response messages are simply sent directly to the CommandListener. It owns the **transport** (p. 72) that it

6.528.2 Constructor & Destructor Documentation

6.528.2.1 activemq::transport::correlator::ResponseCorrelator::ResponseCorrelator (Pointer< Transport > *next*)

Creates a new **ResponseCorrelator** (p. 2613) **transport** (p. 72) filter that wraps the given **transport** (p. 72).

Parameters:

next the next **transport** (p. 72) in the chain

Exceptions:

NullPointerException if next if NULL.

6.528.2.2 virtual activemq::transport::correlator::ResponseCorrelator::~ResponseCorrelator () [virtual]

6.528.3 Member Function Documentation

6.528.3.1 virtual Pointer<FutureResponse> activemq::transport::correlator::ResponseCorrelator::asyncRequest (const Pointer< Command > *command*, const Pointer< ResponseCallback > *responseCallback*) [virtual]

Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.

Parameters:

command The Command object that is to sent out.

responseCallback A callback object that will be notified once a response to the command is received.

Returns:

A **FutureResponse** (p. 1573) instance that can be queried for the Response to the Command.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3138).

6.528.3.2 virtual void activemq::transport::correlator::ResponseCorrelator::doClose () [protected, virtual]

Subclasses can override this method to do their own close work. This method is always called after all the next transports have been closed to prevent this **transport** (p. 72) for destroying resources needed by the lower level transports.

Reimplemented from **activemq::transport::TransportFilter** (p. 3139).

6.528.3.3 virtual void activemq::transport::correlator::ResponseCorrelator::onCommand (const Pointer< Command > *command*) [virtual]

This is called in the context of the nested transport's reading thread. In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters:

command The received from the nested **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3141).

6.528.3.4 virtual void activemq::transport::correlator::ResponseCorrelator::oneway (const Pointer< Command > *command*) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3141).

6.528.3.5 virtual void activemq::transport::correlator::ResponseCorrelator::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 72).

Parameters:

source The source of the exception.

ex The exception that was caught.

Reimplemented from **activemq::transport::TransportFilter** (p. 3142).

6.528.3.6 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > *command*, unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command The command to be sent.

timeout The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3142).

6.528.3.7 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3143).

The documentation for this class was generated from the following file:

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.529.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ResponseMarshaller** (p. 2617). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.529.2 Constructor & Destructor Documentation

6.529.2.1 activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::ResponseMarsh () [inline]

6.529.2.2 virtual activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::~ResponseMars () [inline, virtual]

6.529.3 Member Function Documentation

6.529.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1242), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1284), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1470), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1757).

6.529.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::getDataStructure () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1242), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1284), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1470), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1757).

6.529.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1242), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1284), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1470), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1757).

6.529.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1243), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1285), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1471), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1758).

6.529.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1243), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1285), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1471), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1758).

6.529.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1243), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1285), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1471), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1758).

6.529.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1244), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1286), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1472), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1759).

`#include <src/main/decaf/lang/Runtime.h>`Inheritance diagram for decaf::lang::Runtime:

Public Member Functions

- virtual ~**Runtime** ()

Static Public Member Functions

- static **Runtime** * **getRuntime** ()

  *Gets the single instance of the Decaf **Runtime** (p. 2624) for this Process.*

- static void **initializeRuntime** (int argc, char **argv)

  Initialize the Decaf Library passing it the args that were passed to the application at startup.

- static void **initializeRuntime** ()

  Initialize the Decaf Library.

- static void **shutdownRuntime** ()

  Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

Protected Member Functions

- **Runtime** ()

6.532.1 Constructor & Destructor Documentation

6.532.1.1 decaf::lang::Runtime::Runtime () `[protected]`

6.532.1.2 virtual decaf::lang::Runtime::~Runtime () `[virtual]`

6.532.2 Member Function Documentation

6.532.2.1 static Runtime* decaf::lang::Runtime::getRuntime () `[static]`

Gets the single instance of the Decaf **Runtime** (p. 2624) for this Process.

Returns:

pointer to the single Decaf **Runtime** (p. 2624) instance that exists for this process

6.532.2.2 static void decaf::lang::Runtime::initializeRuntime () [static]

Initialize the Decaf Library.

Exceptions:

runtime_error if the library is already initialized or an error occurs during initialization.

6.532.2.3 static void decaf::lang::Runtime::initializeRuntime (int *argc*, char ** *argv*) [static]

Initialize the Decaf Library passing it the args that were passed to the application at startup.

Parameters:

argc - The number of args passed

argv - Array of char* values passed to the Process on start.

Exceptions:

runtime_error if the library is already initialized or an error occurs during initialization.

6.532.2.4 static void decaf::lang::Runtime::shutdownRuntime () [static]

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

Exceptions:

runtime_error if the library has not already been initialized or an error occurs during shutdown.

6.533 decaf::lang::exceptions::RuntimeException Class Reference

`#include <src/main/decaf/lang/exceptions/RuntimeException.h>`Inheritance diagram for decaf::lang::exceptions::RuntimeException:

Public Member Functions

- **RuntimeException** ()

  Default Constructor.

- **RuntimeException** (const **Exception** &ex)

  Conversion Constructor from some other ActiveMQException.

- **RuntimeException** (const **RuntimeException** &ex)

  Copy Constructor.

- **RuntimeException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **RuntimeException** (const std::exception *cause)

  Constructor.

- **RuntimeException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **RuntimeException** * **clone** () const

  Clones this exception.

- virtual ~**RuntimeException** () throw ()

6.533.1 Constructor & Destructor Documentation

6.533.1.1 decaf::lang::exceptions::RuntimeException::RuntimeException ()

Default Constructor.

6.533.1.2 decaf::lang::exceptions::RuntimeException::RuntimeException (const Exception & *ex*)

Conversion Constructor from some other ActiveMQException.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.533.1.3 decaf::lang::exceptions::RuntimeException::RuntimeException (const RuntimeException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.533.1.4 decaf::lang::exceptions::RuntimeException::RuntimeException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.533.1.5 decaf::lang::exceptions::RuntimeException::RuntimeException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.533.1.6 decaf::lang::exceptions::RuntimeException::RuntimeException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.533.1.7 virtual decaf::lang::exceptions::RuntimeException::~RuntimeException () throw () [virtual]

6.533.2 Member Function Documentation

6.533.2.1 virtual RuntimeException* decaf::lang::exceptions::RuntimeException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

Reimplemented in **decaf::lang::exceptions::NegativeArraySizeException** (p. 2243), **decaf::security::ProviderException** (p. 2504), **decaf::util::ConcurrentModificationException** (p. 1058), and **decaf::util::NoSuchElementException** (p. 2262).

The documentation for this class was generated from the following file:

6.535 activemq::threads::Scheduler Class Reference

Scheduler (p. 2630) class for use in executing Runnable Tasks either periodically or one time only with optional delay.

`#include <src/main/activemq/threads/Scheduler.h>`Inheritance diagram for activemq::threads::Scheduler:

Public Member Functions

- **Scheduler** (const std::string &name)
- virtual ~**Scheduler** ()
- void **executePeriodically** (**decaf::lang::Runnable** *task, long long period, bool ownsTask=true)
- void **schedualPeriodically** (**decaf::lang::Runnable** *task, long long period, bool ownsTask=true)
- void **cancel** (**decaf::lang::Runnable** *task)
- void **executeAfterDelay** (**decaf::lang::Runnable** *task, long long delay, bool ownsTask=true)
- void **shutdown** ()

Protected Member Functions

- virtual void **doStart** ()

  Performs the actual start operation on the service, acquiring all the resources needed to run the service.

- virtual void **doStop** (**activemq::util::ServiceStopper** *stopper)

  Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

6.535.1 Detailed Description

Scheduler (p. 2630) class for use in executing Runnable Tasks either periodically or one time only with optional delay.

Since:

3.3.0

6.535.2 Constructor & Destructor Documentation

6.535.2.1 activemq::threads::Scheduler::Scheduler (const std::string & *name*)

6.535.2.2 virtual activemq::threads::Scheduler::~Scheduler () [virtual]

6.535.3 Member Function Documentation

6.535.3.1 void activemq::threads::Scheduler::cancel (decaf::lang::Runnable * *task*)

6.535.3.2 virtual void activemq::threads::Scheduler::doStart () [protected, virtual]

Performs the actual start operation on the service, acquiring all the resources needed to run the service. Must be implemented in derived class.

Implements **activemq::util::ServiceSupport** (p. 2678).

6.535.3.3 virtual void activemq::threads::Scheduler::doStop (activemq::util::ServiceStopper * *stopper*) [protected, virtual]

Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

Implements **activemq::util::ServiceSupport** (p. 2678).

6.535.3.4 void activemq::threads::Scheduler::executeAfterDelay (decaf::lang::Runnable * *task*, long long *delay*, bool *ownsTask* = true)

6.535.3.5 void activemq::threads::Scheduler::executePeriodically (decaf::lang::Runnable * *task*, long long *period*, bool *ownsTask* = true)

6.535.3.6 void activemq::threads::Scheduler::schedualPeriodically (decaf::lang::Runnable * *task*, long long *period*, bool *ownsTask* = true)

6.535.3.7 void activemq::threads::Scheduler::shutdown ()

The documentation for this class was generated from the following file:

6.536.3 Member Function Documentation

6.536.3.1 virtual void activemq::threads::SchedulerTimerTask::run () `[virtual]`

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2622).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**SchedulerTimerTask.h**

6.537 decaf::security::SecureRandom Class Reference

`#include <src/main/decaf/security/SecureRandom.h>`Inheritance diagram for decaf::security::SecureRandom:

Public Member Functions

- **SecureRandom** ()

  Creates a new instance of a secure random number generator that implements the default random number algorithm.

- **SecureRandom** (const std::vector< unsigned char > &seed)

  Creates a new instance of a secure random number generator that implements the default random number algorithm.

- **SecureRandom** (const unsigned char *seed, int size)

  Creates a new instance of a secure random number generator that implements the default random number algorithm.

- virtual ~**SecureRandom** ()
- virtual void **nextBytes** (std::vector< unsigned char > &buf)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.
  Parameters:

  buf *non-null array to contain the new random bytes*
  See also:

  next *(p. 2522)*

- virtual void **nextBytes** (unsigned char *buf, int size)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.
  Parameters:

  buf *non-null array to contain the new random bytes*
  See also:

  next *(p. 2522)*
  Exceptions:

  NullPointerException *if buff is NULL*
  IllegalArgumentException *if size is negative*

- virtual void **setSeed** (unsigned long long seed)

  Modifies the seed using linear congruential formula presented in The Art of Computer Programming, Volume 2, Section 3.2.1.
  Parameters:

  seed *the seed that alters the state of the random number generator*
  See also:

  next *(p. 2522)*
  Random() *(p. 2522)*
  Random(long)

- virtual void **setSeed** (const std::vector< unsigned char > &seed)

  Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

- virtual void **setSeed** (const unsigned char *seed, int size)

  Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Protected Member Functions

- virtual int **next** (int bits)

  Answers a pseudo-random uniformly distributed ***int*** *value of the number of bits specified by the argument* ***bits*** *as described by Donald E.*
  Knuth in The Art of Computer Programming, Volume 2: Seminumerical Algorithms, section 3.2.1.
  Returns:

  int a pseudo-random generated int number
  Parameters:

  bits *number of bits of the returned value*
  See also:

  nextBytes *(p. 2523)*
  nextDouble *(p. 2524)*
  nextFloat *(p. 2524)*
  nextInt() *(p. 2525)*
  nextInt(int) *(p. 2524)*
  nextGaussian *(p. 2524)*
  nextLong *(p. 2525)*

6.537.1 Detailed Description

Since:

1.0

6.537.2 Constructor & Destructor Documentation

6.537.2.1 decaf::security::SecureRandom::SecureRandom ()

Creates a new instance of a secure random number generator that implements the default random number algorithm. The **SecureRandom** (p. 2633) instance that is created with this constructor is unseeded and can be seeded by calling the setSeed method. Calls to nextBytes on an unseeded **SecureRandom** (p. 2633) result in the object seeding itself.

6.537.2.2 decaf::security::SecureRandom::SecureRandom (const std::vector< unsigned char > & *seed*)

Creates a new instance of a secure random number generator that implements the default random number algorithm. The **SecureRandom** (p. 2633) instance created by this constructor is seeded using the passed byte array.

Parameters:

seed The seed bytes to use to seed this secure random number generator.

6.537.2.3 decaf::security::SecureRandom::SecureRandom (const unsigned char * *seed*, int *size*)

Creates a new instance of a secure random number generator that implements the default random number algorithm. The **SecureRandom** (p. 2633) instance created by this constructor is seeded using the passed byte array.

Parameters:

seed The seed bytes to use to seed this secure random number generator.

size The number of bytes in the seed buffer.

Exceptions:

NullPointerException if the seed buffer is NULL.

IllegalArgumentException if the size value is negative.

6.537.2.4 virtual decaf::security::SecureRandom::~SecureRandom () [virtual]

6.537.3 Member Function Documentation

6.537.3.1 virtual int decaf::security::SecureRandom::next (int *bits*) [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns:

int a pseudo-random generated int number

Parameters:

bits number of bits of the returned value

See also:

nextBytes (p. 2523)
nextDouble (p. 2524)
nextFloat (p. 2524)
nextInt() (p. 2525)
nextInt(int) (p. 2524)
nextGaussian (p. 2524)
nextLong (p. 2525)

Reimplemented from **decaf::util::Random** (p. 2522).

6.537.3.2 virtual void decaf::security::SecureRandom::nextBytes (unsigned char * *buf*, int *size*) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters:

buf non-null array to contain the new random bytes

See also:

next (p. 2522)

Exceptions:

NullPointerException if buff is NULL

IllegalArgumentException if size is negative

Reimplemented from **decaf::util::Random** (p. 2523).

6.537.3.3 virtual void decaf::security::SecureRandom::nextBytes (std::vector< unsigned char > & *buf*) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters:

buf non-null array to contain the new random bytes

See also:

next (p. 2522)

Reimplemented from **decaf::util::Random** (p. 2523).

6.537.3.4 virtual void decaf::security::SecureRandom::setSeed (const unsigned char * *seed*, int *size*) [virtual]

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Parameters:

seed The seed bytes to use to seed this secure random number generator.

size The number of bytes in the seed buffer.

Exceptions:

NullPointerException if the seed buffer is NULL.

IllegalArgumentException if the size value is negative.

6.537.3.5 virtual void decaf::security::SecureRandom::setSeed (const std::vector< unsigned char > & *seed*) [virtual]

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Parameters:

seed A vector of bytes that is used update the seed of the RNG.

6.537.3.6 virtual void decaf::security::SecureRandom::setSeed (unsigned long long *seed*) [virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters:

seed the seed that alters the state of the random number generator

See also:

next (p. 2522)
Random() (p. 2522)
Random(long)

Reimplemented from **decaf::util::Random** (p. 2525).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**SecureRandom.h**

6.538 decaf::internal::security::SecureRandomImpl Class Reference

Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources.

`#include <src/main/decaf/internal/security/unix/SecureRandomImpl.h>`Inheritance diagram for decaf::internal::security::SecureRandomImpl:

Public Member Functions

- **SecureRandomImpl** ()
- virtual ~**SecureRandomImpl** ()
- virtual void **providerSetSeed** (const unsigned char *seed, int size)

  Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

- virtual void **providerNextBytes** (unsigned char *bytes, int numBytes)

  Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

- virtual unsigned char * **providerGenerateSeed** (int numBytes)

  Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

- **SecureRandomImpl** ()
- virtual ~**SecureRandomImpl** ()
- virtual void **providerSetSeed** (const unsigned char *seed, int size)

  Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

- virtual void **providerNextBytes** (unsigned char *bytes, int numBytes)

  Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

- virtual unsigned char * **providerGenerateSeed** (int numBytes)

  Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

6.538.1 Detailed Description

Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources. Secure Random Number Generator for Windows based platforms that attempts to obtain secure bytes with high entropy from known sources.

If the platform does not have a source of secure bytes then the platform random number generator is used if one exists otherwise the Decaf RNG is used as a last resort.

6.538.2.3 decaf::internal::security::SecureRandomImpl::SecureRandomImpl ()

6.538.2.4 virtual decaf::internal::security::SecureRandomImpl::~SecureRandomImpl () [virtual]

6.538.3 Member Function Documentation

6.538.3.1 virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed (int *numBytes*) [virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator. The caller owns the returned array and must delete it.

Parameters:

numBytes The number of bytes that should be generated for the new seed array.

Implements **decaf::security::SecureRandomSpi** (p. 2641).

6.538.3.2 virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed (int *numBytes*) [virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator. The caller owns the returned array and must delete it.

Parameters:

numBytes The number of bytes that should be generated for the new seed array.

Implements **decaf::security::SecureRandomSpi** (p. 2641).

6.538.3.3 virtual void decaf::internal::security::SecureRandomImpl::providerNextBytes (unsigned char * *bytes*, int *numBytes*) [virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array. The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters:

bytes The array that will be filled with random bytes equal to size.

numBytes The number of bytes to generate and write into the bytes array.

Implements **decaf::security::SecureRandomSpi** (p. 2642).

6.538.3.4 virtual void decaf::internal::security::SecureRandomImpl::providerNextBytes (unsigned char * *bytes*, int *numBytes*) [virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array. The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters:

bytes The array that will be filled with random bytes equal to size.

numBytes The number of bytes to generate and write into the bytes array.

Implements **decaf::security::SecureRandomSpi** (p. 2642).

6.538.3.5 virtual void decaf::internal::security::SecureRandomImpl::providerSetSeed (const unsigned char * *seed*, int *size*) [virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters:

seed The array of bytes used to update the generators seed.

size The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 2642).

6.538.3.6 virtual void decaf::internal::security::SecureRandomImpl::providerSetSeed (const unsigned char * *seed*, int *size*) [virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters:

seed The array of bytes used to update the generators seed.

size The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 2642).

The documentation for this class was generated from the following files:

- src/main/decaf/internal/security/unix/**SecureRandomImpl.h**
- src/main/decaf/internal/security/windows/**SecureRandomImpl.h**

6.539 decaf::security::SecureRandomSpi Class Reference

Interface class used by **Security** (p. 2643) Service Providers to implement a source of secure random bytes.

`#include <src/main/decaf/security/SecureRandomSpi.h>`Inheritance diagram for decaf::security::SecureRandomSpi:

Public Member Functions

- **SecureRandomSpi** ()
- virtual ~**SecureRandomSpi** ()
- virtual void **providerSetSeed** (const unsigned char *seed, int size)=0

  Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

- virtual void **providerNextBytes** (unsigned char *bytes, int numBytes)=0

  Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

- virtual unsigned char * **providerGenerateSeed** (int numBytes)=0

  Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

6.539.1 Detailed Description

6.539.3 Member Function Documentation

6.539.3.1 virtual unsigned char* decaf::security::SecureRandomSpi::providerGenerateSeed (int *numBytes*) [pure virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator. The caller owns the returned array and must delete it.

Parameters:

numBytes The number of bytes that should be generated for the new seed array.

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 2639), and **decaf::internal::security::SecureRandomImpl** (p. 2639).

6.539.3.2 virtual void decaf::security::SecureRandomSpi::providerNextBytes (unsigned char * *bytes*, int *numBytes*) [pure virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array. The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters:

bytes The array that will be filled with random bytes equal to size.

numBytes The number of bytes to generate and write into the bytes array.

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 2640), and **decaf::internal::security::SecureRandomImpl** (p. 2640).

6.539.3.3 virtual void decaf::security::SecureRandomSpi::providerSetSeed (const unsigned char * *seed*, int *size*) [pure virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters:

seed The array of bytes used to update the generators seed.

size The size of the passed byte array.

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 2640), and **decaf::internal::security::SecureRandomImpl** (p. 2640).

6.541 decaf::internal::security::SecurityRuntime Class Reference

Internal class used to manage Security related resources and hide platform dependent calls from the higher level API.

`#include <src/main/decaf/internal/security/SecurityRuntime.h>`

Public Member Functions

- virtual ~**SecurityRuntime** ()
- **ServiceRegistry** * **getServiceRegistry** ()

  Return the Security Framework's Service Registry.

- **decaf::util::concurrent::Mutex** * **getRuntimeLock** ()

  Gets a pointer to the Security Runtime's Lock object, this can be used by Security layer APIs to synchronize around certain actions such as adding a resource to the Security layer, etc.

Static Public Member Functions

- static **SecurityRuntime** * **getSecurityRuntime** ()

  Gets the one and only instance of the Security class, if this is called before the Security layer has been initialized or after it has been shutdown then an IllegalStateException is thrown.

- static void **initializeSecurity** ()

  Initialize the Security layer.

- static void **shutdownSecurity** ()

  Shutdown the Security layer and free any associated resources, classes in the Decaf library that use the Security layer will now fail if used after calling the shutdown method.

Protected Member Functions

- **SecurityRuntime** ()

6.541.1 Detailed Description

Internal class used to manage Security related resources and hide platform dependent calls from the higher level API.

Since:

1.0

6.541.2 Constructor & Destructor Documentation

6.541.2.1 decaf::internal::security::SecurityRuntime::SecurityRuntime () [protected]

6.541.3 Member Function Documentation

6.541.3.1 decaf::util::concurrent::Mutex* decaf::internal::security::SecurityRuntime::getRuntimeLock ()

Gets a pointer to the Security Runtime's Lock object, this can be used by Security layer APIs to synchronize around certain actions such as adding a resource to the Security layer, etc. The pointer returned is owned by the Security runtime and should not be deleted or copied by the caller.

Returns:

a pointer to the Security Runtime's single Lock instance.

6.541.3.2 static SecurityRuntime* decaf::internal::security::SecurityRuntime::getSecurityRuntime () [static]

Gets the one and only instance of the Security class, if this is called before the Security layer has been initialized or after it has been shutdown then an IllegalStateException is thrown.

Returns:

pointer to the Security runtime for the Decaf library.

6.541.3.3 ServiceRegistry* decaf::internal::security::SecurityRuntime::getServiceRegistry ()

Return the Security Framework's Service Registry.

Returns:

a pointer to the frameworks Service Registry.

6.541.3.4 static void decaf::internal::security::SecurityRuntime::initializeSecurity () [static]

Initialize the Security layer.

6.541.3.5 static void decaf::internal::security::SecurityRuntime::shutdownSecurity () [static]

Shutdown the Security layer and free any associated resources, classes in the Decaf library that use the Security layer will now fail if used after calling the shutdown method.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/security/**SecurityRuntime.h**

6.543 decaf::util::concurrent::Semaphore Class Reference

A counting semaphore.

`#include <src/main/decaf/util/concurrent/Semaphore.h>`

Public Member Functions

- **Semaphore** (int permits)

  *Creates a **Semaphore** (p. 2648) with the given number of permits and nonfair fairness setting.*

- **Semaphore** (int permits, bool fair)

  *Creates a **Semaphore** (p. 2648) with the given number of permits and the given fairness setting.*

- virtual ~**Semaphore** ()
- void **acquire** ()

  Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.

- void **acquireUninterruptibly** ()

  Acquires a permit from this semaphore, blocking until one is available.

- bool **tryAcquire** ()

  Acquires a permit from this semaphore, only if one is available at the time of invocation.

- bool **tryAcquire** (long long timeout, const **TimeUnit** &unit)

  Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.

- void **release** ()

  Releases a permit, returning it to the semaphore.

- void **acquire** (int permits)

  Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.

- void **acquireUninterruptibly** (int permits)

  Acquires the given number of permits from this semaphore, blocking until all are available.

- bool **tryAcquire** (int permits)

  Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.

- bool **tryAcquire** (int permits, long long timeout, const **TimeUnit** &unit)

  Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.

- void **release** (int permits)

  Releases the given number of permits, returning them to the semaphore.

- int **availablePermits** () const

Returns the current number of permits available in this semaphore.

- int **drainPermits** ()

  Acquires and returns all permits that are immediately available.

- bool **isFair** () const
- std::string **toString** () const

  Returns a string identifying this semaphore, as well as its state.

- int **getQueueLength** () const

  Gets an estimated count of the number of threads that are currently waiting to acquire, this value changes dynamically so the result of this method can be invalid immediately after it is called.

- bool **hasQueuedThreads** () const

Protected Member Functions

- void **reducePermits** (int reduceBy)

  Reduces the number of available permits which can be useful for subclasses.

- **decaf::util::Collection< decaf::lang::Thread * > * getQueuedThreads** () const

  *Creates and returns a new **Collection** (p. 1006) object that contains a best effort snapshot of the threads that are currently waiting to acquire.*

6.543.1 Detailed Description

A counting semaphore. Conceptually, a semaphore maintains a set of permits. Each **acquire()** (p. 2651) blocks if necessary until a permit is available, and then takes it. Each **release()** (p. 2654) adds a permit, potentially releasing a blocking acquirer. However, no actual permit objects are used; the **Semaphore** (p. 2648) just keeps a count of the number available and acts accordingly.

Semaphores are often used to restrict the number of threads than can access some (physical or logical) resource.

class Pool { private:

static const int MAX_AVAILABLE = 100; **Semaphore** (p. 2648) available;

std::vector<std::string> items; std::vector<bool> used;

Mutex (p. 2236) lock;

public:

Pool() : available(MAX_AVAILABLE, true) { used.resize(MAX_AVAILABLE); items.resize(MAX_AVAILABLE); }

std::string getItem() throws InterruptedException { available.acquire(); return getNextAvailableItem(); }

void putItem(std::string x) { if(markAsUnused(x)) { available.release(); } }

std::string getNextAvailableItem() {

synchronized(&lock) (p. 3890) { for(int i = 0; i < MAX_AVAILABLE; ++i) { if(!used[i]) { used[i] = true; return items[i]; } }

return std::string(); // not reached }

bool markAsUnused(const std::string& item) { **synchronized(&lock)** (p. 3890) { for(int i = 0; i < MAX_AVAILABLE; ++i) { if(item == items[i]) { if(used[i]) { used[i] = false; return true; } else return false; } } } return false; } };

Before obtaining an item each thread must acquire a permit from the semaphore, guaranteeing that an item is available for use. When the thread has finished with the item it is returned back to the pool and a permit is returned to the semaphore, allowing another thread to acquire that item. Note that no synchronization lock is held when **acquire()** (p. 2651) is called as that would prevent an item from being returned to the pool. The semaphore encapsulates the synchronization needed to restrict access to the pool, separately from any synchronization needed to maintain the consistency of the pool itself.

A semaphore initialized to one, and which is used such that it only has at most one permit available, can serve as a mutual exclusion lock. This is more commonly known as a binary semaphore, because it only has two states: one permit available, or zero permits available. When used in this way, the binary semaphore has the property (unlike many **Lock** (p. 1924) implementations), that the "lock" can be released by a thread other than the owner (as semaphores have no notion of ownership). This can be useful in some specialized contexts, such as deadlock recovery.

The constructor for this class optionally accepts a fairness parameter. When set false, this class makes no guarantees about the order in which threads acquire permits. In particular, barging is permitted, that is, a thread invoking **acquire()** (p. 2651) can be allocated a permit ahead of a thread that has been waiting - logically the new thread places itself at the head of the queue of waiting threads. When fairness is set true, the semaphore guarantees that threads invoking any of the acquire methods are selected to obtain permits in the order in which their invocation of those methods was processed (first-in-first-out; FIFO). Note that FIFO ordering necessarily applies to specific **internal** (p. 97) points of execution within these methods. So, it is possible for one thread to invoke acquire before another, but reach the ordering point after the other, and similarly upon return from the method. Also note that the untimed tryAcquire methods do not honor the fairness setting, but will take any permits that are available.

Generally, semaphores used to control resource access should be initialized as fair, to ensure that no thread is starved out from accessing a resource. When using semaphores for other kinds of synchronization control, the throughput advantages of non-fair ordering often outweigh fairness considerations.

This class also provides convenience methods to acquire and release multiple permits at a time. Beware of the increased risk of indefinitely postponing when these methods are used without fairness set true.

Since:

1.0

6.543.2 Constructor & Destructor Documentation

6.543.2.1 decaf::util::concurrent::Semaphore::Semaphore (int *permits*)

Creates a **Semaphore** (p. 2648) with the given number of permits and nonfair fairness setting.

Parameters:

permits the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.

6.543.2.2 decaf::util::concurrent::Semaphore::Semaphore (int *permits*, bool *fair*)

Creates a **Semaphore** (p. 2648) with the given number of permits and the given fairness setting.

Parameters:

permits the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.

fair true if this semaphore will guarantee first-in first-out granting of permits under contention, else false

6.543.2.3 virtual decaf::util::concurrent::Semaphore::~Semaphore () [virtual]

6.543.3 Member Function Documentation

6.543.3.1 void decaf::util::concurrent::Semaphore::acquire (int *permits*)

Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted. Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

∗ Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or ∗ Some other thread interrupts the current thread.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread are instead assigned to other threads trying to acquire permits, as if permits had been made available by a call to **release()** (p. 2654).

Parameters:

permits the number of permits to acquire.

Exceptions:

InterruptedException if the current thread is interrupted.

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2648).

6.543.3.2 void decaf::util::concurrent::Semaphore::acquire ()

Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted. Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

∗ Some other thread invokes the **release()** (p. 2654) method for this semaphore and the current thread is next to be assigned a permit; or ∗ Some other thread interrupts the current thread.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Exceptions:

InterruptedException - if the current thread is interrupted.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2648).

6.543.3.3 void decaf::util::concurrent::Semaphore::acquireUninterruptibly (int *permits*)

Acquires the given number of permits from this semaphore, blocking until all are available. Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request.

If the current thread is interrupted while waiting for permits then it will continue to wait and its position in the queue is not affected. When the thread does return from this method its interrupt status will be set.

Parameters:

permits the number of permits to acquire.

Exceptions:

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2648).

6.543.3.4 void decaf::util::concurrent::Semaphore::acquireUninterruptibly ()

Acquires a permit from this semaphore, blocking until one is available. Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes the **release()** (p. 2654) method for this semaphore and the current thread is next to be assigned a permit.

If the current thread is interrupted while waiting for a permit then it will continue to wait, but the time at which the thread is assigned a permit may change compared to the time it would have received the permit had no interruption occurred. When the thread does return from this method its interrupt status will be set.

Exceptions:

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2648).

6.543.3.5 int decaf::util::concurrent::Semaphore::availablePermits () const

Returns the current number of permits available in this semaphore. This method is typically used for debugging and testing purposes.

Returns:

the number of permits available in this semaphore

6.543.3.6 int decaf::util::concurrent::Semaphore::drainPermits ()

Acquires and returns all permits that are immediately available.

Returns:

the number of permits acquired

Exceptions:

RuntimeException if an unexpected error occurs while draining the **Semaphore** (p. 2648).

6.543.3.7 decaf::util::Collection<decaf::lang::Thread*>* decaf::util::concurrent::Semaphore::getQueuedThreads () const [protected]

Creates and returns a new **Collection** (p. 1006) object that contains a best effort snapshot of the threads that are currently waiting to acquire.

Returns:

a **Collection** (p. 1006) pointer that contains waiting threads for lock acquisition. The caller owns the returned pointer.

6.543.3.8 int decaf::util::concurrent::Semaphore::getQueueLength () const

Gets an estimated count of the number of threads that are currently waiting to acquire, this value changes dynamically so the result of this method can be invalid immediately after it is called.

Returns:

an estimate of the number of waiting threads.

6.543.3.9 bool decaf::util::concurrent::Semaphore::hasQueuedThreads () const

Returns:

true if there are threads that are currently waiting to acquire this **Semaphore** (p. 2648).

6.543.3.10 bool decaf::util::concurrent::Semaphore::isFair () const

Returns:

true if this semaphore has fairness set true

6.543.3.11 void decaf::util::concurrent::Semaphore::reducePermits (int *reduceBy*) [protected]

Reduces the number of available permits which can be useful for subclasses. If the subclass is tracking a resource that is transiently available this method can be used to modify the **Semaphore** (p. 2648) to reflect that resources current state. This method does not block waiting for the number of permits to be available, unlike the acquire method.

Parameters:

reduceBy The number of permits to remove from the current available set.

Exceptions:

IllegalArgumentException if the param passed in negative.

6.543.3.12 void decaf::util::concurrent::Semaphore::release (int *permits*)

Releases the given number of permits, returning them to the semaphore. Releases the given number of permits, increasing the number of available permits by that amount. If any threads are trying to acquire permits, then one is selected and given the permits that were just released. If the number of available permits satisfies that thread's request then that thread is (re)enabled for thread scheduling purposes; otherwise the thread will wait until sufficient permits are available. If there are still permits available after this thread's request has been satisfied, then those permits are assigned in turn to other threads trying to acquire permits.

Parameters:

permits the number of permits to release

Exceptions:

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while releasing the **Semaphore** (p. 2648).

6.543.3.13 void decaf::util::concurrent::Semaphore::release ()

Releases a permit, returning it to the semaphore. Releases a permit, increasing the number of available permits by one. If any threads are trying to acquire a permit, then one is selected and given the permit that was just released. That thread is (re)enabled for thread scheduling purposes.

There is no requirement that a thread that releases a permit must have acquired that permit by calling **acquire()** (p. 2651). Correct usage of a semaphore is established by programming convention in the application.

Exceptions:

RuntimeException if an unexpected error occurs while releasing the **Semaphore** (p. 2648).

6.543.3.14 std::string decaf::util::concurrent::Semaphore::toString () const

Returns a string identifying this semaphore, as well as its state. The state, in brackets, includes the String "Permits =" followed by the number of permits.

Returns:

a string identifying this semaphore, as well as its state

6.543.3.15 bool decaf::util::concurrent::Semaphore::tryAcquire (int *permits*, long long *timeout*, const TimeUnit & *unit*)

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted. Acquires the given number of permits, if they are available and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

∗ Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or ∗ Some other thread interrupts the current thread; or ∗ The specified waiting time elapses.

If the permits are acquired then the value true is returned.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting to acquire the permits,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 2654).

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 2654).

Parameters:

permits the number of permits to acquire

timeout the maximum amount of time to wait to acquire the permits.

unit the units that the timeout param represents.

Returns:

true if all permits were acquired and false if the waiting time elapsed before all permits were acquired

Exceptions:

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2648).

6.543.3.16 bool decaf::util::concurrent::Semaphore::tryAcquire (int *permits*)

Acquires the given number of permits from this semaphore, only if all are available at the time of invocation. Acquires the given number of permits, if they are available, and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then this method will return immediately with the value false and the number of available permits is unchanged.

Even when this semaphore has been set to use a fair ordering policy, a call to tryAcquire will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use tryAcquire(permits, 0, **TimeUnit.SECONDS** (p. 3095)) which is almost equivalent (it also detects interruption).

Parameters:

permits the number of permits to acquire

Returns:

true if the permits were acquired and false otherwise.

Exceptions:

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2648).

6.543.3.17 bool decaf::util::concurrent::Semaphore::tryAcquire (long long *timeout*, const TimeUnit & *unit*)

Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted. Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

∗ Some other thread invokes the **release()** (p. 2654) method for this semaphore and the current thread is next to be assigned a permit; or ∗ Some other thread interrupts the current thread; or ∗ The specified waiting time elapses.

If a permit is acquired then the value true is returned.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting to acquire a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters:

timeout the maximum time to wait for a permit

unit the time unit of the timeout argument

Returns:

true if a permit was acquired and false if the waiting time elapsed before a permit was acquired

Exceptions:

InterruptedException if the current thread is interrupted.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2648).

6.543.3.18 bool decaf::util::concurrent::Semaphore::tryAcquire ()

Acquires a permit from this semaphore, only if one is available at the time of invocation. Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then this method will return immediately with the value false.

Even when this semaphore has been set to use a fair ordering policy, a call to **tryAcquire()** (p. 2657) will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use tryAcquire(0, **TimeUnit.SECONDS** (p. 3095)) which is almost equivalent (it also detects interruption).

Returns:

true if a permit was acquired and false otherwise

Exceptions:

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2648).

6.545.1 Detailed Description

This class implements server sockets. A server socket waits for requests to come in over the network.

The actual work of the server socket is performed by an instance of the **SocketImpl** (p. 2794) class. An application can change the socket factory that creates the socket implementation to configure itself to create sockets of a particular type.

Since:

1.0

6.545.2 Constructor & Destructor Documentation

6.545.2.1 decaf::net::ServerSocket::ServerSocket ()

Creates a non-bound server socket.

6.545.2.2 decaf::net::ServerSocket::ServerSocket (int *port*)

Creates a new **ServerSocket** (p. 2659) bound to the specified port, if the value of port is 0, then any free port is chosen. When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 2802) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2794) is created.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

Exceptions:

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.545.2.3 decaf::net::ServerSocket::ServerSocket (int *port*, int *backlog*)

Creates a new **ServerSocket** (p. 2659) bound to the specified port, if the value of port is 0, then any free port is chosen. When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 2802) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2794) is created.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The the number of incoming connection attempts to queue before connections are refused.

Exceptions:

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.545.2.4 decaf::net::ServerSocket::ServerSocket (int *port*, int *backlog*, const InetAddress * *address*)

Creates a new **ServerSocket** (p. 2659) bound to the specified port, if the value of port is 0, then any free port is chosen. If the value of the ifAddress is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 2802) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2794) is created.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The the number of incoming connection attempts to queue before connections are refused.

ifAddress The IP Address to bind to on the local machine.

Exceptions:

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.545.2.5 virtual decaf::net::ServerSocket::~ServerSocket () [virtual]

Releases socket handle if **close()** (p. 2664) hasn't been called.

6.545.2.6 decaf::net::ServerSocket::ServerSocket (SocketImpl * *impl*) [protected]

Creates a **ServerSocket** (p. 2659) wrapping the provided **SocketImpl** (p. 2794) instance, this **Socket** (p. 2770) is considered unconnected. The **ServerSocket** (p. 2659) class takes ownership of this **SocketImpl** (p. 2794) pointer and will delete it when the **Socket** (p. 2770) class is destroyed.

Parameters:

impl The **SocketImpl** (p. 2794) instance to wrap.

Exceptions:

NullPointerException if the passed **SocketImpl** (p. 2794) is Null.

6.545.3 Member Function Documentation

6.545.3.1 virtual Socket* decaf::net::ServerSocket::accept () [virtual]

Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 2659), the caller blocks until a connection is made. If the SO_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 2807) if the operation times out.

Returns:

a new **Socket** (p. 2770) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.

Exceptions:

IOException if an I/O error occurs while binding the socket.

SocketException *(p. 2787)* if an error occurs while blocking on the accept call.

SocketTimeoutException *(p. 2807)* if the SO_TIMEOUT option was used and the accept timed out.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2285).

6.545.3.2 virtual void decaf::net::ServerSocket::bind (const std::string & *host*, int *port*, int *backlog*) [virtual]

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen. If the backlog is greater than zero it will be used instead of the default value, otherwise the default value is used and no error is generated.

Parameters:

host The IP address or host name.

port The TCP port between 1..655535.

backlog The size of listen backlog.

Exceptions:

IOException if an I/O error occurs while binding the socket.

IllegalArgumentException if the parameters are not valid.

6.545.3.3 virtual void decaf::net::ServerSocket::bind (const std::string & *host*, int *port*) [virtual]

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

Parameters:

host The IP address or host name.

port The TCP port between 1..655535.

Exceptions:

IOException if an I/O error occurs while binding the socket.

IllegalArgumentException if the parameters are not valid.

6.545.3.4 void decaf::net::ServerSocket::checkClosed () const [protected]

6.545.3.5 virtual void decaf::net::ServerSocket::close () [virtual]

Closes the server socket, causing any Threads blocked on an accept call to throw an Exception.

Exceptions:

IOException if an I/O error occurs while performing this operation.

6.545.3.6 void decaf::net::ServerSocket::ensureCreated () const [protected]

6.545.3.7 virtual int decaf::net::ServerSocket::getDefaultBacklog () [protected, virtual]

Allows a subclass to override what is considered the default backlog.

Returns:

the default backlog for connections.

6.545.3.8 virtual int decaf::net::ServerSocket::getLocalPort () const [virtual]

Gets the port number on the Local machine that this **ServerSocket** (p. 2659) is bound to.

Returns:

the port number of this machine that is bound, if not bound returns -1.

6.545.3.9 virtual int decaf::net::ServerSocket::getReceiveBufferSize () const [virtual]

Gets the receive buffer size for this socket, SO_RCVBUF. This is the buffer used by the underlying platform socket to buffer received data.

Returns:

the receive buffer size in bytes.

Exceptions:

SocketException *(p. 2787)* if the operation fails.

6.545.3.10 virtual bool decaf::net::ServerSocket::getReuseAddress () const [virtual]

Gets the reuse address flag, SO_REUSEADDR.

Returns:

True if the address can be reused.

Exceptions:

SocketException *(p. 2787)* if the operation fails.

6.545.3.11 virtual int decaf::net::ServerSocket::getSoTimeout () const [virtual]

Gets the timeout for socket operations, SO_TIMEOUT.

Returns:

The timeout in milliseconds for socket operations.

Exceptions:

SocketException *(p. 2787)* Thrown if unable to retrieve the information.

6.545.3.12 virtual void decaf::net::ServerSocket::implAccept (Socket * *socket*) [protected, virtual]

Virtual method that allows a **ServerSocket** (p. 2659) subclass to override the accept call and provide its own **SocketImpl** (p. 2794) for the socket.

Parameters:

socket The socket object whose **SocketImpl** (p. 2794) should be used for the accept call.

Exceptions:

IOException if an I/O error occurs while performing this operation.

6.545.3.13 virtual bool decaf::net::ServerSocket::isBound () const [virtual]

Returns:

true of the server socket is bound.

6.545.3.14 virtual bool decaf::net::ServerSocket::isClosed () const [virtual]

Returns:

true if the close method has been called on the **ServerSocket** (p. 2659).

6.545.3.15 virtual void decaf::net::ServerSocket::setReceiveBufferSize (int *size*) [virtual]

Sets the receive buffer size for this socket, SO_RCVBUF.

Parameters:

size Number of bytes to set the receive buffer to.

Exceptions:

SocketException *(p. 2787)* if the operation fails.

IllegalArgumentException if the value is zero or negative.

6.545.3.16 virtual void decaf::net::ServerSocket::setReuseAddress (bool *reuse*) [virtual]

Sets the reuse address flag, SO_REUSEADDR.

Parameters:

reuse If true, sets the flag.

Exceptions:

SocketException *(p. 2787)* if the operation fails.

6.545.3.17 static void decaf::net::ServerSocket::setSocketImplFactory (SocketImplFactory * *factory*) [static]

Sets the instance of a **SocketImplFactory** (p. 2802) that the **ServerSocket** (p. 2659) class should use when new instances of this class are created. This method is only allowed to be used once during the lifetime of the application.

Parameters:

factory The instance of a **SocketImplFactory** (p. 2802) to use when new **SocketImpl** (p. 2794) objects are created.

Exceptions:

IOException if an I/O error occurs while performing this operation.

SocketException *(p. 2787)* if this method has already been called with a valid factory.

6.545.3.18 virtual void decaf::net::ServerSocket::setSoTimeout (int *timeout*) [virtual]

Sets the timeout for socket operations, SO_TIMEOUT. A value of zero indicates that timeout is infinite for operations on this socket.

Parameters:

timeout The timeout in milliseconds for socket operations.

Exceptions:

SocketException *(p. 2787)* Thrown if unable to set the information.

IllegalArgumentException if the timeout value is negative.

6.545.3.19 void decaf::net::ServerSocket::setupSocketImpl (int *port*, int *backlog*, const InetAddress * *ifAddress*) [protected]

6.545.3.20 virtual std::string decaf::net::ServerSocket::toString () const [virtual]

Returns:

a string representing this **ServerSocket** (p. 2659).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ServerSocket.h**

6.546 decaf::net::ServerSocketFactory Class Reference

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

`#include <src/main/decaf/net/ServerSocketFactory.h>`Inheritance diagram for decaf::net::ServerSocketFactory:

Public Member Functions

- virtual ~**ServerSocketFactory** ()
- virtual **ServerSocket** * **createServerSocket** ()

  *Create a new **ServerSocket** (p. 2659) that is unbound.*

- virtual **ServerSocket** * **createServerSocket** (int port)=0

  *Create a new **ServerSocket** (p. 2659) that is bound to the given port.*

- virtual **ServerSocket** * **createServerSocket** (int port, int backlog)=0

  *Create a new **ServerSocket** (p. 2659) that is bound to the given port.*

- virtual **ServerSocket** * **createServerSocket** (int port, int backlog, const **InetAddress** *address)=0

  *Create a new **ServerSocket** (p. 2659) that is bound to the given port.*

Static Public Member Functions

- static **ServerSocketFactory** * **getDefault** ()

  *Returns the Default **ServerSocket** (p. 2659) factory, the pointer is owned by the Decaf runtime and should not be deleted by the caller.*

6.546.1 Detailed Description

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

Since:

1.0

6.546.2 Constructor & Destructor Documentation

6.546.2.1 decaf::net::ServerSocketFactory::ServerSocketFactory () [protected]

6.546.2.2 virtual decaf::net::ServerSocketFactory::~ServerSocketFactory () [virtual]

6.546.3 Member Function Documentation

6.546.3.1 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port*, int *backlog*, const InetAddress * *address*) [pure virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port. The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 2659) will listen on all interfaces.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The number of pending connect request the **ServerSocket** (p. 2659) can queue.

address The address of the interface on the local machine to bind to.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1328), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1338), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2291).

6.546.3.2 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port*, int *backlog*) [pure virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port. The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will use the specified connection backlog setting.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The number of pending connect request the **ServerSocket** (p. 2659) can queue.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1329), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1338), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2291).

6.546.3.3 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port*) [pure virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port. The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1329), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1339), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2292).

6.546.3.4 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket () [virtual]

Create a new **ServerSocket** (p. 2659) that is unbound. The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Reimplemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1330), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1339), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2292).

6.546.3.5 static ServerSocketFactory* decaf::net::ServerSocketFactory::getDefault () [static]

Returns the Default **ServerSocket** (p. 2659) factory, the pointer is owned by the Decaf runtime and should not be deleted by the caller. Only one default **ServerSocketFactory** (p. 2668) exists for the lifetime of the Application.

Returns:

the default **ServerSocketFactory** (p. 2668) for this application.

Reimplemented in **decaf::net::ssl::SSLServerSocketFactory** (p. 2827).

The documentation for this class was generated from the following file:

Implemented in **activemq::util::ServiceSupport** (p. 2679).

6.547.3.2 virtual void activemq::util::Service::stop () [pure virtual]

Implemented in **activemq::util::ServiceSupport** (p. 2679).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**Service.h**

6.548 activemq::util::ServiceListener Class Reference

Listener interface for observers of **Service** (p. 2672) related events.

`#include <src/main/activemq/util/ServiceListener.h>`

Public Member Functions

- virtual ~**ServiceListener** ()
- virtual void **started** (const **Service** *target)=0

  indicates that the target service has completed its start operation.

- virtual void **stopped** (const **Service** *target)=0

  indicates that the target service has completed its stop operation.

6.548.1 Detailed Description

Listener interface for observers of **Service** (p. 2672) related events.

Since:

3.3.0

6.548.2 Constructor & Destructor Documentation

6.548.2.1 virtual activemq::util::ServiceListener::~ServiceListener () [virtual]

6.548.3 Member Function Documentation

6.548.3.1 virtual void activemq::util::ServiceListener::started (const Service * *target*) [pure virtual]

indicates that the target service has completed its start operation.

Parameters:

target The service that triggered this notification.

6.548.3.2 virtual void activemq::util::ServiceListener::stopped (const Service * *target*) [pure virtual]

indicates that the target service has completed its stop operation.

Parameters:

target The service that triggered this notification.

The documentation for this class was generated from the following file:

6.549 decaf::internal::security::ServiceRegistry Class Reference

Serves as a registry for all the Providers for services using the naming format of "ServiceName.Algorithm".

`#include <src/main/decaf/internal/security/ServiceRegistry.h>`

Public Member Functions

- **ServiceRegistry** ()
- virtual ~**ServiceRegistry** ()
- void **addProvider** (const **decaf::security::Provider** *provider)

  Adds the Provider into the registry so that its services can be looked up by the registry clients.

- **decaf::security::ProviderService** * **getService** (const std::string &name)

  Attempts to locate a ProviderService implementation for the named service and return a new instance of the service.

6.549.1 Detailed Description

Serves as a registry for all the Providers for services using the naming format of "ServiceName.Algorithm".

6.549.2 Constructor & Destructor Documentation

6.549.2.1 decaf::internal::security::ServiceRegistry::ServiceRegistry ()

6.549.2.2 virtual decaf::internal::security::ServiceRegistry::~ServiceRegistry () [virtual]

6.549.3 Member Function Documentation

6.549.3.1 void decaf::internal::security::ServiceRegistry::addProvider (const decaf::security::Provider * *provider*)

Adds the Provider into the registry so that its services can be looked up by the registry clients.

Parameters:

provider *(*p. ***105****)* The instance of the Provider which is to be added to the registry

6.549.3.2 decaf::security::ProviderService* decaf::internal::security::ServiceRegistry::getService (const std::string & *name*)

Attempts to locate a ProviderService implementation for the named service and return a new instance of the service. If no service exists for the given name this method returns NULL.

Parameters:

name The name of the service to find, format is "serviceName.algorithmName"

Returns:

a caller owned pointer to a new ProviderService for the named service.

- **ServiceSupport** ()
- virtual ~**ServiceSupport** ()
- void **start** ()

  *Starts the **Service** (p. 2672), notifying any registered listeners of the start if it is successful.*

- void **stop** ()

  *Stops the **Service** (p. 2672).*

- bool **isStarted** () const
- bool **isStopping** () const
- bool **isStopped** () const
- void **addServiceListener** (**ServiceListener** *listener)

  Adds the given listener to this Service's list of listeners, call retains ownership of the pointer.

- void **removeServiceListener** (**ServiceListener** *llistener)

  Removes the given listener to this Service's list of listeners, call retains ownership of the pointer.

Static Public Member Functions

- static void **dispose** (**Service** *service)

  Safely shuts down a service.

Protected Member Functions

- virtual void **doStop** (**ServiceStopper** *stopper)=0

  Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

- virtual void **doStart** ()=0

  Performs the actual start operation on the service, acquiring all the resources needed to run the service.

6.551.1 Detailed Description

Provides a base class for **Service** (p. 2672) implementations.

Since:

3.3.0

6.551.2 Constructor & Destructor Documentation

6.551.2.1 activemq::util::ServiceSupport::ServiceSupport (const ServiceSupport &)

6.551.2.2 activemq::util::ServiceSupport::ServiceSupport ()

6.551.2.3 virtual activemq::util::ServiceSupport::~ServiceSupport () [virtual]

6.551.3 Member Function Documentation

6.551.3.1 void activemq::util::ServiceSupport::addServiceListener (ServiceListener * *listener*)

Adds the given listener to this Service's list of listeners, call retains ownership of the pointer.

6.551.3.2 static void activemq::util::ServiceSupport::dispose (Service * *service*) [static]

Safely shuts down a service.

Parameters:

service The service to stop.

6.551.3.3 virtual void activemq::util::ServiceSupport::doStart () [protected, pure virtual]

Performs the actual start operation on the service, acquiring all the resources needed to run the service. Must be implemented in derived class.

Implemented in **activemq::threads::Scheduler** (p. 2631).

6.551.3.4 virtual void activemq::util::ServiceSupport::doStop (ServiceStopper * *stopper*) [protected, pure virtual]

Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

Implemented in **activemq::threads::Scheduler** (p. 2631).

6.551.3.5 bool activemq::util::ServiceSupport::isStarted () const

Returns:

true if this service has been started

6.551.3.6 bool activemq::util::ServiceSupport::isStopped () const

Returns:

true if this service is closed

6.551.3.7 bool activemq::util::ServiceSupport::isStopping () const

Returns:

true if this service is in the process of closing

6.551.3.8 ServiceSupport& activemq::util::ServiceSupport::operator= (const ServiceSupport &)

6.551.3.9 void activemq::util::ServiceSupport::removeServiceListener (ServiceListener * *llistener*)

Removes the given listener to this Service's list of listeners, call retains ownership of the pointer.

6.551.3.10 void activemq::util::ServiceSupport::start () [virtual]

Starts the **Service** (p. 2672), notifying any registered listeners of the start if it is successful.

Implements **activemq::util::Service** (p. 2672).

6.551.3.11 void activemq::util::ServiceSupport::stop () [virtual]

Stops the **Service** (p. 2672).

Implements **activemq::util::Service** (p. 2672).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**ServiceSupport.h**

6.552 cms::Session Class Reference

A **Session** (p. 2680) object is a single-threaded context for producing and consuming messages.

`#include <src/main/cms/Session.h>`Inheritance diagram for cms::Session:

Public Types

- enum **AcknowledgeMode** {
  AUTO_ACKNOWLEDGE, **DUPS_OK_ACKNOWLEDGE**, **CLIENT_ACKNOWLEDGE**, **SESSION_TRANSACTED**,
  INDIVIDUAL_ACKNOWLEDGE }

Public Member Functions

- virtual ~**Session** ()
- virtual void **close** ()=0

  Closes this session as well as any active child consumers or producers.

- virtual void **commit** ()=0

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()=0

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual void **recover** ()=0

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination)=0

  *Creates a **MessageConsumer** (p. 2127) for the specified destination.*

- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector)=0

  *Creates a **MessageConsumer** (p. 2127) for the specified destination, using a message selector.*

- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector, bool noLocal)=0

  *Creates a **MessageConsumer** (p. 2127) for the specified destination, using a message selector.*

- virtual **MessageConsumer** * **createDurableConsumer** (const **Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)=0

  *Creates a durable subscriber to the specified topic, using a **Message** (p. 2090) selector.*

- virtual **MessageProducer** * **createProducer** (const **Destination** *destination=NULL)=0

  *Creates a **MessageProducer** (p. 2192) to send messages to the specified destination.*

- virtual **QueueBrowser** * **createBrowser** (const **cms::Queue** *queue)=0

  *Creates a new **QueueBrowser** (p. 2519) to peek at Messages on the given **Queue** (p. 2514).*

- virtual **QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector)=0

  *Creates a new **QueueBrowser** (p. 2519) to peek at Messages on the given **Queue** (p. 2514).*

- virtual **Queue** * **createQueue** (const std::string &queueName)=0

  *Creates a queue identity given a **Queue** (p. 2514) name.*

- virtual **Topic** * **createTopic** (const std::string &topicName)=0

  *Creates a topic identity given a **Queue** (p. 2514) name.*

- virtual **TemporaryQueue** * **createTemporaryQueue** ()=0

  *Creates a **TemporaryQueue** (p. 3012) object.*

- virtual **TemporaryTopic** * **createTemporaryTopic** ()=0

  *Creates a **TemporaryTopic** (p. 3013) object.*

- virtual **Message** * **createMessage** ()=0

  *Creates a new **Message** (p. 2090).*

- virtual **BytesMessage** * **createBytesMessage** ()=0

  *Creates a **BytesMessage** (p. 857).*

- virtual **BytesMessage** * **createBytesMessage** (const unsigned char *bytes, int bytesSize)=0

  *Creates a **BytesMessage** (p. 857) and sets the payload to the passed value.*

- virtual **StreamMessage** * **createStreamMessage** ()=0

  *Creates a new **StreamMessage** (p. 2923).*

- virtual **TextMessage** * **createTextMessage** ()=0

  *Creates a new **TextMessage** (p. 3014).*

- virtual **TextMessage** * **createTextMessage** (const std::string &text)=0

  *Creates a new **TextMessage** (p. 3014) and set the text to the value given.*

- virtual **MapMessage** * **createMapMessage** ()=0

  *Creates a new **MapMessage** (p. 2024).*

- virtual **AcknowledgeMode** **getAcknowledgeMode** () const =0

  Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () const =0

  *Gets if the Sessions is a Transacted **Session** (p. 2680).*

- virtual void **unsubscribe** (const std::string &name)=0

  Unsubscribes a durable subscription that has been created by a client.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)=0

  *Set an **MessageTransformer** (p. 2219) instance that is passed on to all **MessageProducer** (p. 2192) and **MessageConsumer** (p. 2127) objects created from this **Session** (p. 2680).*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const =0

  *Gets the currently configured **MessageTransformer** (p. 2219) for this **Session** (p. 2680).*

6.552.1 Detailed Description

A **Session** (p. 2680) object is a single-threaded context for producing and consuming messages. A session serves several purposes:

- It is a factory for its message producers and consumers.
- It supplies provider-optimized message factories.
- It is a factory for TemporaryTopics and TemporaryQueues.
- It provides a way to create **Queue** (p. 2514) or **Topic** (p. 3096) objects for those clients that need to dynamically manipulate provider-specific destination names.
- It supports a single series of transactions that combine work spanning its producers and consumers into atomic units.
- It defines a serial order for the messages it consumes and the messages it produces.
- It retains messages it consumes until they have been acknowledged.
- It serializes execution of message listeners registered with its message consumers.

A session can create and service multiple message producers and consumers.

One typical use is to have a thread block on a synchronous **MessageConsumer** (p. 2127) until a message arrives. The thread may then use one or more of the Session's MessageProducers.

If a client desires to have one thread produce messages while others consume them, the client should use a separate session for its producing thread.

Certain rules apply to a session's `close` method and are detailed below.

- There is no need to close the producers and consumers of a closed session.
- The close call will block until a receive call or message listener in progress has completed. A blocked message consumer receive call returns null when this session is closed.
- Closing a transacted session must roll back the transaction in progress.
- The close method is the only **Session** (p. 2680) method that can be called concurrently.
- Invoking any other **Session** (p. 2680) method on a closed session must throw an **IllegalStateException** (p. 1658). Closing a closed session must not throw any exceptions.

Transacted Sessions

When a **Session** (p. 2680) is created it can be set to operate in a Transaction based mode. Each **Session** (p. 2680) then operates in a single transaction for all Producers and Consumers of that

Session (p. 2680). Messages sent and received within a Transaction are grouped into an atomic unit that is committed or rolled back together.

For a **MessageProducer** (p. 2192) this implies that all messages sent by the producer are not sent to the Provider unit the commit call is made. Rolling back the Transaction results in all produced Messages being dropped.

For a **MessageConsumer** (p. 2127) this implies that all received messages are not Acknowledged until the Commit call is made. Rolling back the Transaction results in all Consumed **Message** (p. 2090) being redelivered to the client, the Provider may allow configuration that limits the Maximum number of redeliveries for a **Message** (p. 2090).

While the **Session** (p. 2680) interface implements the **Startable** (p. 2852) and **Stoppable** (p. 2919) interfaces it is not required to implement these methods and can throw an UnsupportedOperation exception if they are not available for the given CMS provider.

Since:

1.0

6.552.2 Member Enumeration Documentation

6.552.2.1 enum cms::Session::AcknowledgeMode

Enumerator:

AUTO_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns.

DUPS_OK_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns. Acknowledgments may be delayed in this mode to increase performance at the cost of the message being redelivered this client fails.

CLIENT_ACKNOWLEDGE With this acknowledgment mode, the client acknowledges a consumed message by calling the message's acknowledge method.

SESSION_TRANSACTED Messages will be consumed when the transaction commits.

INDIVIDUAL_ACKNOWLEDGE **Message** (p. 2090) will be acknowledged individually. Normally the acks sent acknowledge the given message and all messages received before it, this mode only acknowledges one message.

6.552.3 Constructor & Destructor Documentation

6.552.3.1 virtual cms::Session::~Session () [virtual]

6.552.4 Member Function Documentation

6.552.4.1 virtual void cms::Session::close () [pure virtual]

Closes this session as well as any active child consumers or producers.

Exceptions:

CMSException *(*p. ***979***) - If an internal error occurs.

Implements **cms::Closeable** (p. 965).

Implemented in **activemq::cmsutil::PooledSession** (p. 2382), **activemq::core::ActiveMQSession** (p. 435), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 456).

6.552.4.2 virtual void cms::Session::commit () [pure virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException *(*p. ***979***) - If an internal error occurs.

IllegalStateException *(*p. ***1658***) - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2383), **activemq::core::ActiveMQSession** (p. 436), **activemq::core::ActiveMQXASession** (p. 548), **activemq::core::kernels::ActiveMQSessionKernel** (p. 457), and **activemq::core::kernels::ActiveMQXASessionKernel** (p. 550).

Referenced by activemq::cmsutil::PooledSession::commit().

6.552.4.3 virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * *queue*, const std::string & *selector*) [pure virtual]

Creates a new **QueueBrowser** (p. 2519) to peek at Messages on the given **Queue** (p. 2514).

Parameters:

queue the **Queue** (p. 2514) to browse

selector the **Message** (p. 2090) selector to filter which messages are browsed.

Returns:

New **QueueBrowser** (p. 2519) that is owned by the caller.

Exceptions:

CMSException *(*p. ***979***) - If an internal error occurs.

InvalidDestinationException *(*p. ***1774***) - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2383), **activemq::core::ActiveMQSession** (p. 436), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 457).

6.552.4.4 virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * *queue*) [pure virtual]

Creates a new **QueueBrowser** (p. 2519) to peek at Messages on the given **Queue** (p. 2514).

Parameters:

queue the **Queue** (p. 2514) to browse

Returns:

New **QueueBrowser** (p. 2519) that is owned by the caller.

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

InvalidDestinationException *(p. **1774**)* - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2383), **activemq::core::ActiveMQSession** (p. 436), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 457).

6.552.4.5 virtual BytesMessage* cms::Session::createBytesMessage (const unsigned char * *bytes*, int *bytesSize*) [pure virtual]

Creates a **BytesMessage** (p. 857) and sets the payload to the passed value.

Parameters:

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2384), **activemq::core::ActiveMQSession** (p. 437), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 458).

6.552.4.6 virtual BytesMessage* cms::Session::createBytesMessage () [pure virtual]

Creates a **BytesMessage** (p. 857).

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2384), **activemq::core::ActiveMQSession** (p. 437), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 458).

Referenced by activemq::cmsutil::PooledSession::createBytesMessage().

6.552.4.7 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination*, const std::string & *selector*, bool *noLocal*) [pure virtual]

Creates a **MessageConsumer** (p. 2127) for the specified destination, using a message selector.

Parameters:

destination the **Destination** (p. 1377) that this consumer receiving messages for.

selector the **Message** (p. 2090) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new **MessageConsumer** (p. 2127) that is owned by the caller (caller deletes)

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

InvalidDestinationException *(p. **1774**)* - if an invalid destination is specified.

InvalidSelectorException *(p. **1782**)* - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2385), **activemq::core::ActiveMQSession** (p. 437), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 458).

6.552.4.8 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination*, const std::string & *selector*) [pure virtual]

Creates a **MessageConsumer** (p. 2127) for the specified destination, using a message selector.

Parameters:

destination the **Destination** (p. 1377) that this consumer receiving messages for.

selector the **Message** (p. 2090) Selector to use

Returns:

pointer to a new **MessageConsumer** (p. 2127) that is owned by the caller (caller deletes)

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

InvalidDestinationException *(p. **1774**)* - if an invalid destination is specified.

InvalidSelectorException *(p. **1782**)* - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2385), **activemq::core::ActiveMQSession** (p. 438), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 459).

6.552.4.9 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination*) [pure virtual]

Creates a **MessageConsumer** (p. 2127) for the specified destination.

Parameters:

destination the **Destination** (p. 1377) that this consumer receiving messages for.

Returns:

pointer to a new **MessageConsumer** (p. 2127) that is owned by the caller (caller deletes)

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

InvalidDestinationException *(p. **1774**)* - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2386), **activemq::core::ActiveMQSession** (p. 438), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 459).

Referenced by activemq::cmsutil::PooledSession::createConsumer().

6.552.4.10 virtual MessageConsumer* cms::Session::createDurableConsumer (const Topic * *destination*, const std::string & *name*, const std::string & *selector*, bool *noLocal* = `false`) [pure virtual]

Creates a durable subscriber to the specified topic, using a **Message** (p. 2090) selector. Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters:

destination the topic to subscribe to

name The name used to identify the subscription

selector the **Message** (p. 2090) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new durable **MessageConsumer** (p. 2127) that is owned by the caller (caller deletes)

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

InvalidDestinationException *(p. **1774**)* - if an invalid destination is specified.

InvalidSelectorException *(p. **1782**)* - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2386), **activemq::core::ActiveMQSession** (p. 438), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 460).

Referenced by activemq::cmsutil::PooledSession::createDurableConsumer().

6.552.4.11 virtual MapMessage* cms::Session::createMapMessage () [pure virtual]

Creates a new **MapMessage** (p. 2024).

Exceptions:

CMSException *(*p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2387), **activemq::core::ActiveMQSession** (p. 439), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 460).

Referenced by activemq::cmsutil::PooledSession::createMapMessage().

6.552.4.12 virtual Message* cms::Session::createMessage () [pure virtual]

Creates a new **Message** (p. 2090).

Exceptions:

CMSException *(*p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2387), **activemq::core::ActiveMQSession** (p. 439), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 460).

Referenced by activemq::cmsutil::PooledSession::createMessage().

6.552.4.13 virtual MessageProducer* cms::Session::createProducer (const Destination * *destination* = NULL) [pure virtual]

Creates a **MessageProducer** (p. 2192) to send messages to the specified destination.

Parameters:

destination the **Destination** (p. 1377) to send on

Returns:

New **MessageProducer** (p. 2192) that is owned by the caller.

Exceptions:

CMSException *(*p. ***979***) - If an internal error occurs.

InvalidDestinationException *(*p. ***1774***) - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2387), **activemq::core::ActiveMQSession** (p. 439), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 461).

Referenced by activemq::cmsutil::PooledSession::createProducer().

6.552.4.14 virtual Queue* cms::Session::createQueue (const std::string & *queueName*) [pure virtual]

Creates a queue identity given a **Queue** (p. 2514) name.

Parameters:

queueName the name of the new **Queue** (p. 2514)

Returns:

new **Queue** (p. 2514) pointer that is owned by the caller.

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2388), **activemq::core::ActiveMQSession** (p. 440), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 461).

Referenced by activemq::cmsutil::PooledSession::createQueue().

6.552.4.15 virtual StreamMessage* cms::Session::createStreamMessage () [pure virtual]

Creates a new **StreamMessage** (p. 2923).

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2388), **activemq::core::ActiveMQSession** (p. 440), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 461).

Referenced by activemq::cmsutil::PooledSession::createStreamMessage().

6.552.4.16 virtual TemporaryQueue* cms::Session::createTemporaryQueue () [pure virtual]

Creates a **TemporaryQueue** (p. 3012) object.

Returns:

new **TemporaryQueue** (p. 3012) pointer that is owned by the caller.

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2388), **activemq::core::ActiveMQSession** (p. 440), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 462).

Referenced by activemq::cmsutil::PooledSession::createTemporaryQueue().

6.552.4.17 virtual TemporaryTopic* cms::Session::createTemporaryTopic () [pure virtual]

Creates a **TemporaryTopic** (p. 3013) object.

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2389), **activemq::core::ActiveMQSession** (p. 441), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 462).

Referenced by activemq::cmsutil::PooledSession::createTemporaryTopic().

6.552.4.18 virtual TextMessage* cms::Session::createTextMessage (const std::string & *text*) [pure virtual]

Creates a new **TextMessage** (p. 3014) and set the text to the value given.

Parameters:

text the initial text for the message

Exceptions:

CMSException (p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2389), **activemq::core::ActiveMQSession** (p. 441), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 462).

6.552.4.19 virtual TextMessage* cms::Session::createTextMessage () [pure virtual]

Creates a new **TextMessage** (p. 3014).

Exceptions:

CMSException (p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2389), **activemq::core::ActiveMQSession** (p. 441), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 462).

Referenced by activemq::cmsutil::PooledSession::createTextMessage().

6.552.4.20 virtual Topic* cms::Session::createTopic (const std::string & *topicName*) [pure virtual]

Creates a topic identity given a **Queue** (p. 2514) name.

Parameters:

topicName the name of the new **Topic** (p. 3096)

Returns:

new **Topic** (p. 3096) pointer that is owned by the caller.

Exceptions:

CMSException (p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2390), **activemq::core::ActiveMQSession** (p. 441), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 463).

Referenced by activemq::cmsutil::PooledSession::createTopic().

6.552.4.21 virtual AcknowledgeMode cms::Session::getAcknowledgeMode () const [pure virtual]

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Exceptions:

CMSException *(*p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2390), **activemq::core::ActiveMQSession** (p. 442), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 464).

Referenced by activemq::cmsutil::PooledSession::getAcknowledgeMode().

6.552.4.22 virtual cms::MessageTransformer* cms::Session::getMessageTransformer () const [pure virtual]

Gets the currently configured **MessageTransformer** (p. 2219) for this **Session** (p. 2680).

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implemented in **activemq::cmsutil::PooledSession** (p. 2390), **activemq::core::ActiveMQSession** (p. 442), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 465).

Referenced by activemq::cmsutil::PooledSession::getMessageTransformer().

6.552.4.23 virtual bool cms::Session::isTransacted () const [pure virtual]

Gets if the Sessions is a Transacted **Session** (p. 2680).

Returns:

transacted true - false.

Exceptions:

CMSException *(*p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2391), **activemq::core::ActiveMQSession** (p. 443), **activemq::core::ActiveMQXASession** (p. 549), **activemq::core::kernels::ActiveMQSessionKernel** (p. 467), and **activemq::core::kernels::ActiveMQXASessionKernel** (p. 551).

Referenced by activemq::cmsutil::PooledSession::isTransacted().

6.552.4.24 virtual void cms::Session::recover () [pure virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException *(*p. ***1658****)* - if the method is called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2391), **activemq::core::ActiveMQSession** (p. 443), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 468).

Referenced by activemq::cmsutil::PooledSession::recover().

6.552.4.25 virtual void cms::Session::rollback () [pure virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException *(*p. ***979****)* - If an internal error occurs.

IllegalStateException *(*p. ***1658****)* - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2392), **activemq::core::ActiveMQSession** (p. 444), **activemq::core::ActiveMQXASession** (p. 549), **activemq::core::kernels::ActiveMQSessionKernel** (p. 469), and **activemq::core::kernels::ActiveMQXASessionKernel** (p. 552).

Referenced by activemq::cmsutil::PooledSession::rollback().

6.552.4.26 virtual void cms::Session::setMessageTransformer (cms::MessageTransformer * *transformer*) [pure virtual]

Set an **MessageTransformer** (p. 2219) instance that is passed on to all **MessageProducer** (p. 2192) and **MessageConsumer** (p. 2127) objects created from this **Session** (p. 2680). The CMS **code** (p. 1005) never takes ownership of the **MessageTransformer** (p. 2219) pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the **MessageTransformer** (p. 2219) has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to set on all MessageConsumers and MessageProducers.

Implemented in **activemq::cmsutil::PooledSession** (p. 2392), **activemq::core::ActiveMQSession** (p. 444), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 471).

Referenced by activemq::cmsutil::PooledSession::setMessageTransformer().

6.552.4.27 virtual void cms::Session::unsubscribe (const std::string & *name*) [pure virtual]

Unsubscribes a durable subscription that has been created by a client. This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active **MessageConsumer** (p. 2127) or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

name The name used to identify this subscription

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2393), **activemq::core::ActiveMQSession** (p. 444), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 472).

Referenced by activemq::cmsutil::PooledSession::unsubscribe().

The documentation for this class was generated from the following file:

6.553 activemq::cmsutil::SessionCallback Class Reference

Callback for executing any number of operations on a provided CMS Session.

`#include <src/main/activemq/cmsutil/SessionCallback.h>`Inheritance diagram for activemq::cmsutil::SessionCallback:

Public Member Functions

- virtual ~**SessionCallback** ()
- virtual void **doInCms** (**cms::Session** *session)=0

  Execute any number of operations against the supplied CMS session.

6.553.1 Detailed Description

Callback for executing any number of operations on a provided CMS Session.

6.553.2 Constructor & Destructor Documentation

6.553.2.1 virtual activemq::cmsutil::SessionCallback::~SessionCallback () [virtual]

6.553.3 Member Function Documentation

6.553.3.1 virtual void activemq::cmsutil::SessionCallback::doInCms (cms::Session * *session*) [pure virtual]

Execute any number of operations against the supplied CMS session.

Parameters:

session the CMS `Session`

Exceptions:

CMSException if thrown by CMS API methods

Implemented in **activemq::cmsutil::CmsTemplate::ProducerExecutor** (p. 2465), and **activemq::cmsutil::CmsTemplate::ReceiveExecutor** (p. 2540).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**SessionCallback.h**

6.554 activemq::commands::SessionId Class Reference

`#include <src/main/activemq/commands/SessionId.h>`Inheritance diagram for activemq::commands::SessionId:

Public Types

6.554.3.15 virtual void activemq::commands::SessionId::setConnectionId (const std::string & *connectionId*) [virtual]

6.554.3.16 virtual void activemq::commands::SessionId::setValue (long long *value*) [virtual]

6.554.3.17 virtual std::string activemq::commands::SessionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

6.554.4 Field Documentation

6.554.4.1 std::string activemq::commands::SessionId::connectionId [protected]

6.554.4.2 const unsigned char activemq::commands::SessionId::ID_SESSIONID = 121 [static]

6.554.4.3 long long activemq::commands::SessionId::value [protected]

6.555 activemq::wireformat::openwire::marshal::generated::SessionIdMa Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **SessionIdMarshaller** (p. 2699).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/SessionIdMarshaller.h>`Inheritan diagram for activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller:

Public Member Functions

- **SessionIdMarshaller** ()
- virtual ~**SessionIdMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.555.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **SessionIdMarshaller** (p. 2699). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.555.2 Constructor & Destructor Documentation

6.555.2.1 activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::SessionIdMarsh () [inline]

6.555.2.2 virtual activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::~SessionIdMars () [inline, virtual]

6.555.3 Member Function Documentation

6.555.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.555.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::getDataStructure () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.555.3.3 virtual void activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.555.3.4 virtual void activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.555.3.5 virtual int activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.555.3.6 virtual void activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.555.3.7 virtual void activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**SessionIdMarshaller.h**

6.556 activemq::commands::SessionInfo Class Reference

- virtual void **setSessionId** (const **Pointer**< **SessionId** > &**sessionId**)
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_SESSIONINFO** = 4

Protected Attributes

- **Pointer**< **SessionId** > **sessionId**

6.556.1 Constructor & Destructor Documentation

6.556.1.1 activemq::commands::SessionInfo::SessionInfo ()

6.556.1.2 virtual activemq::commands::SessionInfo::~SessionInfo () [virtual]

6.556.2 Member Function Documentation

6.556.2.1 virtual SessionInfo* activemq::commands::SessionInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.556.2.2 virtual void activemq::commands::SessionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.556.2.3 Pointer<RemoveInfo> activemq::commands::SessionInfo::createRemoveCommand () const

6.556.2.4 virtual bool activemq::commands::SessionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.556.2.5 unsigned int activemq::commands::SessionInfo::getAckMode () const [inline]

6.556.2.6 virtual unsigned char activemq::commands::SessionInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.556.2.7 virtual Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId () [virtual]

6.556.2.8 virtual const Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId () const [virtual]

6.556.2.9 void activemq::commands::SessionInfo::setAckMode (unsigned int *mode*) [inline]

6.556.2.10 virtual void activemq::commands::SessionInfo::setSessionId (const Pointer< SessionId > & *sessionId*) [virtual]

6.556.2.11 virtual std::string activemq::commands::SessionInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.556.2.12 virtual Pointer<Command> activemq::commands::SessionInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.556.3 Field Documentation

6.556.3.1 const unsigned char activemq::commands::SessionInfo::ID_SESSIONINFO = 4 [static]

6.556.3.2 Pointer<SessionId> activemq::commands::SessionInfo::sessionId [protected]

The documentation for this class was generated from the following file:

6.557.3 Member Function Documentation

6.557.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.557.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::getDataStructu () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.557.3.3 virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.557.3.4 virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.557.3.5 virtual int activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.557.3.6 virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.557.3.7 virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**SessionInfoMarshaller.h**

6.558 activemq::cmsutil::SessionPool Class Reference

A pool of CMS sessions from the same connection and with the same acknowledge mode.

`#include <src/main/activemq/cmsutil/SessionPool.h>`

Public Member Functions

- **SessionPool** (**cms::Connection** *connection, **cms::Session::AcknowledgeMode** ackMode, **ResourceLifecycleManager** *resourceLifecycleManager)

  Constructs a session pool.

- virtual ~**SessionPool** ()

  Destroys the pooled session objects, but not the underlying session resources.

- virtual **PooledSession** * **takeSession** ()

  Takes a session from the pool, creating one if necessary.

- virtual void **returnSession** (**PooledSession** *session)

  Returns a session to the pool.

- **ResourceLifecycleManager** * **getResourceLifecycleManager** ()

6.558.1 Detailed Description

A pool of CMS sessions from the same connection and with the same acknowledge mode. Internal session resources are managed through a provided `ResourceLifecycleManager (p. 2602)`, not by this pool. This class is thread-safe.

6.558.2 Constructor & Destructor Documentation

6.558.2.1 activemq::cmsutil::SessionPool::SessionPool (cms::Connection * *connection*, cms::Session::AcknowledgeMode *ackMode*, ResourceLifecycleManager * *resourceLifecycleManager*)

Constructs a session pool.

Parameters:

connection the connection to be used for creating all sessions.

ackMode the acknowledge mode to be used for all sessions

resourceLifecycleManager the object responsible for managing the lifecycle of any allocated **cms::Session** (p. 2680) resources.

6.558.2.2 virtual activemq::cmsutil::SessionPool::~SessionPool () [virtual]

Destroys the pooled session objects, but not the underlying session resources. That is the job of the **ResourceLifecycleManager** (p. 2602).

6.558.3 Member Function Documentation

6.558.3.1 ResourceLifecycleManager* activemq::cmsutil::SessionPool::getResourceLifecycleManager () [inline]

6.558.3.2 virtual void activemq::cmsutil::SessionPool::returnSession (PooledSession * *session*) [virtual]

Returns a session to the pool.

Parameters:

session the session to be returned.

6.558.3.3 virtual PooledSession* activemq::cmsutil::SessionPool::takeSession () [virtual]

Takes a session from the pool, creating one if necessary.

Returns:

the pooled session object

Exceptions:

CMSException if an error occurred

The documentation for this class was generated from the following file:

6.560 decaf::util::Set< E > Class Template Reference

A collection that contains no duplicate elements.

`#include <src/main/decaf/util/Set.h>`Inheritance diagram for decaf::util::Set< E >:

Public Member Functions

- virtual ~**Set** ()

6.560.1 Detailed Description

template<typename E> class decaf::util::Set< E >

A collection that contains no duplicate elements. More formally, sets contain no pair of elements e1 and e2 such that e1 == e2, and at most one null element. As implied by its name, this interface models the mathematical set abstraction.

The additional stipulation on constructors is, not surprisingly, that all constructors must create a set that contains no duplicate elements (as defined above).

Note: Great care must be exercised if mutable objects are used as set elements. The behavior of a set is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is an element in the set.

Since:

1.0

6.560.2 Constructor & Destructor Documentation

6.560.2.1 template<typename E> virtual decaf::util::Set< E >::~Set () [inline, virtual]

6.561 decaf::internal::security::provider::crypto::SHA1MessageDigestSpi Class Reference

SHA1 MessageDigestSpi.

`#include <src/main/decaf/internal/security/provider/crypto/SHA1MessageDigestSpi.h>`Inheritance diagram for decaf::internal::security::provider::crypto::SHA1MessageDigestSpi:

Public Member Functions

- **SHA1MessageDigestSpi** ()
- virtual ~**SHA1MessageDigestSpi** ()
- virtual bool **isCloneable** () const

  Queries the SPI implementation and returns true if the SPI can be cloned.

- virtual MessageDigestSpi * **clone** ()

  Returns a clone if the implementation supports being cloned.

- virtual int **engineGetDigestLength** ()

  Returns the digest length in bytes.

- virtual void **engineUpdate** (unsigned char input)

  Updates the digest using the specified byte.

- virtual void **engineUpdate** (const unsigned char *input, int size, int offset, int length)

  Updates the digest using the specified array of bytes, starting at the specified offset.

- virtual void **engineReset** ()

  Resets the digest for further use.

- virtual void **engineUpdate** (const std::vector< unsigned char > &input)

  Update the digest using the specified Vector of Bytes.

- virtual void **engineUpdate** (**decaf::nio::ByteBuffer** &input)

  Update the digest using the specified ByteBuffer.

- virtual std::vector< unsigned char > **engineDigest** ()

  Completes the hash computation by performing final operations such as padding.

- virtual int **engineDigest** (unsigned char *buffer, int size, int offset, int length)

  Completes the hash computation by performing final operations such as padding.

6.561.1 Detailed Description

SHA1 MessageDigestSpi.

Since:

1.0

6.561.2 Constructor & Destructor Documentation

6.561.2.1 decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::SHA1MessageDigestSp ()

6.561.2.2 virtual decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::~SHA1MessageDigestS () [virtual]

6.561.3 Member Function Documentation

6.561.3.1 virtual MessageDigestSpi* decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::clone () [virtual]

Returns a clone if the implementation supports being cloned.

Returns:

a new pointer that is a copy of this object.

Exceptions:

CloneNotSupportedException if this is called on an implementation that does not support cloning.

Reimplemented from **decaf::security::MessageDigestSpi** (p. 2141).

6.561.3.2 virtual int decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::engineDigest (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Completes the hash computation by performing final operations such as padding. Once engineDigest has been called, the engine should be reset (see engineReset). Resetting is the responsibility of the engine implementor.

Parameters:

buffer The output buffer in which to store the digest

size The size of the given input buffer

offset The offset to start from in the output buffer

length The number of bytes within buffer allotted for the digest. Both this default implementation and the SUN **provider** (p. 105) do not return partial digests. The presence of this parameter is solely for consistency in our API's. If the value of this parameter is less than the actual digest length, the method will throw a DigestException. This parameter is ignored if its value is greater than or equal to the actual digest length.

Returns:

the length of the digest stored in the output buffer.

Exceptions:

DigestException if an error occurs.

NullPointerException if the buffer pointer is NULL.

Implements **decaf::security::MessageDigestSpi** (p. 2141).

6.561.3.3 virtual std::vector<unsigned char> decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::engineDigest () [virtual]

Completes the hash computation by performing final operations such as padding. Once engineDigest has been called, the engine should be reset (see engineReset). Resetting is the responsibility of the engine implementor.

Returns:

an STL vector of bytes containing the resulting hash value.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.561.3.4 virtual int decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::engineGetDigestLength () [virtual]

Returns the digest length in bytes.

Returns:

The digest length in bytes.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.561.3.5 virtual void decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::engineReset () [virtual]

Resets the digest for further use.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.561.3.6 virtual void decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::engineUpdate (decaf::nio::ByteBuffer & *input*) [virtual]

Update the digest using the specified ByteBuffer. The digest is updated using the input.remaining() bytes starting at input.position(). Upon return, the buffer's position will be equal to its limit; its limit will not have changed.

Parameters:

input The ByteBuffer instance that will be used to update the digest.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.561.3.7 virtual void decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::engineUpdate (const std::vector< unsigned char > & *input*) [virtual]

Update the digest using the specified Vector of Bytes.

Parameters:

input The vector of bytes that will be used to update the digest.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.561.3.8 virtual void decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::engineUpdate (const unsigned char * *input*, int *size*, int *offset*, int *length*) [virtual]

Updates the digest using the specified array of bytes, starting at the specified offset.

Parameters:

input The array of bytes to use for the update.

size The size of the given input buffer..

offset The offset to start from in the array of bytes.

length The number of bytes to use, starting at offset.

Exceptions:

NullPointerException if the input array pointer is NULL.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.561.3.9 virtual void decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::engineUpdate (unsigned char *input*) [virtual]

Updates the digest using the specified byte.

Parameters:

input The byte to use for the update.

Implements **decaf::security::MessageDigestSpi** (p. 2144).

6.561.3.10 virtual bool decaf::internal::security::provider::crypto::SHA1MessageDigestSpi::isCloneable () const [inline, virtual]

Queries the SPI implementation and returns true if the SPI can be cloned.

Returns:

true if the SPI is clonable.

Reimplemented from **decaf::security::MessageDigestSpi** (p. 2144).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/security/provider/crypto/**SHA1MessageDigestSpi.h**

6.562 decaf::lang::Short Class Reference

`#include <src/main/decaf/lang/Short.h>`Inheritance diagram for decaf::lang::Short:

Public Member Functions

- **Short** (short value)
- **Short** (const std::string &value)
- virtual ~**Short** ()
- virtual int **compareTo** (const **Short** &s) const

  *Compares this **Short** (p. 2721) instance with another.*

- bool **equals** (const **Short** &s) const
- virtual bool **operator==** (const **Short** &s) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Short** &s) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const short &s) const

  *Compares this **Short** (p. 2721) instance with another.*

- bool **equals** (const short &s) const
- virtual bool **operator==** (const short &s) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const short &s) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (short value)
- static **Short decode** (const std::string &value)

  *Decodes a **String** (p. 2935) into a **Short** (p. 2721).*

- static short **reverseBytes** (short value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

- static short **parseShort** (const std::string &s, int radix)

  Parses the string argument as a signed short in the radix specified by the second argument.

- static short **parseShort** (const std::string &s)

  Parses the string argument as a signed decimal short.

- static **Short valueOf** (short value)

  *Returns a **Short** (p. 2721) instance representing the specified short value.*

- static **Short valueOf** (const std::string &value)

  *Returns a **Short** (p. 2721) object holding the value given by the specified std::string.*

- static **Short valueOf** (const std::string &value, int radix)

  *Returns a **Short** (p. 2721) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE**

  Size of this objects primitive type in bits.

- static const short **MAX_VALUE**

  Max Value for this Object's primitive type.

- static const short **MIN_VALUE**

  Max Value for this Object's primitive type.

6.562.1 Constructor & Destructor Documentation

6.562.1.1 decaf::lang::Short::Short (short *value*)

Parameters:

value - short to wrap

6.562.1.2 decaf::lang::Short::Short (const std::string & *value*)

Parameters:

value The string value to convert to short and wrap.

Exceptions:

NumberFormatException if the string is not well formed number value.

6.562.1.3 virtual decaf::lang::Short::~Short () [inline, virtual]

6.562.2 Member Function Documentation

6.562.2.1 virtual unsigned char decaf::lang::Short::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2269).

6.562.2.2 virtual int decaf::lang::Short::compareTo (const short & *s*) const [virtual]

Compares this **Short** (p. 2721) instance with another.

Parameters:

s - the **Short** (p. 2721) instance to be compared

Returns:

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< short >** (p. 1037).

6.562.2.3 virtual int decaf::lang::Short::compareTo (const Short & *s*) const [virtual]

Compares this **Short** (p. 2721) instance with another.

Parameters:

s - the **Short** (p. 2721) instance to be compared

Returns:

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.562.2.4 static Short decaf::lang::Short::decode (const std::string & *value*) [static]

Decodes a **String** (p. 2935) into a **Short** (p. 2721). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Short.parseShort** (p. 2726) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 2935) is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Short** (p. 2721) object containing the decoded value

Exceptions:

NumberFomatException if the string is not formatted correctly.

6.562.2.5 virtual double decaf::lang::Short::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.562.2.6 bool decaf::lang::Short::equals (const short & *s*) const [inline, virtual]

Returns:

true if the two **Short** (p. 2721) Objects have the same value.

Implements **decaf::lang::Comparable< short >** (p. 1038).

6.562.2.7 bool decaf::lang::Short::equals (const Short & *s*) const [inline]

Returns:

true if the two **Short** (p. 2721) Objects have the same value.

6.562.2.8 virtual float decaf::lang::Short::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.562.2.9 virtual int decaf::lang::Short::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.562.2.10 virtual long long decaf::lang::Short::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.562.2.11 virtual bool decaf::lang::Short::operator< (const short & *s*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< short >** (p. 1038).

6.562.2.12 virtual bool decaf::lang::Short::operator< (const Short & *s*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.562.2.13 virtual bool decaf::lang::Short::operator== (const short & *s*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< short >** (p. 1038).

6.562.2.14 virtual bool decaf::lang::Short::operator== (const Short & *s*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.562.2.15 static short decaf::lang::Short::parseShort (const std::string & *s*) [static]

Parses the string argument as a signed decimal short. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting short value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseShort(const std::string, int) method.

Parameters:

s - **String** (p. 2935) to convert to a short

Returns:

the converted short value

Exceptions:

NumberFormatException if the string is not a short.

6.562.2.16 static short decaf::lang::Short::parseShort (const std::string & *s*, int *radix*) [static]

Parses the string argument as a signed short in the radix specified by the second argument. The characters in the string must all be digits, of the specified radix (as determined by whether

Character.digit(char, int) (p. 917) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type NumberFormatException is thrown if any of the following situations occurs: * The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p. 921) or larger than **Character.MAX_RADIX** (p. 921). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type short.

Parameters:

s - the **String** (p. 2935) containing the short representation to be parsed

radix - the radix to be used while parsing s

Returns:

the short represented by the string argument in the specified radix.

Exceptions:

NumberFormatException - If **String** (p. 2935) does not contain a parsable short.

6.562.2.17 static short decaf::lang::Short::reverseBytes (short *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

Parameters:

value - the short whose bytes we are to reverse

Returns:

the reversed short.

6.562.2.18 virtual short decaf::lang::Short::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2271).

6.562.2.19 static std::string decaf::lang::Short::toString (short *value*) [static]

Returns:

a string representing the primitive value as Base 10

6.562.2.20 std::string decaf::lang::Short::toString () const

Returns:

this **Short** (p. 2721) Object as a **String** (p. 2935) Representation

6.562.2.21 static Short decaf::lang::Short::valueOf (const std::string & *value*, int *radix*) [static]

Returns a **Short** (p. 2721) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed short in the radix specified by the second argument, exactly as if the argument were given to the parseShort(std::string, int) method. The result is a **Short** (p. 2721) object that represents the short value specified by the string.

Parameters:

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Short** (p. 2721) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid short.

6.562.2.22 static Short decaf::lang::Short::valueOf (const std::string & *value*) [static]

Returns a **Short** (p. 2721) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal short, exactly as if the argument were given to the parseShort(std::string) method. The result is a **Short** (p. 2721) object that represents the short value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Short** (p. 2721) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal short.

6.562.2.23 static Short decaf::lang::Short::valueOf (short *value*) [static]

Returns a **Short** (p. 2721) instance representing the specified short value.

Parameters:

value - the short to wrap

Returns:

the new **Short** (p. 2721) object wrapping value.

6.562.3 Field Documentation

6.562.3.1 const short decaf::lang::Short::MAX_VALUE [static]

Max Value for this Object's primitive type.

6.562.3.2 const short decaf::lang::Short::MIN_VALUE [static]

Max Value for this Object's primitive type.

6.562.3.3 const int decaf::lang::Short::SIZE [static]

Size of this objects primitive type in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Short.h**

6.563 decaf::internal::nio::ShortArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/ShortArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::ShortArrayBuffer:

Public Member Functions

- **ShortArrayBuffer** (int size, bool readOnly=false)

  *Creates a **ShortArrayBuffer** (p. 2730) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **ShortArrayBuffer** (short *array, int size, int offset, int length, bool readOnly=false)

  *Creates a **ShortArrayBuffer** (p. 2730) object that wraps the given array.*

- **ShortArrayBuffer** (const **decaf::lang::Pointer**< **ByteArrayAdapter** > &array, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **ShortArrayBuffer** (const **ShortArrayBuffer** &other)

  *Create a **ShortArrayBuffer** (p. 2730) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**ShortArrayBuffer** ()
- virtual short * **array** ()

  Returns the short array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  *the array that backs this **Buffer** (p. 735)*

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  The offset into the backing array where index zero starts.

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual ShortBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only short buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only short buffer which the caller then owns.

- virtual ShortBuffer & **compact** ()

Compacts this buffer.
*The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

*a reference to this **ShortBuffer** (p. 2739).*

Exceptions:

***ReadOnlyBufferException** (p. **2535**) if this buffer is read-only.*

- virtual ShortBuffer * **duplicate** ()

Creates a new short buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

*a new short **Buffer** (p. 735) which the caller owns.*

- virtual short **get** ()

Relative get method.
Reads the value at this buffer's current position, and then increments the position.

Returns:

the short at the current position.

Exceptions:

***BufferUnderflowException** (p. **763**) if there no more data to return.*

- virtual short **get** (int index) const

Absolute get method.
Reads the value at the given index.

Parameters:

***index** The index in the **Buffer** (p. 735) where the short is to be read.*

Returns:

the short that is located at the given index.

Exceptions:

IndexOutOfBoundsException *if index is not smaller than the buffer's limit, or the index is negative.*

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible short array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.
  Returns:

  true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.
  Returns:

  true if, and only if, this buffer is read-only.

- virtual ShortBuffer & **put** (short value)

  Writes the given shorts into this buffer at the current position, and then increments the position.
  Parameters:

  value *The shorts value to be written.*
  Returns:

  a reference to this buffer.
  Exceptions:

  BufferOverflowException *(p. 760) if this buffer's current position is not smaller than its limit.*
  ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual ShortBuffer & **put** (int index, short value)

  Writes the given shorts into this buffer at the given index.
  Parameters:

  index *The position in the* ***Buffer*** *(p. 735) to write the data.*
  value *The shorts to write.*
  Returns:

  a reference to this buffer.
  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written.*
  ReadOnlyBufferException *(p. 2535) if this buffer is read-only.*

- virtual ShortBuffer * **slice** () const

  Creates a new ***ShortBuffer*** *(p. 2739) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the newly create ***ShortBuffer*** *(p. 2739) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **ShortArrayBuffer** (p. 2730) as Read-Only.*

6.563.1 Constructor & Destructor Documentation

6.563.1.1 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **ShortArrayBuffer** (p. 2730) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

IllegalArguementException if the capacity value is negative.

6.563.1.2 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (short * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **ShortArrayBuffer** (p. 2730) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.563.1.3 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset. The capacity and limit of the new **ShortArrayBuffer** (p. 2730) will be that of the remaining capacity of the passed buffer.

Parameters:

array The ByteArrayAdapter to wrap.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if array is NULL

IndexOutOfBoundsException if offset + length is greater than array size.

6.563.1.4 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const ShortArrayBuffer & *other*)

Create a **ShortArrayBuffer** (p. 2730) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters:

other The **ShortArrayBuffer** (p. 2730) this one is to mirror.

6.563.1.5 virtual decaf::internal::nio::ShortArrayBuffer::~ShortArrayBuffer () [virtual]

6.563.2 Member Function Documentation

6.563.2.1 virtual short* decaf::internal::nio::ShortArrayBuffer::array () [virtual]

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735)

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2741).

6.563.2.2 virtual int decaf::internal::nio::ShortArrayBuffer::arrayOffset () [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.
UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2742).

6.563.2.3 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only short buffer which the caller then owns.

Implements **decaf::nio::ShortBuffer** (p. 2742).

6.563.2.4 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::compact () [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **ShortBuffer** (p. 2739).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 2742).

6.563.2.5 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::duplicate () [virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new short **Buffer** (p. 735) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 2743).

6.563.2.6 virtual short decaf::internal::nio::ShortArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the short is to be read.

Returns:

the short that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or the index is negative.

Implements **decaf::nio::ShortBuffer** (p. 2744).

6.563.2.7 virtual short decaf::internal::nio::ShortArrayBuffer::get () [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns:

the short at the current position.

Exceptions:

BufferUnderflowException *(p. 763)* if there no more data to return.

Implements **decaf::nio::ShortBuffer** (p. 2744).

6.563.2.8 virtual bool decaf::internal::nio::ShortArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::ShortBuffer** (p. 2745).

6.563.2.9 virtual bool decaf::internal::nio::ShortArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 738).

6.563.2.10 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (int *index*, short *value*) [virtual]

Writes the given shorts into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The shorts to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 2745).

6.563.2.11 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (short *value*) [virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters:

value The shorts value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 2745).

6.563.2.12 virtual void decaf::internal::nio::ShortArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ShortArrayBuffer** (p. 2730) as Read-Only.

Parameters:

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.563.2.13 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::slice () const [virtual]

Creates a new **ShortBuffer** (p. 2739) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ShortBuffer** (p. 2739) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 2747).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**ShortArrayBuffer.h**

6.564 decaf::nio::ShortBuffer Class Reference

This class defines four categories of operations upon short buffers:.

`#include <src/main/decaf/nio/ShortBuffer.h>`Inheritance diagram for decaf::nio::ShortBuffer:

Public Member Functions

- virtual ~**ShortBuffer** ()
- virtual std::string **toString** () const
- virtual short * **array** ()=0

  Returns the short array that backs this buffer (optional operation).

- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **ShortBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only short buffer that shares this buffer's content.

- virtual **ShortBuffer** & **compact** ()=0

  Compacts this buffer.

- virtual **ShortBuffer** * **duplicate** ()=0

  Creates a new short buffer that shares this buffer's content.

- virtual short **get** ()=0

  Relative get method.

- virtual short **get** (int index) const =0

  Absolute get method.

- **ShortBuffer** & **get** (std::vector< short > buffer)

  Relative bulk get method.

- **ShortBuffer** & **get** (short *buffer, int size, int offset, int length)

  Relative bulk get method.

- virtual bool **hasArray** () const =0

  Tells whether or not this buffer is backed by an accessible short array.

- **ShortBuffer** & **put** (**ShortBuffer** &src)

  This method transfers the shorts remaining in the given source buffer into this buffer.

- **ShortBuffer** & **put** (const short *buffer, int size, int offset, int length)

  This method transfers shorts into this buffer from the given source array.

- **ShortBuffer** & **put** (std::vector< short > &buffer)

  This method transfers the entire content of the given source shorts array into this buffer.

- virtual **ShortBuffer** & **put** (short value)=0

  Writes the given shorts into this buffer at the current position, and then increments the position.

- virtual **ShortBuffer** & **put** (int index, short value)=0

  Writes the given shorts into this buffer at the given index.

- virtual **ShortBuffer** * **slice** () const =0

  *Creates a new **ShortBuffer** (p. 2739) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **ShortBuffer** &value) const

- virtual bool **equals** (const **ShortBuffer** &value) const

- virtual bool **operator==** (const **ShortBuffer** &value) const

- virtual bool **operator<** (const **ShortBuffer** &value) const

Static Public Member Functions

- static **ShortBuffer** * **allocate** (int capacity)

  Allocates a new Double buffer.

- static **ShortBuffer** * **wrap** (short *array, int size, int offset, int length)

  *Wraps the passed buffer with a new **ShortBuffer** (p. 2739).*

- static **ShortBuffer** * **wrap** (std::vector< short > &buffer)

  *Wraps the passed STL short Vector in a **ShortBuffer** (p. 2739).*

Protected Member Functions

- **ShortBuffer** (int capacity)

  *Creates a **ShortBuffer** (p. 2739) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.564.1 Detailed Description

This class defines four categories of operations upon short buffers:. o Absolute and relative get and put methods that read and write single shorts; o Relative bulk get methods that transfer contiguous sequences of shorts from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of shorts from a short array or some other short buffer into this buffer o Methods for compacting, duplicating, and slicing a short buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing short array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.564.2 Constructor & Destructor Documentation

6.564.2.1 decaf::nio::ShortBuffer::ShortBuffer (int *capacity*) [protected]

Creates a **ShortBuffer** (p. 2739) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity The size and limit of the **Buffer** (p. 735) in doubles

Exceptions:

IllegalArguementException if capacity is negative.

6.564.2.2 virtual decaf::nio::ShortBuffer::~ShortBuffer () [inline, virtual]

6.564.3 Member Function Documentation

6.564.3.1 static ShortBuffer* decaf::nio::ShortBuffer::allocate (int *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity The size of the Double buffer in shorts.

Returns:

the **ShortBuffer** (p. 2739) that was allocated, caller owns.

6.564.3.2 virtual short* decaf::nio::ShortBuffer::array () [pure virtual]

Returns the short array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735)

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2734).

6.564.3.3 virtual int decaf::nio::ShortBuffer::arrayOffset () [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2734).

6.564.3.4 virtual ShortBuffer* decaf::nio::ShortBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only short buffer which the caller then owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2735).

6.564.3.5 virtual ShortBuffer& decaf::nio::ShortBuffer::compact () [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **ShortBuffer** (p. 2739).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2735).

6.564.3.6 virtual int decaf::nio::ShortBuffer::compareTo (const ShortBuffer & *value*) const [virtual]

6.564.3.7 virtual ShortBuffer* decaf::nio::ShortBuffer::duplicate () [pure virtual]

Creates a new short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new short **Buffer** (p. 735) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2736).

6.564.3.8 virtual bool decaf::nio::ShortBuffer::equals (const ShortBuffer & *value*) const [virtual]

6.564.3.9 ShortBuffer& decaf::nio::ShortBuffer::get (short * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method. This method transfers shorts from this buffer into the given destination array. If there are fewer shorts remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 740), then no bytes are transferred and a **BufferUnderflowException** (p. 763) is thrown.

Otherwise, this method copies length shorts from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer The pointer to an allocated buffer to fill.

size The size of the buffer provided.

offset The position in the buffer to start filling.

length The amount of data to put in the passed buffer.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are fewer than length shorts remaining in this buffer

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.564.3.10 ShortBuffer& decaf::nio::ShortBuffer::get (std::vector< short > *buffer*)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are fewer than length shorts remaining in this buffer.

6.564.3.11 virtual short decaf::nio::ShortBuffer::get (int *index*) const [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the short is to be read.

Returns:

the short that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or the index is negative.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2736).

6.564.3.12 virtual short decaf::nio::ShortBuffer::get () [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the short at the current position.

Exceptions:

BufferUnderflowException *(*p. *763)* if there no more data to return.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2736).

6.564.3.13 virtual bool decaf::nio::ShortBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible short array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2737).

6.564.3.14 virtual bool decaf::nio::ShortBuffer::operator< (const ShortBuffer & *value*) const [virtual]

6.564.3.15 virtual bool decaf::nio::ShortBuffer::operator== (const ShortBuffer & *value*) const [virtual]

6.564.3.16 virtual ShortBuffer& decaf::nio::ShortBuffer::put (int *index*, short *value*) [pure virtual]

Writes the given shorts into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The shorts to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException *(*p. *2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2737).

6.564.3.17 virtual ShortBuffer& decaf::nio::ShortBuffer::put (short *value*) [pure virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters:

value The shorts value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2737).

6.564.3.18 ShortBuffer& decaf::nio::ShortBuffer::put (std::vector< short > & *buffer*)

This method transfers the entire content of the given source shorts array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters:

buffer The buffer whose contents are copied to this **ShortBuffer** (p. 2739).

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if there is insufficient space in this buffer.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

6.564.3.19 ShortBuffer& decaf::nio::ShortBuffer::put (const short * *buffer*, int *size*, int *offset*, int *length*)

This method transfers shorts into this buffer from the given source array. If there are more shorts to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 740), then no shorts are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer The array from which shorts are to be read.

size The size of the buffer passed.

offset The offset within the array of the first char to be read.

length The number of shorts to be read from the given array.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.564.3.20 ShortBuffer& decaf::nio::ShortBuffer::put (ShortBuffer & *src*)

This method transfers the shorts remaining in the given source buffer into this buffer. If there are more shorts remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 740), then no shorts are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies n = src.remaining() shorts from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src The buffer to take shorts from an place in this one.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer for the remaining shorts in the source buffer.

IllegalArgumentException if the source buffer is this buffer.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

6.564.3.21 virtual ShortBuffer* decaf::nio::ShortBuffer::slice () const [pure virtual]

Creates a new **ShortBuffer** (p. 2739) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ShortBuffer** (p. 2739) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2738).

6.564.3.22 virtual std::string decaf::nio::ShortBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.564.3.23 static ShortBuffer* decaf::nio::ShortBuffer::wrap (std::vector< short > & *buffer*) [static]

Wraps the passed STL short Vector in a **ShortBuffer** (p. 2739). The new buffer will be backed by the given short array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **ShortBuffer** (p. 2739) that is backed by buffer, caller owns.

6.564.3.24 static ShortBuffer* decaf::nio::ShortBuffer::wrap (short * *array*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new **ShortBuffer** (p. 2739). The new buffer will be backed by the given short array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array The array that will back the new buffer.

size The size of the passed in array.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new **ShortBuffer** (p. 2739) that is backed by buffer, caller owns.

Exceptions:

NullPointerException if the array pointer is NULL.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.565.1 Constructor & Destructor Documentation

6.565.1.1 activemq::commands::ShutdownInfo::ShutdownInfo ()

6.565.1.2 virtual activemq::commands::ShutdownInfo::~ShutdownInfo () [virtual]

6.565.2 Member Function Documentation

6.565.2.1 virtual ShutdownInfo* activemq::commands::ShutdownInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.565.2.2 virtual void activemq::commands::ShutdownInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.565.2.3 virtual bool activemq::commands::ShutdownInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.565.2.4 virtual unsigned char activemq::commands::ShutdownInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.565.2.5 virtual bool activemq::commands::ShutdownInfo::isShutdownInfo () const [inline, virtual]

Returns:

an answer of true to the **isShutdownInfo()** (p. 2750) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 640).

6.565.2.6 virtual std::string activemq::commands::ShutdownInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.565.2.7 virtual Pointer<Command> activemq::commands::ShutdownInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.565.3 Field Documentation

6.565.3.1 const unsigned char activemq::commands::ShutdownInfo::ID_SHUTDOWNINFO = 11 [static]

6.566.2.2 virtual activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::~Shutdown () [inline, virtual]

6.566.3 Member Function Documentation

6.566.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.566.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::getDataStruc () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.566.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.566.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::looseUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.566.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.566.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.566.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightUnmarsl (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ShutdownInfoMarshaller.h**

6.567 decaf::security::SignatureException Class Reference

`#include <src/main/decaf/security/SignatureException.h>`Inheritance diagram for decaf::security::SignatureException:

Public Member Functions

- **SignatureException** ()

  Default Constructor.

- **SignatureException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **SignatureException** (const **SignatureException** &ex)

  Copy Constructor.

- **SignatureException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **SignatureException** (const std::exception *cause)

  Convenience Constructor.

- **SignatureException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **SignatureException** * **clone** () const

  Clones this exception.

- virtual ~**SignatureException** () throw ()

6.567.1 Constructor & Destructor Documentation

6.567.1.1 decaf::security::SignatureException::SignatureException ()

Default Constructor.

6.567.1.2 decaf::security::SignatureException::SignatureException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.567.1.3 decaf::security::SignatureException::SignatureException (const SignatureException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.567.1.4 decaf::security::SignatureException::SignatureException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.567.1.5 decaf::security::SignatureException::SignatureException (const std::exception * *cause*)

Convenience Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.567.1.6 decaf::security::SignatureException::SignatureException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.567.1.7 virtual decaf::security::SignatureException::~SignatureException () throw () [virtual]

6.567.2 Member Function Documentation

6.567.2.1 virtual SignatureException* decaf::security::SignatureException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1585).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**SignatureException.h**

6.568 decaf::util::logging::SimpleFormatter Class Reference

Print a brief summary of the **LogRecord** (p. 1960) in a human readable format.

`#include <src/main/decaf/util/logging/SimpleFormatter.h>`Inheritance diagram for decaf::util::logging::SimpleFormatter:

Public Member Functions

- **SimpleFormatter** ()
- virtual ~**SimpleFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const

  Format the given log record and return the formatted string.

6.568.1 Detailed Description

Print a brief summary of the **LogRecord** (p. 1960) in a human readable format. The summary will typically be 1 or 2 lines.

Since:

1.0

6.568.2 Constructor & Destructor Documentation

6.568.2.1 decaf::util::logging::SimpleFormatter::SimpleFormatter ()

6.568.2.2 virtual decaf::util::logging::SimpleFormatter::~SimpleFormatter () [virtual]

6.568.3 Member Function Documentation

6.568.3.1 virtual std::string decaf::util::logging::SimpleFormatter::format (const LogRecord & *record*) const [virtual]

Format the given log record and return the formatted string.

Parameters:

record The Log Record to Format.

Implements **decaf::util::logging::Formatter** (p. 1569).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**SimpleFormatter.h**

6.569 decaf::util::logging::SimpleLogger Class Reference

6.570 activemq::core::SimplePriorityMessageDispatchChannel Class Reference

`#include <src/main/activemq/core/SimplePriorityMessageDispatchChannel.h>`Inheritance diagram for activemq::core::SimplePriorityMessageDispatchChannel:

Public Member Functions

- **SimplePriorityMessageDispatchChannel** ()
- virtual ~**SimplePriorityMessageDispatchChannel** ()
- virtual void **enqueue** (const **Pointer**< **MessageDispatch** > &message)

  Add a Message to the Channel behind all pending message.

- virtual void **enqueueFirst** (const **Pointer**< **MessageDispatch** > &message)

  Add a message to the front of the Channel.

- virtual bool **isEmpty** () const
- virtual bool **isClosed** () const
- virtual bool **isRunning** () const
- virtual **Pointer**< **MessageDispatch** > **dequeue** (long long timeout)

  Used to get an enqueued message.

- virtual **Pointer**< **MessageDispatch** > **dequeueNoWait** ()

  Used to get an enqueued message if there is one queued right now.

- virtual **Pointer**< **MessageDispatch** > **peek** () const

  Peek in the Queue and return the first message in the Channel without removing it from the channel.

- virtual void **start** ()

  Starts dispatch of messages from the Channel.

- virtual void **stop** ()

  Stops dispatch of message from the Channel.

- virtual void **close** ()

  Close this channel no messages will be dispatched after this method is called.

- virtual void **clear** ()

  Clear the Channel, all pending messages are removed.

- virtual int **size** () const
- virtual std::vector< **Pointer**< **MessageDispatch** > > **removeAll** ()

  Remove all messages that are currently in the Channel and return them as a list of Messages.

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.570.1 Constructor & Destructor Documentation

6.570.1.1 activemq::core::SimplePriorityMessageDispatchChannel::SimplePriorityMessageDispatchC ()

6.570.1.2 virtual activemq::core::SimplePriorityMessageDispatchChannel::~SimplePriorityMessageDispatch () [virtual]

6.570.2 Member Function Documentation

6.570.2.1 virtual void activemq::core::SimplePriorityMessageDispatchChannel::clear () [virtual]

Clear the Channel, all pending messages are removed.

Implements **activemq::core::MessageDispatchChannel** (p. 2151).

6.570.2.2 virtual void activemq::core::SimplePriorityMessageDispatchChannel::close () [virtual]

Close this channel no messages will be dispatched after this method is called.

Implements **activemq::core::MessageDispatchChannel** (p. 2151).

6.570.2.3 virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::dequeue (long long *timeout*) [virtual]

Used to get an enqueued message. The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will consumed by this method.

Returns:

null if we timeout or if the consumer is closed.

Exceptions:

ActiveMQException

Implements **activemq::core::MessageDispatchChannel** (p. 2151).

6.570.2.4 virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::dequeueNoWait () [virtual]

Used to get an enqueued message if there is one queued right now. If there is no waiting message than this method returns Null.

Returns:

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 2151).

6.570.2.5 virtual void activemq::core::SimplePriorityMessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & *message*) [virtual]

Add a Message to the Channel behind all pending message.

Parameters:

message - The message to add to the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.570.2.6 virtual void activemq::core::SimplePriorityMessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & *message*) [virtual]

Add a message to the front of the Channel.

Parameters:

message - The Message to add to the front of the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.570.2.7 virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isClosed () const [inline, virtual]

Returns:

has the Queue been closed.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.570.2.8 virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isEmpty () const [virtual]

Returns:

true if there are no messages in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.570.2.9 virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isRunning () const [inline, virtual]

Returns:

true if the Channel currently running and will dequeue message.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.570.2.10 virtual void activemq::core::SimplePriorityMessageDispatchChannel::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

6.570.2.11 virtual void activemq::core::SimplePriorityMessageDispatchChannel::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting **threads** (p. 71).

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.570.2.12 virtual void activemq::core::SimplePriorityMessageDispatchChannel::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting **threads** (p. 71).

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.570.2.13 virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::peek () const [virtual]

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns:

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.570.2.14 virtual std::vector<Pointer<MessageDispatch> > activemq::core::SimplePriorityMessageDispatchChannel::removeAll () [virtual]

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns:

a list of Messages that was previously in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.570.2.15 virtual int activemq::core::SimplePriorityMessageDispatchChannel::size () const [virtual]

Returns:

the number of Messages currently in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.570.2.16 virtual void activemq::core::SimplePriorityMessageDispatchChannel::start () [virtual]

Starts dispatch of messages from the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.570.2.17 virtual void activemq::core::SimplePriorityMessageDispatchChannel::stop () [virtual]

Stops dispatch of message from the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.570.2.18 virtual bool activemq::core::SimplePriorityMessageDispatchChannel::tryLock () [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.570.2.19 virtual void activemq::core::SimplePriorityMessageDispatchChannel::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.570.2.20 virtual void activemq::core::SimplePriorityMessageDispatchChannel::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.570.2.21 virtual void activemq::core::SimplePriorityMessageDispatchChannel::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.570.2.22 virtual void activemq::core::SimplePriorityMessageDispatchChannel::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

6.571 decaf::net::Socket Class Reference

`#include <src/main/decaf/net/Socket.h>`Inheritance diagram for decaf::net::Socket:

Public Member Functions

- **Socket** ()

  *Creates an unconnected **Socket** (p. 2770) using the set **SocketImplFactory** (p. 2802) or if non is set than the default SockImpl type is created.*

- **Socket** (**SocketImpl** *impl)

  *Creates a **Socket** (p. 2770) wrapping the provided **SocketImpl** (p. 2794) instance, this **Socket** (p. 2770) is considered unconnected.*

- **Socket** (const **InetAddress** *address, int port)

  *Creates a new **Socket** (p. 2770) instance and connects it to the given address and port.*

- **Socket** (const **InetAddress** *address, int port, const **InetAddress** *localAddress, int localPort)

  *Creates a new **Socket** (p. 2770) instance and connects it to the given address and port.*

- **Socket** (const std::string &host, int port)

  *Creates a new **Socket** (p. 2770) instance and connects it to the given host and port.*

- **Socket** (const std::string &host, int port, const **InetAddress** *localAddress, int localPort)

  *Creates a new **Socket** (p. 2770) instance and connects it to the given host and port.*

- virtual ~**Socket** ()
- virtual void **bind** (const std::string &ipaddress, int port)

  *Binds this **Socket** (p. 2770) to the given local address and port.*

- virtual void **close** ()

  *Closes the **Socket** (p. 2770).*

- virtual void **connect** (const std::string &host, int port)

  Connects to the specified destination.

- virtual void **connect** (const std::string &host, int port, int timeout)

  Connects to the specified destination, with a specified timeout value.

- bool **isConnected** () const

  Indicates whether or not this socket is connected to am end point.

- bool **isClosed** () const
- bool **isBound** () const
- bool **isInputShutdown** () const
- bool **isOutputShutdown** () const
- virtual **decaf::io::InputStream** * **getInputStream** ()

Gets the InputStream for this socket if its connected.

- virtual **decaf::io::OutputStream** * **getOutputStream** ()

  Gets the OutputStream for this socket if it is connected.

- int **getPort** () const

  Gets the on the remote host this ***Socket*** *(*p. 2770*) is connected to.*

- int **getLocalPort** () const

  Gets the local port the socket is bound to.

- std::string **getInetAddress** () const

  Returns the address to which the socket is connected.

- std::string **getLocalAddress** () const

  Gets the local address to which the socket is bound.

- virtual void **shutdownInput** ()

  Shuts down the InputStream for this socket essentially marking it as EOF.

- virtual void **shutdownOutput** ()

  Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.

- virtual int **getSoLinger** () const

  Gets the linger time for the socket, SO_LINGER.

- virtual void **setSoLinger** (bool state, int timeout)

  Sets the linger time (SO_LINGER) using a specified time value, this limits of this value are platform specific.

- virtual bool **getKeepAlive** () const

  Gets the keep alive flag for this socket, SO_KEEPALIVE.

- virtual void **setKeepAlive** (bool keepAlive)

  Enables/disables the keep alive flag for this socket, SO_KEEPALIVE.

- virtual int **getReceiveBufferSize** () const

  Gets the receive buffer size for this socket, SO_RCVBUF.

- virtual void **setReceiveBufferSize** (int size)

  Sets the receive buffer size for this socket, SO_RCVBUF.

- virtual bool **getReuseAddress** () const

  Gets the reuse address flag, SO_REUSEADDR.

- virtual void **setReuseAddress** (bool reuse)

  Sets the reuse address flag, SO_REUSEADDR.

- virtual int **getSendBufferSize** () const

Gets the send buffer size for this socket, SO_ SNDBUF, this value is used by the platform socket to buffer data written to the socket.

- virtual void **setSendBufferSize** (int size)

  Gets the send buffer size for this socket, SO_ SNDBUF, this value is used by the platform socket to buffer data written to the socket.

- virtual int **getSoTimeout** () const

  Gets the timeout for socket operations, SO_ TIMEOUT.

- virtual void **setSoTimeout** (int timeout)

  Sets the timeout for socket operations, SO_ TIMEOUT.

- virtual bool **getTcpNoDelay** () const

  Gets the Status of the TCP_ NODELAY setting for this socket.

- virtual void **setTcpNoDelay** (bool value)

  Sets the Status of the TCP_ NODELAY param for this socket., this setting is used to disable or enable Nagle's algorithm on the ***Socket*** *(p. 2770).*

- virtual int **getTrafficClass** () const

  Gets the Traffic Class setting for this ***Socket*** *(p. 2770), sometimes referred to as Type of Service setting.*

- virtual void **setTrafficClass** (int value)

  Gets the Traffic Class setting for this ***Socket*** *(p. 2770), sometimes referred to as Type of Service setting.*

- virtual bool **getOOBInline** () const

  Gets the value of the OOBINLINE for this socket.

- virtual void **setOOBInline** (bool value)

  Sets the value of the OOBINLINE for this socket, by default this option is disabled.

- virtual void **sendUrgentData** (int data)

  Sends on byte of urgent data to the ***Socket*** *(p. 2770).*

- virtual std::string **toString** () const

Static Public Member Functions

- static void **setSocketImplFactory** (**SocketImplFactory** *factory)

  Sets the instance of a ***SocketImplFactory*** *(p. 2802) that the* ***Socket*** *(p. 2770) class should use when new instances of this class are created.*

6.571.1 Detailed Description

Since:

1.0

6.571.2 Constructor & Destructor Documentation

6.571.2.1 decaf::net::Socket::Socket ()

Creates an unconnected **Socket** (p. 2770) using the set **SocketImplFactory** (p. 2802) or if non is set than the default SockImpl type is created.

6.571.2.2 decaf::net::Socket::Socket (SocketImpl * *impl*)

Creates a **Socket** (p. 2770) wrapping the provided **SocketImpl** (p. 2794) instance, this **Socket** (p. 2770) is considered unconnected. The **Socket** (p. 2770) class takes ownership of this **SocketImpl** (p. 2794) pointer and will delete it when the **Socket** (p. 2770) class is destroyed.

Parameters:

impl The **SocketImpl** (p. 2794) instance to wrap.

Exceptions:

NullPointerException if the passed **SocketImpl** (p. 2794) is Null.

6.571.2.3 decaf::net::Socket::Socket (const InetAddress * *address*, int *port*)

Creates a new **Socket** (p. 2770) instance and connects it to the given address and port. If there is a **SocketImplFactory** (p. 2802) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 2770) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters:

address The address to connect to.

port The port number to connect to [0...65535]

Exceptions:

UnknownHostException *(p. 3154)* if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 2770).

NullPointerException if the **InetAddress** (p. 1679) instance in NULL.

IllegalArgumentException if the port if not in range [0...65535]

6.571.2.4 decaf::net::Socket::Socket (const InetAddress * *address*, int *port*, const InetAddress * *localAddress*, int *localPort*)

Creates a new **Socket** (p. 2770) instance and connects it to the given address and port. If there is a **SocketImplFactory** (p. 2802) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 2770) implementation is used. The **Socket** (p. 2770) will also bind to the local address and port specified.

Parameters:

address The address to connect to.

port The port number to connect to [0...65535]

localAddress The IP address on the local machine to bind to.

localPort The port on the local machine to bind to.

Exceptions:

UnknownHostException *(p. 3154)* if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 2770).

NullPointerException if the **InetAddress** (p. 1679) instance in NULL.

IllegalArgumentException if the port if not in range [0...65535]

6.571.2.5 decaf::net::Socket::Socket (const std::string & *host*, int *port*)

Creates a new **Socket** (p. 2770) instance and connects it to the given host and port. If there is a **SocketImplFactory** (p. 2802) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 2770) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters:

host The host name or IP address to connect to, empty string means loopback.

port The port number to connect to [0...65535]

Exceptions:

UnknownHostException *(p. 3154)* if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 2770).

IllegalArgumentException if the port if not in range [0...65535]

6.571.2.6 decaf::net::Socket::Socket (const std::string & *host*, int *port*, const InetAddress * *localAddress*, int *localPort*)

Creates a new **Socket** (p. 2770) instance and connects it to the given host and port. If there is a **SocketImplFactory** (p. 2802) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 2770) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters:

host The host name or IP address to connect to, empty string means loopback.

port The port number to connect to [0...65535]

localAddress The IP address on the local machine to bind to.

localPort The port on the local machine to bind to.

Exceptions:

UnknownHostException *(p. 3154)* if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 2770).

IllegalArgumentException if the port if not in range [0...65535]

6.571.2.7 virtual decaf::net::Socket::~Socket () [virtual]

6.571.3 Member Function Documentation

6.571.3.1 void decaf::net::Socket::accepted () [protected]

6.571.3.2 virtual void decaf::net::Socket::bind (const std::string & *ipaddress*, int *port*) [virtual]

Binds this **Socket** (p. 2770) to the given local address and port. If the **SocketAddress** (p. 2785) value is NULL then the **Socket** (p. 2770) will be bound to an available local address and port.

Parameters:

ipaddress The local address and port to bind the socket to.

port The port on the local machine to bind to.

Exceptions:

IOException if an error occurs during the bind operation.

IllegalArgumentException if the **Socket** (p. 2770) can't process the subclass of **SocketAddress** (p. 2785) that has been provided.

6.571.3.3 void decaf::net::Socket::checkClosed () const [protected]

6.571.3.4 virtual void decaf::net::Socket::close () [virtual]

Closes the **Socket** (p. 2770). Once closed a **Socket** (p. 2770) cannot be connected or otherwise operated upon, a new **Socket** (p. 2770) instance must be created.

Exceptions:

IOException if an I/O error occurs while closing the **Socket** (p. 2770).

Implements **decaf::io::Closeable** (p. 967).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2299).

6.571.3.5 virtual void decaf::net::Socket::connect (const std::string & *host*, int *port*, int *timeout*) [virtual]

Connects to the specified destination, with a specified timeout value. If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 2807) is thrown. A timeout value of zero is treated as an inifinite timeout.

Parameters:

host The host name or IP address of the remote host to connect to.

port The port on the remote host to connect to.

timeout The number of Milliseconds to wait before treating the connection as failed.

Exceptions:

IOException Thrown if a failure occurred in the connect.

SocketTimeoutException *(p. 2807)* if the timeout for connection is exceeded.

IllegalArguementException if the timeout value is negative or the endpoint is invalid.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2300).

6.571.3.6 virtual void decaf::net::Socket::connect (const std::string & *host*, int *port*) [virtual]

Connects to the specified destination.

Parameters:

host The host name or IP address of the remote host to connect to.

port The port on the remote host to connect to.

Exceptions:

IOException Thrown if a failure occurred in the connect.

IllegalArguementException if the timeout value is negative or the endpoint is invalid.

6.571.3.7 void decaf::net::Socket::ensureCreated () const [protected]

6.571.3.8 std::string decaf::net::Socket::getInetAddress () const

Returns the address to which the socket is connected.

Returns:

the remote IP address to which this socket is connected, or null if the socket is not connected.

6.571.3.9 virtual decaf::io::InputStream* decaf::net::Socket::getInputStream () [virtual]

Gets the InputStream for this socket if its connected. The pointer returned is the property of the associated **Socket** (p. 2770) and should not be deleted by the caller.

When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broker the read calls will normally throw an exception to indicate the failure.

Closing the InputStream will also close the underlying **Socket** (p. 2770).

Returns:

The InputStream for this socket.

Exceptions:

IOException if an error occurs during creation of the InputStream, also if the **Socket** (p. 2770) is not connected or the input has been shutdown previously.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2301).

6.571.3.10 virtual bool decaf::net::Socket::getKeepAlive () const [virtual]

Gets the keep alive flag for this socket, SO_KEEPALIVE.

Returns:

true if keep alive is enabled for this socket.

Exceptions:

SocketException *(p. 2787)* if the operation fails.

6.571.3.11 std::string decaf::net::Socket::getLocalAddress () const

Gets the local address to which the socket is bound.

Returns:

the local address to which the socket is bound or InetAddress.anyLocalAddress() if the socket is not bound yet.

6.571.3.12 int decaf::net::Socket::getLocalPort () const

Gets the local port the socket is bound to.

Returns:

the local port the socket was bound to, or -1 if the socket is not bound.

6.571.3.13 virtual bool decaf::net::Socket::getOOBInline () const [virtual]

Gets the value of the OOBINLINE for this socket.

Returns:

true if OOBINLINE is enabled, false otherwise.

Exceptions:

SocketException *(*p. *2787)* if an error is encountered while performing this operation.

6.571.3.14 virtual decaf::io::OutputStream* decaf::net::Socket::getOutputStream () [virtual]

Gets the OutputStream for this socket if it is connected. The pointer returned is the property of the **Socket** (p. 2770) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 2770) will also close the underlying **Socket** (p. 2770).

Returns:

the OutputStream for this socket.

Exceptions:

IOException if an error occurs during the creation of this OutputStream, or if the **Socket** (p. 2770) is closed or the output has been shutdown previously.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2301).

6.571.3.15 int decaf::net::Socket::getPort () const

Gets the on the remote host this **Socket** (p. 2770) is connected to.

Returns:

the port on the remote host the socket is connected to, or 0 if not connected.

6.571.3.16 virtual int decaf::net::Socket::getReceiveBufferSize () const [virtual]

Gets the receive buffer size for this socket, SO_RCVBUF. This is the buffer used by the underlying platform socket to buffer received data.

Returns:

the receive buffer size in bytes.

Exceptions:

SocketException *(*p. *2787)* if the operation fails.

6.571.3.17 virtual bool decaf::net::Socket::getReuseAddress () const [virtual]

Gets the reuse address flag, SO_REUSEADDR.

Returns:

True if the address can be reused.

Exceptions:

SocketException *(*p. *2787)* if the operation fails.

6.571.3.18 virtual int decaf::net::Socket::getSendBufferSize () const [virtual]

Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

Returns:

the size in bytes of the send buffer.

Exceptions:

SocketException *(*p. *2787)* if the operation fails.

6.571.3.19 virtual int decaf::net::Socket::getSoLinger () const [virtual]

Gets the linger time for the socket, SO_LINGER. A return value of -1 indicates that the option is disabled.

Returns:

The linger time in seconds.

Exceptions:

SocketException *(*p. *2787)* if the operation fails.

6.571.3.20 virtual int decaf::net::Socket::getSoTimeout () const [virtual]

Gets the timeout for socket operations, SO_TIMEOUT.

Returns:

The timeout in milliseconds for socket operations.

Exceptions:

SocketException *(*p. *2787)* Thrown if unable to retrieve the information.

6.571.3.21 virtual bool decaf::net::Socket::getTcpNoDelay () const [virtual]

Gets the Status of the TCP_NODELAY setting for this socket.

Returns:

true if TCP_NODELAY is enabled for the socket.

Exceptions:

SocketException *(*p. *2787)* Thrown if unable to set the information.

6.571.3.22 virtual int decaf::net::Socket::getTrafficClass () const [virtual]

Gets the Traffic Class setting for this **Socket** (p. 2770), sometimes referred to as Type of Service setting. This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 2770) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

Returns:

the bitset result of querying the traffic class setting.

Exceptions:

SocketException *(*p. *2787)* if an error is encountered while performing this operation.

6.571.3.23 void decaf::net::Socket::initSocketImpl (const std::string & *address*, int *port*, const InetAddress * *localAddress*, int *localPort*) [protected]

6.571.3.24 bool decaf::net::Socket::isBound () const [inline]

Returns:

true if this **Socket** (p. 2770) has been bound to a Local address.

6.571.3.25 bool decaf::net::Socket::isClosed () const [inline]

Returns:

true if the **Socket** (p. 2770) has been closed.

6.571.3.26 bool decaf::net::Socket::isConnected () const [inline]

Indicates whether or not this socket is connected to am end point.

Returns:

true if connected, false otherwise.

6.571.3.27 bool decaf::net::Socket::isInputShutdown () const [inline]

Returns:

true if input on this **Socket** (p. 2770) has been shutdown.

6.571.3.28 bool decaf::net::Socket::isOutputShutdown () const [inline]

Returns:

true if output on this **Socket** (p. 2770) has been shutdown.

6.571.3.29 virtual void decaf::net::Socket::sendUrgentData (int *data*) [virtual]

Sends on byte of urgent data to the **Socket** (p. 2770).

Parameters:

data The value to write as urgent data, only the lower eight bits are sent.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2303).

6.571.3.30 virtual void decaf::net::Socket::setKeepAlive (bool *keepAlive*) [virtual]

Enables/disables the keep alive flag for this socket, SO_KEEPALIVE.

Parameters:

keepAlive If true, enables the flag.

Exceptions:

SocketException *(p. 2787)* if the operation fails.

6.571.3.31 virtual void decaf::net::Socket::setOOBInline (bool *value*) [virtual]

Sets the value of the OOBINLINE for this socket, by default this option is disabled. If enabled the urgent data is read inline on the Socket's InputStream, no notification is give.

Returns:

true if OOBINLINE is enabled, false otherwise.

Exceptions:

SocketException *(p. 2787)* if an error is encountered while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2305).

6.571.3.32 virtual void decaf::net::Socket::setReceiveBufferSize (int *size*) [virtual]

Sets the receive buffer size for this socket, SO_RCVBUF.

Parameters:

size Number of bytes to set the receive buffer to.

Exceptions:

SocketException *(p. 2787)* if the operation fails.
IllegalArgumentException if the value is zero or negative.

6.571.3.33 virtual void decaf::net::Socket::setReuseAddress (bool *reuse*) [virtual]

Sets the reuse address flag, SO_REUSEADDR.

Parameters:

reuse If true, sets the flag.

Exceptions:

SocketException *(p. 2787)* if the operation fails.

6.571.3.34 virtual void decaf::net::Socket::setSendBufferSize (int *size*) [virtual]

Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

Parameters:

size The number of bytes to set the send buffer to, must be larger than zero.

Exceptions:

SocketException *(p. 2787)* if the operation fails.
IllegalArgumentException if the value is zero or negative.

6.571.3.35 static void decaf::net::Socket::setSocketImplFactory (SocketImplFactory * *factory*) [static]

Sets the instance of a **SocketImplFactory** (p. 2802) that the **Socket** (p. 2770) class should use when new instances of this class are created. This method is only allowed to be used once during the lifetime of the application.

Parameters:

factory The instance of a **SocketImplFactory** (p. 2802) to use when new **Socket** (p. 2770) objects are created.

Exceptions:

IOException if an I/O error occurs while performing this operation.
SocketException *(p. 2787)* if this method has already been called with a valid factory.

6.571.3.36 virtual void decaf::net::Socket::setSoLinger (bool *state*, int *timeout*) [virtual]

Sets the linger time (SO_LINGER) using a specified time value, this limits of this value are platform specific.

Parameters:

state The state of SO_LINGER, true is on.

timeout The linger time in seconds, must be non-negative.

Exceptions:

SocketException *(*p. *2787)* if the operation fails.

IllegalArgumentException if state is true and timeout is negative.

6.571.3.37 virtual void decaf::net::Socket::setSoTimeout (int *timeout*) [virtual]

Sets the timeout for socket operations, SO_TIMEOUT. A value of zero indicates that timeout is infinite for operations on this socket.

Parameters:

timeout The timeout in milliseconds for socket operations.

Exceptions:

SocketException *(*p. *2787)* Thrown if unable to set the information.

IllegalArgumentException if the timeout value is negative.

6.571.3.38 virtual void decaf::net::Socket::setTcpNoDelay (bool *value*) [virtual]

Sets the Status of the TCP_NODELAY param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p. 2770).

Parameters:

value The setting for the socket's TCP_NODELAY option, true to enable.

Exceptions:

SocketException *(*p. *2787)* Thrown if unable to set the information.

6.571.3.39 virtual void decaf::net::Socket::setTrafficClass (int *value*) [virtual]

Gets the Traffic Class setting for this **Socket** (p. 2770), sometimes referred to as Type of Service setting. This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 2770) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

Parameters:

value The integer value representing the traffic class setting bitset.

Exceptions:

SocketException *(*p. *2787)* if an error is encountered while performing this operation.

IllegalArgumentException if the value is not in the range [0..255].

6.571.3.40 virtual void decaf::net::Socket::shutdownInput () [virtual]

Shuts down the InputStream for this socket essentially marking it as EOF. The stream returns EOF for any calls to read after this method has been called.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2306).

6.571.3.41 virtual void decaf::net::Socket::shutdownOutput () [virtual]

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2306).

6.571.3.42 virtual std::string decaf::net::Socket::toString () const [virtual]

Returns:

a string representing this **Socket** (p. 2770).

6.571.4 Friends And Related Function Documentation

  Constructor - Initializes the file name and line number where this message occurred.

- **SocketException** (const std::exception *cause)

  Constructor.

- **SocketException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **SocketException** * **clone** () const

  Clones this exception.

- virtual ~**SocketException** () throw ()

6.574.1 Detailed Description

Exception for errors when manipulating sockets.

6.574.2 Constructor & Destructor Documentation

6.574.2.1 decaf::net::SocketException::SocketException ()

6.574.2.2 decaf::net::SocketException::SocketException (const lang::Exception & *ex*)

6.574.2.3 decaf::net::SocketException::SocketException (const SocketException & *ex*)

6.574.2.4 decaf::net::SocketException::SocketException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.574.2.5 decaf::net::SocketException::SocketException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.574.2.6 decaf::net::SocketException::SocketException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.574.2.7 virtual decaf::net::SocketException::~SocketException () throw () [virtual]

6.574.3 Member Function Documentation

6.574.3.1 virtual SocketException* decaf::net::SocketException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1788).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2310), **decaf::net::BindException** (p. 675), **decaf::net::ConnectException** (p. 1088), **decaf::net::NoRouteToHostException** (p. 2256), and **decaf::net::PortUnreachableException** (p. 2396).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketException.h**

6.575 decaf::net::SocketFactory Class Reference

The **SocketFactory** (p. 2789) is used to create **Socket** (p. 2770) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.

6.575.2.1 decaf::net::SocketFactory::SocketFactory () [protected]

6.575.2.2 virtual decaf::net::SocketFactory::~SocketFactory () [virtual]

6.575.3 Member Function Documentation

6.575.3.1 virtual Socket* decaf::net::SocketFactory::createSocket (const std::string & *name*, int *port*, const InetAddress * *ifAddress*, int *localPort*) [pure virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 2770) to.

localPort The local port to bind the **Socket** (p. 2770) to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1332), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1344), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2315).

6.575.3.2 virtual Socket* decaf::net::SocketFactory::createSocket (const std::string & *name*, int *port*) [pure virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1333), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1344), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2315).

6.575.3.3 virtual Socket* decaf::net::SocketFactory::createSocket (const InetAddress * *host*, int *port*, const InetAddress * *ifAddress*, int *localPort*) [pure virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789). The **Socket** (p. 2770) will be bound to the specified local address and port.

Parameters:

host The host to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 2770) to.

localPort The local port to bind the **Socket** (p. 2770) to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1333), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1345), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2316).

6.575.3.4 virtual Socket* decaf::net::SocketFactory::createSocket (const InetAddress * *host*, int *port*) [pure virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host to connect the socket to.

port The port on the remote host to connect to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException (p. *3154*) if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1334), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1345), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2316).

6.575.3.5 virtual Socket* decaf::net::SocketFactory::createSocket () [virtual]

Creates an unconnected **Socket** (p. 2770) object.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if the **Socket** (p. 2770) cannot be created.

Reimplemented in **decaf::internal::net::DefaultSocketFactory** (p. 1334), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1346), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2317).

6.575.3.6 static SocketFactory* decaf::net::SocketFactory::getDefault () [static]

Returns an pointer to the default **SocketFactory** (p. 2789) for this Application, there is only one default **SocketFactory** (p. 2789) per application, the pointer returned by this method is owned by the **SocketFactory** (p. 2789) class and in not to be deleted by the caller.

Returns:

pointer to the applications default **SocketFactory** (p. 2789).

Exceptions:

SocketException (p. *2787*) if an error occurs while getting the default instance.

Reimplemented in **decaf::net::ssl::SSLSocketFactory** (p. 2838).

The documentation for this class was generated from the following file:

  *The remote port that this **Socket** (p. 2770) is connected to.*

- int **localPort**

  *The port on the Local Machine that this **Socket** (p. 2770) is Bound to.*

- std::string **address**

  *The Remote Address that the **Socket** (p. 2770) is connected to.*

- **io::FileDescriptor** * **fd**

  *The File Descriptor for this **Socket** (p. 2770).*

6.577.1 Detailed Description

Acts as a base class for all physical **Socket** (p. 2770) implementations.

Since:

1.0

6.577.2 Constructor & Destructor Documentation

6.577.2.1 decaf::net::SocketImpl::SocketImpl ()

6.577.2.2 virtual decaf::net::SocketImpl::~SocketImpl () [virtual]

6.577.3 Member Function Documentation

6.577.3.1 virtual void decaf::net::SocketImpl::accept (SocketImpl * *socket*) [pure virtual]

Accepts a new connection on the given **Socket** (p. 2770).

Parameters:

socket The accepted connection.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

SocketException (p. ***2787***) if an error occurs while performing an Accept on the socket.

SocketTimeoutException (p. ***2807***) if the accept call times out due to SO_TIMEOUT being set.

6.577.3.2 virtual int decaf::net::SocketImpl::available () [pure virtual]

Gets the number of bytes that can be read from the **Socket** (p. 2770) without blocking.

Returns:

the number of bytes that can be read from the **Socket** (p. 2770) without blocking.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2995).

6.577.3.3 virtual void decaf::net::SocketImpl::bind (const std::string & *ipaddress*, int *port*) [pure virtual]

Binds this **Socket** (p. 2770) instance to the local ip address and port number given.

Parameters:

ipaddress The address of local ip to bind to.

port The port number on the host to bind to.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2995).

6.577.3.4 virtual void decaf::net::SocketImpl::close () [pure virtual]

Closes the socket, terminating any blocked reads or writes.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2995).

6.577.3.5 virtual void decaf::net::SocketImpl::connect (const std::string & *hostname*, int *port*, int *timeout*) [pure virtual]

Connects this socket to the given host and port.

Parameters:

hostname The name of the host to connect to, or IP address.

port The port number on the host to connect to.

timeout Time in milliseconds to wait for a connection, 0 indicates forever.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

SocketTimeoutException *(*p. *2807)* if the connect call times out due to timeout being set.

IllegalArguementException if a parameter has an illegal value.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2996).

6.577.3.6 virtual void decaf::net::SocketImpl::create () [pure virtual]

Creates the underlying platform **Socket** (p. 2770) data structures which allows for **Socket** (p. 2770) options to be applied. The created socket is in an unconnected state.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2996).

6.577.3.7 const decaf::io::FileDescriptor* decaf::net::SocketImpl::getFileDescriptor () const [inline]

Gets the FileDescriptor for this **Socket** (p. 2770), the Object is owned by this **Socket** (p. 2770) and should not be deleted by the caller.

Returns:

a pointer to this Socket's FileDescriptor object.

6.577.3.8 std::string decaf::net::SocketImpl::getInetAddress () const [inline]

Gets the value of this SocketImpl's address field.

Returns:

the value of the address field.

6.577.3.9 virtual decaf::io::InputStream* decaf::net::SocketImpl::getInputStream () [pure virtual]

Gets the InputStream linked to this **Socket** (p. 2770).

Returns:

an InputStream pointer owned by the **Socket** (p. 2770) object.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2996).

6.577.3.10 virtual std::string decaf::net::SocketImpl::getLocalAddress () const [pure virtual]

Gets the value of the local Inet address the **Socket** (p. 2770) is bound to if bound, otherwise return the **InetAddress** (p. 1679) ANY value "0.0.0.0".

Returns:

the local address bound to, or ANY.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2996).

6.577.3.11 int decaf::net::SocketImpl::getLocalPort () const [inline]

Gets the value of this SocketImpl's local port field.

Returns:

the value of localPort.

6.577.3.12 virtual int decaf::net::SocketImpl::getOption (int *option*) const [pure virtual]

Gets the specified **Socket** (p. 2770) option.

Parameters:

option The **Socket** (p. 2770) options whose value is to be retrieved.

Returns:

the value of the given socket option.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2997).

6.577.3.13 virtual decaf::io::OutputStream* decaf::net::SocketImpl::getOutputStream () [pure virtual]

Gets the OutputStream linked to this **Socket** (p. 2770).

Returns:

an OutputStream pointer owned by the **Socket** (p. 2770) object.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2997).

6.577.3.14 int decaf::net::SocketImpl::getPort () const [inline]

Gets the port that this socket has been assigned.

Returns:

the Socket's port number.

6.577.3.15 virtual void decaf::net::SocketImpl::listen (int *backlog*) [pure virtual]

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument. If a connection indication arrives when the queue is full, the connection is refused.

Parameters:

backlog The maximum length of the connection queue.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2998).

6.577.3.16 virtual void decaf::net::SocketImpl::sendUrgentData (int *data*) [virtual]

Sends on byte of urgent data to the **Socket** (p. 2770).

Parameters:

data The value to write as urgent data, only the lower eight bits are sent.

Exceptions:

IOException if an I/O error occurs while performing this operation.

6.577.3.17 virtual void decaf::net::SocketImpl::setOption (int *option*, int *value*) [pure virtual]

Sets the specified option on the **Socket** (p. 2770) if supported.

Parameters:

option The **Socket** (p. 2770) option to set.

value The value of the socket option to apply to the socket.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2998).

6.577.3.18 virtual void decaf::net::SocketImpl::shutdownInput () [pure virtual]

Places the input stream for this socket at "end of stream". Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 2800) on the socket, the stream will return EOF.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2999).

6.577.3.19 virtual void decaf::net::SocketImpl::shutdownOutput () [pure virtual]

Disables the output stream for this socket. For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 2800) on the socket, the stream will throw an IOException.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2999).

6.577.3.20 virtual bool decaf::net::SocketImpl::supportsUrgentData () const [inline, virtual]

Returns:

true if this **SocketImpl** (p. 2794) supports sending Urgent Data. The default implementation always returns false.

6.577.3.21 std::string decaf::net::SocketImpl::toString () const

Returns a string containing the address and port of this **Socket** (p. 2770) instance.

Returns:

a string containing the address and port of this socket.

6.577.4 Field Documentation

6.577.4.1 std::string decaf::net::SocketImpl::address [protected]

The Remote Address that the **Socket** (p. 2770) is connected to.

6.577.4.2 io::FileDescriptor* decaf::net::SocketImpl::fd [protected]

The File Descriptor for this **Socket** (p. 2770).

6.577.4.3 int decaf::net::SocketImpl::localPort [protected]

The port on the Local Machine that this **Socket** (p. 2770) is Bound to.

6.577.4.4 int decaf::net::SocketImpl::port [protected]

The remote port that this **Socket** (p. 2770) is connected to.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketImpl.h**

6.578 decaf::net::SocketImplFactory Class Reference

Factory class interface for a Factory that creates ScoketImpl objects.

`#include <src/main/decaf/net/SocketImplFactory.h>`

Public Member Functions

- virtual ~**SocketImplFactory** ()
- virtual **SocketImpl** * **createSocketImpl** ()=0

  *Creates a new SokcetImpl instance and returns it, the caller then owns the instance and must delete it when finished with the **SocketImpl** (p. 2794).*

6.578.1 Detailed Description

Factory class interface for a Factory that creates ScoketImpl objects. These factories can be used to create various types of Sockets, e.g. Streaming, Multicast, SSL, or platform specific variations of these types.

See also:

decaf::net::Socket (p. 2770)
decaf::net::ServerSocket (p. 2659)

Since:

1.0

6.578.2 Constructor & Destructor Documentation

6.578.2.1 virtual decaf::net::SocketImplFactory::~SocketImplFactory () [virtual]

6.578.3 Member Function Documentation

6.578.3.1 virtual SocketImpl* decaf::net::SocketImplFactory::createSocketImpl () [pure virtual]

Creates a new SokcetImpl instance and returns it, the caller then owns the instance and must delete it when finished with the **SocketImpl** (p. 2794).

Returns:

new **SocketImpl** (p. 2794) instance that is owned by the caller.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketImplFactory.h**

6.579 decaf::net::SocketOptions Class Reference

`#include <src/main/decaf/net/SocketOptions.h>`Inheritance diagram for decaf::net::SocketOptions:

Public Member Functions

- virtual ~**SocketOptions** ()

Static Public Attributes

- static const int **SOCKET_OPTION_TCP_NODELAY**

  Disable Nagle's algorithm for this connection.

- static const int **SOCKET_OPTION_BINDADDR**

  Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed).

- static const int **SOCKET_OPTION_REUSEADDR**

  Sets SO_REUSEADDR for a socket.

- static const int **SOCKET_OPTION_BROADCAST**

  Sets SO_BROADCAST for a socket.

- static const int **SOCKET_OPTION_IP_MULTICAST_IF**

  Set which outgoing interface on which to send multicast packets.

- static const int **SOCKET_OPTION_IP_MULTICAST_IF2**

  Same as above.

- static const int **SOCKET_OPTION_IP_MULTICAST_LOOP**

  This option enables or disables local loopback of multicast datagrams.

- static const int **SOCKET_OPTION_IP_TOS**

  This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.

- static const int **SOCKET_OPTION_LINGER**

  Specify a linger-on-close timeout.

- static const int **SOCKET_OPTION_TIMEOUT**

  *Set a timeout on blocking **Socket** (p. 2770) operations.*

- static const int **SOCKET_OPTION_SNDBUF**

  Set a hint the size of the underlying buffers used by the platform for outgoing network I/O.

- static const int **SOCKET_OPTION_RCVBUF**

Set a hint the size of the underlying buffers used by the platform for incoming network I/O.

- static const int **SOCKET_OPTION_KEEPALIVE**

  When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.

- static const int **SOCKET_OPTION_OOBINLINE**

  When the OOBINLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.

6.579.1 Detailed Description

Since:

1.0

6.579.2 Constructor & Destructor Documentation

6.579.2.1 virtual decaf::net::SocketOptions::~SocketOptions () [virtual]

6.579.3 Field Documentation

6.579.3.1 const int decaf::net::SocketOptions::SOCKET_OPTION_BINDADDR [static]

Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed). The default local address of a socket is INADDR_ANY, meaning any local address on a multi-homed host. A multi-homed host can use this option to accept connections to only one of its addresses (in the case of a **ServerSocket** (p. 2659) or DatagramSocket), or to specify its return address to the peer (for a **Socket** (p. 2770) or DatagramSocket). The parameter of this option is an **InetAddress** (p. 1679).

6.579.3.2 const int decaf::net::SocketOptions::SOCKET_OPTION_BROADCAST [static]

Sets SO_BROADCAST for a socket. This option enables and disables the ability of the process to send broadcast messages. It is supported for only datagram sockets and only on networks that support the concept of a broadcast message (e.g. Ethernet, token ring, etc.), and it is set by default for DatagramSockets.

6.579.3.3 const int decaf::net::SocketOptions::SOCKET_OPTION_IP_-MULTICAST_IF [static]

Set which outgoing interface on which to send multicast packets. Useful on hosts with multiple network interfaces, where applications want to use other than the system default. Takes/returns an **InetAddress** (p. 1679).

Valid for Multicast: DatagramSocketImpl.

6.579.3.4 const int decaf::net::SocketOptions::SOCKET_OPTION_IP_-MULTICAST_IF2 [static]

Same as above. This option is introduced so that the behaviour with IP_MULTICAST_IF will be kept the same as before, while this new option can support setting outgoing interfaces with either IPv4 and IPv6 addresses.

6.579.3.5 const int decaf::net::SocketOptions::SOCKET_OPTION_IP_-MULTICAST_LOOP [static]

This option enables or disables local loopback of multicast datagrams. This option is enabled by default for Multicast Sockets.

6.579.3.6 const int decaf::net::SocketOptions::SOCKET_OPTION_IP_TOS [static]

This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.

6.579.3.7 const int decaf::net::SocketOptions::SOCKET_OPTION_KEEPALIVE [static]

When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer. This probe is a TCP segment to which the peer must respond. One of three responses is expected: 1. The peer responds with the expected ACK. The application is not notified (since everything is OK). TCP will send another probe following another 2 hours of inactivity. 2. The peer responds with an RST, which tells the local TCP that the peer host has crashed and rebooted. The socket is closed. 3. There is no response from the peer. The socket is closed. The purpose of this option is to detect if the peer host crashes.

Valid only for TCP socket: **SocketImpl** (p. 2794)

6.579.3.8 const int decaf::net::SocketOptions::SOCKET_OPTION_LINGER [static]

Specify a linger-on-close timeout. This option disables/enables immediate return from a close() of a TCP **Socket** (p. 2770). Enabling this option with a non-zero Integer timeout means that a close() will block pending the transmission and acknowledgment of all data written to the peer, at which point the socket is closed gracefully. Upon reaching the linger timeout, the socket is closed forcefully, with a TCP RST. Enabling the option with a timeout of zero does a forceful close immediately. If the specified timeout value exceeds 65,535 it will be reduced to 65,535.

Valid only for TCP: **SocketImpl** (p. 2794)

6.579.3.9 const int decaf::net::SocketOptions::SOCKET_OPTION_OOBINLINE [static]

When the OOBINLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream. When the option is disabled (which is the default) urgent data is silently discarded.

6.579.3.10 const int decaf::net::SocketOptions::SOCKET_OPTION_RCVBUF [static]

Set a hint the size of the underlying buffers used by the platform for incoming network I/O. When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be received over the socket. When used in get, this must return the size of the buffer actually used by the platform when receiving in data on this socket. Valid for all sockets: **SocketImpl** (p. 2794), DatagramSocketImpl.

6.579.3.11 const int decaf::net::SocketOptions::SOCKET_OPTION_REUSEADDR [static]

Sets SO_REUSEADDR for a socket. This is used only for MulticastSockets in **decaf** (p. 96), and it is set by default for MulticastSockets.

6.579.3.12 const int decaf::net::SocketOptions::SOCKET_OPTION_SNDBUF [static]

Set a hint the size of the underlying buffers used by the platform for outgoing network I/O. When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be sent over the socket. When used in get, this must return the size of the buffer actually used by the platform when sending out data on this socket. Valid for all sockets: **SocketImpl** (p. 2794), DatagramSocketImpl

6.579.3.13 const int decaf::net::SocketOptions::SOCKET_OPTION_TCP_NODELAY [static]

Disable Nagle's algorithm for this connection. Written data to the network is not buffered pending acknowledgment of previously written data. Valid for TCP sockets.

6.579.3.14 const int decaf::net::SocketOptions::SOCKET_OPTION_TIMEOUT [static]

Set a timeout on blocking **Socket** (p. 2770) operations. The option must be set prior to entering a blocking operation to take effect.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketOptions.h**

6.580 decaf::net::SocketTimeoutException Class Reference

`#include <src/main/decaf/net/SocketTimeoutException.h>`Inheritance diagram for decaf::net::SocketTimeoutException:

Public Member Functions

- **SocketTimeoutException** ()

  Default Constructor.

- **SocketTimeoutException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **SocketTimeoutException** (const **SocketTimeoutException** &ex)

  Copy Constructor.

- **SocketTimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **SocketTimeoutException** (const std::exception *cause)

  Constructor.

- **SocketTimeoutException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **SocketTimeoutException** * **clone** () const

  Clones this exception.

- virtual ~**SocketTimeoutException** () throw ()

6.580.1 Constructor & Destructor Documentation

6.580.1.1 decaf::net::SocketTimeoutException::SocketTimeoutException ()

Default Constructor.

6.580.1.2 decaf::net::SocketTimeoutException::SocketTimeoutException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.580.1.3 decaf::net::SocketTimeoutException::SocketTimeoutException (const SocketTimeoutException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.580.1.4 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.580.1.5 decaf::net::SocketTimeoutException::SocketTimeoutException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.580.1.6 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.580.1.7 virtual decaf::net::SocketTimeoutException::~SocketTimeoutException () throw () [virtual]

6.580.2 Member Function Documentation

6.580.2.1 virtual SocketTimeoutException* decaf::net::SocketTimeoutException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::InterruptedIOException** (p. 1771).

  *Gets the Default **SSLContext** (p. 2810).*

- static void **setDefault** (**SSLContext** *context)

  *Sets the default **SSLContext** (p. 2810) to be returned from future calls to getDefault.*

6.581.1 Detailed Description

Represents on implementation of the Secure **Socket** (p. 2770) Layer for streaming based sockets. This class servers a a source of factories to be used to create new SSL **Socket** (p. 2770) instances.

Since:

1.0

6.581.2 Constructor & Destructor Documentation

6.581.2.1 decaf::net::ssl::SSLContext::SSLContext (SSLContextSpi * *contextImpl*)

6.581.2.2 virtual decaf::net::ssl::SSLContext::~SSLContext () [virtual]

6.581.3 Member Function Documentation

6.581.3.1 static SSLContext* decaf::net::ssl::SSLContext::getDefault () [static]

Gets the Default **SSLContext** (p. 2810). The default instance of the **SSLContext** (p. 2810) should be immediately usable without any need for the client to initialize this context.

Returns:

a pointer to the Default **SSLContext** (p. 2810) instance.

6.581.3.2 SSLParameters* decaf::net::ssl::SSLContext::getDefaultSSLParameters ()

Returns:

a new instance of an **SSLParameters** (p. 2816) object containing the default set of settings for this **SSLContext** (p. 2810).

Exceptions:

UnsupportedOperationException if the parameters cannot be retrieved.

6.581.3.3 ServerSocketFactory* decaf::net::ssl::SSLContext::getServerSocketFactory ()

Returns an **ServerSocketFactory** (p. 2668) instance for use with this Context, the **ServerSocketFactory** (p. 2668) is owned by the Context and should not be deleted by the caller.

Returns:

a pointer to this SSLContext's **ServerSocketFactory** (p. 2668) for creating **SSLServerSocket** (p. 2820) objects.

Exceptions:

IllegalStateException if the **SSLContextSpi** (p. 2813) requires initialization but it has not yet been initialized.

6.581.3.4 SocketFactory* decaf::net::ssl::SSLContext::getSocketFactory ()

Returns an **SocketFactory** (p. 2789) instance for use with this Context, the **SocketFactory** (p. 2789) is owned by the Context and should not be deleted by the caller.

Returns:

a pointer to this SSLContext's **SocketFactory** (p. 2789) for creating **SSLSocket** (p. 2829) objects.

Exceptions:

IllegalStateException if the **SSLContextSpi** (p. 2813) requires initialization but it has not yet been initialized.

6.581.3.5 SSLParameters* decaf::net::ssl::SSLContext::getSupportedSSLParameters ()

Returns:

a new instance of an **SSLParameters** (p. 2816) object containing the complete set of settings for this **SSLContext** (p. 2810).

Exceptions:

UnsupportedOperationException if the parameters cannot be retrieved.

6.581.3.6 static void decaf::net::ssl::SSLContext::setDefault (SSLContext * *context*) [static]

Sets the default **SSLContext** (p. 2810) to be returned from future calls to getDefault. The set **SSLContext** (p. 2810) must be fully initialized and usable. The caller is responsible for deleting this object before the Library shutdown methods are called.

Exceptions:

NullPointerException if the context passed is NULL.

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLContext.h**

6.582 decaf::net::ssl::SSLContextSpi Class Reference

Defines the interface that should be provided by an **SSLContext** (p. 2810) provider.

`#include <src/main/decaf/net/ssl/SSLContextSpi.h>`Inheritance diagram for decaf::net::ssl::SSLContextSpi:

Public Member Functions

- virtual ~**SSLContextSpi** ()
- virtual void **providerInit** (**security::SecureRandom** *random)=0

  Perform the initialization of this Context.

- virtual **SSLParameters** * **providerGetDefaultSSLParameters** ()

  *Creates a returns a new **SSLParameters** (p. 2816) instance that contains the default settings for this Providers **SSLContext** (p. 2810).*

- virtual **SSLParameters** * **providerGetSupportedSSLParameters** ()

  *Creates and returns a new **SSLParameters** (p. 2816) instance that contains the full set of supported parameters for this SSL Context.*

- virtual **SocketFactory** * **providerGetSocketFactory** ()=0

  *Returns a **SocketFactory** (p. 2789) instance that can be used to create new **SSLSocket** (p. 2829) objects.*

- virtual **ServerSocketFactory** * **providerGetServerSocketFactory** ()=0

  *Returns a **ServerSocketFactory** (p. 2668) instance that can be used to create new **SSLServerSocket** (p. 2820) objects.*

6.582.1 Detailed Description

Defines the interface that should be provided by an **SSLContext** (p. 2810) provider.

Since:

1.0

6.582.2 Constructor & Destructor Documentation

6.582.2.1 virtual decaf::net::ssl::SSLContextSpi::~SSLContextSpi () [virtual]

6.582.3 Member Function Documentation

6.582.3.1 virtual SSLParameters* decaf::net::ssl::SSLContextSpi::providerGetDefaultSSLParameters () [virtual]

Creates a returns a new **SSLParameters** (p. 2816) instance that contains the default settings for this Providers **SSLContext** (p. 2810). The returned **SSLParameters** (p. 2816) instance is

requires to have non-empty values in its ciphersuites and protocols.

Returns:

new **SSLParameters** (p. 2816) instance with the **SSLContext** (p. 2810) defaults.

Exceptions:

UnsupportedOperationException if the defaults cannot be obtained.

6.582.3.2 virtual ServerSocketFactory* decaf::net::ssl::SSLContextSpi::providerGetServerSocketFactory () [pure virtual]

Returns a **ServerSocketFactory** (p. 2668) instance that can be used to create new **SSLServerSocket** (p. 2820) objects. The **ServerSocketFactory** (p. 2668) is owned by the Service Provider and should not be destroyed by the caller.

Returns:

SocketFactory (p. 2789) instance that can be used to create new SSLServerSockets.

Exceptions:

IllegalStateException if the **SSLContextSpi** (p. 2813) object requires initialization but has not been initialized yet.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2278).

6.582.3.3 virtual SocketFactory* decaf::net::ssl::SSLContextSpi::providerGetSocketFactory () [pure virtual]

Returns a **SocketFactory** (p. 2789) instance that can be used to create new **SSLSocket** (p. 2829) objects. The **SocketFactory** (p. 2789) is owned by the Service Provider and should not be destroyed by the caller.

Returns:

SocketFactory (p. 2789) instance that can be used to create new SSLSockets.

Exceptions:

IllegalStateException if the **SSLContextSpi** (p. 2813) object requires initialization but has not been initialized yet.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2278).

6.582.3.4 virtual SSLParameters* decaf::net::ssl::SSLContextSpi::providerGetSupportedSSLParameters () [virtual]

Creates and returns a new **SSLParameters** (p. 2816) instance that contains the full set of supported parameters for this SSL Context. The returned **SSLParameters** (p. 2816) instance is requires to have non-empty values in its ciphersuites and protocols.

Returns:

a new **SSLParameters** (p. 2816) instance with the full set of settings that are supported.

Exceptions:

UnsupportedOperationException if the supported parameters cannot be obtained.

6.582.3.5 virtual void decaf::net::ssl::SSLContextSpi::providerInit (security::SecureRandom * *random*) [pure virtual]

Perform the initialization of this Context.

Parameters:

random Pointer to an instance of a secure random number generator.

Exceptions:

NullPointerException if the SecureRandom instance is NULL.

KeyManagementException if an error occurs while initializing the context.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2279).

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLContextSpi.h**

6.583 decaf::net::ssl::SSLParameters Class Reference

`#include <src/main/decaf/net/ssl/SSLParameters.h>`

Public Member Functions

- **SSLParameters** ()

  *Creates a new **SSLParameters** (p. 2816) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.*

- **SSLParameters** (const std::vector< std::string > &cipherSuites)

  *Creates a new **SSLParameters** (p. 2816) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.*

- **SSLParameters** (const std::vector< std::string > &cipherSuites, const std::vector< std::string > &protocols)

  *Creates a new **SSLParameters** (p. 2816) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.*

- virtual ~**SSLParameters** ()
- std::vector< std::string > **getCipherSuites** () const
- void **setCipherSuites** (const std::vector< std::string > &cipherSuites)

  Sets the vector of ciphersuites.

- std::vector< std::string > **getProtocols** () const
- void **setProtocols** (const std::vector< std::string > &protocols)

  Sets the vector of protocols.

- bool **getWantClientAuth** () const
- void **setWantClientAuth** (bool wantClientAuth)

  Sets whether client authentication should be requested.

- bool **getNeedClientAuth** () const
- void **setNeedClientAuth** (bool needClientAuth)

  Sets whether client authentication should be required.

- void **setServerNames** (const std::vector< std::string > &serverNames)

  Sets the Server Names that this client wants to encode for use during the SSL Handshaking phase.

- std::vector< std::string > **getServerNames** () const

  Gets the currently set list of server names used.

6.583.1 Constructor & Destructor Documentation

6.583.1.1 decaf::net::ssl::SSLParameters::SSLParameters ()

Creates a new **SSLParameters** (p. 2816) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.

6.583.1.2 decaf::net::ssl::SSLParameters::SSLParameters (const std::vector< std::string > & *cipherSuites*)

Creates a new **SSLParameters** (p. 2816) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.

Parameters:

cipherSuites The vector of cipherSuites for this **SSLParameters** (p. 2816) instance (can be empty).

6.583.1.3 decaf::net::ssl::SSLParameters::SSLParameters (const std::vector< std::string > & *cipherSuites*, const std::vector< std::string > & *protocols*)

Creates a new **SSLParameters** (p. 2816) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.

Parameters:

cipherSuites The vector of cipherSuites for this **SSLParameters** (p. 2816) instance (can be empty).

protocols The vector of protocols for this **SSLParameters** (p. 2816) instance (can be empty).

6.583.1.4 virtual decaf::net::ssl::SSLParameters::~SSLParameters () [virtual]

6.583.2 Member Function Documentation

6.583.2.1 std::vector<std::string> decaf::net::ssl::SSLParameters::getCipherSuites () const [inline]

Returns:

a copy of the vector of ciphersuites or an empty vector if none have been set.

6.583.2.2 bool decaf::net::ssl::SSLParameters::getNeedClientAuth () const [inline]

Returns:

whether client authentication should be required.

6.583.2.3 std::vector<std::string> decaf::net::ssl::SSLParameters::getProtocols () const [inline]

Returns:

a copy of the vector of protocols or an empty vector if none have been set.

6.583.2.4 std::vector<std::string> decaf::net::ssl::SSLParameters::getServerNames () const [inline]

Gets the currently set list of server names used. This method returns a copy of the list so that it cannot be modified. If updates are needed a new list must be set via {**setServerNames** (p. 2818)}.

Returns:

a list of server names if any were previously configured.

6.583.2.5 bool decaf::net::ssl::SSLParameters::getWantClientAuth () const [inline]

Returns:

whether client authentication should be requested.

6.583.2.6 void decaf::net::ssl::SSLParameters::setCipherSuites (const std::vector< std::string > & *cipherSuites*) [inline]

Sets the vector of ciphersuites.

Parameters:

cipherSuites The vector of cipherSuites (can be an empty vector).

6.583.2.7 void decaf::net::ssl::SSLParameters::setNeedClientAuth (bool *needClientAuth*) [inline]

Sets whether client authentication should be required. Calling this method clears the wantClientAuth flag.

Parameters:

needClientAuth whether client authentication should be required.

6.583.2.8 void decaf::net::ssl::SSLParameters::setProtocols (const std::vector< std::string > & *protocols*) [inline]

Sets the vector of protocols.

Parameters:

protocols the vector of protocols (or an empty vector)

6.583.2.9 void decaf::net::ssl::SSLParameters::setServerNames (const std::vector< std::string > & *serverNames*) [inline]

Sets the Server Names that this client wants to encode for use during the SSL Handshaking phase. The list is copied so the values cannot be changed later.

Parameters:

serverNames The server name to encode into the SSL handshake.

6.583.2.10 void decaf::net::ssl::SSLParameters::setWantClientAuth (bool *wantClientAuth*) [inline]

Sets whether client authentication should be requested. Calling this method clears the needClientAuth flag.

Parameters:

whether client authentication should be requested.

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLParameters.h**

6.584 decaf::net::ssl::SSLServerSocket Class Reference

Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol.

6.584.1 Detailed Description

Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol. The main function of this class is to create **SSLSocket** (p. 2829) objects by accepting connections from client sockets over SSL.

Since:

1.0

6.584.2 Constructor & Destructor Documentation

6.584.2.1 decaf::net::ssl::SSLServerSocket::SSLServerSocket () [protected]

Creates a non-bound server socket.

6.584.2.2 decaf::net::ssl::SSLServerSocket::SSLServerSocket (int *port*) [protected]

Creates a new **ServerSocket** (p. 2659) bound to the specified port, if the value of port is 0, then any free port is chosen. When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 2802) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2794) is created.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

Exceptions:

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.584.2.3 decaf::net::ssl::SSLServerSocket::SSLServerSocket (int *port*, int *backlog*) [protected]

Creates a new **ServerSocket** (p. 2659) bound to the specified port, if the value of port is 0, then any free port is chosen. When this constructor is called the size of the backlog queue is set at

backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 2802) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2794) is created.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The the number of incoming connection attempts to queue before connections are refused.

Exceptions:

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.584.2.4 decaf::net::ssl::SSLServerSocket::SSLServerSocket (int *port*, int *backlog*, const decaf::net::InetAddress * *address*) [protected]

Creates a new **ServerSocket** (p. 2659) bound to the specified port, if the value of port is 0, then any free port is chosen. If the value of the ifAddress is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 2802) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2794) is created.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The the number of incoming connection attempts to queue before connections are refused.

ifAddress The IP Address to bind to on the local machine.

Exceptions:

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.584.2.5 virtual decaf::net::ssl::SSLServerSocket::~SSLServerSocket () [virtual]

6.584.3 Member Function Documentation

6.584.3.1 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledCipherSuites () const [pure virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 2820).

Returns:

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2285).

6.584.3.2 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledProtocols () const [pure virtual]

Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 2820).

Returns:

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2286).

6.584.3.3 virtual bool decaf::net::ssl::SSLServerSocket::getNeedClientAuth () const [pure virtual]

Returns:

true if the **Socket** (p. 2770) requires client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2286).

6.584.3.4 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getSupportedCipherSuites () const [pure virtual]

Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 2820). Normally not all of these cipher suites will be enabled on the **Socket** (p. 2770).

Returns:

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2286).

6.584.3.5 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getSupportedProtocols () const [pure virtual]

Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 2820) instance.

Returns:

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2286).

6.584.3.6 virtual bool decaf::net::ssl::SSLServerSocket::getWantClientAuth () const [pure virtual]

Returns:

true if the **Socket** (p. 2770) request client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2287).

6.584.3.7 virtual void decaf::net::ssl::SSLServerSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [pure virtual]

Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 2820) connection. Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters:

suites An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions:

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2287).

6.584.3.8 virtual void decaf::net::ssl::SSLServerSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [pure virtual]

Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 2820) connection. Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters:

protocols An Vector of names for all the Protocols that are to be enabled.

Exceptions:

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2287).

6.584.3.9 virtual void decaf::net::ssl::SSLServerSocket::setNeedClientAuth (bool *value*) [pure virtual]

Sets whether or not this **Socket** (p. 2770) will require Client Authentication. If set to true the **Socket** (p. 2770) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.

Parameters:

value Whether the server socket should require client authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2287).

6.584.3.10 virtual void decaf::net::ssl::SSLServerSocket::setWantClientAuth (bool *value*) [pure virtual]

Sets whether or not this **Socket** (p. 2770) will request Client Authentication. If set to true the **Socket** (p. 2770) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.

Parameters:

value Whether the server socket should request client authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2288).

6.585.1 Detailed Description

Factory class interface that provides methods to create SSL Server Sockets.

Since:

1.0

6.585.2 Constructor & Destructor Documentation

6.585.2.1 decaf::net::ssl::SSLServerSocketFactory::SSLServerSocketFactory () [protected]

6.585.2.2 virtual decaf::net::ssl::SSLServerSocketFactory::~SSLServerSocketFactory () [virtual]

6.585.3 Member Function Documentation

6.585.3.1 static ServerSocketFactory* decaf::net::ssl::SSLServerSocketFactory::getDefault () [static]

Returns the current default SSL **ServerSocketFactory** (p. 2668), the factory is returned as a pointer however the caller does not own this pointer and should not delete it. This method returns **SSLContext::getDefault()** (p. 2810)->getServerSocketFactory(). If that call fails, a non-functional factory is returned.

Returns:

the default SSL **ServerSocketFactory** (p. 2668) pointer.

See also:

decaf::net::ssl::SSLContext::getDefault() (p. 2810)

Reimplemented from **decaf::net::ServerSocketFactory** (p. 2670).

6.585.3.2 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getDefaultCipherSuites () [pure virtual]

Returns the list of cipher suites which are enabled by default. Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns:

an STL vector containing the list of cipher suites enabled by default.

See also:

getSupportedCipherSuites() (p. 2827)

Implemented in **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1339), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2292).

6.585.3.3 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getSupportedCipherSuites () [pure virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection. Normally, only a subset of these will actually be enabled by default, since this list may include

cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns:

an STL vector containing the list of supported cipher suites.

See also:

getDefaultCipherSuites() (p. 2827)

Implemented in **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1340), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2293).

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLServerSocketFactory.h**

6.586 decaf::net::ssl::SSLSocket Class Reference

  *Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 2770).*

- virtual void **setEnabledProtocols** (const std::vector< std::string > &protocols)=0

  *Sets the Protocols that are to be enabled on the SSL **Socket** (p. 2770) connection.*

- virtual **SSLParameters** **getSSLParameters** () const

  *Returns an **SSLParameters** (p. 2816) object for this **SSLSocket** (p. 2829) instance.*

- virtual void **setSSLParameters** (const **SSLParameters** &value)

  *Sets the **SSLParameters** (p. 2816) for this **SSLSocket** (p. 2829) using the supplied **SSLParameters** (p. 2816) instance.*

- virtual void **startHandshake** ()=0

  Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

- virtual void **setUseClientMode** (bool value)=0

  Determines the mode that the socket uses when a handshake is initiated, client or server.

- virtual bool **getUseClientMode** () const =0

  *Gets whether this **Socket** (p. 2770) is in Client or Server mode, true indicates that the mode is set to Client.*

- virtual void **setNeedClientAuth** (bool value)=0

  *Sets the **Socket** (p. 2770) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

- virtual bool **getNeedClientAuth** () const =0

  Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.

- virtual void **setWantClientAuth** (bool value)=0

  *Sets the **Socket** (p. 2770) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

- virtual bool **getWantClientAuth** () const =0

  Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that cleints that do not send a certificate are not considered to have failed authentication.

6.586.1 Detailed Description

Since:

1.0

6.586.2 Constructor & Destructor Documentation

6.586.2.1 decaf::net::ssl::SSLSocket::SSLSocket ()

6.586.2.2 decaf::net::ssl::SSLSocket::SSLSocket (const InetAddress * *address*, int *port*)

Creates a new **SSLSocket** (p. 2829) instance and connects it to the given address and port. If the host parameter is empty then the loop back address is used.

Parameters:

address The address to connect to.

port The port number to connect to [0...65535]

Exceptions:

UnknownHostException *(p. 3154)* if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 2770).

NullPointerException if the **InetAddress** (p. 1679) instance in NULL.

IllegalArgumentException if the port if not in range [0...65535]

6.586.2.3 decaf::net::ssl::SSLSocket::SSLSocket (const InetAddress * *address*, int *port*, const InetAddress * *localAddress*, int *localPort*)

Creates a new **SSLSocket** (p. 2829) instance and connects it to the given address and port. The **Socket** (p. 2770) will also bind to the local address and port specified.

Parameters:

address The address to connect to.

port The port number to connect to [0...65535]

localAddress The IP address on the local machine to bind to.

localPort The port on the local machine to bind to.

Exceptions:

UnknownHostException *(p. 3154)* if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 2770).

NullPointerException if the **InetAddress** (p. 1679) instance in NULL.

IllegalArgumentException if the port if not in range [0...65535]

6.586.2.4 decaf::net::ssl::SSLSocket::SSLSocket (const std::string & *host*, int *port*)

Creates a new **SSLSocket** (p. 2829) instance and connects it to the given host and port. If the host parameter is empty then the loop back address is used.

Parameters:

host The host name or IP address to connect to, empty string means loopback.

port The port number to connect to [0...65535]

Exceptions:

UnknownHostException *(p. 3154)* if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 2770).

IllegalArgumentException if the port if not in range [0...65535]

6.586.2.5 decaf::net::ssl::SSLSocket::SSLSocket (const std::string & *host*, int *port*, const InetAddress * *localAddress*, int *localPort*)

Creates a new **SSLSocket** (p. 2829) instance and connects it to the given host and port. If the host parameter is empty then the loop back address is used.

Parameters:

host The host name or IP address to connect to, empty string means loopback.

port The port number to connect to [0...65535]

localAddress The IP address on the local machine to bind to.

localPort The port on the local machine to bind to.

Exceptions:

UnknownHostException *(p. 3154)* if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 2770).

IllegalArgumentException if the port if not in range [0...65535]

6.586.2.6 virtual decaf::net::ssl::SSLSocket::~SSLSocket () [virtual]

6.586.3 Member Function Documentation

6.586.3.1 virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getEnabledCipherSuites () const [pure virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this SSL **Socket** (p. 2770).

Returns:

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2300).

6.586.3.2 virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getEnabledProtocols () const [pure virtual]

Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 2770).

Returns:

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2300).

6.586.3.3 virtual bool decaf::net::ssl::SSLSocket::getNeedClientAuth () const [pure virtual]

Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected. This option is only useful when the socket is operating in server mode.

Returns:

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2301).

6.586.3.4 virtual SSLParameters decaf::net::ssl::SSLSocket::getSSLParameters () const [virtual]

Returns an **SSLParameters** (p. 2816) object for this **SSLSocket** (p. 2829) instance. The cipherSuites and protocols vectors in the returned **SSLParameters** (p. 2816) reference will never be empty.

Returns:

an **SSLParameters** (p. 2816) object with the settings in use for the **SSLSocket** (p. 2829).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2302).

6.586.3.5 virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getSupportedCipherSuites () const [pure virtual]

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 2829). Normally not all of these cipher suites will be enabled on the **Socket** (p. 2770).

Returns:

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2302).

6.586.3.6 virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getSupportedProtocols () const [pure virtual]

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 2829) instance.

Returns:

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2302).

6.586.3.7 virtual bool decaf::net::ssl::SSLSocket::getUseClientMode () const [pure virtual]

Gets whether this **Socket** (p. 2770) is in Client or Server mode, true indicates that the mode is set to Client.

Returns:

true if the **Socket** (p. 2770) is in Client mode, false otherwise.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2302).

6.586.3.8 virtual bool decaf::net::ssl::SSLSocket::getWantClientAuth () const [pure virtual]

Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that cleints that do not send a certificate are not considered to have failed authentication. This option is only useful when the socket is operating in server mode.

Returns:

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2303).

6.586.3.9 virtual void decaf::net::ssl::SSLSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [pure virtual]

Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 2770) connection. Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters:

suites An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions:

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2304).

6.586.3.10 virtual void decaf::net::ssl::SSLSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [pure virtual]

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 2770) connection. Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters:

protocols An Vector of names for all the Protocols that are to be enabled.

Exceptions:

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2304).

6.586.3.11 virtual void decaf::net::ssl::SSLSocket::setNeedClientAuth (bool *value*) [pure virtual]

Sets the **Socket** (p. 2770) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket. This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

Parameters:

value The value indicating if a client is required to authenticate itself or not.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2304).

6.586.3.12 virtual void decaf::net::ssl::SSLSocket::setSSLParameters (const SSLParameters & *value*) [virtual]

Sets the **SSLParameters** (p. 2816) for this **SSLSocket** (p. 2829) using the supplied **SSLParameters** (p. 2816) instance. If the cipherSutes vector in the **SSLParameters** (p. 2816) instance is not empty them the setEnabledCipherSuites method is called with that vector, if the protocols vector in the **SSLParameters** (p. 2816) instance is not empty then the setEnabledProtocols method is called with that vector. If the needClientAuth value or the wantClientAuth value is true then the setNeedClientAuth and setWantClientAuth methods are called respectively with a value of true, otherwise the setWantClientAuth method is called with a value of false.

Parameters:

value The **SSLParameters** (p. 2816) instance that is used to update this SSLSocket's settings.

Exceptions:

IllegalArgumentException if an error occurs while calling setEnabledCipherSuites or setEnabledProtocols.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2305).

6.586.3.13 virtual void decaf::net::ssl::SSLSocket::setUseClientMode (bool *value*) [pure virtual]

Determines the mode that the socket uses when a handshake is initiated, client or server. This method must be called prior to any handshake attempts on this **Socket** (p. 2770), once a handshake has be initiated this socket remains the the set mode; client or server, for the life of this object.

Parameters:

value The mode setting, true for client or false for server.

Exceptions:

IllegalArguementException if the handshake process has begun and mode is lcoked.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2305).

6.586.3.14 virtual void decaf::net::ssl::SSLSocket::setWantClientAuth (bool *value*) [pure virtual]

Sets the **Socket** (p. 2770) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket. This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

Parameters:

value The value indicating if a client is requested to authenticate itself or not.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2306).

6.586.3.15 virtual void decaf::net::ssl::SSLSocket::startHandshake () [pure virtual]

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session. When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an IOException to indicate an error.

Exceptions:

IOException if an I/O error occurs while performing the Handshake

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2307).

6.587.1 Detailed Description

Factory class interface for a **SocketFactory** (p. 2789) that can create **SSLSocket** (p. 2829) objects.

Since:

1.0

6.587.2 Constructor & Destructor Documentation

6.587.2.1 decaf::net::ssl::SSLSocketFactory::SSLSocketFactory () [protected]

6.587.2.2 virtual decaf::net::ssl::SSLSocketFactory::~SSLSocketFactory () [virtual]

6.587.3 Member Function Documentation

6.587.3.1 virtual Socket* decaf::net::ssl::SSLSocketFactory::createSocket (Socket * *socket*, std::string *host*, int *port*, bool *autoClose*) [pure virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port. This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters:

socket The existing socket to layer over.

host The server host the original **Socket** (p. 2770) is connected to.

port The server port the original **Socket** (p. 2770) is connected to.

autoClose Should the layered over **Socket** (p. 2770) be closed when the topmost socket is closed.

Returns:

a new **Socket** (p. 2770) instance that wraps the given **Socket** (p. 2770).

Exceptions:

IOException if an I/O exception occurs while performing this operation.

UnknownHostException *(p. 3154)* if the host is unknown.

Implemented in **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1343), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2314).

6.587.3.2 static SocketFactory* decaf::net::ssl::SSLSocketFactory::getDefault () [static]

Returns the current default SSL **SocketFactory** (p. 2789), the factory is returned as a pointer however the caller does not own this pointer and should not delete it. This method returns **SSLContext::getDefault()** (p. 2810)->getSocketFactory(). If that call fails, a non-functional factory is returned.

Returns:

the default SSL **SocketFactory** (p. 2789) pointer.

See also:

decaf::net::ssl::SSLContext::getDefault() (p. 2810)

Reimplemented from **decaf::net::SocketFactory** (p. 2792).

6.587.3.3 virtual std::vector<std::string> decaf::net::ssl::SSLSocketFactory::getDefaultCipherSuites () [pure virtual]

Returns the list of cipher suites which are enabled by default. Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns:

an STL vector containing the list of cipher suites enabled by default.

See also:

getSupportedCipherSuites() (p. 2839)

Implemented in **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1346), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2317).

6.587.3.4 virtual std::vector<std::string> decaf::net::ssl::SSLSocketFactory::getSupportedCipherSuites () [pure virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection. Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns:

an STL vector containing the list of supported cipher suites.

See also:

getDefaultCipherSuites() (p. 2839)

Implemented in **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1346), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2317).

6.588 activemq::transport::tcp::SslTransport Class Reference

Transport (p. 3125) for connecting to a Broker using an SSL Socket.

`#include <src/main/activemq/transport/tcp/SslTransport.h>`Inheritance diagram for activemq::transport::tcp::SslTransport:

Public Member Functions

- **SslTransport** (const **Pointer**< **Transport** > **next**, const **decaf::net::URI** &location)

  *Creates a new instance of the **SslTransport** (p. 2840), the **transport** (p. 72) will not attempt to connect to a remote host until the connect method is called.*

- virtual ~**SslTransport** ()

Protected Member Functions

- virtual **decaf::net::Socket** * **createSocket** ()

  *Create an unconnected Socket instance to be used by the **transport** (p. 72) to communicate with the broker.*
  Returns:

  a newly created unconnected Socket instance.
  Exceptions:

  ***IOException** if there is an error while creating the unconnected Socket.*

- virtual void **configureSocket** (**decaf::net::Socket** *socket)

  Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.
  Subclasses can override this option to set more configuration options, they should called the base class version to allow the default set of Socket options to also be configured.
  Parameters:

  ***socket** The Socket instance to configure using options from the given Properties.*
  Exceptions:

  ***NullPointerException** if the Socket instance is null.*
  ***IllegalArgumentException** if the socket instance is not handled by the class.*
  ***SocketException** if there is an error while setting one of the Socket options.*

6.588.1 Detailed Description

Transport (p. 3125) for connecting to a Broker using an SSL Socket. This **transport** (p. 72) simply wraps the **TcpTransport** (p. 3005) and provides the **TcpTransport** (p. 3005) an SSL based Socket pointer allowing the **core** (p. 63) **TcpTransport** (p. 3005) logic to be reused.

Since:

3.2.0

6.588.2 Constructor & Destructor Documentation

6.588.2.1 activemq::transport::tcp::SslTransport::SslTransport (const Pointer< Transport > *next*, const decaf::net::URI & *location*)

Creates a new instance of the **SslTransport** (p. 2840), the **transport** (p. 72) will not attempt to connect to a remote host until the connect method is called.

Parameters:

next The next **transport** (p. 72) in the chain

location The URI of the host this **transport** (p. 72) is to connect to.

6.588.2.2 virtual activemq::transport::tcp::SslTransport::~SslTransport () [virtual]

6.588.3 Member Function Documentation

6.588.3.1 virtual void activemq::transport::tcp::SslTransport::configureSocket (decaf::net::Socket * *socket*) [protected, virtual]

Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

Subclasses can override this option to set more configuration options, they should called the base class version to allow the default set of Socket options to also be configured.

Parameters:

socket The Socket instance to configure using options from the given Properties.

Exceptions:

NullPointerException if the Socket instance is null.

IllegalArgumentException if the socket instance is not handled by the class.

SocketException if there is an error while setting one of the Socket options.

Reimplemented from **activemq::transport::tcp::TcpTransport** (p. 3007).

6.588.3.2 virtual decaf::net::Socket* activemq::transport::tcp::SslTransport::createSocket () [protected, virtual]

Create an unconnected Socket instance to be used by the **transport** (p. 72) to communicate with the broker.

Returns:

a newly created unconnected Socket instance.

Exceptions:

IOException if there is an error while creating the unconnected Socket.

Reimplemented from **activemq::transport::tcp::TcpTransport** (p. 3007).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/**SslTransport.h**

6.591 decaf::internal::io::StandardErrorOutputStream Class Reference

Wrapper Around the Standard error Output facility on the current platform.

`#include <src/main/decaf/internal/io/StandardErrorOutputStream.h>`Inheritance diagram for decaf::internal::io::StandardErrorOutputStream:

Public Member Functions

- **StandardErrorOutputStream** ()
- virtual ~**StandardErrorOutputStream** ()
- virtual void **flush** ()

  Flushes this stream by writing any buffered output to the underlying stream.

  Exceptions:

  IOException (p. ***1787***) *if an I/O error occurs.*

  The default implementation of this method does nothing.

- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.

  Exceptions:

  IOException (p. ***1787***) *if an error occurs while closing.*

  The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.591.1 Detailed Description

Wrapper Around the Standard error Output facility on the current platform. This allows for the use of alternate output methods on platforms or compilers that do not support `std::cerr`.

6.591.2 Constructor & Destructor Documentation

6.591.2.1 decaf::internal::io::StandardErrorOutputStream::StandardErrorOutputStream ()

6.591.2.2 virtual decaf::internal::io::StandardErrorOutputStream::~StandardErrorOutputStream () [virtual]

6.591.3 Member Function Documentation

6.591.3.1 virtual void decaf::internal::io::StandardErrorOutputStream::close () [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions:

IOException *(*p. *1787)* if an error occurs while closing.

The default implementation of this method does nothing. The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2349).

6.591.3.2 virtual void decaf::internal::io::StandardErrorOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2350).

6.591.3.3 virtual void decaf::internal::io::StandardErrorOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2350).

6.591.3.4 virtual void decaf::internal::io::StandardErrorOutputStream::flush () [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions:

IOException *(*p. *1787)* if an I/O error occurs.

The default implementation of this method does nothing. The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2350).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardErrorOutputStream.h**

6.592 decaf::internal::io::StandardInputStream Class Reference

`#include <src/main/decaf/internal/io/StandardInputStream.h>`Inheritance diagram for decaf::internal::io::StandardInputStream:

Public Member Functions

- **StandardInputStream** ()
- virtual ~**StandardInputStream** ()
- virtual int **available** () const

  Indicates the number of bytes available.

Protected Member Functions

- virtual int **doReadByte** ()

6.592.1 Constructor & Destructor Documentation

6.592.1.1 decaf::internal::io::StandardInputStream::StandardInputStream ()

6.592.1.2 virtual decaf::internal::io::StandardInputStream::~StandardInputStream () `[virtual]`

6.592.2 Member Function Documentation

6.592.2.1 virtual int decaf::internal::io::StandardInputStream::available () const `[virtual]`

Indicates the number of bytes available. The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1708).

6.592.2.2 virtual int decaf::internal::io::StandardInputStream::doReadByte () [protected, virtual]

Implements **decaf::io::InputStream** (p. 1710).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardInputStream.h**

6.593 decaf::internal::io::StandardOutputStream Class Reference

`#include <src/main/decaf/internal/io/StandardOutputStream.h>`Inheritance diagram for decaf::internal::io::StandardOutputStream:

Public Member Functions

- **StandardOutputStream** ()

6.594 cms::Startable Class Reference

Interface for a class that implements the start method.

`#include <src/main/cms/Startable.h>`Inheritance diagram for cms::Startable:

Public Member Functions

- virtual ~**Startable** ()
- virtual void **start** ()=0

  Starts the service.

6.594.1 Detailed Description

Interface for a class that implements the start method. An object that implements the **Startable** (p. 2852) interface implies that until its start method is called it will be considered to be in a closed or stopped state and will throw an Exception to indicate that it is not in an started state if one of its methods is called.

Since:

1.0

6.594.2 Constructor & Destructor Documentation

6.594.2.1 virtual cms::Startable::~Startable () [virtual]

6.594.3 Member Function Documentation

6.594.3.1 virtual void cms::Startable::start () [pure virtual]

Starts the service.

Exceptions:

CMSException *(*p. ***979****)* if an internal error occurs while starting.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 875), **activemq::cmsutil::PooledSession** (p. 2392), **activemq::core::ActiveMQConnection** (p. 265), **activemq::core::ActiveMQConsumer** (p. 302), **activemq::core::ActiveMQDestinationSource** (p. 339), **activemq::core::ActiveMQSession** (p. 444), **activemq::core::kernels::ActiveMQConsumerKernel** (p. 317), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 471).

Referenced by activemq::cmsutil::PooledSession::start(), and activemq::cmsutil::CachedConsumer::start().

6.597 decaf::util::StlList< E > Class Template Reference

List (p. 1902) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

`#include <src/main/decaf/util/StlList.h>`Inheritance diagram for decaf::util::StlList< E >:

Data Structures

- class **ConstStlListIterator**
- class **StlListIterator**

Public Member Functions

- **StlList** ()

  Default constructor - does nothing.

- **StlList** (const **StlList** &source)

  Copy constructor - copies the content of the given set into this one.

- **StlList** (const **Collection**< E > &source)

  Copy constructor - copies the content of the given set into this one.

- virtual bool **equals** (const **Collection**< E > &collection) const

  *Answers true if this **Collection** (p. 1006) and the one given are the same size and if each element contained in the **Collection** (p. 1006) given is equal to an element contained in this collection.*

  Parameters:

  ***collection** - The **Collection** (p. 1006) to be compared to this one.*

  Returns:

  *true if this **Collection** (p. 1006) is equal to the one given.*

- virtual void **copy** (const **Collection**< E > &collection)

  *Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006).*
  The default implementation iterates over the contents of the given collection adding each to this collection after first calling this Collection's clear method.

  Parameters:

  ***collection** The collection to mirror.*

  Exceptions:

  ***UnsupportedOperationExceptio** if this is an unmodifiable collection.*
  ***IllegalStateException** if the elements cannot be added at this time due to insertion restrictions.*

- virtual **Iterator**< E > * **iterator** ()

  Returns:

  an iterator over a set of elements of type T.

- virtual **Iterator**< E > * **iterator** () const

- virtual **ListIterator**< E > * **listIterator** ()

  Returns:

  a list iterator over the elements in this list (in proper sequence).

- virtual **ListIterator**< E > * **listIterator** () const
- virtual **ListIterator**< E > * **listIterator** (int index)

  Parameters:

  index *index of first element to be returned from the list iterator (by a call to the next method).*

  Returns:

  a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

  Exceptions:

  IndexOutOfBoundsException *if the index is out of range (index < 0 || index >* ***size()*** *(p. 1015))*

- virtual **ListIterator**< E > * **listIterator** (int index) const
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  This implementation iterates over this collection, removing each element using the ***Iterator.remove*** *(p. 1803) operation. Most implementations will probably choose to override this method for efficiency.*
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

  Exceptions:

  UnsupportedOperationException *if the clear operation is not supported by this collection*

- virtual bool **isEmpty** () const

  Returns true if this collection contains no elements.
  This implementation returns ***size()*** *(p. 1015) == 0.*

  Returns:

  true if the size method return 0.

- virtual int **size** () const

  Returns the number of elements in this collection.
  If this collection contains more than Integer::MAX_ VALUE elements, returns Integer::MAX_ VALUE.

  Returns:

  the number of elements in this collection

- virtual E **get** (int index) const

  Gets the element contained at position passed.

  Parameters:

  index *The position to get.*

  Returns:

  value at index specified.

Exceptions:

IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*

- virtual E **set** (int index, const E &element)

  Replaces the element at the specified position in this list with the specified element.

  Parameters:

  index *The index of the element to replace.*
  element *The element to be stored at the specified position.*

  Returns:

  the element previously at the specified position.

  Exceptions:

  IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*
  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
  IllegalArgumentException *if some property of the element prevents it from being added to this collection*
  IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

- virtual void **add** (int index, const E &element)

  Inserts the specified element at the specified position in this list.

- virtual bool **add** (const E &value)

  Returns true if this collection changed as a result of the call.

- virtual bool **addAll** (const **Collection**< E > &collection)

  This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
  Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual bool **addAll** (int index, const **Collection**< E > &collection)

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
  Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

  Parameters:

  index *The index at which to insert the first element from the specified collection*
  source *The* ***Collection*** *(p. 1006) containing elements to be added to this list*

  Returns:

  true if this list changed as a result of the call

  Exceptions:

  IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*
  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
  IllegalArgumentException *if some property of the element prevents it from being added to this collection*

IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters:

  value *The reference to the element to remove from this* ***Collection*** *(*p. *1006).*

  Returns:

  true if the collection was changed, false otherwise.

  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(*p. *1006) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual E **removeAt** (int index)

  Removes the element at the specified position in this list.
  Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

  Parameters:

  index *- the index of the element to be removed.*

  Returns:

  the element previously at the specified position.

  Exceptions:

  IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(*p. *1902) size.*
  UnsupportedOperationExceptio *if this is an unmodifiable collection.*

- virtual int **indexOf** (const E &value) const

  Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual int **lastIndexOf** (const E &value) const

  Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual bool **contains** (const E &value) const

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

  Parameters:

  value *The value to check for presence in the collection.*

  Returns:

  true if there is at least one of the elements in the collection

Exceptions:

NullPointerException *if the* ***Collection*** *(p. 1006) contains pointers and the* ***Collection*** *(p. 1006) does not allow for NULL elements (optional check).*

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

6.597.1 Detailed Description

template<typename E> class decaf::util::StlList< E >

List (p. 1902) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

6.597.2 Constructor & Destructor Documentation

6.597.2.1 template<typename E> decaf::util::StlList< E >::StlList () [inline]

Default constructor - does nothing.

6.597.2.2 template<typename E> decaf::util::StlList< E >::StlList (const StlList< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

References decaf::util::StlList< E >::copy().

6.597.2.3 template<typename E> decaf::util::StlList< E >::StlList (const Collection< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

References decaf::util::StlList< E >::copy().

6.597.3 Member Function Documentation

6.597.3.1 template<typename E> virtual bool decaf::util::StlList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and

others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 158).

6.597.3.2 template<typename E> virtual void decaf::util::StlList< E >::add (int *index*, const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list. Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index The index at which the specified element is to be inserted.

element The element to be inserted in this **List** (p. 1902).

Exceptions:

IndexOutOfBoundsException if the index is greater than size of the **List** (p. 1902).

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1903).

References decaf::util::StlList< E >::size().

6.597.3.3 template<typename E> virtual bool decaf::util::StlList< E >::addAll (int *index*, const Collection< E > & *collection*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1006) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 159).

References decaf::util::Collection< E >::isEmpty(), decaf::util::StlList< E >::listIterator(), decaf::util::StlList< E >::size(), and decaf::util::Collection< E >::toArray().

6.597.3.4 template<typename E> virtual bool decaf::util::StlList< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty). This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 143).

References decaf::util::Collection< E >::isEmpty(), decaf::util::StlList< E >::listIterator(), and decaf::util::Collection< E >::toArray().

6.597.3.5 template<typename E> virtual void decaf::util::StlList< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractList< E >** (p. 160).

6.597.3.6 template<typename E> virtual bool decaf::util::StlList< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element. This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 145).

6.597.3.7 template<typename E> virtual void decaf::util::StlList< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this Collection's clear method.

Parameters:

collection The collection to mirror.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

IllegalStateException if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 146).

References NULL.

Referenced by decaf::util::StlList< E >::StlList().

6.597.3.8 template<typename E> virtual bool decaf::util::StlList< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 1006) and the one given are the same size and if each element contained in the **Collection** (p. 1006) given is equal to an element contained in this collection.

Parameters:

collection - The **Collection** (p. 1006) to be compared to this one.

Returns:

true if this **Collection** (p. 1006) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

References NULL.

6.597.3.9 template<typename E> virtual E decaf::util::StlList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters:

index The position to get.

Returns:

value at index specified.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

Implements **decaf::util::List< E >** (p. 1905).

References decaf::util::StlList< E >::size().

6.597.3.10 template<typename E> virtual int decaf::util::StlList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 160).

6.597.3.11 template<typename E> virtual bool decaf::util::StlList< E >::isEmpty () const [inline, virtual]

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 1015) == 0.

Returns:

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

6.597.3.12 template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator () const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 161).

6.597.3.13 template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Reimplemented from **decaf::util::AbstractList< E >** (p. 161).

6.597.3.14 template<typename E> virtual int decaf::util::StlList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 162).

References decaf::util::StlList< E >::size().

6.597.3.15 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (int index) const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 162).

References decaf::util::StlList< E >::size().

6.597.3.16 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (int index) [inline, virtual]

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (index < 0 || index > **size()** (p. 1015))

Reimplemented from **decaf::util::AbstractList< E >** (p. 163).

References decaf::util::StlList< E >::size().

6.597.3.17 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 164).

6.597.3.18 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () [inline, virtual]

Returns:

a list iterator over the elements in this list (in proper sequence).

Reimplemented from **decaf::util::AbstractList< E >** (p. 164).

Referenced by decaf::util::StlList< E >::addAll().

6.597.3.19 template<typename E> virtual bool decaf::util::StlList< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 149).

References decaf::util::StlList< E >::size().

6.597.3.20 template<typename E> virtual E decaf::util::StlList< E >::removeAt (int index) [inline, virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

Reimplemented from **decaf::util::AbstractList< E >** (p. 165).

References decaf::util::StlList< E >::size().

6.597.3.21 template<typename E> virtual E decaf::util::StlList< E >::set (int index, const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters:

index The index of the element to replace.

element The element to be stored at the specified position.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1911).

References decaf::util::StlList< E >::size().

6.597.3.22 template<typename E> virtual int decaf::util::StlList< E >::size () const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1015).

Referenced by decaf::util::StlList< E >::add(), decaf::util::StlList< E >::addAll(), decaf::util::StlList< E >::get(), decaf::util::StlList< E >::lastIndexOf(), decaf::util::StlList< E >::listIterator(), decaf::util::StlList< E >::remove(), decaf::util::StlList< E >::removeAt(), and decaf::util::StlList< E >::set().

Public Member Functions

- **StlMap** ()

  Default constructor - does nothing.

- **StlMap** (const **StlMap** &source)

  Copy constructor - copies the content of the given map into this one.

- **StlMap** (const **Map**< K, V > &source)

  Copy constructor - copies the content of the given map into this one.

- virtual ~**StlMap** ()
- virtual bool **equals** (const **StlMap** &source) const

  Compares the specified object with this map for equality.
  *Returns true if the two maps represent the same mappings. More formally, two maps m1 and m2 represent the same mappings if m1.entrySet().equals(m2.entrySet()). This ensures that the equals method works properly across different implementations of the **Map** (p. 2008) interface.*

  Parameters:

  source *__Map__ (p. 2008) to compare to this one.*

  Returns:

  true if the __Map__ (p. 2008) passed is equal in value to this one.

- virtual bool **equals** (const **Map**< K, V > &source) const

- virtual void **copy** (const **StlMap** &source)

  Copies the content of the source map into this map.
  *Erases all existing mappings in this map. The copy is performed by using the entrySet of the source **Map** (p. 2008) and iterating over those entries, inserting each into the target.*
  Parameters:

  source *The source object to copy from.*

- virtual void **copy** (const **Map**< K, V > &source)

- virtual void **clear** ()

  Removes all of the mappings from this map (optional operation).
  The map will be empty after this call returns.
  Exceptions:

  UnsupportedOperationException *if the clear operation is not supported by this map.*

- virtual bool **containsKey** (const K &key) const

  Returns true if this map contains a mapping for the specified key.
  More formally, returns true if and only if this map contains a mapping for a key k such that (key == k). (There can be at most one such mapping.)
  Parameters:

  key *The key to look up.*
  Returns:

  true if this map contains the key mapping, otherwise false.

- virtual bool **containsValue** (const V &value) const

  Returns true if this map maps one or more keys to the specified value.
  *More formally, returns true if and only if this map contains at least one mapping to a value v such that (value==v). This operation will probably require time linear in the map size for most implementations of the **Map** (p. 2008) interface.*
  Parameters:

  value *The Value to look up in this **Map** (p. 2008).*
  Returns:

  true if this map contains at least one mapping for the value, otherwise false.

- virtual bool **isEmpty** () const
  Returns:

  *if the **Map** (p. 2008) contains any element or not, TRUE or FALSE*

- virtual int **size** () const
  Returns:

  The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key)

*Gets the value mapped to the specified key in the **Map** (p. 2008).*
*If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.*

Parameters:

key *The search key whose value should be returned if present.*

Returns:

*A reference to the value for the given key if present in the **Map** (p. 2008).*

Exceptions:

***NoSuchElementException** (p. **2260**) if the key requests doesn't exist in the **Map** (p. 2008).*

- virtual const V & **get** (const K &key) const

*Gets the value mapped to the specified key in the **Map** (p. 2008).*
*If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.*

Parameters:

key *The search key whose value should be returned if present.*

Returns:

*A const reference to the value for the given key if present in the **Map** (p. 2008).*

Exceptions:

***NoSuchElementException** (p. **2260**) if the key requests doesn't exist in the **Map** (p. 2008).*

- virtual bool **put** (const K &key, const V &value)

Associates the specified value with the specified key in this map (optional operation).
If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

Parameters:

key *The target key.*
value *The value to be set.*

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException *if this map is unmodifiable.*
IllegalArgumentException *if some property of the specified key or value prevents it from being stored in this map*

- virtual bool **put** (const K &key, const V &value, V &oldValue)

Associates the specified value with the specified key in this map (optional operation).
If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)
This method accepts a reference to a value which will be assigned the previous value for the given key (if any). If there was no previous mapping for the given key the out value is not written to. A return of true indicates that a value was replaced by this put operation.

Parameters:

key *The target key.*
value *The value to be set.*
oldValue *(out) The value previously held in the mapping for this key. .*

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException *if this map is unmodifiable.*
IllegalArgumentException *if some property of the specified key or value prevents it from being stored in this map*

- virtual void **putAll** (const **StlMap**< K, V, COMPARATOR > &other)

Copies all of the mappings from the specified map to this map (optional operation).
The effect of this call is equivalent to that of calling put(k, v) on this map once for each mapping from key k to value v in the specified map. The behavior of this operation is undefined if the specified map is modified while the operation is in progress.

Parameters:

other *A* ***Map*** (p. *2008*) *instance whose elements are to all be inserted in this* ***Map*** (p. *2008*).

Exceptions:

UnsupportedOperationException *If the implementing class does not support the putAll operation.*

- virtual void **putAll** (const **Map**< K, V > &other)

- virtual V **remove** (const K &key)

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.
Care must be taken when using this operation as it will throw an exception if there is no mapping for the given key.

Parameters:

key *The search key whose mapping is to be removed.*

Returns:

a copy of the element that was previously mapped to the given key.

Exceptions:

NoSuchElementException (p. *2260*) *if this key is not in the* ***Map*** (p. *2008*).
UnsupportedOperationException *if this map is unmodifiable.*

- virtual **Set**< **MapEntry**< K, V > > & **entrySet** ()

Returns a ***Set*** (p. *2715*) *view of the mappings contained in this map.*

- virtual const **Set**< **MapEntry**< K, V > > & **entrySet** () const
- virtual **Set**< K > & **keySet** ()

Returns a ***Set*** (p. *2715*) *view of the keys contained in this map.*

- virtual const **Set**< K > & **keySet** () const
- virtual **Collection**< V > & **values** ()

Returns a ***Collection*** (p. *1006*) *view of the values contained in this map.*

- virtual const **Collection**< V > & **values** () const
- virtual void **lock** ()

Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.598.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>> class decaf::util::StlMap< K, V, COMPARATOR >

Map (p. 2008) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

Since:

1.0

6.598.2 Constructor & Destructor Documentation

6.598.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap () [inline]

Default constructor - does nothing.

6.598.2.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const StlMap< K, V, COMPARATOR > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source **StlMap** (p. 2869) whose entries are copied into this **Map** (p. 2008).

6.598.2.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const Map< K, V > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source ma whose entries are copied into this **Map** (p. 2008)..

6.598.2.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::StlMap< K, V, COMPARATOR >::~StlMap () [inline, virtual]

6.598.3 Member Function Documentation

6.598.3.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::clear () [inline, virtual]

Removes all of the mappings from this map (optional operation).

The map will be empty after this call returns.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this map.

Implements **decaf::util::Map< K, V >** (p. 2010).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::copy().

6.598.3.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsKey (const K & *key*) const [inline, virtual]

Returns true if this map contains a mapping for the specified key.

More formally, returns true if and only if this map contains a mapping for a key k such that (key == k). (There can be at most one such mapping.)

Parameters:

key The key to look up.

Returns:

true if this map contains the key mapping, otherwise false.

Implements **decaf::util::Map< K, V >** (p. 2011).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), and decaf::util::StlMap< std::string, cms::Topic * >::put().

6.598.3.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsValue (const V & *value*) const [inline, virtual]

Returns true if this map maps one or more keys to the specified value.

More formally, returns true if and only if this map contains at least one mapping to a value v such that (value==v). This operation will probably require time linear in the map size for most implementations of the **Map** (p. 2008) interface.

Parameters:

value The Value to look up in this **Map** (p. 2008).

Returns:

true if this map contains at least one mapping for the value, otherwise false.

Implements **decaf::util::Map< K, V >** (p. 2011).

6.598.3.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const Map< K, V > & *source*) [inline, virtual]

6.598.3.5 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const StlMap< K, V, COMPARATOR > & *source*) [inline, virtual]

Copies the content of the source map into this map.

Erases all existing mappings in this map. The copy is performed by using the entrySet of the source **Map** (p. 2008) and iterating over those entries, inserting each into the target.

Parameters:

source The source object to copy from.

Implements **decaf::util::Map< K, V >** (p. 2012).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::StlMap().

6.598.3.6 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const Set< MapEntry<K, V> >& decaf::util::StlMap< K, V, COMPARATOR >::entrySet () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2012).

6.598.3.7 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual Set< MapEntry<K, V> >& decaf::util::StlMap< K, V, COMPARATOR >::entrySet () [inline, virtual]

Returns a **Set** (p. 2715) view of the mappings contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while

an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Set.remove** (p. 1013), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns:

a reference to a **Set** (p. 2715)<MapEntry<K,V>> that is backed by this **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2012).

6.598.3.8 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const Map< K, V > & *source*) const [inline, virtual]

6.598.3.9 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const StlMap< K, V, COMPARATOR > & *source*) const [inline, virtual]

Compares the specified object with this map for equality.

Returns true if the two maps represent the same mappings. More formally, two maps m1 and m2 represent the same mappings if m1.entrySet().equals(m2.entrySet()). This ensures that the equals method works properly across different implementations of the **Map** (p. 2008) interface.

Parameters:

source **Map** (p. 2008) to compare to this one.

Returns:

true if the **Map** (p. 2008) passed is equal in value to this one.

Implements **decaf::util::Map< K, V >** (p. 2013).

6.598.3.10 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::StlMap< K, V, COMPARATOR >::get (const K & *key*) const [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 2008).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.

Parameters:

key The search key whose value should be returned if present.

Returns:

A const reference to the value for the given key if present in the **Map** (p. 2008).

Exceptions:

NoSuchElementException *(p. 2260)* if the key requests doesn't exist in the **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2014).

6.598.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::StlMap< K, V, COMPARATOR >::get (const K & *key*) [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 2008).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.

Parameters:

key The search key whose value should be returned if present.

Returns:

A reference to the value for the given key if present in the **Map** (p. 2008).

Exceptions:

NoSuchElementException *(p. 2260)* if the key requests doesn't exist in the **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2014).

6.598.3.12 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::isEmpty () const [inline, virtual]

Returns:

if the **Map** (p. 2008) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V >** (p. 2015).

6.598.3.13 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const Set<K>& decaf::util::StlMap< K, V, COMPARATOR >::keySet () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2015).

6.598.3.14 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual Set<K>& decaf::util::StlMap< K, V, COMPARATOR >::keySet () [inline, virtual]

Returns a **Set** (p. 2715) view of the keys contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an

iteration over the set is in progress (except through the iterator's own remove operation), the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Set.remove** (p. 1013), removeAll, retainAll, and clear operations. It does not support the add or addAll operations.

Returns:

a set view of the keys contained in this map,

Implements **decaf::util::Map< K, V >** (p. 2016).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals().

6.598.3.15 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

6.598.3.16 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.598.3.17 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.598.3.18 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::put (const K & *key*, const V & *value*, V & *oldValue*) [inline, virtual]

Associates the specified value with the specified key in this map (optional operation).

If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

This method accepts a reference to a value which will be assigned the previous value for the given key (if any). If there was no previous mapping for the given key the out value is not written to. A return of true indicates that a value was replaced by this put operation.

Parameters:

key The target key.

value The value to be set.

oldValue (out) The value previously held in the mapping for this key. .

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

IllegalArgumentException if some property of the specified key or value prevents it from being stored in this map

Implements **decaf::util::Map< K, V >** (p. 2017).

6.598.3.19 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::put (const K & *key*, const V & *value*) [inline, virtual]

Associates the specified value with the specified key in this map (optional operation).

If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

Parameters:

key The target key.

value The value to be set.

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

IllegalArgumentException if some property of the specified key or value prevents it from being stored in this map

Implements **decaf::util::Map< K, V >** (p. 2017).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::putAll().

6.598.3.20 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const Map< K, V > & *other*) [inline, virtual]

6.598.3.21 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const StlMap< K, V, COMPARATOR > & *other*) [inline, virtual]

Copies all of the mappings from the specified map to this map (optional operation).

The effect of this call is equivalent to that of calling put(k, v) on this map once for each mapping from key k to value v in the specified map. The behavior of this operation is undefined if the specified map is modified while the operation is in progress.

Parameters:

other A **Map** (p. 2008) instance whose elements are to all be inserted in this **Map** (p. 2008).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implements **decaf::util::Map< K, V >** (p. 2018).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::copy().

6.598.3.22 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::StlMap< K, V, COMPARATOR >::remove (const K & *key*) [inline, virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Care must be taken when using this operation as it will throw an exception if there is no mapping for the given key.

Parameters:

key The search key whose mapping is to be removed.

Returns:

a copy of the element that was previously mapped to the given key.

Exceptions:

NoSuchElementException *(p. 2260)* if this key is not in the **Map** (p. 2008).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V >** (p. 2018).

6.598.3.23 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual int decaf::util::StlMap< K, V, COMPARATOR >::size () const [inline, virtual]

Returns:

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V >** (p. 2019).

6.598.3.24 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::tryLock () [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.598.3.25 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.598.3.26 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const Collection<V>& decaf::util::StlMap< K, V, COMPARATOR >::values () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2020).

6.598.3.27 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual Collection<V>& decaf::util::StlMap< K, V, COMPARATOR >::values () [inline, virtual]

Returns a **Collection** (p. 1006) view of the values contained in this map. The collection is backed by the map, so changes to the map are reflected in the collection, and vice-versa. If the map is modified while an iteration over the collection is in progress (except through the iterator's own remove operation), the results of the iteration are undefined. The collection supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Collection.remove** (p. 1013), removeAll, retainAll and clear operations. It does not support the add or addAll operations. For the const version of this method the **Collection** (p. 1006) can only be used as a view into the **Map** (p. 2008).

Returns:

a collection view of the values contained in this map.

Implements **decaf::util::Map< K, V >** (p. 2020).

6.598.3.28 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.598.3.29 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.598.3.30 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

- T & **getSafeValue** ()

  Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

6.599.1 Detailed Description

template<typename T> class decaf::util::StlQueue< T >

The **Queue** (p. 2515) class accepts messages with an psuh(m) command where m is the message to be queued. It destructively returns the message with **pop()** (p. 2888). **pop()** (p. 2888) returns messages in the order they were enqueued.

Queue (p. 2515) is implemented with an instance of the STL queue object. The interface is essentially the same as that of the STL queue except that the pop method actually reaturns a reference to the element popped. This frees the app from having to call the `front` method before calling pop.

Queue<string> sq; // make a queue to hold string messages sq.push(s); // enqueues a message m string s = sq.pop(); // dequeues a message

= DESIGN CONSIDERATIONS

The **Queue** (p. 2515) class inherits from the Synchronizable interface and provides methods for locking and unlocking this queue as well as waiting on this queue. In a multi-threaded app this can allow for multiple threads to be reading from and writing to the same **Queue** (p. 2515).

Clients should consider that in a multiple threaded app it is possible that items could be placed on the queue faster than you are taking them off, so protection should be placed in your polling loop to ensure that you don't get stuck there.

6.599.2 Constructor & Destructor Documentation

6.599.2.1 template<typename T> decaf::util::StlQueue< T >::StlQueue () [inline]

6.599.2.2 template<typename T> virtual decaf::util::StlQueue< T >::~StlQueue () [inline, virtual]

6.599.3 Member Function Documentation

6.599.3.1 template<typename T> const T& decaf::util::StlQueue< T >::back () const [inline]

Returns a Reference to the element at the tail of the queue.

Returns:

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.599.3.2 template<typename T> T& decaf::util::StlQueue< T >::back () [inline]

Returns a Reference to the element at the tail of the queue.

Returns:

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.599.3.3 template<typename T> void decaf::util::StlQueue< T >::clear () [inline]

Empties this queue.

6.599.3.4 template<typename T> bool decaf::util::StlQueue< T >::empty () const [inline]

Checks if this **Queue** (p. 2515) is currently empty.

Returns:

boolean indicating queue emptiness

6.599.3.5 template<typename T> void decaf::util::StlQueue< T >::enqueueFront (const T & t) [inline]

Places a new Object at the front of the queue.

Parameters:

t - **Queue** (p. 2515) Object Type reference.

6.599.3.6 template<typename T> const T& decaf::util::StlQueue< T >::front () const [inline]

Returns a Reference to the element at the head of the queue.

Returns:

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.599.3.7 template<typename T> T& decaf::util::StlQueue< T >::front () [inline]

Returns a Reference to the element at the head of the queue.

Returns:

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.599.3.8 template<typename T> T& decaf::util::StlQueue< T >::getSafeValue () [inline]

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

Returns:

Reference to this Queues safe object

Referenced by decaf::util::StlQueue< T >::back(), decaf::util::StlQueue< T >::front(), and decaf::util::StlQueue< T >::pop().

6.599.3.9 template<typename T> Iterator<T>* decaf::util::StlQueue< T >::iterator () [inline]

Gets an **Iterator** (p. 1802) over this **Queue** (p. 2515).

Returns:

new iterator pointer that is owned by the caller.

6.599.3.10 template<typename T> virtual void decaf::util::StlQueue< T >::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

References decaf::util::concurrent::Mutex::lock().

6.599.3.11 template<typename T> virtual void decaf::util::StlQueue< T >::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

References decaf::util::concurrent::Mutex::notify().

6.599.3.12 template<typename T> virtual void decaf::util::StlQueue< T >::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

References decaf::util::concurrent::Mutex::notifyAll().

6.599.3.13 template<typename T> T decaf::util::StlQueue< T >::pop () [inline]

Removes and returns the element that is at the Head of the queue.

Returns:

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.599.3.14 template<typename T> void decaf::util::StlQueue< T >::push (const T & *t*) [inline]

Places a new Object at the Tail of the queue.

Parameters:

t - **Queue** (p. 2515) Object Type reference.

6.599.3.15 template<typename T> void decaf::util::StlQueue< T >::reverse (StlQueue< T > & *target*) const [inline]

Reverses the order of the contents of this queue and stores them in the target queue.

Parameters:

target - The target queue that will receive the contents of this queue in reverse order.

6.599.3.16 template<typename T> size_t decaf::util::StlQueue< T >::size () const [inline]

Gets the Number of elements currently in the **Queue** (p. 2515).

Returns:

Queue (p. 2515) Size

6.599.3.17 template<typename T> virtual std::vector<T> decaf::util::StlQueue< T >::toArray () const [inline, virtual]

Returns:

the all values in this queue as a std::vector.

6.599.3.18 template<typename T> virtual bool decaf::util::StlQueue< T >::tryLock () [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

References decaf::util::concurrent::Mutex::tryLock().

6.599.3.19 template<typename T> virtual void decaf::util::StlQueue< T >::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

References decaf::util::concurrent::Mutex::unlock().

6.599.3.20 template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

References decaf::util::concurrent::Mutex::wait().

6.599.3.21 template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

References decaf::util::concurrent::Mutex::wait().

6.599.3.22 template<typename T> virtual void decaf::util::StlQueue< T >::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

References decaf::util::concurrent::Mutex::wait().

The documentation for this class was generated from the following file:

- src/main/decaf/util/**StlQueue.h**

6.600 decaf::util::StlSet< E > Class Template Reference

Set (p. 2715) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

`#include <src/main/decaf/util/StlSet.h>`Inheritance diagram for decaf::util::StlSet< E >:

Data Structures

- class **ConstSetIterator**
- class **SetIterator**

Public Member Functions

- **StlSet** ()

  Default constructor - does nothing.

- **StlSet** (const **StlSet** &source)

  Copy constructor - copies the content of the given set into this one.

- **StlSet** (const **Collection**< E > &source)

  Copy constructor - copies the content of the given set into this one.

- virtual ~**StlSet** ()
- **Iterator**< E > * **iterator** ()

  Returns:

  an iterator over a set of elements of type T.

- **Iterator**< E > * **iterator** () const
- virtual bool **equals** (const **Collection**< E > &collection) const

  *Answers true if this **Collection** (p. 1006) and the one given are the same size and if each element contained in the **Collection** (p. 1006) given is equal to an element contained in this collection.*

  Parameters:

  ***collection** - The **Collection** (p. 1006) to be compared to this one.*

  Returns:

  *true if this **Collection** (p. 1006) is equal to the one given.*

- virtual void **copy** (const **Collection**< E > &collection)

  *Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006).*
  The default implementation iterates over the contents of the given collection adding each to this collection after first calling this Collection's clear method.

  Parameters:

  ***collection** The collection to mirror.*

  Exceptions:

  ***UnsupportedOperationExceptio** if this is an unmodifiable collection.*
  ***IllegalStateException** if the elements cannot be added at this time due to insertion restrictions.*

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  This implementation iterates over this collection, removing each element using the ***Iterator.remove*** *(p. 1803) operation. Most implementations will probably choose to override this method for efficiency.*
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.
  Exceptions:

  UnsupportedOperationException *if the clear operation is not supported by this collection*

- virtual bool **contains** (const E &value) const

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).
  Parameters:

  value *The value to check for presence in the collection.*
  Returns:

  true if there is at least one of the elements in the collection
  Exceptions:

  NullPointerException *if the* ***Collection*** *(p. 1006) contains pointers and the* ***Collection*** *(p. 1006) does not allow for NULL elements (optional check).*

  This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual bool **isEmpty** () const
- virtual int **size** () const
- virtual bool **add** (const E &value)

  Returns true if this collection changed as a result of the call.
  (Returns false if this collection does not permit duplicates and already contains the specified element.)
  Collections *(p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added.* ***Collection*** *(p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.*
  If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.
  For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.
  Parameters:

  value *The reference to the element to add to this* ***Collection*** *(p. 1006).*
  Returns:

  true if the element was added to this ***Collection*** *(p. 1006).*
  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
  IllegalArgumentException *if some property of the element prevents it from being added to this collection*

IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters:

  value *The reference to the element to remove from this* ***Collection*** *(*p. *1006).*

  Returns:

  true if the collection was changed, false otherwise.

  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(*p. *1006) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

6.600.1 Detailed Description

template<typename E> class decaf::util::StlSet< E >

Set (p. 2715) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

6.600.2 Constructor & Destructor Documentation

6.600.2.1 template<typename E> decaf::util::StlSet< E >::StlSet () [inline]

Default constructor - does nothing.

6.600.2.2 template<typename E> decaf::util::StlSet< E >::StlSet (const StlSet< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

6.600.2.3 template<typename E> decaf::util::StlSet< E >::StlSet (const Collection< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

6.600.2.4 template<typename E> virtual decaf::util::StlSet< E >::~StlSet () [inline, virtual]

6.600.3 Member Function Documentation

6.600.3.1 template<typename E> virtual bool decaf::util::StlSet< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 1007).

6.600.3.2 template<typename E> virtual void decaf::util::StlSet< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 144).

6.600.3.3 template<typename E> virtual bool decaf::util::StlSet< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 145).

6.600.3.4 template<typename E> virtual void decaf::util::StlSet< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this Collection's clear method.

Parameters:

collection The collection to mirror.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

IllegalStateException if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 146).

Referenced by decaf::util::StlSet< Resource * >::copy(), and decaf::util::StlSet< Resource * >::StlSet().

6.600.3.5 template<typename E> virtual bool decaf::util::StlSet< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 1006) and the one given are the same size and if each element contained in the **Collection** (p. 1006) given is equal to an element contained in this collection.

Parameters:

collection - The **Collection** (p. 1006) to be compared to this one.

Returns:

true if this **Collection** (p. 1006) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

Referenced by decaf::util::StlSet< Resource * >::equals().

6.600.3.6 template<typename E> virtual bool decaf::util::StlSet< E >::isEmpty () const [inline, virtual]

Returns:

if the set contains any element or not, TRUE or FALSE

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

6.600.3.7 template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1799).

6.600.3.8 template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1800).

6.600.3.9 template<typename E> virtual bool decaf::util::StlSet< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 149).

6.600.3.10 template<typename E> virtual int decaf::util::StlSet< E >::size () const [inline, virtual]

Returns:

The number of elements in this set.

Implements **decaf::util::Collection< E >** (p. 1015).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**StlSet.h**

6.602 activemq::wireformat::stomp::StompFrame Class Reference

A Stomp-level message frame that encloses all messages to and from the broker.

`#include <src/main/activemq/wireformat/stomp/StompFrame.h>`

Public Member Functions

- **StompFrame** ()
  Default constructor.
- virtual ~**StompFrame** ()
  Destruction.
- **StompFrame** * **clone** () const
  Clonse this message exactly, returns a new instance that the caller is required to delete.
- void **copy** (const **StompFrame** *src)
  Copies the contents of the passed Frame to this one.
- void **setCommand** (const std::string &cmd)
  *Sets the command for this **stomp** (p. 90) frame.*
- const std::string & **getCommand** () const
  Accessor for this frame's command field.
- bool **hasProperty** (const std::string &name) const
  Checks if the given property is present in the Frame.
- std::string **getProperty** (const std::string &name, const std::string &fallback="") const
  Gets a property from this Frame's properties and returns it, or the default value given.
- std::string **removeProperty** (const std::string &name)
  Gets and remove the property specified, if the property is not set, this method returns the empty string.
- void **setProperty** (const std::string &name, const std::string &value)
  Sets the property given to the value specified in this Frame's Properties.
- **decaf::util::Properties** & **getProperties** ()
  Gets access to the header properties for this frame.
- const **decaf::util::Properties** & **getProperties** () const
- const std::vector< unsigned char > & **getBody** () const
  Accessor for the body data of this frame.
- std::vector< unsigned char > & **getBody** ()
  Non-const version of the body accessor.

- std::size_t **getBodyLength** () const

  Return the number of bytes contained in this frames body.

- void **setBody** (const unsigned char *bytes, std::size_t numBytes)

  Sets the body data of this frame as a byte sequence.

- void **toStream** (**decaf::io::DataOutputStream** *stream) const

  Writes this Frame to an OuputStream in the Stomp Wire Format.

- void **fromStream** (**decaf::io::DataInputStream** *stream)

  Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

6.602.1 Detailed Description

A Stomp-level message frame that encloses all messages to and from the broker.

6.602.2 Constructor & Destructor Documentation

6.602.2.1 activemq::wireformat::stomp::StompFrame::StompFrame ()

Default constructor.

6.602.2.2 virtual activemq::wireformat::stomp::StompFrame::~StompFrame () [virtual]

Destruction.

6.602.3 Member Function Documentation

6.602.3.1 StompFrame* activemq::wireformat::stomp::StompFrame::clone () const

Clonse this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

6.602.3.2 void activemq::wireformat::stomp::StompFrame::copy (const StompFrame * *src*)

Copies the contents of the passed Frame to this one.

Parameters:

src - Frame to copy

6.602.3.3 void activemq::wireformat::stomp::StompFrame::fromStream (decaf::io::DataInputStream * *stream*)

Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

Parameters:

stream - The stream to read the Frame from.

Exceptions:

IOException if an error occurs while writing the Frame.

6.602.3.4 std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () [inline]

Non-const version of the body accessor.

6.602.3.5 const std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () const [inline]

Accessor for the body data of this frame.

Returns:

char pointer to body data

6.602.3.6 std::size_t activemq::wireformat::stomp::StompFrame::getBodyLength () const [inline]

Return the number of bytes contained in this frames body.

Returns:

Body bytes length.

6.602.3.7 const std::string& activemq::wireformat::stomp::StompFrame::getCommand () const [inline]

Accessor for this frame's command field.

6.602.3.8 const decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () const [inline]

6.602.3.9 decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () [inline]

Gets access to the header properties for this frame.

Returns:

the Properties object owned by this Frame

6.602.3.10 std::string activemq::wireformat::stomp::StompFrame::getProperty (const std::string & *name*, const std::string & *fallback* = "") const [inline]

Gets a property from this Frame's properties and returns it, or the default value given.

Parameters:

name - The name of the property to lookup

fallback - The default value to return if this value isn't set

Returns:

string value of the property asked for.

6.602.3.11 bool activemq::wireformat::stomp::StompFrame::hasProperty (const std::string & *name*) const [inline]

Checks if the given property is present in the Frame.

Parameters:

name - The name of the property to check for.

6.602.3.12 std::string activemq::wireformat::stomp::StompFrame::removeProperty (const std::string & *name*) [inline]

Gets and remove the property specified, if the property is not set, this method returns the empty string.

Parameters:

name - the Name of the property to get and return.

6.602.3.13 void activemq::wireformat::stomp::StompFrame::setBody (const unsigned char * *bytes*, std::size_t *numBytes*)

Sets the body data of this frame as a byte sequence.

Parameters:

bytes The byte buffer to be set in the body.

numBytes The number of bytes in the buffer.

6.602.3.14 void activemq::wireformat::stomp::StompFrame::setCommand (const std::string & *cmd*) [inline]

Sets the command for this **stomp** (p. 90) frame.

Parameters:

cmd command The command to be set.

6.602.3.15 void activemq::wireformat::stomp::StompFrame::setProperty (const std::string & *name*, const std::string & *value*) [inline]

Sets the property given to the value specified in this Frame's Properties.

Parameters:

name - Name of the property.

value - Value to set the property to.

6.602.3.16 void activemq::wireformat::stomp::StompFrame::toStream (decaf::io::DataOutputStream * *stream*) const

Writes this Frame to an OuputStream in the Stomp Wire Format.

Parameters:

stream - The stream to write the Frame to.

Exceptions:

IOException if an error occurs while reading the Frame.

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompFrame.h**

6.603 activemq::wireformat::stomp::StompHelper Class Reference

Utility Methods used when marshaling to and from StompFrame's.

`#include <src/main/activemq/wireformat/stomp/StompHelper.h>`

Public Member Functions

- **StompHelper** (**StompWireFormat** *wireFormat)
- virtual ~**StompHelper** ()
- void **convertProperties** (const **Pointer**< **StompFrame** > &frame, const **Pointer**< **Message** > &message)

  Converts the Headers in a Stomp Frame into Headers in the given Message Command.

- void **convertProperties** (const **Pointer**< **Message** > &message, const **Pointer**< **StompFrame** > &frame)

  Converts the Properties in a Message Command to Valid Headers and Properties in the ***StompFrame*** *(p. 2903).*

- **Pointer**< **ActiveMQDestination** > **convertDestination** (const std::string &destination)

  Converts from a Stomp Destination to an ActiveMQDestination.

- std::string **convertDestination** (const **Pointer**< **ActiveMQDestination** > &destination)

  Converts from a ActiveMQDestination to a Stomp Destination Name.

- std::string **convertMessageId** (const **Pointer**< **MessageId** > &messageId)

  Converts a MessageId instance to a Stomp MessageId String.

- **Pointer**< **MessageId** > **convertMessageId** (const std::string &messageId)

  Converts a Stomp MessageId string to a MessageId.

- std::string **convertConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)

  Converts a ConsumerId instance to a Stomp ConsumerId String.

- **Pointer**< **ConsumerId** > **convertConsumerId** (const std::string &consumerId)

  Converts a Stomp ConsumerId string to a ConsumerId.

- std::string **convertProducerId** (const **Pointer**< **ProducerId** > &producerId)

  Converts a ProducerId instance to a Stomp ProducerId String.

- **Pointer**< **ProducerId** > **convertProducerId** (const std::string &producerId)

  Converts a Stomp ProducerId string to a ProducerId.

- std::string **convertTransactionId** (const **Pointer**< **TransactionId** > &transactionId)

  Converts a TransactionId instance to a Stomp TransactionId String.

- **Pointer**< **TransactionId** > **convertTransactionId** (const std::string &transactionId)

  Converts a Stomp TransactionId string to a TransactionId.

6.603.1 Detailed Description

Utility Methods used when marshaling to and from StompFrame's.

Since:

3.0

6.603.2 Constructor & Destructor Documentation

6.603.2.1 activemq::wireformat::stomp::StompHelper::StompHelper (StompWireFormat * *wireFormat*)

6.603.2.2 virtual activemq::wireformat::stomp::StompHelper::~StompHelper () [virtual]

6.603.3 Member Function Documentation

6.603.3.1 Pointer<ConsumerId> activemq::wireformat::stomp::StompHelper::convertConsumerId (const std::string & *consumerId*)

Converts a Stomp ConsumerId string to a ConsumerId.

Parameters:

consumerId - the String Consumer Id to convert.

Returns:

Pointer to a new ConsumerId.

6.603.3.2 std::string activemq::wireformat::stomp::StompHelper::convertConsumerId (const Pointer< ConsumerId > & *consumerId*)

Converts a ConsumerId instance to a Stomp ConsumerId String.

Parameters:

consumerId - the Consumer instance to convert.

Returns:

a Stomp Consumer Id String.

6.603.3.3 std::string activemq::wireformat::stomp::StompHelper::convertDestination (const Pointer< ActiveMQDestination > & *destination*)

Converts from a ActiveMQDestination to a Stomp Destination Name.

Parameters:

destination - The ActiveMQDestination to Convert

Returns:

the Stomp String name that defines the destination.

6.603.3.4 Pointer<ActiveMQDestination> activemq::wireformat::stomp::StompHelper::convertDestination (const std::string & *destination*)

Converts from a Stomp Destination to an ActiveMQDestination.

Parameters:

destination - The Stomp Destination name string.

Returns:

Pointer to a new ActiveMQDestination.

6.603.3.5 Pointer<MessageId> activemq::wireformat::stomp::StompHelper::convertMessageId (const std::string & *messageId*)

Converts a Stomp MessageId string to a MessageId.

Parameters:

messageId - the String message Id to convert.

Returns:

Pointer to a new MessageId.

6.603.3.6 std::string activemq::wireformat::stomp::StompHelper::convertMessageId (const Pointer< MessageId > & *messageId*)

Converts a MessageId instance to a Stomp MessageId String.

Parameters:

messageId - the MessageId instance to convert.

Returns:

a Stomp Message Id String.

6.603.3.7 Pointer<ProducerId> activemq::wireformat::stomp::StompHelper::convertProducerId (const std::string & *producerId*)

Converts a Stomp ProducerId string to a ProducerId.

Parameters:

producerId - the String Producer Id to convert.

Returns:

Pointer to a new ProducerId.

6.603.3.8 std::string activemq::wireformat::stomp::StompHelper::convertProducerId (const Pointer< ProducerId > & *producerId*)

Converts a ProducerId instance to a Stomp ProducerId String.

Parameters:

producerId - the Producer instance to convert.

Returns:

a Stomp Producer Id String.

6.603.3.9 void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< Message > & *message*, const Pointer< StompFrame > & *frame*)

Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 2903).

Parameters:

message - The message to move the Headers to.

frame - The frame to extract headers from.

6.603.3.10 void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< StompFrame > & *frame*, const Pointer< Message > & *message*)

Converts the Headers in a Stomp Frame into Headers in the given Message Command.

Parameters:

frame - The frame to extract headers from.

message - The message to move the Headers to.

6.603.3.11 Pointer<TransactionId> activemq::wireformat::stomp::StompHelper::convertTransactionId (const std::string & *transactionId*)

Converts a Stomp TransactionId string to a TransactionId.

Parameters:

transactionId - the String Transaction Id to convert.

Returns:

Pointer to a new TransactionId.

6.603.3.12 std::string activemq::wireformat::stomp::StompHelper::convertTransactionId (const Pointer< TransactionId > & *transactionId*)

Converts a TransactionId instance to a Stomp TransactionId String.

Parameters:

transactionId - the Transaction instance to convert.

Returns:

a Stomp Transaction Id String.

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompHelper.h**

6.604 activemq::wireformat::stomp::StompWireFormat Class Reference

`#include <src/main/activemq/wireformat/stomp/StompWireFormat.h>`Inheritance diagram for activemq::wireformat::stomp::StompWireFormat:

Public Member Functions

- **StompWireFormat** ()
- virtual ~**StompWireFormat** ()
- virtual void **marshal** (const **Pointer**< **commands::Command** > command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)

  Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

- virtual void **setVersion** (int version AMQCPP_UNUSED)

  Set the Version.

- virtual int **getVersion** () const

  Get the Version.

- std::string **getTopicPrefix** () const

  Gets the prefix used to address Topics.

- void **setTopicPrefix** (const std::string &prefix)

  Sets the prefix used to address Topics.

- std::string **getQueuePrefix** () const

  Gets the prefix used to address Queues.

- void **setQueuePrefix** (const std::string &prefix)

  Sets the prefix used to address Queues.

- std::string **getTempTopicPrefix** () const

  Gets the prefix used to address Temporary Topics.

- void **setTempTopicPrefix** (const std::string &prefix)

  Sets the prefix used to address Temporary Topics.

- std::string **getTempQueuePrefix** () const

  Gets the prefix used to address Temporary Queues.

- void **setTempQueuePrefix** (const std::string &prefix)

Sets the prefix used to address Temporary Queues.

- virtual bool **inReceive** () const

  Is there a Message being unmarshaled?

- virtual bool **hasNegotiator** () const

  *Returns true if this **WireFormat** (p. 3227) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual **Pointer< transport::Transport > createNegotiator** (const **Pointer< transport::Transport >** transport)

  If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

6.604.1 Constructor & Destructor Documentation

6.604.1.1 activemq::wireformat::stomp::StompWireFormat::StompWireFormat ()

6.604.1.2 virtual activemq::wireformat::stomp::StompWireFormat::~StompWireFormat () [virtual]

6.604.2 Member Function Documentation

6.604.2.1 virtual Pointer<transport::Transport> activemq::wireformat::stomp::StompWireFormat::createNegotiator (const Pointer< transport::Transport > *transport*) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns:

new instance of a **WireFormatNegotiator** (p. 3247).

Exceptions:

UnsupportedOperationException if the **WireFormat** (p. 3227) doesn't have a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3228).

6.604.2.2 std::string activemq::wireformat::stomp::StompWireFormat::getQueuePrefix () const

Gets the prefix used to address Queues.

Returns:

the string prefix used to address Queues.

6.604.2.3 std::string activemq::wireformat::stomp::StompWireFormat::getTempQueuePrefix () const

Gets the prefix used to address Temporary Queues.

Returns:

the string prefix used to address Temporary Queues.

6.604.2.4 std::string activemq::wireformat::stomp::StompWireFormat::getTempTopicPrefix () const

Gets the prefix used to address Temporary Topics.

Returns:

the string prefix used to address Temporary Topics.

6.604.2.5 std::string activemq::wireformat::stomp::StompWireFormat::getTopicPrefix () const

Gets the prefix used to address Topics.

Returns:

the string prefix used to address Topics.

6.604.2.6 virtual int activemq::wireformat::stomp::StompWireFormat::getVersion () const [inline, virtual]

Get the Version.

Returns:

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 3228).

6.604.2.7 virtual bool activemq::wireformat::stomp::StompWireFormat::hasNegotiator () const [inline, virtual]

Returns true if this **WireFormat** (p. 3227) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 3227) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3228).

6.604.2.8 virtual bool activemq::wireformat::stomp::StompWireFormat::inReceive () const [inline, virtual]

Is there a Message being unmarshaled?

Returns:

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 3229).

6.604.2.9 virtual void activemq::wireformat::stomp::StompWireFormat::marshal (const Pointer< commands::Command > *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal to the output stream.

transport *(p. 72)* The Transport that initiated this marshal call.

out The output stream to write the command to.

Exceptions:

IOException

Implements **activemq::wireformat::WireFormat** (p. 3229).

6.604.2.10 void activemq::wireformat::stomp::StompWireFormat::setQueuePrefix (const std::string & *prefix*)

Sets the prefix used to address Queues.

Parameters:

prefix The prefix to use.

6.604.2.11 void activemq::wireformat::stomp::StompWireFormat::setTempQueuePrefix (const std::string & *prefix*)

Sets the prefix used to address Temporary Queues.

Parameters:

prefix The prefix to use.

6.604.2.12 void activemq::wireformat::stomp::StompWireFormat::setTempTopicPrefix (const std::string & *prefix*)

Sets the prefix used to address Temporary Topics.

Parameters:

prefix The prefix to use.

6.604.2.13 void activemq::wireformat::stomp::StompWireFormat::setTopicPrefix (const std::string & *prefix*)

Sets the prefix used to address Topics.

Parameters:

prefix The prefix to use.

6.604.2.14 virtual void activemq::wireformat::stomp::StompWireFormat::setVersion (int version *AMQCPP_UNUSED*) [inline, virtual]

Set the Version.

Parameters:

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 3229).

6.604.2.15 virtual Pointer<commands::Command> activemq::wireformat::stomp::StompWireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) [virtual]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form. Returns a Pointer to the newly unmarshaled Command.

Parameters:

transport *(p. 72)* - Pointer to the **transport** (p. 72) that is making this request.

in - the input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException

Implements **activemq::wireformat::WireFormat** (p. 3229).

6.606 cms::Stoppable Class Reference

Interface for a class that implements the stop method.

`#include <src/main/cms/Stoppable.h>`Inheritance diagram for cms::Stoppable:

Public Member Functions

- virtual ~**Stoppable** ()
- virtual void **stop** ()=0

  Stops this service.

6.606.1 Detailed Description

Interface for a class that implements the stop method. An object that implements this interface implies that it will halt all operations that result in events being propagated to external users, internally the Object can continue to process data but not events will be generated to clients and methods that return data will not return valid results until the object is started again.

Since:

1.0

6.606.2 Constructor & Destructor Documentation

6.606.2.1 virtual cms::Stoppable::~Stoppable () [virtual]

6.606.3 Member Function Documentation

6.606.3.1 virtual void cms::Stoppable::stop () [pure virtual]

Stops this service.

Exceptions:

CMSException *(*p. ***979****)* - if an internal error occurs while stopping the Service.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 875), **activemq::cmsutil::PooledSession** (p. 2392), **activemq::core::ActiveMQConnection** (p. 265), **activemq::core::ActiveMQConsumer** (p. 302), **activemq::core::ActiveMQDestinationSource** (p. 340), **activemq::core::ActiveMQSession** (p. 444), **activemq::core::kernels::ActiveMQConsumerKernel** (p. 317), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 471).

Referenced by activemq::cmsutil::PooledSession::stop(), and activemq::cmsutil::CachedConsumer::stop().

The documentation for this class was generated from the following file:

- src/main/cms/**Stoppable.h**

6.607 decaf::util::logging::StreamHandler Class Reference

Stream based **logging** (p. 135) **Handler** (p. 1590).

`#include <src/main/decaf/util/logging/StreamHandler.h>`Inheritance diagram for decaf::util::logging::StreamHandler:

Public Member Functions

- **StreamHandler** ()

  *Create a **StreamHandler** (p. 2920), with no current output stream.*

- **StreamHandler** (**decaf::io::OutputStream** *stream, **Formatter** *formatter)

  *Create a **StreamHandler** (p. 2920), with no current output stream.*

- virtual ~**StreamHandler** ()
- virtual void **close** ()

  Close the current output stream.

- virtual void **flush** ()

  Flush the Handler's output, clears any buffers.

- virtual void **publish** (const **LogRecord** &record)

  *Publish the Log Record to this **Handler** (p. 1590).*

- virtual bool **isLoggable** (const **LogRecord** &record) const

  *Check if this **Handler** (p. 1590) would actually log a given **LogRecord** (p. 1960).*

Protected Member Functions

- virtual void **setOuputStream** (**decaf::io::OutputStream** *stream)

  Change the output stream.

- void **close** (bool closeStream)

  Closes this handler, but the underlying output stream is only closed if closeStream is true.

6.607.1 Detailed Description

Stream based **logging** (p. 135) **Handler** (p. 1590). This is primarily intended as a base class or support class to be used in implementing other **logging** (p. 135) Handlers.

LogRecords are published to a given `decaf::io::OutputStream` (p. 2348).

Configuration: By default each **StreamHandler** (p. 2920) is initialized using the following **LogManager** (p. 1954) configuration properties. If properties are not defined (or have invalid values) then the specified default values are used.

* decaf.util.logging.StreamHandler.level specifies the default level for the **Handler** (p. 1590) (defaults to **Level.INFO** (p. 1863)). * decaf.util.logging.StreamHandler.filter specifies the name of a **Filter** (p. 1520) class to use (defaults to no **Filter** (p. 1520)). * decaf.util.logging.StreamHandler.formatter specifies the name of a **Formatter** (p. 1569) class to use (defaults to **decaf.util.logging.SimpleFormatter** (p. 2759)).

Since:

1.0

6.607.2 Constructor & Destructor Documentation

6.607.2.1 decaf::util::logging::StreamHandler::StreamHandler ()

Create a **StreamHandler** (p. 2920), with no current output stream.

6.607.2.2 decaf::util::logging::StreamHandler::StreamHandler (decaf::io::OutputStream * *stream*, Formatter * *formatter*)

Create a **StreamHandler** (p. 2920), with no current output stream.

6.607.2.3 virtual decaf::util::logging::StreamHandler::~StreamHandler () [virtual]

6.607.3 Member Function Documentation

6.607.3.1 void decaf::util::logging::StreamHandler::close (bool *closeStream*) [protected]

Closes this handler, but the underlying output stream is only closed if closeStream is true.

Parameters:

closeStream whether to close the underlying output stream.

6.607.3.2 virtual void decaf::util::logging::StreamHandler::close () [virtual]

Close the current output stream. The close method will perform a flush and then close the **Handler** (p. 1590). After close has been called this **Handler** (p. 1590) should no longer be used. Method calls may either be silently ignored or may throw runtime exceptions.

Exceptions:

IOException if an I/O error occurs.

Implements **decaf::io::Closeable** (p. 967).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 1153).

6.607.3.3 virtual void decaf::util::logging::StreamHandler::flush () [virtual]

Flush the Handler's output, clears any buffers.

Implements **decaf::util::logging::Handler** (p. 1591).

6.607.3.4 virtual bool decaf::util::logging::StreamHandler::isLoggable (const LogRecord & *record*) const [virtual]

Check if this **Handler** (p. 1590) would actually log a given **LogRecord** (p. 1960).

Parameters:

record `LogRecord (p. 1960)` to check

Returns:

true if the record can be logged with current settings.

Reimplemented from **decaf::util::logging::Handler** (p. 1592).

6.607.3.5 virtual void decaf::util::logging::StreamHandler::publish (const LogRecord & *record*) [virtual]

Publish the Log Record to this **Handler** (p. 1590).

Parameters:

record The `LogRecord (p. 1960)` to Publish

Implements **decaf::util::logging::Handler** (p. 1592).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 1154).

6.607.3.6 virtual void decaf::util::logging::StreamHandler::setOuputStream (decaf::io::OutputStream * *stream*) [protected, virtual]

Change the output stream. If there is a current output stream then the Formatter's tail string is written and the stream is flushed and closed. Then the output stream is replaced with the new output stream.

Parameters:

stream The new output stream. May not be NULL.

Exceptions:

NullPointerException if the passed stream is NULL.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**StreamHandler.h**

6.608 cms::StreamMessage Class Reference

Interface for a **StreamMessage** (p. 2923).

`#include <src/main/cms/StreamMessage.h>`Inheritance diagram for cms::StreamMessage:

Public Member Functions

- virtual ~**StreamMessage** ()
- virtual **ValueType getNextValueType** () const =0

  *Returns the value type for the element in the **StreamMessage** (p. 2923).*

- virtual bool **readBoolean** () const =0

  Reads a Boolean from the Stream message stream.

- virtual void **writeBoolean** (bool value)=0

  Writes a boolean to the Stream message stream as a 1-byte value.

- virtual unsigned char **readByte** () const =0

  Reads a Byte from the Stream message stream.

- virtual void **writeByte** (unsigned char value)=0

  Writes a byte to the Stream message stream as a 1-byte value.

- virtual int **readBytes** (std::vector< unsigned char > &value) const =0

  Reads a byte array from the Stream message stream.

- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0

  Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

- virtual int **readBytes** (unsigned char *buffer, int length) const =0

  Reads a portion of the Stream message stream.

- virtual void **writeBytes** (const unsigned char *value, int offset, int length)=0

  Writes a portion of a byte array to the Stream message stream.

- virtual char **readChar** () const =0

  Reads a Char from the Stream message stream.

- virtual void **writeChar** (char value)=0

  Writes a char to the Stream message stream as a 1-byte value.

- virtual float **readFloat** () const =0

  Reads a 32 bit float from the Stream message stream.

- virtual void **writeFloat** (float value)=0

  Writes a float to the Stream message stream as a 4 byte value.

- virtual double **readDouble** () const =0

  Reads a 64 bit double from the Stream message stream.

- virtual void **writeDouble** (double value)=0

  Writes a double to the Stream message stream as a 8 byte value.

- virtual short **readShort** () const =0

  Reads a 16 bit signed short from the Stream message stream.

- virtual void **writeShort** (short value)=0

  Writes a signed short to the Stream message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const =0

  Reads a 16 bit unsigned short from the Stream message stream.

- virtual void **writeUnsignedShort** (unsigned short value)=0

  Writes a unsigned short to the Stream message stream as a 2 byte value.

- virtual int **readInt** () const =0

  Reads a 32 bit signed integer from the Stream message stream.

- virtual void **writeInt** (int value)=0

  Writes a signed int to the Stream message stream as a 4 byte value.

- virtual long long **readLong** () const =0

  Reads a 64 bit long from the Stream message stream.

- virtual void **writeLong** (long long value)=0

  Writes a long long to the Stream message stream as a 8 byte value.

- virtual std::string **readString** () const =0

  Reads an ASCII String from the Stream message stream.

- virtual void **writeString** (const std::string &value)=0

  Writes an ASCII String to the Stream message stream.

- virtual void **reset** ()=0

  Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

6.608.1 Detailed Description

Interface for a **StreamMessage** (p. 2923). The stream Messages provides a **Message** (p. 2090) type whose body is a stream of self describing primitive types. The primitive values are read and written using accessors specific to the given types.

StreamMessage (p. 2923) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 979). The string-to-primitive conversions may throw a runtime exception if the primitive's valueOf() method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X								X	
byte		X	X		X	X			X	
short			X		X	X			X	
char				X					X	
int					X	X			X	
long						X			X	
float							X	X	X	
double								X	X	
String	X	X	X		X	X	X	X	X	
byte[]										X

Since:

1.3

6.608.2 Constructor & Destructor Documentation

6.608.2.1 virtual cms::StreamMessage::~StreamMessage () [virtual]

6.608.3 Member Function Documentation

6.608.3.1 virtual ValueType cms::StreamMessage::getNextValueType () const [pure virtual]

Returns the value type for the element in the **StreamMessage** (p. 2923). The CMS provider should translate all internal type identifiers into the CMS Value types returning UNKNOWN_TYPE for any specialized types not directly supported in the CMS API. The call can fail if the **StreamMessage** (p. 2923) is currently in the middle of a ready of a Byte array.

Returns:

The ValueType contained in the next message element.

Exceptions:

CMSException *(p. **979**)* if no property exists that matches the requested key.

MessageEOFException *(p. **2170**)* - if unexpected end of message stream has been reached.

MessageFormatException *(p. **2172**)* - if the message contains invalid data.

MessageNotReadableException *(p. **2188**)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 479).

6.608.3.2 virtual bool cms::StreamMessage::readBoolean () const [pure virtual]

Reads a Boolean from the Stream message stream.

Returns:

boolean value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 479).

6.608.3.3 virtual unsigned char cms::StreamMessage::readByte () const [pure virtual]

Reads a Byte from the Stream message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 479).

6.608.3.4 virtual int cms::StreamMessage::readBytes (unsigned char * *buffer*, int *length*) const [pure virtual]

Reads a portion of the Stream message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an **CMSException** (p. 979) is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. ***2170****)* - if unexpected end of message stream has been reached.

MessageFormatException *(*p. ***2172****)* - if this type conversion is invalid.

MessageNotReadableException *(*p. ***2188****)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 480).

6.608.3.5 virtual int cms::StreamMessage::readBytes (std::vector< unsigned char > & *value*) const [pure virtual]

Reads a byte array from the Stream message stream. If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException *(*p. ***979****)* - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. ***2170****)* - if unexpected end of message stream has been reached.

MessageFormatException *(*p. ***2172****)* - if this type conversion is invalid.

MessageNotReadableException *(*p. ***2188****)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 480).

6.608.3.6 virtual char cms::StreamMessage::readChar () const [pure virtual]

Reads a Char from the Stream message stream.

Returns:

char value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 481).

6.608.3.7 virtual double cms::StreamMessage::readDouble () const [pure virtual]

Reads a 64 bit double from the Stream message stream.

Returns:

double value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 481).

6.608.3.8 virtual float cms::StreamMessage::readFloat () const [pure virtual]

Reads a 32 bit float from the Stream message stream.

Returns:

double value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 482).

6.608.3.9 virtual int cms::StreamMessage::readInt () const [pure virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns:

int value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 482).

6.608.3.10 virtual long long cms::StreamMessage::readLong () const [pure virtual]

Reads a 64 bit long from the Stream message stream.

Returns:

long long value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2188***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 482).

6.608.3.11 virtual short cms::StreamMessage::readShort () const [pure virtual]

Reads a 16 bit signed short from the Stream message stream.

Returns:

short value from stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2170***) - if unexpected end of message stream has been reached.

MessageFormatException *(*p. *2172)* - if this type conversion is invalid.
MessageNotReadableException *(*p. *2188)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 483).

6.608.3.12 virtual std::string cms::StreamMessage::readString () const [pure virtual]

Reads an ASCII String from the Stream message stream.

Returns:

String from stream

Exceptions:

CMSException *(*p. *979)* - if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(*p. *2170)* - if unexpected end of message stream has been reached.
MessageFormatException *(*p. *2172)* - if this type conversion is invalid.
MessageNotReadableException *(*p. *2188)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 483).

6.608.3.13 virtual unsigned short cms::StreamMessage::readUnsignedShort () const [pure virtual]

Reads a 16 bit unsigned short from the Stream message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSException *(*p. *979)* - if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(*p. *2170)* - if unexpected end of message stream has been reached.
MessageFormatException *(*p. *2172)* - if this type conversion is invalid.
MessageNotReadableException *(*p. *2188)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 483).

6.608.3.14 virtual void cms::StreamMessage::reset () [pure virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions:

CMSException *(*p. *979)* - If the provider fails to perform the reset operation.
MessageFormatException *(*p. *2172)* - If the **Message** (p. 2090) has an invalid format.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 484).

6.608.3.15 virtual void cms::StreamMessage::writeBoolean (bool *value*) [pure virtual]

Writes a boolean to the Stream message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value boolean to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 484).

6.608.3.16 virtual void cms::StreamMessage::writeByte (unsigned char *value*) [pure virtual]

Writes a byte to the Stream message stream as a 1-byte value.

Parameters:

value byte to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 485).

6.608.3.17 virtual void cms::StreamMessage::writeBytes (const unsigned char * *value*, int *offset*, int *length*) [pure virtual]

Writes a portion of a byte array to the Stream message stream. size as the number of bytes to write.

Parameters:

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 485).

6.608.3.18 virtual void cms::StreamMessage::writeBytes (const std::vector< unsigned char > & *value*) [pure virtual]

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters:

value bytes to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 485).

6.608.3.19 virtual void cms::StreamMessage::writeChar (char *value*) [pure virtual]

Writes a char to the Stream message stream as a 1-byte value.

Parameters:

value char to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 486).

6.608.3.20 virtual void cms::StreamMessage::writeDouble (double *value*) [pure virtual]

Writes a double to the Stream message stream as a 8 byte value.

Parameters:

value double to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 486).

6.608.3.21 virtual void cms::StreamMessage::writeFloat (float *value*) [pure virtual]

Writes a float to the Stream message stream as a 4 byte value.

Parameters:

value float to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 486).

6.608.3.22 virtual void cms::StreamMessage::writeInt (int *value*) [pure virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters:

value signed int to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 486).

6.608.3.23 virtual void cms::StreamMessage::writeLong (long long *value*) [pure virtual]

Writes a long long to the Stream message stream as a 8 byte value.

Parameters:

value signed long long to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 487).

6.608.3.24 virtual void cms::StreamMessage::writeShort (short *value*) [pure virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters:

value signed short to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 487).

6.608.3.25 virtual void cms::StreamMessage::writeString (const std::string & *value*) [pure virtual]

Writes an ASCII String to the Stream message stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 487).

6.608.3.26 virtual void cms::StreamMessage::writeUnsignedShort (unsigned short *value*) [pure virtual]

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters:

value unsigned short to write to the stream

Exceptions:

CMSException (p. ***979***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 488).

The documentation for this class was generated from the following file:

6.609 decaf::lang::String Class Reference

The **String** (p. 2935) class represents an immutable sequence of chars.

`#include <src/main/decaf/lang/String.h>`Inheritance diagram for decaf::lang::String:

Public Member Functions

- **String** ()

  *Creates a new empty **String** (p. 2935) object.*

- **String** (const **String** &source)

  *Create a new **String** (p. 2935) object that represents the given STL string.*

- **String** (const std::string &source)

  *Create a new **String** (p. 2935) object that represents the given STL string.*

- **String** (const char *array, int size)

  *Create a new **String** (p. 2935) object that represents the given array of characters.*

- **String** (const char *array, int size, int offset, int length)

  *Create a new **String** (p. 2935) object that represents the given array of characters.*

- virtual ~**String** ()
- **String** & **operator**= (const **String** &)
- **String** & **operator**= (const std::string &)
- bool **isEmpty** () const
- virtual int **length** () const

  Returns:

  the length of the underlying character sequence.

- virtual char **charAt** (int index) const

  Returns the Char at the specified index so long as the index is not greater than the length of the sequence.
  Parameters:

  ***index** The position to return the char at.*
  Returns:

  the char at the given position.
  Exceptions:

  ***IndexOutOfBoundsException** if index is > than **length()** (p. 950) or negative*

- virtual **CharSequence** * **subSequence** (int start, int end) const

  *Returns a new **CharSequence** (p. 949) that is a subsequence of this sequence.*
  The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.
  Parameters:

  ***start** The start index, inclusive.*

end *The end index, exclusive.*

Returns:

a new ***CharSequence*** *(p. 949)*

Exceptions:

IndexOutOfBoundsException *if start or end > **length()*** *(p. 950) or start or end are negative.*

- virtual std::string **toString** () const

  Returns:

  the string representation of this ***CharSequence*** *(p. 949)*

Static Public Member Functions

- static **String valueOf** (bool value)

  Returns a ***String*** *(p. 2935) that represents the value of the given boolean value.*

- static **String valueOf** (char value)

  Returns a ***String*** *(p. 2935) that represents the value of the given char value.*

- static **String valueOf** (float value)

  Returns a ***String*** *(p. 2935) that represents the value of the given float value.*

- static **String valueOf** (double value)

  Returns a ***String*** *(p. 2935) that represents the value of the given double value.*

- static **String valueOf** (short value)

  Returns a ***String*** *(p. 2935) that represents the value of the given short value.*

- static **String valueOf** (int value)

  Returns a ***String*** *(p. 2935) that represents the value of the given integer value.*

- static **String valueOf** (long long value)

  Returns a ***String*** *(p. 2935) that represents the value of the given 64bit long value.*

6.609.1 Detailed Description

The **String** (p. 2935) class represents an immutable sequence of chars.

Since:

1.0

6.609.2 Constructor & Destructor Documentation

6.609.2.1 decaf::lang::String::String ()

Creates a new empty **String** (p. 2935) object.

6.609.2.2 decaf::lang::String::String (const String & *source*)

Create a new **String** (p. 2935) object that represents the given STL string.

Parameters:

source The string to copy into this new **String** (p. 2935) object.

6.609.2.3 decaf::lang::String::String (const std::string & *source*)

Create a new **String** (p. 2935) object that represents the given STL string.

Parameters:

source The string to copy into this new **String** (p. 2935) object.

6.609.2.4 decaf::lang::String::String (const char * *array*, int *size*)

Create a new **String** (p. 2935) object that represents the given array of characters. The method takes the size of the array as a parameter to allow for strings that are not NULL terminated, the caller can pass strlen(array) in the case where the array is properly NULL terminated.

Parameters:

array The character buffer to copy into this new **String** (p. 2935) object.

size The size of the string buffer given, in case the string is not NULL terminated.

Exceptions:

NullPointerException if the character array parameter is NULL.

IndexOutOfBoundsException if the size parameter is negative.

6.609.2.5 decaf::lang::String::String (const char * *array*, int *size*, int *offset*, int *length*)

Create a new **String** (p. 2935) object that represents the given array of characters. The method takes the size of the array as a parameter to allow for strings that are not NULL terminated, the caller can pass strlen(array) in the case where the array is properly NULL terminated.

Parameters:

array The character buffer to copy into this new **String** (p. 2935) object.

size The size of the string buffer given, in case the string is not NULL terminated.

offset The position to start copying from in the given buffer.

length The number of bytes to copy from the given buffer starting from the offset.

Exceptions:

NullPointerException if the character array parameter is NULL.

IndexOutOfBoundsException if the size, offset or length parameter is negative or if the length to copy is greater than the span of size - offset.

6.609.2.6 virtual decaf::lang::String::~String () [virtual]

6.609.3 Member Function Documentation

6.609.3.1 virtual char decaf::lang::String::charAt (int *index*) const [virtual]

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters:

index The position to return the char at.

Returns:

the char at the given position.

Exceptions:

IndexOutOfBoundsException if index is > than **length()** (p. 950) or negative

Implements **decaf::lang::CharSequence** (p. 949).

6.609.3.2 bool decaf::lang::String::isEmpty () const

Returns:

true if the length of this **String** (p. 2935) is zero.

6.609.3.3 virtual int decaf::lang::String::length () const [virtual]

Returns:

the length of the underlying character sequence.

Implements **decaf::lang::CharSequence** (p. 950).

6.609.3.4 String& decaf::lang::String::operator= (const std::string &)

6.609.3.5 String& decaf::lang::String::operator= (const String &)

6.609.3.6 virtual CharSequence* decaf::lang::String::subSequence (int *start*, int *end*) const [virtual]

Returns a new **CharSequence** (p. 949) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters:

start The start index, inclusive.

end The end index, exclusive.

Returns:

a new **CharSequence** (p. 949)

Exceptions:

IndexOutOfBoundsException if start or end > **length()** (p. 950) or start or end are negative.

Implements **decaf::lang::CharSequence** (p. 950).

6.609.3.7 virtual std::string decaf::lang::String::toString () const [virtual]

Returns:

the string representation of this **CharSequence** (p. 949)

Implements **decaf::lang::CharSequence** (p. 950).

6.609.3.8 static String decaf::lang::String::valueOf (long long *value*) [static]

Returns a **String** (p. 2935) that represents the value of the given 64bit long value.

Parameters:

value The value whose string representation is to be returned.

Returns:

a **String** (p. 2935) that contains the string representation of the 64 bit long value given.

6.609.3.9 static String decaf::lang::String::valueOf (int *value*) [static]

Returns a **String** (p. 2935) that represents the value of the given integer value.

Parameters:

value The value whose string representation is to be returned.

Returns:

a **String** (p. 2935) that contains the string representation of the integer value given.

6.609.3.10 static String decaf::lang::String::valueOf (short *value*) [static]

Returns a **String** (p. 2935) that represents the value of the given short value.

Parameters:

value The value whose string representation is to be returned.

Returns:

a **String** (p. 2935) that contains the string representation of the short value given.

6.609.3.11 static String decaf::lang::String::valueOf (double *value*) [static]

Returns a **String** (p. 2935) that represents the value of the given double value.

Parameters:

value The value whose string representation is to be returned.

Returns:

a **String** (p. 2935) that contains the string representation of the double value given.

6.609.3.12 static String decaf::lang::String::valueOf (float *value*) [static]

Returns a **String** (p. 2935) that represents the value of the given float value.

Parameters:

value The value whose string representation is to be returned.

Returns:

a **String** (p. 2935) that contains the string representation of the float value given.

6.609.3.13 static String decaf::lang::String::valueOf (char *value*) [static]

Returns a **String** (p. 2935) that represents the value of the given char value.

Parameters:

value The value whose string representation is to be returned.

Returns:

a **String** (p. 2935) that contains the single character value given.

6.609.3.14 static String decaf::lang::String::valueOf (bool *value*) [static]

Returns a **String** (p. 2935) that represents the value of the given boolean value.

Parameters:

value The value whose string representation is to be returned.

Returns:

"true" if the boolean is true, "false" otherwise.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**String.h**

6.610 decaf::util::StringTokenizer Class Reference

Class that allows for parsing of string based on Tokens.

`#include <src/main/decaf/util/StringTokenizer.h>`

Public Member Functions

- **StringTokenizer** (const std::string &str, const std::string &delim=" \t\n\r\f", bool returnDelims=false)

  Constructs a string tokenizer for the specified string.

- virtual ~**StringTokenizer** ()
- virtual int **countTokens** () const

  Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.

- virtual bool **hasMoreTokens** () const

  Tests if there are more tokens available from this tokenizer's string.

- virtual std::string **nextToken** ()

  Returns the next token from this string tokenizer.

- virtual std::string **nextToken** (const std::string &delim)

  Returns the next token in this string tokenizer's string.

- virtual unsigned int **toArray** (std::vector< std::string > &array)

  Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

- virtual void **reset** (const std::string &str="", const std::string &delim="", bool returnDelims=false)

  Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

6.610.1 Detailed Description

Class that allows for parsing of string based on Tokens.

Since:

1.0

6.610.2 Constructor & Destructor Documentation

6.610.2.1 decaf::util::StringTokenizer::StringTokenizer (const std::string & *str*, const std::string & *delim* = " \t\n\r\f", bool *returnDelims* = false)

Constructs a string tokenizer for the specified string. All characters in the delim argument are the delimiters for separating tokens.

If the returnDelims flag is true, then the delimiter characters are also returned as tokens. Each delimiter is returned as a string of length one. If the flag is false, the delimiter characters are skipped and only serve as separators between tokens.

Note that if delim is "", this constructor does not throw an exception. However, trying to invoke other methods on the resulting **StringTokenizer** (p. 2941) may result in an Exception.

Parameters:

str - The string to tokenize

delim - String containing the delimiters

returnDelims - boolean indicating if the delimiters are returned as tokens

6.610.2.2 virtual decaf::util::StringTokenizer::~StringTokenizer () [virtual]

6.610.3 Member Function Documentation

6.610.3.1 virtual int decaf::util::StringTokenizer::countTokens () const [virtual]

Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception. The current position is not advanced.

Returns:

Count of remaining tokens

6.610.3.2 virtual bool decaf::util::StringTokenizer::hasMoreTokens () const [virtual]

Tests if there are more tokens available from this tokenizer's string.

Returns:

true if there are more tokens remaining

6.610.3.3 virtual std::string decaf::util::StringTokenizer::nextToken (const std::string & *delim*) [virtual]

Returns the next token in this string tokenizer's string. First, the set of characters considered to be delimiters by this **StringTokenizer** (p. 2941) object is changed to be the characters in the string delim. Then the next token in the string after the current position is returned. The current position is advanced beyond the recognized token. The new delimiter set remains the default after this call.

Parameters:

delim The string containing the new set of delimiters.

Returns:

next string in the token list

Exceptions:

NoSuchElementException *(p. 2260)* if there are no more tokens in this string.

6.610.3.4 virtual std::string decaf::util::StringTokenizer::nextToken () [virtual]

Returns the next token from this string tokenizer.

Returns:

string value of next token

Exceptions:

NoSuchElementException *(*p. *2260)* if there are no more tokens in this string.

6.610.3.5 virtual void decaf::util::StringTokenizer::reset (const std::string & *str* = "", const std::string & *delim* = "", bool *returnDelims* = false) [virtual]

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning. This allows this object to be reused, the caller need not create a new instance every time a String needs tokenizing.

∗ If set the string param will reset the string that this Tokenizer is working on. If set to "" no change is made. ∗ If set the delim param will reset the string that this Tokenizer is using to tokenizer the string. If set to "", no change is made ∗ If set the return Delims will set if this Tokenizer will return delimiters as tokens. Defaults to false.

Parameters:

str New String to tokenize or "", defaults to ""

delim New Delimiter String to use or "", defaults to ""

returnDelims Should the Tokenizer return delimiters as Tokens, default false

6.610.3.6 virtual unsigned int decaf::util::StringTokenizer::toArray (std::vector< std::string > & *array*) [virtual]

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

Parameters:

array - vector to place token strings in

Returns:

number of string placed into the vector

The documentation for this class was generated from the following file:

- src/main/decaf/util/**StringTokenizer.h**

6.611 decaf::internal::util::StringUtils Class Reference

`#include <src/main/decaf/internal/util/StringUtils.h>`

Public Member Functions

- virtual ~**StringUtils** ()

Static Public Member Functions

- static int **compareIgnoreCase** (const char *left, const char *right)

  Perform a comparison between two strings using natural ordering and ignoring case.

- static int **compare** (const char *left, const char *right)

  Perform a comparison between two strings using natural ordering case is not ignored here, so two otherwise equal string will not match if case differes.

6.611.1 Constructor & Destructor Documentation

6.611.1.1 virtual decaf::internal::util::StringUtils::~StringUtils () [inline, virtual]

6.611.2 Member Function Documentation

6.611.2.1 static int decaf::internal::util::StringUtils::compare (const char * *left*, const char * *right*) [static]

Perform a comparison between two strings using natural ordering case is not ignored here, so two otherwise equal string will not match if case differes.

Parameters:

left The left-hand string of the comparison.

right The right-hand string of the comparison.

Returns:

a negative integer, zero, or a positive integer as the specified string is greater than, equal to, or less than this String, ignoring case considerations.

6.611.2.2 static int decaf::internal::util::StringUtils::compareIgnoreCase (const char * *left*, const char * *right*) [static]

Perform a comparison between two strings using natural ordering and ignoring case.

Parameters:

left The left-hand string of the comparison.

right The right-hand string of the comparison.

Returns:

a negative integer, zero, or a positive integer as the specified string is greater than, equal to, or less than this String, ignoring case considerations.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.612.2.2 virtual void activemq::commands::SubscriptionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

6.612.2.3 virtual bool activemq::commands::SubscriptionInfo::equals (const DataStructure * *value*) const [virtual]

6.612.2.4 virtual std::string& activemq::commands::SubscriptionInfo::getClientId () [virtual]

6.612.2.5 virtual const std::string& activemq::commands::SubscriptionInfo::getClientId () const [virtual]

6.612.2.6 virtual unsigned char activemq::commands::SubscriptionInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.612.2.7 virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination () [virtual]

6.612.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination () const [virtual]

6.612.2.9 virtual std::string& activemq::commands::SubscriptionInfo::getSelector () [virtual]

6.612.2.10 virtual const std::string& activemq::commands::SubscriptionInfo::getSelector () const [virtual]

6.612.2.11 virtual std::string& activemq::commands::SubscriptionInfo::getSubcriptionName () [virtual]

6.612.2.12 virtual const std::string& activemq::commands::SubscriptionInfo::getSubcriptionName () const [virtual]

6.612.2.13 virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination () [virtual]

6.612.2.14 virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination () const [virtual]

6.612.2.15 virtual void activemq::commands::SubscriptionInfo::setClientId (const std::string & *clientId*) [virtual]

6.612.2.16 virtual void activemq::commands::SubscriptionInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.612.2.17 virtual void activemq::commands::SubscriptionInfo::setSelector (const std::string & *selector*) [virtual]

6.612.2.18 virtual void activemq::commands::SubscriptionInfo::setSubcriptionName (const std::string & *subcriptionName*) [virtual]

6.612.2.19 virtual void activemq::commands::SubscriptionInfo::setSubscribedDestination (const Pointer< ActiveMQDestination > & *subscribedDestination*) [virtual]

6.612.2.20 virtual std::string activemq::commands::SubscriptionInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

6.612.3 Field Documentation

6.612.3.1 std::string activemq::commands::SubscriptionInfo::clientId [protected]

6.612.3.2 Pointer<ActiveMQDestination> activemq::commands::SubscriptionInfo::destination [protected]

6.612.3.3 const unsigned char activemq::commands::SubscriptionInfo::ID_SUBSCRIPTIONINFO = 55 [static]

6.612.3.4 std::string activemq::commands::SubscriptionInfo::selector [protected]

6.612.3.5 std::string activemq::commands::SubscriptionInfo::subcriptionName [protected]

6.612.3.6 Pointer<ActiveMQDestination> activemq::commands::SubscriptionInfo::subscribedDestination [protected]

6.613 activemq::wireformat::openwire::marshal::generated::SubscriptionI Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2950).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/SubscriptionInfoMarshaller.h>I`
diagram for activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller:

Public Member Functions

- **SubscriptionInfoMarshaller** ()
- virtual ~**SubscriptionInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.613.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2950). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.613.2 Constructor & Destructor Documentation

6.613.2.1 activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::Subscrip () [inline]

6.613.2.2 virtual activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::~Subscr () [inline, virtual]

6.613.3 Member Function Documentation

6.613.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::createObje () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.613.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::getDataStr () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.613.3.3 virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::looseMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.613.3.4 virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::looseUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.613.3.5 virtual int activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.613.3.6 virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.613.3.7 virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**SubscriptionInfoMarshaller.h**

6.614 decaf::util::concurrent::Synchronizable Class Reference

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

`#include <src/main/decaf/util/concurrent/Synchronizable.h>`Inheritance diagram for decaf::util::concurrent::Synchronizable:

Public Member Functions

- virtual ~**Synchronizable** ()
- virtual void **lock** ()=0

  Locks the object.

- virtual bool **tryLock** ()=0

  *Attempts to **Lock** (p. 1924) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** ()=0

  Unlocks the object.

- virtual void **wait** ()=0

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)=0

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)=0

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()=0

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()=0

  Signals the waiters on this object that it can now wake up and continue.

6.614.1 Detailed Description

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

Since:

1.0

6.614.2 Constructor & Destructor Documentation

6.614.2.1 virtual decaf::util::concurrent::Synchronizable::~Synchronizable () [virtual]

6.614.3 Member Function Documentation

6.614.3.1 virtual void decaf::util::concurrent::Synchronizable::lock () [pure virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1514), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2765), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2965), **decaf::io::InputStream** (p. 1710), **decaf::io::OutputStream** (p. 2351), **decaf::util::AbstractCollection< E >** (p. 148), **decaf::util::AbstractMap< K, V >** (p. 168), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1068), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1214), **decaf::util::concurrent::Mutex** (p. 2237), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2878), **decaf::util::StlQueue< T >** (p. 2888), **decaf::util::AbstractCollection< ServiceListener * >** (p. 148), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 148), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 148), **decaf::util::AbstractCollection< Resource * >** (p. 148), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 148), **decaf::util::AbstractCollection< CompositeTask * >** (p. 148), **decaf::util::AbstractCollection< URI >** (p. 148), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 148), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 148), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 148), **decaf::util::AbstractCollection< V >** (p. 148), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 148), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 148), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 148), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 148), **decaf::util::AbstractCollection< cms::Destination * >** (p. 148), **decaf::util::AbstractCollection< cms::Session * >** (p. 148), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 148), **decaf::util::AbstractCollection< cms::Connection * >** (p. 148), **decaf::util::AbstractCollection< K >** (p. 148), **decaf::util::AbstractMap< E, Set< E > * >** (p. 168), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1068), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2878), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2878), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2878), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2878), **decaf::util::StlMap< std::string, cms::Queue ***

> (p. 2878), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2878), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2878), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2878), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2878), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2878).

6.614.3.2 virtual void decaf::util::concurrent::Synchronizable::notify () [pure virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1514), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2765), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2965), **decaf::io::InputStream** (p. 1711), **decaf::io::OutputStream** (p. 2351), **decaf::util::AbstractCollection< E >** (p. 148), **decaf::util::AbstractMap< K, V >** (p. 169), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1069), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1214), **decaf::util::concurrent::Mutex** (p. 2237), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2878), **decaf::util::StlQueue< T >** (p. 2888), **decaf::util::AbstractCollection< ServiceListener * >** (p. 148), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 148), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 148), **decaf::util::AbstractCollection< Resource * >** (p. 148), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 148), **decaf::util::AbstractCollection< CompositeTask * >** (p. 148), **decaf::util::AbstractCollection< URI >** (p. 148), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 148), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 148), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 148), **decaf::util::AbstractCollection< V >** (p. 148), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 148), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 148), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 148), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 148), **decaf::util::AbstractCollection< cms::Destination * >** (p. 148), **decaf::util::AbstractCollection< cms::Session * >** (p. 148), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 148), **decaf::util::AbstractCollection< cms::Connection * >** (p. 148), **decaf::util::AbstractCollection< K >** (p. 148), **decaf::util::AbstractMap< E, Set< E > * >** (p. 169), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1069), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1069), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1069), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1069), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2878), **decaf::util::StlMap< std::string,**

WireFormatFactory * > (p. 2878), **decaf::util::StlMap< decaf::lang::Runnable** *, **decaf::util::TimerTask** * > (p. 2878), **decaf::util::StlMap< std::string, PrimitiveValueNode** > (p. 2878), **decaf::util::StlMap< std::string, cms::Queue** * > (p. 2878), **decaf::util::StlMap< std::string, CachedConsumer** * > (p. 2878), **decaf::util::StlMap< std::string, TransportFactory** * > (p. 2878), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR** > (p. 2878), **decaf::util::StlMap< std::string, CachedProducer** * > (p. 2878), and **decaf::util::StlMap< std::string, cms::Topic** * > (p. 2878).

6.614.3.3 virtual void decaf::util::concurrent::Synchronizable::notifyAll () [pure virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1515), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2766), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2965), **decaf::io::InputStream** (p. 1711), **decaf::io::OutputStream** (p. 2351), **decaf::util::AbstractCollection< E >** (p. 148), **decaf::util::AbstractMap< K, V >** (p. 169), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1069), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1215), **decaf::util::concurrent::Mutex** (p. 2237), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2878), **decaf::util::StlQueue< T >** (p. 2888), **decaf::util::AbstractCollection< ServiceListener** * > (p. 148), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 148), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 148), **decaf::util::AbstractCollection< Resource** * > (p. 148), **decaf::util::AbstractCollection< cms::MessageConsumer** * > (p. 148), **decaf::util::AbstractCollection< CompositeTask** * > (p. 148), **decaf::util::AbstractCollection< URI >** (p. 148), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 148), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 148), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 148), **decaf::util::AbstractCollection< V >** (p. 148), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 148), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 148), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 148), **decaf::util::AbstractCollection< cms::MessageProducer** * > (p. 148), **decaf::util::AbstractCollection< cms::Destination** * > (p. 148), **decaf::util::AbstractCollection< cms::Session** * > (p. 148), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 148), **decaf::util::AbstractCollection< cms::Connection** * > (p. 148), **decaf::util::AbstractCollection< K >** (p. 148), **decaf::util::AbstractMap< E, Set< E >** * > (p. 169), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR** > (p. 1069), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR** > (p. 1069), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR** > (p. 1069),

decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1069), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2878), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2878), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2878), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2878), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2878), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2878), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2878), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2878), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2878), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2878).

6.614.3.4 virtual bool decaf::util::concurrent::Synchronizable::tryLock () [pure virtual]

Attempts to **Lock** (p. 1924) the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1516), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2767), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2966), **decaf::io::InputStream** (p. 1714), **decaf::io::OutputStream** (p. 2352), **decaf::util::AbstractCollection< E >** (p. 151), **decaf::util::AbstractMap< K, V >** (p. 169), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1074), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1218), **decaf::util::concurrent::Mutex** (p. 2238), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2881), **decaf::util::StlQueue< T >** (p. 2889), **decaf::util::AbstractCollection< ServiceListener * >** (p. 151), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 151), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 151), **decaf::util::AbstractCollection< Resource * >** (p. 151), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 151), **decaf::util::AbstractCollection< CompositeTask * >** (p. 151), **decaf::util::AbstractCollection< URI >** (p. 151), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 151), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 151), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 151), **decaf::util::AbstractCollection< V >** (p. 151), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 151), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 151), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 151), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 151), **decaf::util::AbstractCollection< cms::Destination * >** (p. 151), **decaf::util::AbstractCollection< cms::Session * >** (p. 151), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 151), **decaf::util::AbstractCollection< cms::Connection * >** (p. 151), **decaf::util::AbstractCollection< K >** (p. 151), **decaf::util::AbstractMap< E, Set< E > * >** (p. 169), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR**

> (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1074), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2881), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2881), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2881), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2881), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2881), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2881), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2881), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2881), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2881), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2881).

6.614.3.5 virtual void decaf::util::concurrent::Synchronizable::unlock () [pure virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1516), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2767), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2966), **decaf::io::InputStream** (p. 1714), **decaf::io::OutputStream** (p. 2352), **decaf::util::AbstractCollection< E >** (p. 151), **decaf::util::AbstractMap< K, V >** (p. 169), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1074), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1219), **decaf::util::concurrent::Mutex** (p. 2238), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2881), **decaf::util::StlQueue< T >** (p. 2890), **decaf::util::AbstractCollection< ServiceListener * >** (p. 151), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 151), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 151), **decaf::util::AbstractCollection< Resource * >** (p. 151), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 151), **decaf::util::AbstractCollection< CompositeTask * >** (p. 151), **decaf::util::AbstractCollection< URI >** (p. 151), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 151), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 151), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 151), **decaf::util::AbstractCollection< V >** (p. 151), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 151), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 151), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 151), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 151), **decaf::util::AbstractCollection< cms::Destination * >** (p. 151), **decaf::util::AbstractCollection< cms::Session * >** (p. 151), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 151), **decaf::util::AbstractCollection< cms::Connection * >** (p. 151), **decaf::util::AbstractCollection< K >** (p. 151), **decaf::util::AbstractMap< E, Set< E > * >** (p. 169), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId**

>, **Pointer< SessionState >**, **SessionId::COMPARATOR** > (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR** > (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR** > (p. 1074), **decaf::util::StlMap< cms::Session** *, **SessionResolver** * > (p. 2881), **decaf::util::StlMap< std::string, WireFormatFactory** * > (p. 2881), **decaf::util::StlMap< decaf::lang::Runnable** *, **decaf::util::TimerTask** * > (p. 2881), **decaf::util::StlMap< std::string, PrimitiveValueNode** > (p. 2881), **decaf::util::StlMap< std::string, cms::Queue** * > (p. 2881), **decaf::util::StlMap< std::string, CachedConsumer** * > (p. 2881), **decaf::util::StlMap< std::string, TransportFactory** * > (p. 2881), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR** > (p. 2881), **decaf::util::StlMap< std::string, CachedProducer** * > (p. 2881), and **decaf::util::StlMap< std::string, cms::Topic** * > (p. 2881).

6.614.3.6 virtual void decaf::util::concurrent::Synchronizable::wait (long long *millisecs*, int *nanos*) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1516), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2767), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2966), **decaf::io::InputStream** (p. 1715), **decaf::io::OutputStream** (p. 2352), **decaf::util::AbstractCollection< E >** (p. 151), **decaf::util::AbstractMap< K, V >** (p. 170), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1075), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1219), **decaf::util::concurrent::Mutex** (p. 2238), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2882), **decaf::util::StlQueue< T >** (p. 2890), **decaf::util::AbstractCollection< ServiceListener** * > (p. 151), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 151), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 151), **decaf::util::AbstractCollection< Resource**

* > (p. 151), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 151), **decaf::util::AbstractCollection< CompositeTask * >** (p. 151), **decaf::util::AbstractCollection< URI >** (p. 151), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 151), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 151), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 151), **decaf::util::AbstractCollection< V >** (p. 151), **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 151), **decaf::util::AbstractCollection< decaf::net::URI >** (p. 151), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 151), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 151), **decaf::util::AbstractCollection< cms::Destination * >** (p. 151), **decaf::util::AbstractCollection< cms::Session * >** (p. 151), **decaf::util::AbstractCollection< Pointer< ActiveMQDestination > >** (p. 151), **decaf::util::AbstractCollection< cms::Connection * >** (p. 151), **decaf::util::AbstractCollection< K >** (p. 151), **decaf::util::AbstractMap< E, Set< E > * >** (p. 170), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1075), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1075), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1075), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1075), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2882), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2882), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2882), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2882), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2882), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2882), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2882), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2882), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2882), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2882).

6.614.3.7 virtual void decaf::util::concurrent::Synchronizable::wait (long long *millisecs*) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1517), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2768), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2967), **decaf::io::InputStream** (p. 1715), **decaf::io::OutputStream** (p. 2353), **decaf::util::AbstractCollection<**

6.615 decaf::internal::util::concurrent::SynchronizableImpl Class Reference

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

`#include <src/main/decaf/internal/util/concurrent/SynchronizableImpl.h>`Inheritance diagram for decaf::internal::util::concurrent::SynchronizableImpl:

Public Member Functions

- **SynchronizableImpl** ()
- virtual ~**SynchronizableImpl** ()
- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.615.1 Detailed Description

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

Since:

1.0

6.615.2 Constructor & Destructor Documentation

6.615.2.1 decaf::internal::util::concurrent::SynchronizableImpl::SynchronizableImpl ()

6.615.2.2 virtual decaf::internal::util::concurrent::SynchronizableImpl::~SynchronizableImpl () [virtual]

6.615.3 Member Function Documentation

6.615.3.1 virtual void decaf::internal::util::concurrent::SynchronizableImpl::lock () [virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

6.615.3.2 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notify () [virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.615.3.3 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notifyAll () [virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.615.3.4 virtual bool decaf::internal::util::concurrent::SynchronizableImpl::tryLock () [virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.615.3.5 virtual void decaf::internal::util::concurrent::SynchronizableImpl::unlock () [virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.615.3.6 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long *millisecs*, int *nanos*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.615.3.7 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long *millisecs*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.615.3.8 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait () [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/**SynchronizableImpl.h**

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(p. 1006).*

- virtual int **drainTo** (**Collection**< E > &c)

  Removes all available elements from this queue and adds them to the given collection.

- virtual int **drainTo** (**Collection**< E > &c, int maxElements)

  Removes at most the given number of available elements from this queue and adds them to the given collection.

6.617.1 Detailed Description

template<typename E> class decaf::util::concurrent::SynchronousQueue< E >

A **blocking queue** (p. 690) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa. A synchronous queue does not have any **internal** (p. 97) capacity, not even a capacity of one. You cannot `peek` at a synchronous queue because an element is only present when you try to remove it; you cannot insert an element (using any method) unless another thread is trying to remove it; you cannot iterate as there is nothing to

iterate. The *head* of the queue is the element that the first queued inserting thread is trying to add to the queue; if there is no such queued thread then no element is available for removal and `poll()` (p. 2975) will return `null`. For purposes of other `Collection` (p. 1006) methods (for example `contains`), a `SynchronousQueue` (p. 2969) acts as an empty collection. This queue does not permit `null` elements.

Synchronous queues are similar to rendezvous channels used in CSP and Ada. They are well suited for handoff designs, in which an object running in one thread must sync up with an object running in another thread in order to hand it some information, event, or task.

This class supports an optional fairness policy for ordering waiting producer and consumer threads. By default, this ordering is not guaranteed. However, a queue constructed with fairness set to `true` grants threads access in FIFO order.

This class and its iterator implement all of the *optional* methods of the **Collection** (p. 1006) and **Iterator** (p. 1802) interfaces.

Since:

1.0

6.617.2 Constructor & Destructor Documentation

6.617.2.1 template<typename E > decaf::util::concurrent::SynchronousQueue< E >::SynchronousQueue () [inline]

6.617.2.2 template<typename E > virtual decaf::util::concurrent::SynchronousQueue< E >::~SynchronousQueue () [inline, virtual]

6.617.3 Member Function Documentation

6.617.3.1 template<typename E > virtual void decaf::util::concurrent::SynchronousQueue< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

This implementation repeatedly invokes poll until it returns false. This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 177).

6.617.3.2 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::contains (const E &value *DECAF_UNUSED*) const [inline, virtual]

6.617.3.3 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::containsAll (const Collection< E > & *collection*) const [inline, virtual]

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false. This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 146).

References decaf::util::Collection< E >::isEmpty().

6.617.3.4 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::drainTo (Collection< E > & *c*, int *maxElements*) [inline, virtual]

Removes at most the given number of available elements from this queue and adds them to the given collection. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters:

c the collection to transfer elements into

maxElements the maximum number of elements to transfer

Returns:

the number of elements transferred

Exceptions:

UnsupportedOperationException if addition of elements is not supported by the specified collection

IllegalArgumentException if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 692).

References decaf::util::Collection< E >::add(), decaf::util::AbstractQueue< E >::element(), and decaf::util::concurrent::SynchronousQueue< E >::poll().

6.617.3.5 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::drainTo (Collection< E > & *c*) [inline, virtual]

Removes all available elements from this queue and adds them to the given collection. This operation may be more efficient than repeatedly polling this queue. A failure encountered while

attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters:

c the collection to transfer elements into

Returns:

the number of elements transferred

Exceptions:

UnsupportedOperationException if addition of elements is not supported by the specified collection

IllegalArgumentException if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 693).

References decaf::util::Collection< E >::add(), decaf::util::AbstractQueue< E >::element(), and decaf::util::concurrent::SynchronousQueue< E >::poll().

6.617.3.6 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 1006) and the one given are the same size and if each element contained in the **Collection** (p. 1006) given is equal to an element contained in this collection.

Parameters:

collection - The **Collection** (p. 1006) to be compared to this one.

Returns:

true if this **Collection** (p. 1006) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

6.617.3.7 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::isEmpty () const [inline, virtual]

Returns true if this collection contains no elements. This implementation returns **size()** (p. 2977) == 0.

Returns:

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

6.617.3.8 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::SynchronousQueue< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1799).

6.617.3.9 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::SynchronousQueue< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1800).

6.617.3.10 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::offer (const E & *value*) [inline, virtual]

Inserts the specified element into this queue, if another thread is waiting to receive it.

Parameters:

value the element to add to the **Queue** (p. 2515)

Returns:

`true` if the element was added to this queue, else `false`

Exceptions:

NullPointerException if the **Queue** (p. 2515) implementation does not allow Null values to be inserted into the **Queue** (p. 2515).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2516).

6.617.3.11 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::offer (const E & *e*, long long *timeout*, const TimeUnit & *unit*) [inline, virtual]

Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.

Returns:

`true` if successful, or `false` if the specified waiting time elapses before a consumer appears.

Exceptions:

InterruptedException Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

NullPointerException Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

IllegalArgumentException Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 693).

6.617.3.12 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::peek (E &result *DECAF_UNUSED*) const [inline, virtual]

6.617.3.13 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::poll (E & *result*) [inline, virtual]

Retrieves and removes the head of this queue, if another thread is currently making an element available.

Parameters:

result a reference to the value where the head of the **Queue** (p. 2515) should be copied to.

Returns:

true if the head of the **Queue** (p. 2515) was copied to the result param or false if no value could be returned.

Implements **decaf::util::Queue< E >** (p. 2517).

6.617.3.14 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::poll (E & *result*, long long *timeout*, const TimeUnit & *unit*) [inline, virtual]

Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.

Parameters:

result a reference to the value where the head of the **Queue** (p. 2515) should be copied to.

timeout the time that the method should block if there is no element available to return.

unit the Time Units that the timeout value represents.

Returns:

true if the head of the **Queue** (p. 2515) was copied to the result param or false if no value could be returned.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 694).

Referenced by decaf::util::concurrent::SynchronousQueue< E >::drainTo().

6.617.3.15 template<typename E > virtual void decaf::util::concurrent::SynchronousQueue< E >::put (const E & *value*) [inline, virtual]

Adds the specified element to this queue, waiting if necessary for another thread to receive it.

Parameters:

value the element to add to the **Queue** (p. 2515).

Exceptions:

InterruptedException Inserts the specified element into this queue, waiting if necessary for space to become available.

NullPointerException Inserts the specified element into this queue, waiting if necessary for space to become available.

IllegalArgumentException Inserts the specified element into this queue, waiting if necessary for space to become available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 694).

6.617.3.16 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::remainingCapacity () const [inline, virtual]

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit. Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns:

the remaining capacity

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 695).

6.617.3.17 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::remove (const E &value *DECAF_UNUSED*) [inline, virtual]

6.617.3.18 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::removeAll (const Collection< E > &collection *DECAF_UNUSED*) [inline, virtual]

6.617.3.19 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::retainAll (const Collection< E > &collection *DECAF_UNUSED*) [inline, virtual]

6.617.3.20 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1015).

6.617.3.21 template<typename E > virtual E decaf::util::concurrent::SynchronousQueue< E >::take () [inline, virtual]

Retrieves and removes the head of this queue, waiting if necessary for another thread to insert it.

Returns:

the head of this queue

Exceptions:

InterruptedException Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 695).

6.617.3.22 template<typename E > virtual std::vector<E> decaf::util::concurrent::SynchronousQueue< E >::toArray () const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1006). All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns:

an vector of copies of all the elements from this **Collection** (p. 1006)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 150).

The documentation for this class was generated from the following file:

Public Member Functions

- virtual ~**System** ()

Static Public Member Functions

- static void **arraycopy** (const char *src, std::size_t srcPos, char *dest, std::size_t destPos, std::size_t length)

  Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const unsigned char *src, std::size_t srcPos, unsigned char *dest, std::size_t destPos, std::size_t length)

  Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const short *src, std::size_t srcPos, short *dest, std::size_t destPos, std::size_t length)

  Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const int *src, std::size_t srcPos, int *dest, std::size_t destPos, std::size_t length)

  Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const long long *src, std::size_t srcPos, long long *dest, std::size_t destPos, std::size_t length)

  Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const float *src, std::size_t srcPos, float *dest, std::size_t destPos, std::size_t length)

  Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const double *src, std::size_t srcPos, double *dest, std::size_t destPos, std::size_t length)

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- template<typename E >
  static void **arraycopy** (const E *src, std::size_t srcPos, E *dest, std::size_t destPos, std::size_t length)

  Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static const **util::Map**< std::string, std::string > & **getenv** ()

  Enumerates the system environment and returns a map of env variable names to the string values they hold.

- static std::string **getenv** (const std::string &name)

  Reads an environment value from the system and returns it as a string object.

- static void **unsetenv** (const std::string &name)

  Clears a set environment value if one is set.

- static void **setenv** (const std::string &name, const std::string &value)

  Sets the specified system property to the value given.

- static long long **currentTimeMillis** ()

  Returns the current time in milliseconds.

- static long long **nanoTime** ()

  Returns the current value of the most precise available system timer, in nanoseconds.

- static int **availableProcessors** ()

  Returns the number of processors available for execution of Decaf Threads.

- static **decaf::util::Properties** & **getProperties** ()

  Gets the Properties object that holds the Properties accessed from calls to getProperty and setProperty.

- static std::string **getProperty** (const std::string &key)

  *Gets the specified **System** (p. 2979) property if set, otherwise returns an empty string.*

- static std::string **getProperty** (const std::string &key, const std::string &defaultValue)

  *Gets the specified **System** (p. 2979) property if set, otherwise returns the specified default value.*

- static std::string **setProperty** (const std::string &key, const std::string &value)

  *Sets the **System** (p. 2979) Property to the specified value.*

- static std::string **clearProperty** (const std::string &key)

  Clear any value associated with the system property specified.

1.0

6.618.2 Constructor & Destructor Documentation

6.618.2.1 decaf::lang::System::System () [protected]

6.618.2.2 virtual decaf::lang::System::~System () [inline, virtual]

6.618.3 Member Function Documentation

6.618.3.1 template<typename E > static void decaf::lang::System::arraycopy (const E * *src*, std::size_t *srcPos*, E * *dest*, std::size_t *destPos*, std::size_t *length*) [inline, static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters:

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions:

NullPointerException if src or dest are NULL.

References NULL.

6.618.3.2 static void decaf::lang::System::arraycopy (const double * *src*, std::size_t *srcPos*, double * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters:

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions:

NullPointerException if src or dest are NULL.

6.618.3.3 static void decaf::lang::System::arraycopy (const float * *src*, std::size_t *srcPos*, float * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters:

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions:

NullPointerException if src or dest are NULL.

6.618.3.4 static void decaf::lang::System::arraycopy (const long long * *src*, std::size_t *srcPos*, long long * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters:

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions:

NullPointerException if src or dest are NULL.

6.618.3.5 static void decaf::lang::System::arraycopy (const int * *src*, std::size_t *srcPos*, int * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters:

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions:

NullPointerException if src or dest are NULL.

6.618.3.6 static void decaf::lang::System::arraycopy (const short * *src*, std::size_t *srcPos*, short * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters:

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions:

NullPointerException if src or dest are NULL.

6.618.3.7 static void decaf::lang::System::arraycopy (const unsigned char * *src*, std::size_t *srcPos*, unsigned char * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters:

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions:

NullPointerException if src or dest are NULL.

6.618.3.8 static void decaf::lang::System::arraycopy (const char * *src*, std::size_t *srcPos*, char * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters:

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions:

NullPointerException if src or dest are NULL.

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent(), decaf::lang::ArrayPointer< HashMapEntry * >::clone(), decaf::util::ArrayList< Pointer< ActiveMQDestination > >::ensureCapacity(), decaf::util::ArrayList< Pointer< ActiveMQDestination > >::removeAt(), and decaf::util::ArrayList< Pointer< ActiveMQDestination > >::trimToSize().

6.618.3.9 static int decaf::lang::System::availableProcessors () [static]

Returns the number of processors available for execution of Decaf Threads. This value may change during a particular execution of a Decaf based application. Applications that are sensitive to the number of available processors should therefore occasionally poll this property and adjust their resource usage appropriately.

Returns:

the number of available processors.

6.618.3.10 static std::string decaf::lang::System::clearProperty (const std::string & *key*) [static]

Clear any value associated with the system property specified.

Parameters:

key The key name of the system property to clear.

Returns:

the previous value of the property named by key if there was one, otherwise returns an empty string.

Exceptions:

IllegalArgumentException if key is an empty string.

6.618.3.11 static long long decaf::lang::System::currentTimeMillis () [static]

Returns the current time in milliseconds. Note that while the unit of time of the return value is a millisecond, the granularity of the value depends on the underlying operating system and may be larger. For example, many operating systems measure time in units of tens of milliseconds.

See the description of the class Date for a discussion of slight discrepancies that may arise between "computer time" and coordinated universal time (UTC).

Returns:

the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.

6.618.3.12 static std::string decaf::lang::System::getenv (const std::string & *name*) [static]

Reads an environment value from the system and returns it as a string object.

Parameters:

name The environment variable to read.

Returns:

a string with the value from the variables or ""

Exceptions:

***an* Exception** (p. 1458) if an error occurs while reading the Env.

6.618.3.13 static const util::Map<std::string, std::string>& decaf::lang::System::getenv () [static]

Enumerates the system environment and returns a map of env variable names to the string values they hold.

Returns:

A Map of all environment variables.

Exceptions:

Exception *(p. 1458)* if an error occurs while getting the Environment Map.

6.618.3.14 static decaf::util::Properties& decaf::lang::System::getProperties () [static]

Gets the Properties object that holds the Properties accessed from calls to getProperty and setProperty. If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Returns:

a reference to the static system Properties object.

6.618.3.15 static std::string decaf::lang::System::getProperty (const std::string & *key*, const std::string & *defaultValue*) [static]

Gets the specified **System** (p. 2979) property if set, otherwise returns the specified default value. If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Parameters:

key The key name of the desired system property to retrieve.

defaultValue The default value to return if the key is not set in the **System** (p. 2979) properties.

Returns:

the value of the named system property or the defaultValue if the property isn't set..

Exceptions:

IllegalArgumentException if key is an empty string.

6.618.3.16 static std::string decaf::lang::System::getProperty (const std::string & *key*) [static]

Gets the specified **System** (p. 2979) property if set, otherwise returns an empty string. If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Parameters:

key The key name of the desired system property to retrieve.

Returns:

an empty string if the named property is not set, otherwise returns the value.

Exceptions:

IllegalArgumentException if key is an empty string.

6.618.3.17 static long long decaf::lang::System::nanoTime () [static]

Returns the current value of the most precise available system timer, in nanoseconds. This method can only be used to measure elapsed time and is not related to any other notion of system or wall-clock time. The value returned represents nanoseconds since some fixed but arbitrary time (perhaps in the future, so values may be negative). This method provides nanosecond precision, but not necessarily nanosecond accuracy. No guarantees are made about how frequently values change. Differences in successive calls that span greater than approximately 292 years (263 nanoseconds) will not accurately compute elapsed time due to numerical overflow.

For example, to measure how long some **code** (p. 1005) takes to execute:

long long startTime = **System::nanoTime()** (p. 2987); // ... the **code** (p. 1005) being measured ... long long estimatedTime = **System::nanoTime()** (p. 2987) - startTime;

Returns:

The current value of the system timer, in nanoseconds.

6.618.3.18 static void decaf::lang::System::setenv (const std::string & *name*, const std::string & *value*) [static]

Sets the specified system property to the value given.

Parameters:

name The name of the environment variables to set.

value The value to assign to name.

Exceptions:

an **Exception** (p. 1458) if an error occurs when setting the environment variable.

6.618.3.19 static std::string decaf::lang::System::setProperty (const std::string & *key*, const std::string & *value*) [static]

Sets the **System** (p. 2979) Property to the specified value.

Parameters:

key The key name of the system property to set to the given value.

value The value to assign to the key.

Returns:

the previous value of the property named by key if there was one, otherwise returns an empty string.

Exceptions:

IllegalArgumentException if key is an empty string.

6.618.3.20 static void decaf::lang::System::unsetenv (const std::string & *name*) [static]

Clears a set environment value if one is set.

Parameters:

name The environment variables to clear.

Exceptions:

an **Exception** (p. 1458) if an error occurs while reading the environment.

6.618.4 Friends And Related Function Documentation

6.618.4.1 friend class decaf::lang::Runtime [friend]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**System.h**

6.619 activemq::threads::Task Class Reference

Represents a unit of work that requires one or more iterations to complete.

`#include <src/main/activemq/threads/Task.h>`Inheritance diagram for activemq::threads::Task:

Public Member Functions

- virtual ~**Task** ()
- virtual bool **iterate** ()=0

  Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.619.1 Detailed Description

Represents a unit of work that requires one or more iterations to complete.

Since:

3.0

6.619.2 Constructor & Destructor Documentation

6.619.2.1 virtual activemq::threads::Task::~Task () [virtual]

6.619.3 Member Function Documentation

6.619.3.1 virtual bool activemq::threads::Task::iterate () [pure virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns:

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implemented in **activemq::core::ActiveMQSessionExecutor** (p. 448), **activemq::threads::CompositeTaskRunner** (p. 1047), **activemq::transport::failover::BackupTransportPool** (p. 632), **activemq::transport::failover::CloseTransportsTask** (p. 970), and **activemq::transport::failover::FailoverTransport** (p. 1498).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**Task.h**

6.620 activemq::threads::TaskRunner Class Reference

`#include <src/main/activemq/threads/TaskRunner.h>`Inheritance diagram for activemq::threads::TaskRunner:

Public Member Functions

- virtual ~**TaskRunner** ()
- virtual void **start** ()=0

  Starts the task runner.

- virtual bool **isStarted** () const =0

  true if the start method has been called.

- virtual void **shutdown** (long long timeout)=0

  Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

- virtual void **shutdown** ()=0

  Shutdown once the task has finished and the TaskRunner's thread has exited.

- virtual void **wakeup** ()=0

  *Signal the **TaskRunner** (p. 2990) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2989) instance will be run until its iterate method has returned false indicating it is done.*

6.620.1 Constructor & Destructor Documentation

6.620.1.1 virtual activemq::threads::TaskRunner::~TaskRunner () [virtual]

6.620.2 Member Function Documentation

6.620.2.1 virtual bool activemq::threads::TaskRunner::isStarted () const [pure virtual]

true if the start method has been called.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 1047), and **activemq::threads::DedicatedTaskRunner** (p. 1310).

6.620.2.2 virtual void activemq::threads::TaskRunner::shutdown () [pure virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 1048), and **activemq::threads::DedicatedTaskRunner** (p. 1311).

6.620.2.3 virtual void activemq::threads::TaskRunner::shutdown (long long *timeout*) [pure virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters:

timeout - Time in Milliseconds to wait for the task to stop.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 1048), and **activemq::threads::DedicatedTaskRunner** (p. 1311).

6.620.2.4 virtual void activemq::threads::TaskRunner::start () [pure virtual]

Starts the task runner. Prior to call this method tasks can be added to a Runner, but no executions will occur. The start method will create the background Thread(s) which do the work for this task runner.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 1048), and **activemq::threads::DedicatedTaskRunner** (p. 1311).

6.620.2.5 virtual void activemq::threads::TaskRunner::wakeup () [pure virtual]

Signal the **TaskRunner** (p. 2990) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2989) instance will be run until its iterate method has returned false indicating it is done.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 1048), and **activemq::threads::DedicatedTaskRunner** (p. 1311).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**TaskRunner.h**

6.621 decaf::internal::net::tcp::TcpSocket Class Reference

Platform-independent implementation of the socket interface.

`#include <src/main/decaf/internal/net/tcp/TcpSocket.h>`Inheritance diagram for decaf::internal::net::tcp::TcpSocket:

Public Member Functions

- **TcpSocket** ()

  Construct a non-connected socket.

- virtual ~**TcpSocket** ()

  Releases the socket handle but not gracefully shut down the connection.

- bool **isConnected** () const
- bool **isClosed** () const
- virtual std::string **getLocalAddress** () const

  Gets the value of the local Inet address the ***Socket*** *(p. 2770) is bound to if bound, otherwise return the* ***InetAddress*** *(p. 1679) ANY value "0.0.0.0".*

  Returns:

  the local address bound to, or ANY.

- virtual void **create** ()

  Creates the underlying platform ***Socket*** *(p. 2770) data structures which allows for* ***Socket*** *(p. 2770) options to be applied.*
  The created socket is in an unconnected state.

  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual void **accept** (SocketImpl *socket)

- virtual void **bind** (const std::string &ipaddress, int **port**)

  Binds this ***Socket*** *(p. 2770) instance to the local ip address and port number given.*

  Parameters:

  ipaddress *The address of local ip to bind to.*
  port *The port number on the host to bind to.*

  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual void **connect** (const std::string &hostname, int **port**, int timeout)

  Connects this socket to the given host and port.

  Parameters:

  hostname *The name of the host to connect to, or IP address.*
  port *The port number on the host to connect to.*
  timeout *Time in milliseconds to wait for a connection, 0 indicates forever.*

Exceptions:

IOException *if an I/O error occurs while attempting this operation.*
SocketTimeoutException *(p. 2807) if the connect call times out due to timeout being set.*
IllegalArguementException *if a parameter has an illegal value.*

- virtual void **listen** (int backlog)

  Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.
  If a connection indication arrives when the queue is full, the connection is refused.
  Parameters:

  backlog *The maximum length of the connection queue.*
  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual **decaf::io::InputStream** * **getInputStream** ()

  Gets the InputStream linked to this ***Socket*** *(p. 2770).*
  Returns:

  an InputStream pointer owned by the ***Socket*** *(p. 2770) object.*
  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual **decaf::io::OutputStream** * **getOutputStream** ()

  Gets the OutputStream linked to this ***Socket*** *(p. 2770).*
  Returns:

  an OutputStream pointer owned by the ***Socket*** *(p. 2770) object.*
  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual int **available** ()

  Gets the number of bytes that can be read from the ***Socket*** *(p. 2770) without blocking.*
  Returns:

  the number of bytes that can be read from the ***Socket*** *(p. 2770) without blocking.*
  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual void **close** ()

  Closes the socket, terminating any blocked reads or writes.
  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual void **shutdownInput** ()

  Places the input stream for this socket at "end of stream".
  Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking ***shutdownInput()*** *(p. 2800) on the socket, the stream will return EOF.*
  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual void **shutdownOutput** ()

  Disables the output stream for this socket.
  For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking ***shutdownOutput()*** *(p. 2800) on the socket, the stream will throw an IOException.*
  Exceptions:

  IOException *if an I/O error occurs while attempting this operation.*

- virtual int **getOption** (int option) const

  Gets the specified ***Socket*** *(p. 2770) option.*
  Parameters:

  option *The* ***Socket*** *(p. 2770) options whose value is to be retrieved.*
  Returns:

  the value of the given socket option.
  Exceptions:

  IOException *if an I/O error occurs while performing this operation.*

- virtual void **setOption** (int option, int value)

  Sets the specified option on the ***Socket*** *(p. 2770) if supported.*
  Parameters:

  option *The* ***Socket*** *(p. 2770) option to set.*
  value *The value of the socket option to apply to the socket.*
  Exceptions:

  IOException *if an I/O error occurs while performing this operation.*

- int **read** (unsigned char *buffer, int size, int offset, int length)

  Reads the requested data from the Socket and write it into the passed in buffer.

- void **write** (const unsigned char *buffer, int size, int offset, int length)

  Writes the specified data in the passed in buffer to the Socket.

Protected Member Functions

- void **checkResult** (apr_status_t value) const

6.621.1 Detailed Description

Platform-independent implementation of the socket interface.

6.621.2 Constructor & Destructor Documentation

6.621.2.1 decaf::internal::net::tcp::TcpSocket::TcpSocket ()

Construct a non-connected socket.

Exceptions:

SocketException thrown if an error occurs while creating the Socket.

6.621.2.2 virtual decaf::internal::net::tcp::TcpSocket::~TcpSocket () [virtual]

Releases the socket handle but not gracefully shut down the connection.

6.621.3 Member Function Documentation

6.621.3.1 virtual void decaf::internal::net::tcp::TcpSocket::accept (SocketImpl * *socket*) [virtual]

6.621.3.2 virtual int decaf::internal::net::tcp::TcpSocket::available () [virtual]

Gets the number of bytes that can be read from the **Socket** (p. 2770) without blocking.

Returns:

the number of bytes that can be read from the **Socket** (p. 2770) without blocking.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2796).

6.621.3.3 virtual void decaf::internal::net::tcp::TcpSocket::bind (const std::string & *ipaddress*, int *port*) [virtual]

Binds this **Socket** (p. 2770) instance to the local ip address and port number given.

Parameters:

ipaddress The address of local ip to bind to.

port The port number on the host to bind to.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2796).

6.621.3.4 void decaf::internal::net::tcp::TcpSocket::checkResult (apr_status_t *value*) const [protected]

6.621.3.5 virtual void decaf::internal::net::tcp::TcpSocket::close () [virtual]

Closes the socket, terminating any blocked reads or writes.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2797).

6.621.3.6 virtual void decaf::internal::net::tcp::TcpSocket::connect (const std::string & *hostname*, int *port*, int *timeout*) [virtual]

Connects this socket to the given host and port.

Parameters:

hostname The name of the host to connect to, or IP address.

port The port number on the host to connect to.

timeout Time in milliseconds to wait for a connection, 0 indicates forever.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

SocketTimeoutException *(*p. *2807)* if the connect call times out due to timeout being set.

IllegalArguementException if a parameter has an illegal value.

Implements **decaf::net::SocketImpl** (p. 2797).

6.621.3.7 virtual void decaf::internal::net::tcp::TcpSocket::create () [virtual]

Creates the underlying platform **Socket** (p. 2770) data structures which allows for **Socket** (p. 2770) options to be applied.

The created socket is in an unconnected state.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2797).

6.621.3.8 virtual decaf::io::InputStream* decaf::internal::net::tcp::TcpSocket::getInputStream () [virtual]

Gets the InputStream linked to this **Socket** (p. 2770).

Returns:

an InputStream pointer owned by the **Socket** (p. 2770) object.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2798).

6.621.3.9 virtual std::string decaf::internal::net::tcp::TcpSocket::getLocalAddress () const [virtual]

Gets the value of the local Inet address the **Socket** (p. 2770) is bound to if bound, otherwise return the **InetAddress** (p. 1679) ANY value "0.0.0.0".

Returns:

the local address bound to, or ANY.

Implements **decaf::net::SocketImpl** (p. 2798).

6.621.3.10 virtual int decaf::internal::net::tcp::TcpSocket::getOption (int *option*) const [virtual]

Gets the specified **Socket** (p. 2770) option.

Parameters:

option The **Socket** (p. 2770) options whose value is to be retrieved.

Returns:

the value of the given socket option.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Implements **decaf::net::SocketImpl** (p. 2798).

6.621.3.11 virtual decaf::io::OutputStream* decaf::internal::net::tcp::TcpSocket::getOutputStream () [virtual]

Gets the OutputStream linked to this **Socket** (p. 2770).

Returns:

an OutputStream pointer owned by the **Socket** (p. 2770) object.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2799).

6.621.3.12 bool decaf::internal::net::tcp::TcpSocket::isClosed () const

Returns:

true if the close method has been called on this Socket.

6.621.3.13 bool decaf::internal::net::tcp::TcpSocket::isConnected () const

Returns:

true if the socketHandle is not in a disconnected state.

6.621.3.14 virtual void decaf::internal::net::tcp::TcpSocket::listen (int *backlog*) [virtual]

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

Parameters:

backlog The maximum length of the connection queue.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2799).

6.621.3.15 int decaf::internal::net::tcp::TcpSocket::read (unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Reads the requested data from the Socket and write it into the passed in buffer.

Parameters:

buffer The buffer to read into

size The size of the specified buffer

offset The offset into the buffer where reading should start filling.

length The number of bytes past offset to fill with data.

Returns:

the actual number of bytes read or -1 if at EOF.

Exceptions:

IOException if an I/O error occurs during the read.

NullPointerException if buffer is Null.

IndexOutOfBoundsException if offset + length is greater than buffer size.

6.621.3.16 virtual void decaf::internal::net::tcp::TcpSocket::setOption (int *option*, int *value*) [virtual]

Sets the specified option on the **Socket** (p. 2770) if supported.

Parameters:

option The **Socket** (p. 2770) option to set.

value The value of the socket option to apply to the socket.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Implements **decaf::net::SocketImpl** (p. 2800).

6.621.3.17 virtual void decaf::internal::net::tcp::TcpSocket::shutdownInput () [virtual]

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 2800) on the socket, the stream will return EOF.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2800).

6.621.3.18 virtual void decaf::internal::net::tcp::TcpSocket::shutdownOutput () [virtual]

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 2800) on the socket, the stream will throw an IOException.

Exceptions:

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 2800).

6.621.3.19 void decaf::internal::net::tcp::TcpSocket::write (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Writes the specified data in the passed in buffer to the Socket.

Parameters:

buffer The buffer to write to the socket.

size The size of the specified buffer.

offset The offset into the buffer where the data to write starts at.

length The number of bytes past offset to write.

Exceptions:

IOException if an I/O error occurs during the write.

NullPointerException if buffer is Null.

IndexOutOfBoundsException if offset + length is greater than buffer size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/**TcpSocket.h**

6.622 decaf::internal::net::tcp::TcpSocketInputStream Class Reference

Input stream for performing reads on a socket.

`#include <src/main/decaf/internal/net/tcp/TcpSocketInputStream.h>`Inheritance diagram for decaf::internal::net::tcp::TcpSocketInputStream:

Public Member Functions

- **TcpSocketInputStream** (**TcpSocket** *socket)

  Create a new InputStream to use for reading from the TCP/IP socket.

- virtual ~**TcpSocketInputStream** ()
- virtual int **available** () const

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns:

  the number of bytes available on this input stream.

  Exceptions:

  IOException (p. ***1787***) *if an I/O error occurs.*

- virtual void **close** ()

  Close - does nothing.

- virtual long long **skip** (long long num)

  Not supported.

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.622.1 Detailed Description

Input stream for performing reads on a socket. This class will only work properly for blocking sockets.

Since:

1.0

6.622.2 Constructor & Destructor Documentation

6.622.2.1 decaf::internal::net::tcp::TcpSocketInputStream::TcpSocketInputStream (TcpSocket * *socket*)

Create a new InputStream to use for reading from the TCP/IP socket.

Parameters:

socket The parent SocketImpl for this stream.

6.622.2.2 virtual decaf::internal::net::tcp::TcpSocketInputStream::~TcpSocketInputStream () [virtual]

6.622.3 Member Function Documentation

6.622.3.1 virtual int decaf::internal::net::tcp::TcpSocketInputStream::available () const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1708).

6.622.3.2 virtual void decaf::internal::net::tcp::TcpSocketInputStream::close () [virtual]

Close - does nothing. It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error occurs while closing the **InputStream** (p. 1707).

Reimplemented from **decaf::io::InputStream** (p. 1709).

6.622.3.3 virtual int decaf::internal::net::tcp::TcpSocketInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1709).

6.622.3.4 virtual int decaf::internal::net::tcp::TcpSocketInputStream::doReadByte () [protected, virtual]

Implements **decaf::io::InputStream** (p. 1710).

6.622.3.5 virtual long long decaf::internal::net::tcp::TcpSocketInputStream::skip (long long *num*) [virtual]

Not supported. Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1713).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/**TcpSocketInputStream.h**

6.623 decaf::internal::net::tcp::TcpSocketOutputStream Class Reference

Output stream for performing write operations on a socket.

`#include <src/main/decaf/internal/net/tcp/TcpSocketOutputStream.h>`Inheritance diagram for decaf::internal::net::tcp::TcpSocketOutputStream:

Public Member Functions

- **TcpSocketOutputStream** (**TcpSocket** *socket)

  Create a new instance of a Socket OutputStream class.

- virtual ~**TcpSocketOutputStream** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.
  Exceptions:

  IOException *(*p. ***1787****) if an error occurs while closing.*

  The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char c)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.623.1 Detailed Description

Output stream for performing write operations on a socket.

Since:

1.0

6.623.2 Constructor & Destructor Documentation

6.623.2.1 decaf::internal::net::tcp::TcpSocketOutputStream::TcpSocketOutputStream (TcpSocket * *socket*)

Create a new instance of a Socket OutputStream class.

Parameters:

socket The socket to use to write out the data.

6.623.2.2 virtual decaf::internal::net::tcp::TcpSocketOutputStream::~TcpSocketOutputStream () [virtual]

6.623.3 Member Function Documentation

6.623.3.1 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::close () [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions:

IOException *(*p. *1787**)* if an error occurs while closing.

The default implementation of this method does nothing. The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2349).

6.623.3.2 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2350).

6.623.3.3 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::doWriteByte (unsigned char *c*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2350).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/**TcpSocketOutputStream.h**

6.624 activemq::transport::tcp::TcpTransport Class Reference

Implements a TCP/IP based **transport** (p. 72) filter, this **transport** (p. 72) is meant to wrap an instance of an **IOTransport** (p. 1790).

`#include <src/main/activemq/transport/tcp/TcpTransport.h>`Inheritance diagram for activemq::transport::tcp::TcpTransport:

Public Member Functions

- **TcpTransport** (const **Pointer**< **Transport** > **next**, const **decaf::net::URI** &location)

- virtual bool **isConnected** () const

  *Is the **Transport** (p. 3125) Connected to its Broker.*

Protected Member Functions

- **decaf::net::URI getLocation** () const
- virtual void **beforeNextIsStarted** ()

  Subclasses can override this method to do their own startup work.

- virtual void **afterNextIsStopped** ()

  Subclasses can override this method to do their own stop work.

- virtual void **doClose** ()

  Subclasses can override this method to do their own close work.

- void **connect** ()

  Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.

- virtual **decaf::net::Socket** * **createSocket** ()

  *Create an unconnected Socket instance to be used by the **transport** (p. 72) to communicate with the broker.*

- virtual void **configureSocket** (**decaf::net::Socket** *socket)

  Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

6.624.1 Detailed Description

Implements a TCP/IP based **transport** (p. 72) filter, this **transport** (p. 72) is meant to wrap an instance of an **IOTransport** (p. 1790). The lower level **transport** (p. 72) should take care of managing stream reads and writes.

6.624.2 Constructor & Destructor Documentation

6.624.2.1 activemq::transport::tcp::TcpTransport::TcpTransport (const Pointer< Transport > *next*, const decaf::net::URI & *location*)

Creates a new instance of a **TcpTransport** (p. 3005), the **transport** (p. 72) is left unconnected and is in a unusable **state** (p. 70) until the connect method is called.

Parameters:

next The next **transport** (p. 72) in the chain

location The URI of the host this **transport** (p. 72) is to connect to.

6.624.2.2 virtual activemq::transport::tcp::TcpTransport::~TcpTransport () [virtual]

6.624.3 Member Function Documentation

6.624.3.1 virtual void activemq::transport::tcp::TcpTransport::afterNextIsStopped () [protected, virtual]

Subclasses can override this method to do their own stop work. This method is always called after all the next transports have been stopped to prevent this **transport** (p. 72) for destroying resources needed by the lower level transports.

Reimplemented from **activemq::transport::TransportFilter** (p. 3138).

6.624.3.2 virtual void activemq::transport::tcp::TcpTransport::beforeNextIsStarted () [protected, virtual]

Subclasses can override this method to do their own startup work. This method will always be called before the next **transport** (p. 72) in the chain is called in order to allow this **transport** (p. 72) a chance to initialize required resources.

Reimplemented from **activemq::transport::TransportFilter** (p. 3138).

6.624.3.3 virtual void activemq::transport::tcp::TcpTransport::configureSocket (decaf::net::Socket * *socket*) [protected, virtual]

Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server. Subclasses can override this option to set more configuration options, they should called the base class version to allow the default set of Socket options to also be configured.

Parameters:

socket The Socket instance to configure using options from the given Properties.

Exceptions:

NullPointerException if the Socket instance is null.

IllegalArgumentException if the socket instance is not handled by the class.

SocketException if there is an error while setting one of the Socket options.

Reimplemented in **activemq::transport::tcp::SslTransport** (p. 2841).

6.624.3.4 void activemq::transport::tcp::TcpTransport::connect () [protected]

Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.

6.624.3.5 virtual decaf::net::Socket* activemq::transport::tcp::TcpTransport::createSocket () [protected, virtual]

Create an unconnected Socket instance to be used by the **transport** (p. 72) to communicate with the broker.

Returns:

a newly created unconnected Socket instance.

Exceptions:

IOException if there is an error while creating the unconnected Socket.

Reimplemented in **activemq::transport::tcp::SslTransport** (p. 2841).

6.624.3.6 virtual void activemq::transport::tcp::TcpTransport::doClose () [protected, virtual]

Subclasses can override this method to do their own close work. This method is always called after all the next transports have been closed to prevent this **transport** (p. 72) for destroying resources needed by the lower level transports.

Reimplemented from **activemq::transport::TransportFilter** (p. 3139).

6.624.3.7 int activemq::transport::tcp::TcpTransport::getConnectTimeout () const

6.624.3.8 int activemq::transport::tcp::TcpTransport::getInputBufferSize () const

6.624.3.9 int activemq::transport::tcp::TcpTransport::getLinger () const

6.624.3.10 decaf::net::URI activemq::transport::tcp::TcpTransport::getLocation () const [protected]

6.624.3.11 int activemq::transport::tcp::TcpTransport::getOutputBufferSize () const

6.624.3.12 int activemq::transport::tcp::TcpTransport::getReceiveBufferSize () const

6.624.3.13 int activemq::transport::tcp::TcpTransport::getSendBufferSize () const

6.624.3.14 virtual bool activemq::transport::tcp::TcpTransport::isConnected () const [virtual]

Is the **Transport** (p. 3125) Connected to its Broker.

Returns:

true if a connection has been made.

Reimplemented from **activemq::transport::TransportFilter** (p. 3140).

6.624.3.15 virtual bool activemq::transport::tcp::TcpTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3125) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3125) is fault tolerant.

Reimplemented from **activemq::transport::TransportFilter** (p. 3140).

6.624.3.16 bool activemq::transport::tcp::TcpTransport::isKeepAlive () const

6.624.3.17 bool activemq::transport::tcp::TcpTransport::isTcpNoDelay () const

6.624.3.18 bool activemq::transport::tcp::TcpTransport::isTrace () const

6.624.3.19 void activemq::transport::tcp::TcpTransport::setConnectTimeout (int *soConnectTimeout*)

6.624.3.20 void activemq::transport::tcp::TcpTransport::setInputBufferSize (int *inputBufferSize*)

6.624.3.21 void activemq::transport::tcp::TcpTransport::setKeepAlive (bool *soKeepAlive*)

6.624.3.22 void activemq::transport::tcp::TcpTransport::setLinger (int *soLinger*)

6.624.3.23 void activemq::transport::tcp::TcpTransport::setOutputBufferSize (int *outputBufferSize*)

6.624.3.24 void activemq::transport::tcp::TcpTransport::setReceiveBufferSize (int *soReceiveBufferSize*)

6.624.3.25 void activemq::transport::tcp::TcpTransport::setSendBufferSize (int *soSendBufferSize*)

6.624.3.26 void activemq::transport::tcp::TcpTransport::setTcpNoDelay (bool *tcpNoDelay*)

6.624.3.27 void activemq::transport::tcp::TcpTransport::setTrace (bool *trace*)

Factory Responsible for creating the **TcpTransport** (p. 3005).

6.625.2 Constructor & Destructor Documentation

6.625.2.1 virtual activemq::transport::tcp::TcpTransportFactory::~TcpTransportFactory () [inline, virtual]

6.625.3 Member Function Documentation

6.625.3.1 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::create (const decaf::net::URI & *location*) [virtual]

Creates a fully configured **Transport** (p. 3125) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3133).

6.625.3.2 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::createComposite (const decaf::net::URI & *location*) [virtual]

Creates a slimed down **Transport** (p. 3125) instance which can be used in composite **transport** (p. 72) instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3134).

6.625.3.3 virtual void activemq::transport::tcp::TcpTransportFactory::doConfigureTransport (Pointer< Transport >, const decaf::util::Properties & *properties*) [protected, virtual]

6.628 cms::TextMessage Class Reference

Interface for a text message.

`#include <src/main/cms/TextMessage.h>`Inheritance diagram for cms::TextMessage:

Public Member Functions

- virtual ~**TextMessage** ()
- virtual std::string **getText** () const =0

  Gets the message character buffer.

- virtual void **setText** (const char *msg)=0

  Sets the message contents, does not take ownership of the passed char, but copies it instead.*

- virtual void **setText** (const std::string &msg)=0

  Sets the message contents.

6.628.1 Detailed Description

Interface for a text message. A **TextMessage** (p. 3014) can contain any Text based pay load such as an XML Document or other Text based document.

Like all Messages, a **TextMessage** (p. 3014) is received in Read-Only mode, any attempt to write to the **Message** (p. 2090) will result in a MessageNotWritableException being thrown until the `clearBody` method is called which will erase the contents and place the message back in a read / write mode.

Since:

1.0

6.628.2 Constructor & Destructor Documentation

6.628.2.1 virtual cms::TextMessage::~TextMessage () [virtual]

6.628.3 Member Function Documentation

6.628.3.1 virtual std::string cms::TextMessage::getText () const [pure virtual]

Gets the message character buffer.

Returns:

The message character buffer.

Exceptions:

CMSException *(p. **979**)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 521).

6.628.3.2 virtual void cms::TextMessage::setText (const std::string & *msg*) [pure virtual]

Sets the message contents.

Parameters:

msg The message buffer.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 521).

6.628.3.3 virtual void cms::TextMessage::setText (const char * *msg*) [pure virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters:

msg The message buffer.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

MessageNotWriteableException (p. ***2190***) - if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 521).

The documentation for this class was generated from the following file:

- src/main/cms/**TextMessage.h**

6.629 decaf::lang::Thread Class Reference

A **Thread** (p. 3016) is a concurrent unit of execution.

`#include <src/main/decaf/lang/Thread.h>`Inheritance diagram for decaf::lang::Thread:

Data Structures

- class **UncaughtExceptionHandler**

  *Interface for handlers invoked when a **Thread** (p. 3016) abruptly terminates due to an uncaught exception.*

Public Types

- enum **State** {
  NEW = 0, **RUNNABLE** = 1, **BLOCKED** = 2, **WAITING** = 3,
  TIMED_WAITING = 4, **SLEEPING** = 5, **TERMINATED** = 6 }

  *Represents the various states that the **Thread** (p. 3016) can be in during its lifetime.*

Public Member Functions

- **Thread** ()

  *Constructs a new **Thread** (p. 3016).*

- **Thread** (**Runnable** *task)

  *Constructs a new **Thread** (p. 3016) with the given target **Runnable** (p. 2622) task.*

- **Thread** (const std::string &name)

  *Constructs a new **Thread** (p. 3016) with the given name.*

- **Thread** (**Runnable** *task, const std::string &name)

  *Constructs a new **Thread** (p. 3016) with the given target **Runnable** (p. 2622) task and name.*

- **Thread** (**Runnable** *task, const std::string &name, long long stackSize)

  *Constructs a new **Thread** (p. 3016) with the given target **Runnable** (p. 2622) task and name.*

- virtual ~**Thread** ()
- virtual void **start** ()

  Creates a system thread and starts it in a joinable mode.

- virtual void **join** ()

  *Forces the Current **Thread** (p. 3016) to wait until the thread exits.*

- virtual void **join** (long long millisecs)

  *Forces the Current **Thread** (p. 3016) to wait until the thread exits.*

- virtual void **join** (long long millisecs, int nanos)

  Forces the Current ***Thread*** (p. *3016*) *to wait until the thread exits.*

- virtual void **run** ()

  Default implementation of the run method - does nothing.

- long long **getId** () const

  Obtains the ***Thread*** (p. *3016*) *Id of the current thread, this value is OS specific but is guaranteed not to change for the lifetime of this thread.*

- std::string **getName** () const

  Returns the Thread's assigned name.

- void **setName** (const std::string &name)

  Sets the name of the ***Thread*** (p. *3016*) *to the new Name given by the argument name.*

- int **getPriority** () const

  Gets the currently set priority for this ***Thread*** (p. *3016*).

- void **setPriority** (int value)

  Sets the current Thread's priority to the newly specified value.

- **UncaughtExceptionHandler** * **getUncaughtExceptionHandler** () const

  Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

- void **setUncaughtExceptionHandler** (**UncaughtExceptionHandler** *handler)

  Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

- std::string **toString** () const

  Returns a string that describes the ***Thread*** (p. *3016*).

- bool **isAlive** () const

  Returns true if the ***Thread*** (p. *3016*) *is alive, meaning it has been started and has not yet died.*

- **Thread::State getState** () const

  Returns the currently set State of this ***Thread*** (p. *3016*).

- void **interrupt** ()

  Interrupts the ***Thread*** (p. *3016*) *if it is blocked and in an interruptible state.*

- bool **isInterrupted** () const

  Returns but does not clear the state of this Thread's interrupted flag.

Static Public Member Functions

- static void **sleep** (long long millisecs)

  Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.

- static void **sleep** (long long millisecs, int nanos)

  Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.

- static void **yield** ()

  Causes the currently executing thread object to temporarily pause and allow other threads to execute.

- static **Thread** * **currentThread** ()

  Returns a pointer to the currently executing thread object.

- static bool **interrupted** ()

  Returns whether the thread has been interrupted and clears the interrupted state such that a subsequent call will return false unless an interrupt occurs between the two calls.

- static **UncaughtExceptionHandler** * **getDefaultUncaughtExceptionHandler** ()

  *Set the default handler invoked when a thread abruptly terminates due to an uncaught exception, this handler is used only if there is no other handler defined for the **Thread** (p. 3016).*

- static void **setDefaultUncaughtExceptionHandler** (**UncaughtExceptionHandler** *handler)

  Set the default handler invoked when a thread abruptly terminates due to an uncaught exception,.

Static Public Attributes

- static const int **MIN_PRIORITY** = 1

  The minimum priority that a thread can have.

- static const int **NORM_PRIORITY** = 5

  The default priority that a thread is given at create time.

- static const int **MAX_PRIORITY** = 10

  The maximum priority that a thread can have.

Friends

- class **decaf::internal::util::concurrent::Threading**
- class **ThreadGroup**

6.629.1 Detailed Description

A **Thread** (p. 3016) is a concurrent unit of execution. It has its own call stack for methods being invoked, their arguments and local variables. Each process has at least one main **Thread** (p. 3016) running when it is started; typically, there are several others for housekeeping. The application might decide to launch additional Threads for specific purposes.

Threads in the same process interact and synchronize by the use of shared objects and monitors associated with these objects.

There are basically two main ways of having a **Thread** (p. 3016) execute application **code** (p. 1005). One is providing a new class that extends **Thread** (p. 3016) and overriding its **run()** (p. 3023) method. The other is providing a new **Thread** (p. 3016) instance with a **Runnable** (p. 2622) object during its creation. In both cases, the **start()** (p. 3025) method must be called to actually execute the new **Thread** (p. 3016).

Each **Thread** (p. 3016) has an integer priority that basically determines the amount of CPU time the **Thread** (p. 3016) gets. It can be set using the **setPriority(int)** (p. 3024) method.

1.0

6.629.2 Member Enumeration Documentation

6.629.2.1 enum decaf::lang::Thread::State

Represents the various states that the **Thread** (p. 3016) can be in during its lifetime.

Enumerator:

NEW Before a **Thread** (p. 3016) is started it exists in this State.

RUNNABLE While a **Thread** (p. 3016) is running and is not blocked it is in this State.

BLOCKED A **Thread** (p. 3016) that is waiting to acquire a lock is in this state.

WAITING A **Thread** (p. 3016) that is waiting for another **Thread** (p. 3016) to perform an action is in this state.

TIMED_WAITING A **Thread** (p. 3016) that is waiting for another **Thread** (p. 3016) to perform an action up to a specified time interval is in this state.

SLEEPING A **Thread** (p. 3016) that is blocked in a Sleep call is in this state.

TERMINATED A **Thread** (p. 3016) whose run method has exited is in this state.

6.629.3 Constructor & Destructor Documentation

6.629.3.1 decaf::lang::Thread::Thread ()

Constructs a new **Thread** (p. 3016). This constructor has the same effect as Thread(NULL, NULL, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

6.629.3.2 decaf::lang::Thread::Thread (Runnable * *task*)

Constructs a new **Thread** (p. 3016) with the given target **Runnable** (p. 2622) task. This constructor has the same effect as Thread(NULL, task, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters:

task the **Runnable** (p. 2622) that this thread manages, if the task is NULL the Thread's run method is used instead.

6.629.3.3 decaf::lang::Thread::Thread (const std::string & *name*)

Constructs a new **Thread** (p. 3016) with the given name. This constructor has the same effect as Thread(NULL, NULL, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters:

name the name to assign to this **Thread** (p. 3016).

6.629.3.4 decaf::lang::Thread::Thread (Runnable * *task*, const std::string & *name*)

Constructs a new **Thread** (p. 3016) with the given target **Runnable** (p. 2622) task and name. This constructor has the same effect as Thread(NULL, task, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters:

task the **Runnable** (p. 2622) that this thread manages, if the task is NULL the Thread's run method is used instead.

name the name to assign to this **Thread** (p. 3016).

6.629.3.5 decaf::lang::Thread::Thread (Runnable * *task*, const std::string & *name*, long long *stackSize*)

Constructs a new **Thread** (p. 3016) with the given target **Runnable** (p. 2622) task and name. This constructor has the same effect as Thread(NULL, task, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

The stack size option is platform independent and may have no effect on the newly created thread on some systems. If the value given is invalid on the system a RuntimeException is thrown, the stack size can be invalid if it is outside the allowed range or doesn't match the size of the system page size on some system.

Parameters:

task The **Runnable** (p. 2622) that this thread manages, if the task is NULL the Thread's run method is used instead.

name The name to assign to this **Thread** (p. 3016).

stackSize The size of the newly allocated thread's stack.

6.629.3.6 virtual decaf::lang::Thread::~Thread () [virtual]

6.629.4 Member Function Documentation

6.629.4.1 static Thread* decaf::lang::Thread::currentThread () [static]

Returns a pointer to the currently executing thread object.

Returns:

Pointer (p. 2370) to the **Thread** (p. 3016) object representing the currently running **Thread** (p. 3016).

6.629.4.2 static UncaughtExceptionHandler* decaf::lang::Thread::getDefaultUncaughtExceptionHandler () [static]

Set the default handler invoked when a thread abruptly terminates due to an uncaught exception, this handler is used only if there is no other handler defined for the **Thread** (p. 3016). This method will return NULL if no handler has ever been set, or the handler is cleared via a call to the setDefaultUncaughtExceptionHandler method will NULL as the value of the handler argument.

Returns:

a pointer to the default **UncaughtExceptionHandler** (p. 3153) for all Threads.

6.629.4.3 long long decaf::lang::Thread::getId () const

Obtains the **Thread** (p. 3016) Id of the current thread, this value is OS specific but is guaranteed not to change for the lifetime of this thread.

Returns:

Thread (p. 3016) Id of this **Thread** (p. 3016) instance.

6.629.4.4 std::string decaf::lang::Thread::getName () const

Returns the Thread's assigned name.

Returns:

the Name of the **Thread** (p. 3016).

6.629.4.5 int decaf::lang::Thread::getPriority () const

Gets the currently set priority for this **Thread** (p. 3016).

Returns:

an int value representing the Thread's current priority.

6.629.4.6 Thread::State decaf::lang::Thread::getState () const

Returns the currently set State of this **Thread** (p. 3016).

Returns:

the Thread's current state.

6.629.4.7 UncaughtExceptionHandler* decaf::lang::Thread::getUncaughtExceptionHandler () const

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

Returns:

a pointer to the set **UncaughtExceptionHandler** (p. 3153).

6.629.4.8 void decaf::lang::Thread::interrupt ()

Interrupts the **Thread** (p. 3016) if it is blocked and in an interruptible state. When the thread is in one of its own join or sleep methods or blocked by a call to a monitor or mutex wait call it will clear its interrupted flag and and an InterruptedException will be thrown.

In other cases the thread's interrupted status will be set and an instance of an InterruptedException may be thrown.

If the thread is not alive when this method is called there is no affect.

6.629.4.9 static bool decaf::lang::Thread::interrupted () [static]

Returns whether the thread has been interrupted and clears the interrupted state such that a subsequent call will return false unless an interrupt occurs between the two calls.

Returns:

true if the thread was interrupted, false otherwise.

6.629.4.10 bool decaf::lang::Thread::isAlive () const

Returns true if the **Thread** (p. 3016) is alive, meaning it has been started and has not yet died.

Returns:

true if the thread is alive.

6.629.4.11 bool decaf::lang::Thread::isInterrupted () const

Returns but does not clear the state of this Thread's interrupted flag.

Returns:

true if the thread was interrupted, false otherwise.

6.629.4.12 virtual void decaf::lang::Thread::join (long long *millisecs*, int *nanos*) [virtual]

Forces the Current **Thread** (p. 3016) to wait until the thread exits.

Parameters:

millisecs the time in Milliseconds before the thread resumes

nanos 0-999999 extra nanoseconds to sleep.

Exceptions:

IllegalArgumentException if the nanoseconds parameter is out of range or the milliseconds paramter is negative.

InterruptedException if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.629.4.13 virtual void decaf::lang::Thread::join (long long *millisecs*) [virtual]

Forces the Current **Thread** (p. 3016) to wait until the thread exits.

Parameters:

millisecs the time in Milliseconds before the thread resumes

Exceptions:

IllegalArgumentException if the milliseconds parameter is negative.

InterruptedException if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.629.4.14 virtual void decaf::lang::Thread::join () [virtual]

Forces the Current **Thread** (p. 3016) to wait until the thread exits.

Exceptions:

InterruptedException if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.629.4.15 virtual void decaf::lang::Thread::run () [virtual]

Default implementation of the run method - does nothing.

Implements **decaf::lang::Runnable** (p. 2622).

Reimplemented in **activemq::transport::mock::InternalCommandListener** (p. 1765).

6.629.4.16 static void decaf::lang::Thread::setDefaultUncaughtExceptionHandler (UncaughtExceptionHandler * *handler*) [static]

Set the default handler invoked when a thread abruptly terminates due to an uncaught exception,.

Parameters:

handler The UncaightExceptionHandler to invoke when a **Thread** (p. 3016) terminates due to an uncaught exception, passing NULL clears this value.

6.629.4.17 void decaf::lang::Thread::setName (const std::string & *name*)

Sets the name of the **Thread** (p. 3016) to the new Name given by the argument *name*. name the new name of the **Thread** (p. 3016).

6.629.4.18 void decaf::lang::Thread::setPriority (int *value*)

Sets the current Thread's priority to the newly specified value. The given value must be within the range **Thread::MIN_PRIORITY** (p. 3026) and **Thread::MAX_PRIORITY** (p. 3026).

Parameters:

value the new priority value to assign to this **Thread** (p. 3016).

Exceptions:

IllegalArgumentException if the value is out of range.

6.629.4.19 void decaf::lang::Thread::setUncaughtExceptionHandler (UncaughtExceptionHandler * *handler*)

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

Parameters:

handler the UncaightExceptionHandler to invoke when the **Thread** (p. 3016) terminates due to an uncaught exception.

6.629.4.20 static void decaf::lang::Thread::sleep (long long *millisecs*, int *nanos*) [static]

Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers. Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters:

millisecs time in milliseconds to halt execution.

nanos 0-999999 extra nanoseconds to sleep.

Exceptions:

IllegalArgumentException if the nanoseconds parameter is out of range or the milliseconds paramter is negative.

InterruptedException if the **Thread** (p. 3016) was interrupted while sleeping.

6.629.4.21 static void decaf::lang::Thread::sleep (long long *millisecs*) [static]

Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers. Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters:

millisecs time in milliseconds to halt execution.

Exceptions:

IllegalArgumentException if the milliseconds parameter is negative.

InterruptedException if the **Thread** (p. 3016) was interrupted while sleeping.

6.629.4.22 virtual void decaf::lang::Thread::start () [virtual]

Creates a system thread and starts it in a joinable mode. Upon creation, the **run()** (p. 3023) method of either this object or the provided **Runnable** (p. 2622) object will be invoked in the context of this thread.

Exceptions:

IllegalThreadStateException if the thread has already been started.

RuntimeException if the **Thread** (p. 3016) cannot be created for some reason.

6.629.4.23 std::string decaf::lang::Thread::toString () const

Returns a string that describes the **Thread** (p. 3016).

Returns:

string describing the **Thread** (p. 3016).

6.629.4.24 static void decaf::lang::Thread::yield () [static]

Causes the currently executing thread object to temporarily pause and allow other threads to execute.

6.629.5 Friends And Related Function Documentation

6.630 decaf::util::concurrent::ThreadFactory Class Reference

public interface **ThreadFactory** (p. 3027)

`#include <src/main/decaf/util/concurrent/ThreadFactory.h>`

Public Member Functions

- virtual ~**ThreadFactory** ()
- virtual **decaf::lang::Thread** * **newThread** (**decaf::lang::Runnable** *r)=0

  Constructs a new Thread.

6.630.1 Detailed Description

public interface **ThreadFactory** (p. 3027) An object that creates new threads on demand. Using thread factories removes hardwiring of calls to new Thread, enabling applications to use special thread subclasses, priorities, etc.

The simplest implementation of this interface is just:

class SimpleThreadFactory : public **ThreadFactory** (p. 3027) { public: Thread* newThread(Runnable* r) { return new Thread(r); } }

The Executors.defaultThreadFactory() method provides a more useful simple implementation, that sets the created thread context to known values before returning it.

Since:

1.0

6.630.2 Constructor & Destructor Documentation

6.630.2.1 virtual decaf::util::concurrent::ThreadFactory::~ThreadFactory () [inline, virtual]

6.630.3 Member Function Documentation

6.630.3.1 virtual decaf::lang::Thread* decaf::util::concurrent::ThreadFactory::newThread (decaf::lang::Runnable * r) [pure virtual]

Constructs a new Thread. Implementations may also initialize priority, name, daemon status, ThreadGroup, etc. The pointer passed is still owned by the caller and is not deleted by the Thread object. The caller owns the returned Thread object and must delete it when finished.

Parameters:

r A pointer to a Runnable instance to be executed by new Thread instance returned.

Returns:

constructed thread, or NULL if the request to create a thread is rejected the caller owns the returned pointer.

Static Public Member Functions

- static void **initialize** ()

  *Called by the Decaf Runtime at startup to allow the Platform **Threading*** (p. *3033*) ***code*** (p. *1005*) *to initialize any necessary **Threading*** (p. *3033*) *constructs needed to support the features of this class.*

- static void **shutdown** ()

  *Called by the Decaf Runtime at Shutdown to allow the Platform **Threading*** (p. *3033*) ***code*** (p. *1005*) *to return any resources that were allocated at startup for the **Threading*** (p. *3033*) *library.*

- static void **lockThreadsLib** ()

  *Locks the **Threading*** (p. *3033*) *library allowing an object to perform some operations safely in a multi-threaded environment.*

- static void **unlockThreadsLib** ()

  *Unlocks the **Threading*** (p. *3033*) *library when locked.*

- static void **dumpRunningThreads** ()

  Diagnostic method dumps all threads info to console.

- static **MonitorHandle** * **takeMonitor** (bool alreadyLocked=false)

  Gets a monitor for use as a locking mechanism.

- static void **returnMonitor** (**MonitorHandle** *monitor, bool alreadyLocked=false)

  Returns a given monitor to the Monitor pool after the Monitor is no longer needed.

- static void **enterMonitor** (**MonitorHandle** *monitor)

  Monitor locking method.

- static bool **tryEnterMonitor** (**MonitorHandle** *monitor)

  Monitor locking method.

- static void **exitMonitor** (**MonitorHandle** *monitor)

  Exit the acquired monitor giving up the lock that is held and allowing other threads to acquire the monitor.

- static bool **waitOnMonitor** (**MonitorHandle** *monitor, long long mills, int nanos)

  Waits on a monitor to be signaled by another thread.

- static void **notifyWaiter** (**MonitorHandle** *monitor)

  Notify a single waiter on the given Monitor instance, if there is no thread currently waiting on the specified monitor then no action is taken.

- static void **notifyAllWaiters** (**MonitorHandle** *monitor)

  Notifies all waiting threads for the given Monitor.

- static bool **isMonitorLocked** (**MonitorHandle** *monitor)

  Query the monitor object to determine if it is currently locked.

- static **ThreadHandle** * **createNewThread** (**Thread** *parant, const char *name, long long stackSize)

  Creates a new thread instance with the given Thread object as its parent, assigning it the given name and stack size.

- static void **start** (**ThreadHandle** *thread)

  Starts the given thread running, if the thread is already running then this method has no effect.

- static bool **join** (**ThreadHandle** *thread, long long mills, int nanos)

  Joins the given thread instance and waits for it to either terminate or for the given timeout period to expire.

6.633.1 Member Function Documentation

6.633.1.1 static ThreadHandle* decaf::internal::util::concurrent::Threading::createNewThread (Thread * *parant*, const char * *name*, long long *stackSize*) [static]

Creates a new thread instance with the given Thread object as its parent, assigning it the given name and stack size. The Thread class provides its own main Runnable for executing task.

Parameters:

parent The parent Thread object that the new thread is owned by.

name Name given to the new Thread, used for debugging purposes.

stackSize The size to allocate for the new thread's stack.

Returns:

a new **ThreadHandle** (p. 3030) that identifies the thread and allows the parent to interact with it.

6.633.1.2 static int decaf::internal::util::concurrent::Threading::createThreadLocalSlot (ThreadLocalImpl * *threadLocal*) [static]

Allocates a slot in the library for a new **ThreadLocalImpl** (p. 3045) to store its values for each thread. The parent **ThreadLocalImpl** (p. 3045) is stored so that the library can call each **ThreadLocalImpl** (p. 3045) to cleanup its resources if there are active objects at the time the library is shutdown or the Thread terminates.

Parameters:

threadLocal The **ThreadLocalImpl** (p. 3045) to assign a storage slot.

Returns:

a new storage slot Id for the given ThreadLocalImpl's value to be assigned.

6.633.1.3 static ThreadHandle* decaf::internal::util::concurrent::Threading::createThreadWrapper (decaf::lang::Thread * *parent*, const char * *name*) [static]

Creates and returns a **ThreadHandle** (p. 3030) that references the currently running thread. This method is called to obtain a **ThreadHandle** (p. 3030) that references an thread that was not created using the Decaf Thread class. A parent Thread instance is passed to associate with the target thread so that a call to getCurrentThread can return a Decaf Thread as it would for any thread created using Thread.

Parameters:

parent The Decaf thread instace to associate with this thread handle.

name The name to assign to the returned **ThreadHandle** (p. 3030).

Returns:

a new **ThreadHandle** (p. 3030) instance for the parent Decaf Thread.

6.633.1.4 static void decaf::internal::util::concurrent::Threading::destoryThreadLocalSlot (int *slot*) [static]

6.633.1.5 static void decaf::internal::util::concurrent::Threading::destroyThread (ThreadHandle * *thread*) [static]

6.633.1.6 static void decaf::internal::util::concurrent::Threading::dumpRunningThreads () [static]

Diagnostic method dumps all threads info to console.

6.633.1.7 static void decaf::internal::util::concurrent::Threading::enterMonitor (MonitorHandle * *monitor*) [static]

Monitor locking method. The calling thread blocks until it acquires the monitor. A thread can enter the same monitor more than once, but must then exit the monitor the same number of times.

Parameters:

monitor The handle to the monitor that the current thread is attempting to lock.

6.633.1.8 static void decaf::internal::util::concurrent::Threading::exitMonitor (MonitorHandle * *monitor*) [static]

Exit the acquired monitor giving up the lock that is held and allowing other threads to acquire the monitor. If the calling thread has entered the monitor more than once then it must exit that monitor the same number of times.

Parameters:

monitor Handle to the monitor instance that is to be excited.

Exceptions:

IllegalMonitorStateException if the caller is not the owner of the monitor.

6.633.1.9 static Thread* decaf::internal::util::concurrent::Threading::getCurrentThread () [static]

Returns:

the Decaf Thread pointer instance for the currently running thread.

6.633.1.10 static ThreadHandle* decaf::internal::util::concurrent::Threading::getCurrentThreadHandle () [static]

Returns:

the **ThreadHandle** (p. 3030) instance for the currently running thread.

6.633.1.11 static long long decaf::internal::util::concurrent::Threading::getThreadId (ThreadHandle * *thread*) [static]

6.633.1.12 static void* decaf::internal::util::concurrent::Threading::getThreadLocalValue (int *slot*) [static]

6.633.1.13 static const char* decaf::internal::util::concurrent::Threading::getThreadName (ThreadHandle * *thread*) [static]

6.633.1.14 static int decaf::internal::util::concurrent::Threading::getThreadPriority (ThreadHandle * *thread*) [static]

6.633.1.15 static Thread::State decaf::internal::util::concurrent::Threading::getThreadState (ThreadHandle * *thread*) [static]

6.633.1.16 static void decaf::internal::util::concurrent::Threading::initialize () [static]

Called by the Decaf Runtime at startup to allow the Platform **Threading** (p. 3033) **code** (p. 1005) to initialize any necessary **Threading** (p. 3033) constructs needed to support the features of this class.

6.633.1.17 static void decaf::internal::util::concurrent::Threading::interrupt (ThreadHandle * *thread*) [static]

6.633.1.18 static bool decaf::internal::util::concurrent::Threading::interrupted () [static]

6.633.1.19 static bool decaf::internal::util::concurrent::Threading::isInterrupted (ThreadHandle * *thread*, bool *reset*) [static]

6.633.1.20 static bool decaf::internal::util::concurrent::Threading::isMonitorLocked (MonitorHandle * *monitor*) [static]

Query the monitor object to determine if it is currently locked. This method is a mainly a diagnostic tool and its return value is not guaranteed to reflect the locked state after its been called as the state can change quickly.

6.633.1.21 static bool decaf::internal::util::concurrent::Threading::isThreadAlive (ThreadHandle * *thread*) [static]

6.633.1.22 static bool decaf::internal::util::concurrent::Threading::join (ThreadHandle * *thread*, long long *mills*, int *nanos*) [static]

Joins the given thread instance and waits for it to either terminate or for the given timeout period to expire. If the value of of the timeout is zero then this method waits forever.

Parameters:

thread The target thread to join.

mills The number of milliseconds to wait.

nanos The number of nanoseconds to wait [0-999999].

Returns:

true if the timeout period expired, false otherwise.

Exceptions:

InterruptedException if the Join was interrupted.

IllegalArgumentException if the value of mills or nanos is invalid.

6.633.1.23 static void decaf::internal::util::concurrent::Threading::lockThreadsLib () [static]

Locks the **Threading** (p. 3033) library allowing an object to perform some operations safely in a multi-threaded environment.

6.633.1.24 static void decaf::internal::util::concurrent::Threading::notifyAllWaiters (MonitorHandle * *monitor*) [static]

Notifies all waiting threads for the given Monitor. If there are no threads currently waiting on the given monitor instance then no action is taken. The calling thread must own the given monitor otherwise an IllegalMonitorStateException is thrown.

Parameters:

monitor The monitor handle that is to have all of its waiting thread signaled.

Exceptions:

IllegalMonitorStateException if the caller does not own the monitor.

6.633.1.25 static void decaf::internal::util::concurrent::Threading::notifyWaiter (MonitorHandle * *monitor*) [static]

Notify a single waiter on the given Monitor instance, if there is no thread currently waiting on the specified monitor then no action is taken. The calling thread must own the given monitor otherwise an IllegalMonitorStateException is thrown.

Parameters:

monitor The monitor handle that is to have a single waiting thread signaled.

Exceptions:

IllegalMonitorStateException if the caller does not own the monitor.

6.633.1.26 static bool decaf::internal::util::concurrent::Threading::park (Thread * *thread*, long long *mills*, int *nanos*) [static]

Removes the given thread from scheduling unless a call to unpark has already reset the park token in which case this method simple consumes the unpark token and returned.

Parameters:

thread The target thread to park.

mills The time in milliseconds to park the target thread.

nanos The additional time in nanoseconds to park the target thread.

6.633.1.27 static void decaf::internal::util::concurrent::Threading::park (Thread * *thread*) [static]

Removes the given thread from scheduling unless a call to unpark has already reset the park token in which case this method simple consumes the unpark token and returned.

Parameters:

thread The target thread to park.

6.633.1.28 static void decaf::internal::util::concurrent::Threading::returnMonitor (MonitorHandle * *monitor*, bool *alreadyLocked* = false) [static]

Returns a given monitor to the Monitor pool after the Monitor is no longer needed.

Parameters:

monitor The handle of the Monitor to return to the Monitor pool.

Exceptions:

IllegalMonitorStateException if the monitor is in use when returned.

6.633.1.29 static void decaf::internal::util::concurrent::Threading::setThreadLocalValue (int *slot*, void * *value*) [static]

6.633.1.30 static void decaf::internal::util::concurrent::Threading::setThreadName (ThreadHandle * *thread*, const char * *name*) [static]

6.633.1.31 static void decaf::internal::util::concurrent::Threading::setThreadPriority (ThreadHandle * *thread*, int *priority*) [static]

6.633.1.32 static void decaf::internal::util::concurrent::Threading::shutdown () [static]

Called by the Decaf Runtime at Shutdown to allow the Platform **Threading** (p. 3033) **code** (p. 1005) to return any resources that were allocated at startup for the **Threading** (p. 3033) library.

6.633.1.33 static bool decaf::internal::util::concurrent::Threading::sleep (long long *mills*, int *nanos*) [static]

6.633.1.34 static void decaf::internal::util::concurrent::Threading::start (ThreadHandle * *thread*) [static]

Starts the given thread running, if the thread is already running then this method has no effect.

Parameters:

thread The thread instance to start.

6.633.1.35 static MonitorHandle* decaf::internal::util::concurrent::Threading::takeMonitor (bool *alreadyLocked* = false) [static]

Gets a monitor for use as a locking mechanism. The monitor returned will be initialized and ready for use. Each monitor that is taken must be returned before the **Threading** (p. 3033) library is shutdown.

Returns:

handle to a Monitor instance that has been initialized.

6.633.1.36 static bool decaf::internal::util::concurrent::Threading::tryEnterMonitor (MonitorHandle * *monitor*) [static]

Monitor locking method. If the calling thread cannot immediately acquire the lock on the monitor then this method returns false, otherwise the thread gains the lock on the monitor and the method returns true. A thread can enter a monitor multiple times, but must ensure that it exits the monitor the same number of times that it entered it.

Parameters:

monitor The handle to the monitor that the current thread is attempting to lock.

Returns:

true if the caller obtains the lock on the Monitor, false otherwise.

6.633.1.37 static void decaf::internal::util::concurrent::Threading::unlockThreadsLib () [static]

Unlocks the **Threading** (p. 3033) library when locked.

6.633.1.38 static void decaf::internal::util::concurrent::Threading::unpark (Thread * *thread*) [static]

If the target thread is not currently parked then this method sets the un-park token for the thread and returns. If the thread is parked than this method places the thread back in a state where it can be scheduled once more.

Parameters:

thread The thread to unpark.

6.633.1.39 static bool decaf::internal::util::concurrent::Threading::waitOnMonitor (MonitorHandle * *monitor*, long long *mills*, int *nanos*) [static]

Waits on a monitor to be signaled by another thread. The caller can wait for a given timeout or pass zero for both mills and nanos to indicate it wants to wait forever. If the caller specifies a timeout and that timeout expires before the monitor is signaled this method returns true. The calling thread must own the monitor in order to call this method, otherwise an IllegalMonitorStateException is thrown.

Parameters:

monitor Handle to the monitor that the calling thread is to wait on for a signal.

mills The time in milliseconds to wait for the monitor to be signaled.

nanos The time in nanoseconds to wait for the monitor to be signaled.

Returns:

true if the timeout given expires before the caller was signaled.

Exceptions:

IllegalMonitorStateException if the caller does not own the monitor.

6.633.1.40 static void decaf::internal::util::concurrent::Threading::yeild () [static]

6.634 decaf::lang::ThreadLocal< E > Class Template Reference

This class provides thread-local variables.

`#include <src/main/decaf/lang/ThreadLocal.h>`Inheritance diagram for decaf::lang::ThreadLocal< E >:

Public Member Functions

- **ThreadLocal** ()

  Creates a new instance of a ***ThreadLocal*** *(p. 3042).*

- virtual ~**ThreadLocal** ()
- E & **get** ()

  Returns the value in the current thread's copy of this thread-local variable.

- void **set** (const E &value)

  Sets the current thread's copy of this thread-local variable to the specified value.

- void **remove** ()

  Removes the current thread's value for this thread-local variable.

Protected Member Functions

- virtual E **initialValue** () const

  Returns the current thread's "initial value" for this thread-local variable.

- virtual void **doDelete** (void *value)

  Called to destroy the value held by the current thread or by the library on shutdown if there are still ThreadLocalImpl instances that have assigned TLS slots.

6.634.1 Detailed Description

template<typename E> class decaf::lang::ThreadLocal< E >

This class provides thread-local variables. These variables differ from their normal counterparts in that each thread that accesses one (via its get or set method) has its own, independently initialized copy of the variable. **ThreadLocal** (p. 3042) instances are typically private static fields in classes that wish to associate state with a thread (e.g., a user ID or Transaction ID). This class imposes the restriction on the type that it will contains that it must by both assignable and copyable.

Each thread holds an implicit reference to its copy of a thread-local variable as long as the thread is alive and the **ThreadLocal** (p. 3042) instance is accessible; after a thread goes away, all of its copies of thread-local instances are destroyed.

Since:

1.0

6.634.2 Constructor & Destructor Documentation

6.634.2.1 template<typename E > decaf::lang::ThreadLocal< E >::ThreadLocal () [inline]

Creates a new instance of a **ThreadLocal** (p. 3042).

6.634.2.2 template<typename E > virtual decaf::lang::ThreadLocal< E >::~ThreadLocal () [inline, virtual]

References decaf::internal::util::concurrent::ThreadLocalImpl::removeAll().

6.634.3 Member Function Documentation

6.634.3.1 template<typename E > virtual void decaf::lang::ThreadLocal< E >::doDelete (void * *value*) [inline, protected, virtual]

Called to destroy the value held by the current thread or by the library on shutdown if there are still ThreadLocalImpl instances that have assigned TLS slots. Its up to the implementor if this interface to ensure that the value held in the void* is cleaned up correctly.

Parameters:

value The value to be destroyed for the current thread.

Implements **decaf::internal::util::concurrent::ThreadLocalImpl** (p. 3045).

6.634.3.2 template<typename E > E& decaf::lang::ThreadLocal< E >::get () [inline]

Returns the value in the current thread's copy of this thread-local variable. If the variable has no value for the current thread, it is first initialized to the value returned by an invocation of the **initialValue()** (p. 3043) method.

Returns:

the current thread's value for this thread local.

References decaf::internal::util::concurrent::ThreadLocalImpl::getRawValue(), decaf::lang::ThreadLocal< E >::initialValue(), NULL, and decaf::internal::util::concurrent::ThreadLocalImpl::setRawValue().

6.634.3.3 template<typename E > virtual E decaf::lang::ThreadLocal< E >::initialValue () const [inline, protected, virtual]

Returns the current thread's "initial value" for this thread-local variable. This method will be invoked the first time a thread accesses the variable with the **get()** (p. 3043) method, unless the

thread previously invoked the **set()** (p. 3044) method, in which case the initialValue method will not be invoked for the thread. Normally, this method is invoked at most once per thread, but it may be invoked again in case of subsequent invocations of **remove()** (p. 3044) followed by **get()** (p. 3043).

This implementation simply returns E(); if the programmer desires thread-local variables to have an initial value other than E(), **ThreadLocal** (p. 3042) must be subclassed, and this method overridden. Typically, an inner class will be used.

Parameters:

value **Pointer** (p. 2370) to the thread local value created by this thread when **get()** (p. 3043) is first called.

Referenced by decaf::lang::ThreadLocal< E >::get().

6.634.3.4 template<typename E > void decaf::lang::ThreadLocal< E >::remove () [inline]

Removes the current thread's value for this thread-local variable. If this thread-local variable is subsequently read by the current thread, its value will be reinitialized by invoking its **initialValue()** (p. 3043) method, unless its value is set by the current thread in the interim. This may result in multiple invocations of the initialValue method in the current thread.

References NULL, and decaf::internal::util::concurrent::ThreadLocalImpl::setRawValue().

6.634.3.5 template<typename E > void decaf::lang::ThreadLocal< E >::set (const E & *value*) [inline]

Sets the current thread's copy of this thread-local variable to the specified value. Most subclasses will have no need to override this method, relying solely on the **initialValue()** (p. 3043) method to set the values of thread-locals.

Parameters:

value The new value to assign to this **Thread** (p. 3016) local.

References decaf::internal::util::concurrent::ThreadLocalImpl::setRawValue().

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**ThreadLocal.h**

6.635 decaf::internal::util::concurrent::ThreadLocalImpl Class Reference

`#include <src/main/decaf/internal/util/concurrent/ThreadLocalImpl.h>`Inheritance diagram for decaf::internal::util::concurrent::ThreadLocalImpl:

Public Member Functions

- **ThreadLocalImpl** ()
- virtual ~**ThreadLocalImpl** ()
- void * **getRawValue** () const

  Returns the current threads assigned value, but retains ownership to this value unless the remove method is subsequently called.

- void **setRawValue** (void *value)

  Sets the raw void value for the current thread.*

- void **removeAll** ()

  Removes from all threads any allocated data stored for this ThreadLocal instance.

- virtual void **doDelete** (void *value)=0

  *Called to destroy the value held by the current thread or by the library on shutdown if there are still **ThreadLocalImpl** (p. 3045) instances that have assigned TLS slots.*

6.635.1 Constructor & Destructor Documentation

6.635.1.1 decaf::internal::util::concurrent::ThreadLocalImpl::ThreadLocalImpl ()

6.635.1.2 virtual decaf::internal::util::concurrent::ThreadLocalImpl::~ThreadLocalImpl () [virtual]

6.635.2 Member Function Documentation

6.635.2.1 virtual void decaf::internal::util::concurrent::ThreadLocalImpl::doDelete (void * *value*) [pure virtual]

Called to destroy the value held by the current thread or by the library on shutdown if there are still **ThreadLocalImpl** (p. 3045) instances that have assigned TLS slots. Its up to the implementor if this interface to ensure that the value held in the void* is cleaned up correctly.

Parameters:

value The value to be destroyed for the current thread.

Implemented in **decaf::lang::ThreadLocal< E >** (p. 3043).

6.635.2.2 void* decaf::internal::util::concurrent::ThreadLocalImpl::getRawValue () const

Returns the current threads assigned value, but retains ownership to this value unless the remove method is subsequently called.

Returns:

the currently held value for this thread.

Referenced by decaf::lang::ThreadLocal< E >::get().

6.635.2.3 void decaf::internal::util::concurrent::ThreadLocalImpl::removeAll ()

Removes from all threads any allocated data stored for this ThreadLocal instance. Subclasses should call this method in their destructor to ensure that all the values that are stored in each thread can be deallocated using their custom doDelete method.

Referenced by decaf::lang::ThreadLocal< E >::~ThreadLocal().

6.635.2.4 void decaf::internal::util::concurrent::ThreadLocalImpl::setRawValue (void * *value*)

Sets the raw void* value for the current thread. If the value is NULL and the old value is non-NULL then the library will call the doDelete method to destroy the previous value.

Parameters:

value Pointer to the value to be stored for the current thread or NULL.

Referenced by decaf::lang::ThreadLocal< E >::get(), decaf::lang::ThreadLocal< E >::remove(), and decaf::lang::ThreadLocal< E >::set().

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/**ThreadLocalImpl.h**

6.636 decaf::util::concurrent::ThreadPoolExecutor Class Reference

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

`#include <src/main/decaf/util/concurrent/ThreadPoolExecutor.h>`Inheritance diagram for decaf::util::concurrent::ThreadPoolExecutor:

Data Structures

- class **AbortPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute*** (p. *3055*) *this class always throws a **RejectedExecutionException*** (p. *2567*).

- class **CallerRunsPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute*** (p. *3055*) *this class will attempt to run the task in the Thread that called the execute method unless the executor is shutdown in which case the task is not run and is destroyed.*

- class **DiscardOldestPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute*** (p. *3055*) *this class always destroys the oldest unexecuted task in the **Queue*** (p. *2515*) *and then attempts to execute the rejected task using the passed in executor.*

- class **DiscardPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute*** (p. *3055*) *this class always destroys the rejected task and returns quietly.*

Public Member Functions

- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, const **TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue)

  *Creates a new instance of a **ThreadPoolExecutor*** (p. *3047*).

- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, const **TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **RejectedExecutionHandler** *handler)

  *Creates a new instance of a **ThreadPoolExecutor*** (p. *3047*).

- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, const **TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **ThreadFactory** *threadFactory)

  *Creates a new instance of a **ThreadPoolExecutor*** (p. *3047*).

- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, const **TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **ThreadFactory** *threadFactory, **RejectedExecutionHandler** *handler)

*Creates a new instance of a **ThreadPoolExecutor** (p. 3047).*

- virtual ~**ThreadPoolExecutor** ()
- virtual void **execute** (**decaf::lang::Runnable** *task)

  This method is the same as calling the two param execute method and passing true as the second argument.

- virtual void **execute** (**decaf::lang::Runnable** *task, bool takeOwnership)

  Executes the given command at some time in the future.

- virtual void **shutdown** ()

  *Performs an orderly shutdown of this **Executor** (p. 1476).*

- virtual **ArrayList**< **decaf::lang::Runnable** * > **shutdownNow** ()

  *Attempts to stop all currently executing tasks and returns an **ArrayList** (p. 585) containing the Runnables that did not get executed, these object become the property of the caller and are not deleted by this class, they are removed from the work queue and forgotten about.*

- virtual bool **awaitTermination** (long long timeout, const **decaf::util::concurrent::TimeUnit** &unit)

  The caller will block until the executor has completed termination meaning all tasks that where scheduled before shutdown have now completed and the executor is ready for deletion.

- virtual bool **isShutdown** () const

  Returns whether this executor has been shutdown or not.

- virtual bool **isTerminated** () const

  Returns whether all tasks have completed after this executor was shut down.

- virtual int **getPoolSize** () const

  *Returns the number of threads that currently exists for this **Executor** (p. 1476).*

- virtual int **getCorePoolSize** () const

  *Returns the configured number of core threads for this **Executor** (p. 1476).*

- virtual void **setCorePoolSize** (int poolSize)

  ***Set** (p. 2715) the number of threads that this executor treats as its core threads, this value will override the value set in the constructor.*

- virtual int **getMaximumPoolSize** () const

  *Returns the configured maximum number of threads for this **Executor** (p. 1476).*

- virtual void **setMaximumPoolSize** (int maxSize)

  *Sets the maximum number of workers this **Executor** (p. 1476) is allowed to have at any given time above the core pool size.*

- virtual long long **getTaskCount** () const

  Returns the current number of pending tasks in the work queue.

- virtual int **getActiveCount** () const

Returns an approximation of the number of threads that are currently running tasks for this executor.

- virtual long long **getCompletedTaskCount** () const

  *Returns the approximate number of Tasks that have been completed by this **Executor** (p. 1476), this value never decreases.*

- virtual int **getLargestPoolSize** () const

  *Returns the most Threads that have ever been active at one time within this **Executors** (p. 1479) Thread pool.*

- virtual **BlockingQueue**< **decaf::lang::Runnable** * > * **getQueue** ()

  *Provides access to the Task **Queue** (p. 2515) used by this **Executor** (p. 1476).*

- virtual bool **isTerminating** () const

  Returns true if the executor has begin the process of terminating but has not yet completed the process of shutting down all worker threads.

- virtual void **allowCoreThreadTimeout** (bool value)

  When true this setting allows the threads in the core pool to terminate if they sit idle longer than the set keep alive time.

- virtual bool **allowsCoreThreadTimeout** () const

  Returns whether this executor has been configured to allow core threads to terminate if they sit idle longer than the configured keep alive time.

- virtual long long **getKeepAliveTime** (const **TimeUnit** &unit) const

  Returns the currently set value for the maximum amount of time a worker Thread that is not part of the core threads is allowed to sit idle before it terminates.

- virtual void **setKeepAliveTime** (long long timeout, const **TimeUnit** &unit)

  Configures the amount of time a non core Thread will remain alive after it has completed its assigned task.

- virtual void **setThreadFactory** (**ThreadFactory** *factory)

  *Sets the **ThreadFactory** (p. 3027) instance used to create new Threads for this **Executor** (p. 1476).*

- virtual **ThreadFactory** * **getThreadFactory** () const

  *Gets the currently configured **ThreadFactory** (p. 3027).*

- virtual **RejectedExecutionHandler** * **getRejectedExecutionHandler** () const

  *Gets the currently configured **RejectedExecutionHandler** (p. 2570) for this **Executor** (p. 1476).*

- virtual void **setRejectedExecutionHandler** (**RejectedExecutionHandler** *handler)

  *Sets the new **RejectedExecutionHandler** (p. 2570) that this executor should use to process any rejected Runnable tasks.*

- virtual bool **prestartCoreThread** ()

  By default a Core thread is only created once the first task is queued, this method forces the creation of core thread that waits in an idle mode for new work to be enqueued.

- virtual int **prestartAllCoreThreads** ()

  This method will create and start new core threads running in an idle state waiting for new tasks up to the set core thread limit.

- bool **remove** (**decaf::lang::Runnable** *task)

  Attempts to remove the Runnable from the work queue, if successful then the caller now owns the Runnable and is responsible for deleting it.

- virtual void **purge** ()

  *Attempts to remove any **Future** (p. 1571) derived tasks from the pending work queue if they have been canceled.*

Protected Member Functions

- virtual void **beforeExecute** (**decaf::lang::Thread** *thread, **decaf::lang::Runnable** *task)

  Method called before a task is executed by the given thread.

- virtual void **afterExecute** (**decaf::lang::Runnable** *task, **decaf::lang::Throwable** *error)

  Called upon completion of execution of a given task.

- virtual void **terminated** ()

  *Method invoked when the **Executor** (p. 1476) has terminated, by default this method does nothing.*

- virtual void **onShutdown** ()

  *Used by some Decaf **ThreadPoolExecutor** (p. 3047) extensions to correctly handle the shutdown case.*

Friends

- class **ExecutorKernel**

6.636.1 Detailed Description

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks. The Thread Poll has max size that it will grow to. The thread pool allocates threads in blocks. When there are no waiting worker threads and a task is queued then a new batch is allocated. The user can specify the size of the blocks, otherwise a default value is used.

When the user queues a task they must also queue a listener to be notified when the task has completed, this provides the user with a mechanism to know when a task object can be freed.

To have the Thread Pool perform a task, the user enqueue's an object that implements the `Runnable` interface and one of the worker threads will executing it in its thread context.

6.636.2 Constructor & Destructor Documentation

6.636.2.1 decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int *corePoolSize*, int *maxPoolSize*, long long *keepAliveTime*, const TimeUnit & *unit*, BlockingQueue< decaf::lang::Runnable * > * *workQueue*)

Creates a new instance of a **ThreadPoolExecutor** (p. 3047). The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters:

corePoolSize The number of threads to pool regardless of their idle state.

maxPoolSize The maximum number of threads that will ever exist at one time in the pool.

keepAliveTime The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.

unit The units that the keepAliveTime is specified in.

workQueue A **BlockingQueue** (p. 690) implementation that will be used to hold Runnable tasks that are awaiting execution within this executor. The **Executor** (p. 1476) takes ownership of the **BlockingQueue** (p. 690) instance passed once this method returns.

Exceptions:

IllegalArguementException if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.

NullPointerException if the workQueue pointer is NULL.

6.636.2.2 decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int *corePoolSize*, int *maxPoolSize*, long long *keepAliveTime*, const TimeUnit & *unit*, BlockingQueue< decaf::lang::Runnable * > * *workQueue*, RejectedExecutionHandler * *handler*)

Creates a new instance of a **ThreadPoolExecutor** (p. 3047). The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters:

corePoolSize The number of threads to pool regardless of their idle state.

maxPoolSize The maximum number of threads that will ever exist at one time in the pool.

keepAliveTime The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.

unit The units that the keepAliveTime is specified in.

workQueue A **BlockingQueue** (p. 690) implementation that will be used to hold Runnable tasks that are awaiting execution within this executor. The **Executor** (p. 1476) takes ownership of the **BlockingQueue** (p. 690) instance passed once this method returns.

handler A **RejectedExecutionHandler** (p. 2570) implementation that will be used to handle any rejected tasks when they are submitted to this executor. The **Executor** (p. 1476) takes ownership of the **RejectedExecutionHandler** (p. 2570) instance passed once this method returns.

Exceptions:

IllegalArguementException if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.

NullPointerException if the workQueue pointer is NULL.

6.636.2.3 decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int *corePoolSize*, int *maxPoolSize*, long long *keepAliveTime*, const TimeUnit & *unit*, BlockingQueue< decaf::lang::Runnable * > * *workQueue*, ThreadFactory * *threadFactory*)

Creates a new instance of a **ThreadPoolExecutor** (p. 3047). The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters:

corePoolSize The number of threads to pool regardless of their idle state.

maxPoolSize The maximum number of threads that will ever exist at one time in the pool.

keepAliveTime The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.

unit The units that the keepAliveTime is specified in.

workQueue A **BlockingQueue** (p. 690) implementation that will be used to hold Runnable tasks that are awaiting execution within this executor. The **Executor** (p. 1476) takes ownership of the **BlockingQueue** (p. 690) instance passed once this method returns.

threadFactory A **ThreadFactory** (p. 3027) implementation that will be used to create worker threads that are used by this executor to run the submitted tasks. The **Executor** (p. 1476) takes ownership of the **ThreadFactory** (p. 3027) instance passed once this method returns.

Exceptions:

IllegalArguementException if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.

NullPointerException if the workQueue pointer is NULL.

6.636.2.4 decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int *corePoolSize*, int *maxPoolSize*, long long *keepAliveTime*, const TimeUnit & *unit*, BlockingQueue< decaf::lang::Runnable * > * *workQueue*, ThreadFactory * *threadFactory*, RejectedExecutionHandler * *handler*)

Creates a new instance of a **ThreadPoolExecutor** (p. 3047). The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters:

corePoolSize The number of threads to pool regardless of their idle state.

maxPoolSize The maximum number of threads that will ever exist at one time in the pool.

keepAliveTime The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.

unit The units that the keepAliveTime is specified in.

workQueue A **BlockingQueue** (p. 690) implementation that will be used to hold Runnable tasks that are awaiting execution within this executor. The **Executor** (p. 1476) takes ownership of the **BlockingQueue** (p. 690) instance passed once this method returns.

threadFactory A **ThreadFactory** (p. 3027) implementation that will be used to create worker threads that are used by this executor to run the submitted tasks. The **Executor** (p. 1476) takes ownership of the **ThreadFactory** (p. 3027) instance passed once this method returns.

handler A **RejectedExecutionHandler** (p. 2570) implementation that will be used to handle any rejected tasks when they are submitted to this executor. The **Executor** (p. 1476) takes ownership of the **BlockingQueue** (p. 690) instance passed once this method returns.

Exceptions:

IllegalArguementException if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.

NullPointerException if the workQueue pointer is NULL.

6.636.2.5 virtual decaf::util::concurrent::ThreadPoolExecutor::~ThreadPoolExecutor () [virtual]

6.636.3 Member Function Documentation

6.636.3.1 virtual void decaf::util::concurrent::ThreadPoolExecutor::afterExecute (decaf::lang::Runnable * *task*, decaf::lang::Throwable * *error*) [protected, virtual]

Called upon completion of execution of a given task. This method is called from the Thread that executed the given Runnable. If the Throwable pointer is not NULL then its value is the Exception that caused the task to terminate.

The base class implementation does nothing, a derived class should call this method on its base class to ensure that all subclasses have a chance to process the afterExecute event.

Parameters:

task The Runnable instance that was executed by the calling Thread.

error The exception that was thrown from the given Runnable.

6.636.3.2 virtual void decaf::util::concurrent::ThreadPoolExecutor::allowCoreThreadTimeout (bool *value*) [virtual]

When true this setting allows the threads in the core pool to terminate if they sit idle longer than the set keep alive time. Core threads that terminate are replaced as needed by new ones on

demand. This settings requires that the set keep alive time be greater than zero and will throw an IllegalArguementException if that is not the case.

Parameters:

value Boolean value indicating if core threads are allowed to time out when idle.

Exceptions:

IllegalArgumentException if the keep alive time is set to zero.

6.636.3.3 virtual bool decaf::util::concurrent::ThreadPoolExecutor::allowsCoreThreadTimeout () const [virtual]

Returns whether this executor has been configured to allow core threads to terminate if they sit idle longer than the configured keep alive time. Threads that are not core threads continue to time out using the set keep alive value regardless of whether this option is enabled.

Returns:

true if core threads can timeout when idle.

6.636.3.4 virtual bool decaf::util::concurrent::ThreadPoolExecutor::awaitTermination (long long *timeout*, const decaf::util::concurrent::TimeUnit & *unit*) [virtual]

The caller will block until the executor has completed termination meaning all tasks that where scheduled before shutdown have now completed and the executor is ready for deletion. If the timeout period elapses before the executor reaches the terminated state then this method return false to indicate it has not terminated.

Parameters:

timeout The amount of time to wait before abandoning the wait for termination.

unit The unit of time that the timeout value represents.

Returns:

true if the executor terminated or false if the timeout expired.

Exceptions:

InterruptedException if this call is interrupted while awaiting termination.

Implements **decaf::util::concurrent::ExecutorService** (p. 1485).

6.636.3.5 virtual void decaf::util::concurrent::ThreadPoolExecutor::beforeExecute (decaf::lang::Thread * *thread*, decaf::lang::Runnable * *task*) [protected, virtual]

Method called before a task is executed by the given thread. The default implementation of this method does nothing, however a subclass can override this method to add some new functionality.

It is recommended that a subclass call this method on its base class to ensure that all base classes have a chance to process this event.

Parameters:

thread The thread that will be executing the given task.

task The task that will be executed by the given thread.

6.636.3.6 virtual void decaf::util::concurrent::ThreadPoolExecutor::execute (decaf::lang::Runnable * *command*, bool *takeOwnership*) [virtual]

Executes the given command at some time in the future. The command may execute in a new thread, in a pooled thread, or in the calling thread, at the discretion of the `Executor (p. 1476)` implementation.

Parameters:

command The runnable task to be executed.

takeOwnership Indicates if the **Executor** (p. 1476) should assume ownership of the task and delete the pointer once the task has completed.

Exceptions:

RejectedExecutionException *(p. 2567)* if this task cannot be accepted for execution.

NullPointerException if command is null

Implements **decaf::util::concurrent::Executor** (p. 1477).

6.636.3.7 virtual void decaf::util::concurrent::ThreadPoolExecutor::execute (decaf::lang::Runnable * *command*) [virtual]

This method is the same as calling the two param execute method and passing true as the second argument.

Parameters:

command The runnable task to be executed.

Exceptions:

RejectedExecutionException *(p. 2567)* if this task cannot be accepted for execution.

NullPointerException if command is null

Implements **decaf::util::concurrent::Executor** (p. 1477).

Referenced by decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy::rejectedExecution().

6.636.3.8 virtual int decaf::util::concurrent::ThreadPoolExecutor::getActiveCount () const [virtual]

Returns an approximation of the number of threads that are currently running tasks for this executor. This value can change rapidly.

Returns:

the number of currently active threads.

6.636.3.9 virtual long long decaf::util::concurrent::ThreadPoolExecutor::getCompletedTaskCount () const [virtual]

Returns the approximate number of Tasks that have been completed by this **Executor** (p. 1476), this value never decreases.

Returns:

the number of completed tasks since creation of the **Executor** (p. 1476).

6.636.3.10 virtual int decaf::util::concurrent::ThreadPoolExecutor::getCorePoolSize () const [virtual]

Returns the configured number of core threads for this **Executor** (p. 1476).

Returns:

the configured number of core Threads.

6.636.3.11 virtual long long decaf::util::concurrent::ThreadPoolExecutor::getKeepAliveTime (const TimeUnit & *unit*) const [virtual]

Returns the currently set value for the maximum amount of time a worker Thread that is not part of the core threads is allowed to sit idle before it terminates.

Parameters:

unit The unit of time to return the results in.

Returns:

the configure keep alive time in the requested time units.

6.636.3.12 virtual int decaf::util::concurrent::ThreadPoolExecutor::getLargestPoolSize () const [virtual]

Returns the most Threads that have ever been active at one time within this **Executors** (p. 1479) Thread pool.

Returns:

the largest number of threads ever to coexist in this executor.

6.636.3.13 virtual int decaf::util::concurrent::ThreadPoolExecutor::getMaximumPoolSize () const [virtual]

Returns the configured maximum number of threads for this **Executor** (p. 1476).

Returns:

the configured maximum number of Threads.

6.636.3.14 virtual int decaf::util::concurrent::ThreadPoolExecutor::getPoolSize () const [virtual]

Returns the number of threads that currently exists for this **Executor** (p. 1476).

Returns:

the configured number of Threads in the Pool.

6.636.3.15 virtual BlockingQueue<decaf::lang::Runnable*>* decaf::util::concurrent::ThreadPoolExecutor::getQueue () [virtual]

Provides access to the Task **Queue** (p. 2515) used by this **Executor** (p. 1476). This method is meant mainly for debugging and monitoring, care should be taken when using this method. The executor continues to execute tasks from the **Queue** (p. 2515).

Returns:

a pointer to the blocking queue that this executor stores future tasks in.

Referenced by decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy::rejectedExecution().

6.636.3.16 virtual RejectedExecutionHandler* decaf::util::concurrent::ThreadPoolExecutor::getRejectedExecutionHandler () const [virtual]

Gets the currently configured **RejectedExecutionHandler** (p. 2570) for this **Executor** (p. 1476).

Returns:

a pointer to the current **RejectedExecutionHandler** (p. 2570).

6.636.3.17 virtual long long decaf::util::concurrent::ThreadPoolExecutor::getTaskCount () const [virtual]

Returns the current number of pending tasks in the work queue. This is an approximation as the number of pending tasks can quickly changes as tasks complete and new tasks are started.

Returns:

number of outstanding tasks, approximate.

6.636.3.18 virtual ThreadFactory* decaf::util::concurrent::ThreadPoolExecutor::getThreadFactory () const [virtual]

Gets the currently configured **ThreadFactory** (p. 3027). It is considered a programming error to delete the pointer returned by this method.

Returns:

the currently configured **ThreadFactory** (p. 3027) instance used by this object.

6.636.3.19 virtual bool decaf::util::concurrent::ThreadPoolExecutor::isShutdown () const [virtual]

Returns whether this executor has been shutdown or not.

Returns:

true if this executor has been shutdown.

Implements **decaf::util::concurrent::ExecutorService** (p. 1486).

Referenced by decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy::rejectedExecution().

6.636.3.20 virtual bool decaf::util::concurrent::ThreadPoolExecutor::isTerminated () const [virtual]

Returns whether all tasks have completed after this executor was shut down.

Returns:

true if all tasks have completed after a request to shut down was made.

Implements **decaf::util::concurrent::ExecutorService** (p. 1486).

6.636.3.21 virtual bool decaf::util::concurrent::ThreadPoolExecutor::isTerminating () const [virtual]

Returns true if the executor has begin the process of terminating but has not yet completed the process of shutting down all worker threads. If the **Executor** (p. 1476) does not transition from this state to terminated after some time its generally an indication that one of the submitted tasks will not complete and the executor is locked in a terminating state.

Returns:

true if all tasks have completed after a request to shut down was made.

6.636.3.22 virtual void decaf::util::concurrent::ThreadPoolExecutor::onShutdown () [protected, virtual]

Used by some Decaf **ThreadPoolExecutor** (p. 3047) extensions to correctly handle the shutdown case.

6.636.3.23 virtual int decaf::util::concurrent::ThreadPoolExecutor::prestartAllCoreThreads () [virtual]

This method will create and start new core threads running in an idle state waiting for new tasks up to the set core thread limit. When the limit is reached this method returns zero to indicate no more core threads can be created.

Returns:

the number of core threads created, or zero if the limit has already been met.

6.636.3.24 virtual bool decaf::util::concurrent::ThreadPoolExecutor::prestartCoreThread () [virtual]

By default a Core thread is only created once the first task is queued, this method forces the creation of core thread that waits in an idle mode for new work to be enqueued. If the limit on core threads has already been reached then this method returns false.

Returns:

true if a new core thread was added, false otherwise.

6.636.3.25 virtual void decaf::util::concurrent::ThreadPoolExecutor::purge () [virtual]

Attempts to remove any **Future** (p. 1571) derived tasks from the pending work queue if they have been canceled. This method can be used to more quickly remove and reclaim space as canceled tasks are not run but must await a worker thread to be removed normally. Since there are multiple threads in operation its possible for this method to not remove all canceled tasks from the work queue.

6.636.3.26 bool decaf::util::concurrent::ThreadPoolExecutor::remove (decaf::lang::Runnable * *task*)

Attempts to remove the Runnable from the work queue, if successful then the caller now owns the Runnable and is responsible for deleting it.

Parameters:

task The task that is to be removed from the work queue.

Returns:

true if the task was removed from the **Queue** (p. 2515).

6.636.3.27 virtual void decaf::util::concurrent::ThreadPoolExecutor::setCorePoolSize (int *poolSize*) [virtual]

Set (p. 2715) the number of threads that this executor treats as its core threads, this value will override the value set in the constructor. If the value given is less than the current value then

the core threads will shrink to the new value over time. If the value is larger than the current value then new threads may be started to process currently pending tasks, otherwise they will be started as needed when new tasks arrive.

Parameters:

poolSize The new core pool size for this executor.

Exceptions:

IllegalArgumentException if the pool size value is less than zero.

6.636.3.28 virtual void decaf::util::concurrent::ThreadPoolExecutor::setKeepAliveTime (long long *timeout*, const TimeUnit & *unit*) [virtual]

Configures the amount of time a non core Thread will remain alive after it has completed its assigned task. This value can also be applied to core threads if the allowCoreThreadsTimeout option is enabled.

Parameters:

timeout The amount of time an idle worker will live before terminating.

unit The units that the timeout is given in.

Exceptions:

IllegalArgumentException if allowCoreThreadsTimeout is enabled and the the timeout value given is zero, or the timeout given is negative.

6.636.3.29 virtual void decaf::util::concurrent::ThreadPoolExecutor::setMaximumPoolSize (int *maxSize*) [virtual]

Sets the maximum number of workers this **Executor** (p. 1476) is allowed to have at any given time above the core pool size. This new value overrides any set in the constructor and if smaller than the current value worker threads will terminate as they complete their current tasks and become idle.

Parameters:

maxSize The new maximum allowed worker pool size.

Exceptions:

IllegalArgumentException if maxSize is negative or less than core pool size.

6.636.3.30 virtual void decaf::util::concurrent::ThreadPoolExecutor::setRejectedExecutionHandler (RejectedExecutionHandler * *handler*) [virtual]

Sets the new **RejectedExecutionHandler** (p. 2570) that this executor should use to process any rejected Runnable tasks. This executor takes ownership of the supplied pointer and will desotroy it upon termination, any previous handler is destroyed by this call.

Parameters:

handler The new **RejectedExecutionHandler** (p. 2570) instance to use.

Exceptions:

NullPointerException if the handler is NULL.

6.636.3.31 virtual void decaf::util::concurrent::ThreadPoolExecutor::setThreadFactory (ThreadFactory * *factory*) [virtual]

Sets the **ThreadFactory** (p. 3027) instance used to create new Threads for this **Executor** (p. 1476). This class takes ownership of the given **ThreadFactory** (p. 3027) and will destroy it upon termination or when a new **ThreadFactory** (p. 3027) is set using this method.

Parameters:

factory A **ThreadFactory** (p. 3027) instance used by this **Executor** (p. 1476) to create new Threads.

Exceptions:

NullPointerException if the given factory pointer is NULL.

6.636.3.32 virtual void decaf::util::concurrent::ThreadPoolExecutor::shutdown () [virtual]

Performs an orderly shutdown of this **Executor** (p. 1476). Previously queued tasks are allowed to complete but no new tasks are accepted for execution. Calling this method more than once has no affect on this executor.

Implements **decaf::util::concurrent::ExecutorService** (p. 1486).

6.636.3.33 virtual ArrayList<decaf::lang::Runnable*> decaf::util::concurrent::ThreadPoolExecutor::shutdownNow () [virtual]

Attempts to stop all currently executing tasks and returns an **ArrayList** (p. 585) containing the Runnables that did not get executed, these object become the property of the caller and are not deleted by this class, they are removed from the work queue and forgotten about. There is no guarantee that this method will halt execution of currently executing tasks.

Returns:

an **ArrayList** (p. 585) containing all Runnable instance that were still waiting to be executed by this class, call now owns those pointers.

Implements **decaf::util::concurrent::ExecutorService** (p. 1486).

6.636.3.34 virtual void decaf::util::concurrent::ThreadPoolExecutor::terminated () [protected, virtual]

Method invoked when the **Executor** (p. 1476) has terminated, by default this method does nothing. When overridden the subclass should call superclass::terminated to ensure that all subclasses have their terminated method invoked.

6.636.4 Friends And Related Function Documentation

6.636.4.1 friend class ExecutorKernel [friend]

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadPoolExecutor.h**

6.637 decaf::lang::Throwable Class Reference

This class represents an error that has occurred.

`#include <src/main/decaf/lang/Throwable.h>`Inheritance diagram for decaf::lang::Throwable:

Public Member Functions

- **Throwable** ()
- virtual ~**Throwable** () throw ()
- virtual std::string **getMessage** () const =0

  Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.

- virtual const std::exception * **getCause** () const =0

  Gets the exception that caused this one to be thrown, this allows for chaining of ***exceptions*** *(*p. 116*) in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.*

- virtual void **initCause** (const std::exception *cause)=0

  Initializes the contained cause exception with the one given.

- virtual void **setMark** (const char *file, const int lineNumber)=0

  Adds a file/line number to the stack trace.

- virtual **Throwable** * **clone** () const =0

  Clones this exception.

- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const =0

  Provides the stack trace for every point where this exception was caught, marked, and rethrown.

- virtual void **printStackTrace** () const =0

  Prints the stack trace to std::err.

- virtual void **printStackTrace** (std::ostream &stream) const =0

  Prints the stack trace to the given output stream.

- virtual std::string **getStackTraceString** () const =0

  Gets the stack trace as one contiguous string.

6.637.1 Detailed Description

This class represents an error that has occurred. All Exceptions in the Decaf library should extend from this or from the **Exception** (p. 1458) class in order to ensure that all Decaf Exceptions are interchangeable with the std::exception class.

Throwable (p. 3063) can wrap another **Throwable** (p. 3063) as the cause if the error being thrown. The user can inspect the cause by calling `getCause`, the pointer returned is the property of the **Throwable** (p. 3063) instance and will be deleted when it is deleted or goes out of scope.

Since:

1.0

6.637.2 Constructor & Destructor Documentation

6.637.2.1 decaf::lang::Throwable::Throwable ()

6.637.2.2 virtual decaf::lang::Throwable::~Throwable () throw () [virtual]

6.637.3 Member Function Documentation

6.637.3.1 virtual Throwable* decaf::lang::Throwable::clone () const [pure virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

Copy of this **Exception** (p. 1458) object

Implemented in **activemq::exceptions::ActiveMQException** (p. 342), **activemq::exceptions::BrokerException** (p. 714), **activemq::exceptions::ConnectionFailedException** (p. 1119), **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2310), **decaf::io::EOFException** (p. 1453), **decaf::io::InterruptedIOException** (p. 1771), **decaf::io::IOException** (p. 1788), **decaf::io::UnsupportedEncodingException** (p. 3162), **decaf::io::UTFDataFormatException** (p. 3218), **decaf::lang::Exception** (p. 1460), **decaf::lang::exceptions::ClassCastException** (p. 961), **decaf::lang::exceptions::CloneNotSupportedException** (p. 964), **decaf::lang::exceptions::IllegalArgumentException** (p. 1654), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 1657), **decaf::lang::exceptions::IllegalStateException** (p. 1662), **decaf::lang::exceptions::IllegalThreadStateException** (p. 1665), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 1672), **decaf::lang::exceptions::InterruptedException** (p. 1768), **decaf::lang::exceptions::InvalidStateException** (p. 1786), **decaf::lang::exceptions::NegativeArraySizeException** (p. 2243), **decaf::lang::exceptions::NullPointerException** (p. 2268), **decaf::lang::exceptions::NumberFormatException** (p. 2274), **decaf::lang::exceptions::OutOfMemoryError** (p. 2347), **decaf::lang::exceptions::RuntimeException** (p. 2628), **decaf::lang::exceptions::UnsupportedOperationExce** (p. 3165), **decaf::net::BindException** (p. 675), **decaf::net::ConnectException** (p. 1088), **decaf::net::HttpRetryException** (p. 1649), **decaf::net::MalformedURLException** (p. 2007), **decaf::net::NoRouteToHostException** (p. 2256), **decaf::net::PortUnreachableException** (p. 2396), **decaf::net::ProtocolException** (p. 2499), **decaf::net::SocketException** (p. 2788), **decaf::net::SocketTimeoutException** (p. 2809), **decaf::net::UnknownHostException** (p. 3156), **decaf::net::UnknownServiceException** (p. 3159), **decaf::net::URISyntaxException** (p. 3200), **decaf::nio::BufferOverflowException**

(p. 762), **decaf::nio::BufferUnderflowException** (p. 765), **decaf::nio::InvalidMarkException** (p. 1781), **decaf::nio::ReadOnlyBufferException** (p. 2537), **decaf::security::cert::CertificateEncodingException** (p. 901), **decaf::security::cert::CertificateException** (p. 904), **decaf::security::cert::CertificateExpiredException** (p. 907), **decaf::security::cert::CertificateNotYetValidException** (p. 910), **decaf::security::cert::CertificateParsingException** (p. 913), **decaf::security::DigestException** (p. 1400), **decaf::security::GeneralSecurityException** (p. 1585), **decaf::security::InvalidKeyException** (p. 1778), **decaf::security::KeyException** (p. 1845), **decaf::security::KeyManagementException** (p. 1848), **decaf::security::NoSuchAlgorithmException** (p. 2259), **decaf::security::NoSuchProviderException** (p. 2265), **decaf::security::ProviderException** (p. 2504), **decaf::security::SignatureException** (p. 2758), **decaf::util::concurrent::BrokenBarrierException** (p. 708), **decaf::util::concurrent::CancellationException** (p. 894), **decaf::util::concurrent::ExecutionException** (p. 1475), **decaf::util::concurrent::RejectedExecutionException** (p. 2569), **decaf::util::concurrent::TimeoutException** (p. 3070), **decaf::util::ConcurrentModificationException** (p. 1058), **decaf::util::NoSuchElementException** (p. 2262), **decaf::util::zip::DataFormatException** (p. 1247), and **decaf::util::zip::ZipException** (p. 3299).

6.637.3.2 virtual const std::exception* decaf::lang::Throwable::getCause () const [pure virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of **exceptions** (p. 116) in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns:

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implemented in **decaf::lang::Exception** (p. 1461).

6.637.3.3 virtual std::string decaf::lang::Throwable::getMessage () const [pure virtual]

Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.

Returns:

string errors message

Implemented in **decaf::lang::Exception** (p. 1462).

6.637.3.4 virtual std::vector< std::pair< std::string, int> > decaf::lang::Throwable::getStackTrace () const [pure virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns:

vector containing stack trace strings

Implemented in **decaf::lang::Exception** (p. 1462).

6.637.3.5 virtual std::string decaf::lang::Throwable::getStackTraceString () const [pure virtual]

Gets the stack trace as one contiguous string.

Returns:

string with formatted stack trace data

Implemented in **decaf::lang::Exception** (p. 1462).

6.637.3.6 virtual void decaf::lang::Throwable::initCause (const std::exception * *cause*) [pure virtual]

Initializes the contained cause exception with the one given. A copy is made to avoid ownership issues.

Parameters:

cause The exception that was the cause of this one.

Implemented in **decaf::lang::Exception** (p. 1462).

6.637.3.7 virtual void decaf::lang::Throwable::printStackTrace (std::ostream & *stream*) const [pure virtual]

Prints the stack trace to the given output stream.

Parameters:

stream the target output stream.

Implemented in **decaf::lang::Exception** (p. 1463).

6.637.3.8 virtual void decaf::lang::Throwable::printStackTrace () const [pure virtual]

Prints the stack trace to std::err.

Implemented in **decaf::lang::Exception** (p. 1463).

6.637.3.9 virtual void decaf::lang::Throwable::setMark (const char * *file*, const int *lineNumber*) [pure virtual]

Adds a file/line number to the stack trace.

Parameters:

file The name of the file calling this method (use __FILE__).

lineNumber The line number in the calling file (use __LINE__).

Implemented in **decaf::lang::Exception** (p. 1463).

The documentation for this class was generated from the following file:

6.638 decaf::util::concurrent::TimeoutException Class Reference

`#include <src/main/decaf/util/concurrent/TimeoutException.h>`Inheritance diagram for decaf::util::concurrent::TimeoutException:

Public Member Functions

- **TimeoutException** ()

  Default Constructor.

- **TimeoutException** (const **decaf::lang::Exception** &ex)

  Conversion Constructor from some other Exception.

- **TimeoutException** (const **TimeoutException** &ex)

  Copy Constructor.

- **TimeoutException** (const std::exception *cause)

  Constructor.

- **TimeoutException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **TimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **TimeoutException** * **clone** () const

  Clones this exception.

- virtual ~**TimeoutException** () throw ()

6.638.1 Constructor & Destructor Documentation

6.638.1.1 decaf::util::concurrent::TimeoutException::TimeoutException ()

Default Constructor.

6.638.1.2 decaf::util::concurrent::TimeoutException::TimeoutException (const decaf::lang::Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.638.1.3 decaf::util::concurrent::TimeoutException::TimeoutException (const TimeoutException & *ex*)

Copy Constructor.

Parameters:

ex The exception to copy from.

6.638.1.4 decaf::util::concurrent::TimeoutException::TimeoutException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.638.1.5 decaf::util::concurrent::TimeoutException::TimeoutException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The string message to report

... list of primitives that are formatted into the message

6.638.1.6 decaf::util::concurrent::TimeoutException::TimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The string message to report

... list of primitives that are formatted into the message

6.638.1.7 virtual decaf::util::concurrent::TimeoutException::~TimeoutException () throw () [virtual]

6.638.2 Member Function Documentation

6.638.2.1 virtual TimeoutException* decaf::util::concurrent::TimeoutException::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new **TimeoutException** (p. 3068) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

6.639 decaf::util::Timer Class Reference

A facility for threads to schedule tasks for future execution in a background thread.

`#include <src/main/decaf/util/Timer.h>`

Public Member Functions

- **Timer** ()
- **Timer** (const std::string &name)

  *Create a new **Timer** (p. 3071) whose associated thread is assigned the name given.*

- virtual ~**Timer** ()
- void **cancel** ()

  Terminates this timer, discarding any currently scheduled tasks.

- bool **awaitTermination** (long long timeout, const **decaf::util::concurrent::TimeUnit** &unit)

  *The caller will block until the **Timer** (p. 3071) has completed termination meaning all tasks that where scheduled before cancelation have now completed and the executor is ready for deletion.*

- int **purge** ()

  Removes all canceled tasks from this timer's task queue.

- void **schedule** (**TimerTask** *task, long long delay)

  Schedules the specified task for execution after the specified delay.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay)

  Schedules the specified task for execution after the specified delay.

- void **schedule** (**TimerTask** *task, const **Date** &time)

  Schedules the specified task for execution at the specified time.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &time)

  Schedules the specified task for execution at the specified time.

- void **schedule** (**TimerTask** *task, long long delay, long long period)

  Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period)

  Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

- void **schedule** (**TimerTask** *task, const **Date** &firstTime, long long period)

  Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &first-Time, long long period)

  Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

- void **scheduleAtFixedRate** (**TimerTask** *task, long long delay, long long period)

  Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

- void **scheduleAtFixedRate** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period)

  Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

- void **scheduleAtFixedRate** (**TimerTask** *task, const **Date** &firstTime, long long period)

  Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

- void **scheduleAtFixedRate** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &firstTime, long long period)

  Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

6.639.1 Detailed Description

A facility for threads to schedule tasks for future execution in a background thread. Tasks may be scheduled for one-time execution, or for repeated execution at regular intervals.

Corresponding to each **Timer** (p. 3071) object is a single background thread that is used to execute all of the timer's tasks, sequentially. **Timer** (p. 3071) tasks should complete quickly. If a timer task takes excessive time to complete, it "hogs" the timer's task execution thread. This can, in turn, delay the execution of subsequent tasks, which may "bunch up" and execute in rapid succession when (and if) the offending task finally completes.

This class is thread-safe: multiple threads can share a single **Timer** (p. 3071) object without the need for external synchronization.

This class does not offer real-time guarantees: it schedules tasks using the wait(long) method.

Since:

1.0

6.639.2 Constructor & Destructor Documentation

6.639.2.1 decaf::util::Timer::Timer ()

6.639.2.2 decaf::util::Timer::Timer (const std::string & *name*)

Create a new **Timer** (p. 3071) whose associated thread is assigned the name given.

Parameters:

name The name to assign to this Timer's Thread.

6.639.2.3 virtual decaf::util::Timer::~Timer () [virtual]

6.639.3 Member Function Documentation

6.639.3.1 bool decaf::util::Timer::awaitTermination (long long *timeout*, const decaf::util::concurrent::TimeUnit & *unit*)

The caller will block until the **Timer** (p. 3071) has completed termination meaning all tasks that where scheduled before cancelation have now completed and the executor is ready for deletion. If the timeout period elapses before the **Timer** (p. 3071) reaches the terminated state then this method return false to indicate it has not terminated.

Parameters:

timeout The amount of time to wait before abandoning the wait for termination.

unit The unit of time that the timeout value represents.

Returns:

true if the **Timer** (p. 3071) terminated or false if the timeout expired.

Exceptions:

InterruptedException if this call is interrupted while awaiting termination.

6.639.3.2 void decaf::util::Timer::cancel ()

Terminates this timer, discarding any currently scheduled tasks. Does not interfere with a currently executing task (if it exists). Once a timer has been terminated, its execution thread terminates gracefully, and no more tasks may be scheduled on it.

Note that calling this method from within the run method of a timer task that was invoked by this timer absolutely guarantees that the ongoing task execution is the last task execution that will ever be performed by this timer.

This method may be called repeatedly; the second and subsequent calls have no effect.

6.639.3.3 int decaf::util::Timer::purge ()

Removes all canceled tasks from this timer's task queue. Calling this method has no effect on the behavior of the timer, but eliminates the canceled tasks from the queue causing the **Timer** (p. 3071) to destroy the **TimerTask** (p. 3082) pointer it was originally given, the caller should ensure that they no longer have any references to TimerTasks that were previously scheduled.

Most programs will have no need to call this method. It is designed for use by the rare application that cancels a large number of tasks. Calling this method trades time for space: the runtime of the method may be proportional to n + c log n, where n is the number of tasks in the queue and c is the number of canceled tasks.

This method can be called on a **Timer** (p. 3071) object that has no scheduled tasks without error.

Returns:

the number of tasks removed from the queue.

6.639.3.4 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *firstTime*, long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time. Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters:

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.5 void decaf::util::Timer::schedule (TimerTask * *task*, const Date & *firstTime*, long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time. Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3082) pointer is considered to be owned by the **Timer** (p. 3071) class once it has been scheduled, the **Timer** (p. 3071) will destroy its TimerTask's once they have been canceled or the **Timer** (p. 3071) itself is canceled. A **TimerTask** (p. 3082) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3071) and the caller should ensure that the **TimerTask** (p. 3082) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3082) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in

the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters:

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.6 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, long long *delay*, long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if delay is negative, or delay + **System.currentTimeMillis()** (p. 2985) is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.7 void decaf::util::Timer::schedule (TimerTask * *task*, long long *delay*, long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3082) pointer is considered to be owned by the **Timer** (p. 3071) class once it has been scheduled, the **Timer** (p. 3071) will destroy its TimerTask's once they have been canceled or the **Timer** (p. 3071) itself is canceled. A **TimerTask** (p. 3082) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3071) and the caller should ensure that the **TimerTask** (p. 3082) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3082) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if delay is negative, or delay + **System.currentTimeMillis()** (p. 2985) is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.8 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *time*)

Schedules the specified task for execution at the specified time. If the time is in the past, the task is scheduled for immediate execution.

Parameters:

task - task to be scheduled.

time - time at which task is to be executed.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.9 void decaf::util::Timer::schedule (TimerTask * *task*, const Date & *time*)

Schedules the specified task for execution at the specified time. If the time is in the past, the task is scheduled for immediate execution.

The **TimerTask** (p. 3082) pointer is considered to be owned by the **Timer** (p. 3071) class once it has been scheduled, the **Timer** (p. 3071) will destroy its TimerTask's once they have been canceled or the **Timer** (p. 3071) itself is canceled. A **TimerTask** (p. 3082) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3071) and the caller should ensure that the **TimerTask** (p. 3082) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3082) instance are planned.

Parameters:

task - task to be scheduled.

time - time at which task is to be executed.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.10 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, long long *delay*)

Schedules the specified task for execution after the specified delay.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if delay is negative, or delay + **System.currentTimeMillis()** (p. 2985) is negative.

IllegalStateException - if task was already scheduled or canceled, or timer was canceled.

6.639.3.11 void decaf::util::Timer::schedule (TimerTask * *task*, long long *delay*)

Schedules the specified task for execution after the specified delay. The **TimerTask** (p. 3082) pointer is considered to be owned by the **Timer** (p. 3071) class once it has been scheduled, the **Timer** (p. 3071) will destroy its TimerTask's once they have been canceled or the **Timer** (p. 3071) itself is canceled. A **TimerTask** (p. 3082) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3071) and the caller should ensure that the **TimerTask** (p. 3082) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3082) instance are planned.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if delay is negative, or delay + **System.currentTimeMillis()** (p. 2985) is negative.

IllegalStateException - if task was already scheduled or canceled, or timer was canceled.

6.639.3.12 void decaf::util::Timer::scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *firstTime*, long long *period*)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time. Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters:

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.13 void decaf::util::Timer::scheduleAtFixedRate (TimerTask * *task*, const Date & *firstTime*, long long *period*)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time. Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3082) pointer is considered to be owned by the **Timer** (p. 3071) class once it has been scheduled, the **Timer** (p. 3071) will destroy its TimerTask's once they have been canceled or the **Timer** (p. 3071) itself is canceled. A **TimerTask** (p. 3082) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3071) and the caller should ensure that the **TimerTask** (p. 3082) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3082) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters:

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.14 void decaf::util::Timer::scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > & *task*, long long *delay*, long long *period*)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if delay is negative, or delay + **System.currentTimeMillis()** (p. 2985) is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.639.3.15 void decaf::util::Timer::scheduleAtFixedRate (TimerTask * *task*, long long *delay*, long long *period*)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3082) pointer is considered to be owned by the **Timer** (p. 3071) class once it has been scheduled, the **Timer** (p. 3071) will destroy its TimerTask's once they have been canceled or the **Timer** (p. 3071) itself is canceled. A **TimerTask** (p. 3082) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3071) and the caller should ensure that the **TimerTask** (p. 3082) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3082) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a count down timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3082) value is Null.

IllegalArgumentException - if delay is negative, or delay + **System.currentTimeMillis()** (p. 2985) is negative.

IllegalStateException - if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

- class **decaf::internal::util::TimerTaskHeap**

6.640.1 Detailed Description

A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer** (p. 3071).

Since:

1.0

6.640.2 Constructor & Destructor Documentation

6.640.2.1 decaf::util::TimerTask::TimerTask ()

6.640.2.2 virtual decaf::util::TimerTask::~TimerTask () [inline, virtual]

6.640.3 Member Function Documentation

6.640.3.1 bool decaf::util::TimerTask::cancel ()

Cancels this timer task. If the task has been scheduled for one-time execution and has not yet run, or has not yet been scheduled, it will never run. If the task has been scheduled for repeated execution, it will never run again. (If the task is running when this call occurs, the task will run to completion, but will never run again.)

Note that calling this method from within the run method of a repeating timer task absolutely guarantees that the timer task will not run again.

This method may be called repeatedly; the second and subsequent calls have no effect.

Returns:

true if this task is scheduled for one-time execution and has not yet run, or this task is scheduled for repeated execution. Returns false if the task was scheduled for one-time execution and has already run, or if the task was never scheduled, or if the task was already canceled. (Loosely speaking, this method returns true if it prevents one or more scheduled executions from taking place.)

6.640.3.2 long long decaf::util::TimerTask::getWhen () const [protected]

6.640.3.3 bool decaf::util::TimerTask::isScheduled () const [protected]

6.640.3.4 long long decaf::util::TimerTask::scheduledExecutionTime () const

Returns the scheduled execution time of the most recent actual execution of this task. (If this method is invoked while task execution is in progress, the return value is the scheduled execution time of the ongoing task execution.)

This method is typically invoked from within a task's run method, to determine whether the current execution of the task is sufficiently timely to warrant performing the scheduled activity:

void **run()** (p. 2622) { if(**System::currentTimeMillis()** (p. 2985) - **scheduledExecutionTime()** (p. 3083) >= MAX_TARDINESS) return; // Too late; skip this execution. // Perform the task }

This method is typically not used in conjunction with fixed-delay execution repeating tasks, as their scheduled execution times are allowed to drift over time, and so are not terribly significant.

Returns:

the time at which the most recent execution of this task was scheduled to occur, in the format returned by **Date.getTime()** (p. 1306). The return value is undefined if the task has yet to commence its first execution.

6.640.3.5 void decaf::util::TimerTask::setScheduledTime (long long *time*) [protected]

6.640.4 Friends And Related Function Documentation

6.640.4.1 friend class decaf::internal::util::TimerTaskHeap [friend]

6.640.4.2 friend class Timer [friend]

6.640.4.3 friend class TimerImpl [friend]

The documentation for this class was generated from the following file:

6.641 decaf::internal::util::TimerTaskHeap Class Reference

A Binary Heap implemented specifically for the Timer class in Decaf Util.

`#include <src/main/decaf/internal/util/TimerTaskHeap.h>`

Public Member Functions

- **TimerTaskHeap** ()
- virtual ~**TimerTaskHeap** ()
- **Pointer< TimerTask > peek** ()

  Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.

- bool **isEmpty** () const
- std::size_t **size** () const
- void **insert** (const **Pointer< TimerTask >** &task)

  Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

- void **remove** (std::size_t pos)

  Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

- void **reset** ()

  Clear all contents from the heap.

- void **adjustMinimum** ()

  Resorts the heap starting at the top.

- std::size_t **deleteIfCancelled** ()

  Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.

- std::size_t **find** (const **Pointer< TimerTask >** &task) const

  Searches the heap for the specified TimerTask element and returns its position in the heap.

Resorts the heap starting at the top.

6.641.3.2 std::size_t decaf::internal::util::TimerTaskHeap::deleteIfCancelled ()

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.

Returns:

the number of task that were removed from the heap becuase they were cancelled.

6.641.3.3 std::size_t decaf::internal::util::TimerTaskHeap::find (const Pointer< TimerTask > & *task*) const

Searches the heap for the specified TimerTask element and returns its position in the heap. Returns the unsigned equivalent of -1 if the element is not found.

Returns:

the position in the Heap where the Task is stored, or npos.

6.641.3.4 void decaf::internal::util::TimerTaskHeap::insert (const Pointer< TimerTask > & *task*)

Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

Parameters:

task The TimerTask to insert into the heap.

6.641.3.5 bool decaf::internal::util::TimerTaskHeap::isEmpty () const

Returns:

true if the heap is empty.

6.641.3.6 Pointer<TimerTask> decaf::internal::util::TimerTaskHeap::peek ()

Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.

Returns:

The TimerTask that is scheduled to be executed next if the Heap is empty a Null Pointer value is returned.

6.641.3.7 void decaf::internal::util::TimerTaskHeap::remove (std::size_t *pos*)

Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

Parameters:

pos The position at which to remove the TimerTask and begin a resort of the heap.

6.641.3.8 void decaf::internal::util::TimerTaskHeap::reset ()

Clear all contents from the heap.

6.641.3.9 std::size_t decaf::internal::util::TimerTaskHeap::size () const

Returns:

the size of the heap.

6.642.1 Detailed Description

A **TimeUnit** (p. 3088) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units. A **TimeUnit** (p. 3088) does not maintain time information, but only helps organize and use time representations that may be maintained separately across various contexts. A nanosecond is defined as one thousandth of a microsecond, a microsecond as one thousandth of a millisecond, a millisecond as one thousandth of a second, a minute as sixty seconds, an hour as sixty minutes, and a day as twenty four hours.

A **TimeUnit** (p. 3088) is mainly used to inform time-based methods how a given timing parameter should be interpreted. For example, the following **code** (p. 1005) will timeout in 50 milliseconds if the lock is not available:

Lock (p. 1924) lock = ...; if (lock.tryLock(50, **TimeUnit.MILLISECONDS** (p. 3095))) ...

while this **code** (p. 1005) will timeout in 50 seconds:

Lock (p. 1924) lock = ...; if (lock.tryLock(50, **TimeUnit.SECONDS** (p. 3095))) ...

Note however, that there is no guarantee that a particular timeout implementation will be able to notice the passage of time at the same granularity as the given **TimeUnit** (p. 3088).

6.642.2 Constructor & Destructor Documentation

6.642.2.1 decaf::util::concurrent::TimeUnit::TimeUnit (int *index*, const std::string & *name*) [protected]

Hidden Constructor, this class can not be instantiated directly.

Parameters:

index - Index into the Time Unit set.

name - Name of the unit type being represented.

6.642.2.2 virtual decaf::util::concurrent::TimeUnit::~TimeUnit () [inline, virtual]

6.642.3 Member Function Documentation

6.642.3.1 virtual int decaf::util::concurrent::TimeUnit::compareTo (const TimeUnit & *value*) const [virtual]

6.642.3.2 long long decaf::util::concurrent::TimeUnit::convert (long long *sourceDuration*, const TimeUnit & *sourceUnit*) const

Convert the given time duration in the given unit to this unit. Conversions from finer to coarser granularities truncate, so lose precision. For example converting 999 milliseconds to seconds results in 0. Conversions from coarser to finer granularities with arguments that would numerically overflow saturate to Long.MIN_VALUE if negative or Long.MAX_VALUE if positive.

For example, to convert 10 minutes to milliseconds, use: TimeUnit.MILLISECONDS.convert(10L, **TimeUnit.MINUTES** (p. 3095))

Parameters:

sourceDuration - Duration value to convert.

sourceUnit - Unit type of the source duration.

Returns:

the converted duration in this unit, or Long.MIN_VALUE if conversion would negatively overflow, or Long.MAX_VALUE if it would positively overflow.

6.642.3.3 virtual bool decaf::util::concurrent::TimeUnit::equals (const TimeUnit & *value*) const [virtual]

6.642.3.4 virtual bool decaf::util::concurrent::TimeUnit::operator< (const TimeUnit & *value*) const [virtual]

6.642.3.5 virtual bool decaf::util::concurrent::TimeUnit::operator== (const TimeUnit & *value*) const [virtual]

6.642.3.6 void decaf::util::concurrent::TimeUnit::sleep (long long *timeout*) const

Perform a `Thread.sleep` using this unit. This is a convenience method that converts time arguments into the form required by the `Thread.sleep` method.

Parameters:

timeout the minimum time to sleep

See also:

Thread::sleep

6.642.3.7 void decaf::util::concurrent::TimeUnit::timedJoin (decaf::lang::Thread * *thread*, long long *timeout*)

Perform a timed `Thread.join` using this time unit. This is a convenience method that converts time arguments into the form required by the `Thread.join` method.

Parameters:

thread the thread to wait for

timeout the maximum time to wait

Exceptions:

InterruptedException if interrupted while waiting.

NullPointerException if the thread object is null.

See also:

Thread::join(long long, long long)

6.642.3.8 void decaf::util::concurrent::TimeUnit::timedWait (Synchronizable * *obj*, long long *timeout*) const

Perform a timed `Object.wait` using this time unit. This is a convenience method that converts timeout arguments into the form required by the `Object.wait` method.

For example, you could implement a blocking `poll` method (see **BlockingQueue.poll** (p. 694)) using:

```
Object poll( long long timeout, const TimeUnit& unit )

  while( empty ) {
    unit.timedWait(this, timeout);
    ...
  }
}
```

Parameters:

obj the object to wait on

timeout the maximum time to wait.

Exceptions:

InterruptedException if interrupted while waiting.

NullPointerException if the **Synchronizable** (p. 2954) object is null.

See also:

Synchronizable::wait(long long, long long)

6.642.3.9 long long decaf::util::concurrent::TimeUnit::toDays (long long *duration*) const [inline]

Equivalent to `DAYS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 3090)

6.642.3.10 long long decaf::util::concurrent::TimeUnit::toHours (long long *duration*) const [inline]

Equivalent to `HOURS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 3090)

6.642.3.11 long long decaf::util::concurrent::TimeUnit::toMicros (long long *duration*) const [inline]

Equivalent to `MICROSECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also:

convert (p. 3090)

6.642.3.12 long long decaf::util::concurrent::TimeUnit::toMillis (long long *duration*) const [inline]

Equivalent to `MILLISECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also:

convert (p. 3090)

6.642.3.13 long long decaf::util::concurrent::TimeUnit::toMinutes (long long *duration*) const [inline]

Equivalent to `MINUTES.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 3090)

6.642.3.14 long long decaf::util::concurrent::TimeUnit::toNanos (long long *duration*) const [inline]

Equivalent to `NANOSECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also:

convert (p. 3090)

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::offer(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::poll(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::wait().

6.642.3.15 long long decaf::util::concurrent::TimeUnit::toSeconds (long long *duration*) const [inline]

Equivalent to `SECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 3090)

6.642.3.16 virtual std::string decaf::util::concurrent::TimeUnit::toString () const [virtual]

Converts the **TimeUnit** (p. 3088) type to the Name of the **TimeUnit** (p. 3088).

Returns:

String name of the **TimeUnit** (p. 3088)

6.642.3.17 static const TimeUnit& decaf::util::concurrent::TimeUnit::valueOf (const std::string & *name*) [static]

Returns the **TimeUnit** (p. 3088) constant of this type with the specified name. The string must match exactly an identifier used to declare an **TimeUnit** (p. 3088) constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters:

name The Name of the **TimeUnit** (p. 3088) constant to be returned.

Returns:

A constant reference to the **TimeUnit** (p. 3088) Constant with the given name.

Exceptions:

IllegalArgumentException if this enum type has no constant with the specified name

6.646.3.1 virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1921), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 3287).

6.646.3.2 virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::looseUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1922), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 3288).

6.646.3.3 virtual int activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1922), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 3288).

6.646.3.4 virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1922), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 3288).

6.646.3.5 virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1923), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 3289).

The documentation for this class was generated from the following file:

6.647.1 Constructor & Destructor Documentation

6.647.1.1 activemq::commands::TransactionInfo::TransactionInfo ()

6.647.1.2 virtual activemq::commands::TransactionInfo::~TransactionInfo () [virtual]

6.647.2 Member Function Documentation

6.647.2.1 virtual TransactionInfo* activemq::commands::TransactionInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.647.2.2 virtual void activemq::commands::TransactionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.647.2.3 virtual bool activemq::commands::TransactionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.647.2.4 virtual Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () [virtual]

6.647.2.5 virtual const Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () const [virtual]

6.647.2.6 virtual unsigned char activemq::commands::TransactionInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.647.2.7 virtual Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () [virtual]

6.647.2.8 virtual const Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () const [virtual]

6.647.2.9 virtual unsigned char activemq::commands::TransactionInfo::getType () const [virtual]

6.647.2.10 virtual bool activemq::commands::TransactionInfo::isTransactionInfo () const [inline, virtual]

Returns:

an answer of true to the **isTransactionInfo()** (p. 3108) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 640).

6.647.2.11 virtual void activemq::commands::TransactionInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.647.2.12 virtual void activemq::commands::TransactionInfo::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.647.2.13 virtual void activemq::commands::TransactionInfo::setType (unsigned char *type*) [virtual]

6.647.2.14 virtual std::string activemq::commands::TransactionInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.647.2.15 virtual Pointer<Command> activemq::commands::TransactionInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.647.3 Field Documentation

6.647.3.1 Pointer<ConnectionId> activemq::commands::TransactionInfo::connectionId [protected]

6.647.3.2 const unsigned char activemq::commands::TransactionInfo::ID_TRANSACTIONINFO = 7 [static]

6.647.3.3 Pointer<TransactionId> activemq::commands::TransactionInfo::transactionId [protected]

diagram for activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller:

Public Member Functions

- **TransactionInfoMarshaller** ()
- virtual ~**TransactionInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.648.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **TransactionInfoMarshaller** (p. 3110). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.648.2 Constructor & Destructor Documentation

6.648.2.1 activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::Transacti () [inline]

6.648.2.2 virtual activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::~Transac () [inline, virtual]

6.648.3 Member Function Documentation

6.648.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::createObje () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.648.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::getDataStr () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.648.3.3 virtual void activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::looseMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.648.3.4 virtual void activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::looseUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.648.3.5 virtual int activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.648.3.6 virtual void activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.648.3.7 virtual void activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::tightUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**TransactionInfoMarshaller.h**

6.649 cms::TransactionInProgressException Class Reference

This exception is thrown when an operation is invalid because a transaction is in progress.

`#include <src/main/cms/TransactionInProgressException.h>`Inheritance diagram for cms::TransactionInProgressException:

Public Member Functions

- **TransactionInProgressException** ()
- **TransactionInProgressException** (const **TransactionInProgressException** &ex)
- **TransactionInProgressException** (const std::string &message)
- **TransactionInProgressException** (const std::string &message, const std::exception *cause)
- **TransactionInProgressException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**TransactionInProgressException** () throw ()
- virtual **TransactionInProgressException** * **clone** ()

  *Creates a cloned version of this **CMSException** (p. 979) instance.*

6.649.1 Detailed Description

This exception is thrown when an operation is invalid because a transaction is in progress. For instance, an attempt to call **Session::commit** (p. 2684) when a session is part of a distributed transaction should throw a **TransactionInProgressException** (p. 3114).

Since:

2.3

6.649.2 Constructor & Destructor Documentation

  Performs a take.

6.653.1 Detailed Description

template<typename E> class decaf::internal::util::concurrent::TransferQueue< E >

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers. The algorithm is a little simpler than that for stacks because fulfillers do not need explicit nodes, and matching is done by CAS'ing QNode.item field from non-null to null (for put) or vice versa (for take).

6.653.2 Constructor & Destructor Documentation

6.653.2.1 template<typename E > decaf::internal::util::concurrent::TransferQueue< E >::TransferQueue () [inline]

Node class for **TransferQueue** (p. 3121). Tries to cancel by CAS'ing ref to NULL if that succeeds then we mark as cancelled. Returns true if this node is known to be off the queue because its next pointer has been forgotten due to an advanceHead operation.

6.653.2.2 template<typename E > virtual decaf::internal::util::concurrent::TransferQueue< E >::~TransferQueue () [inline, virtual]

6.653.3 Member Function Documentation

6.653.3.1 template<typename E > virtual E* decaf::internal::util::concurrent::TransferQueue< E >::transfer (bool *timed*, long long *nanos*) [inline, virtual]

Performs a take.

Parameters:

timed if this operation should timeout

nanos the timeout, in nanoseconds

Returns:

the item provided or received;

Exceptions:

TimeoutException if the operation timed out waiting for the producer to offer an item.

InterruptedException if the thread was interrupted while waiting for the producer to offer an item.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3120).

References NULL.

6.653.3.2 template<typename E > virtual void decaf::internal::util::concurrent::TransferQueue< E >::transfer (E * *e*, bool *timed*, long long *nanos*) [inline, virtual]

Performs a put.

Parameters:

e the item to be handed to a consumer;

timed if this operation should timeout

nanos the timeout, in nanoseconds

Exceptions:

TimeoutException if the operation timed out waiting for the consumer to accept the item offered.

InterruptedException if the thread was interrupted while waiting for the consumer to accept the item offered.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3120).

The documentation for this class was generated from the following file:

6.655.1 Detailed Description

Interface for a **transport** (p. 72) layer for command objects. Callers can send oneway messages or make synchronous requests. Non-response messages will be delivered to the specified listener object upon receipt. A user of the **Transport** (p. 3125) can set an exception listener to be notified of errors that occurs in Threads that the **Transport** (p. 3125) layer runs. Transports should be given an instance of a WireFormat object when created so that they can turn the built in Commands to / from the required wire format encoding.

6.655.2 Constructor & Destructor Documentation

6.655.2.1 virtual activemq::transport::Transport::~Transport () [virtual]

6.655.3 Member Function Documentation

6.655.3.1 virtual Pointer<FutureResponse> activemq::transport::Transport::asyncRequest (const Pointer< Command > *command*, const Pointer< ResponseCallback > *responseCallback*) [pure virtual]

Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.

Parameters:

command The Command object that is to sent out.

responseCallback A callback object that will be notified once a response to the command is received.

Returns:

A **FutureResponse** (p. 1573) instance that can be queried for the Response to the Command.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2614), **activemq::transport::failover::FailoverTransport** (p. 1493), **activemq::transport::IOTransport** (p. 1793), **activemq::transport::mock::MockTransport** (p. 2223), and **activemq::transport::TransportFilter** (p. 3138).

6.655.3.2 virtual std::string activemq::transport::Transport::getRemoteAddress () const [pure virtual]

Returns:

the remote address for this connection

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1495), **activemq::transport::IOTransport** (p. 1793), **activemq::transport::mock::MockTransport** (p. 2225), and **activemq::transport::TransportFilter** (p. 3139).

6.655.3.3 virtual TransportListener* activemq::transport::Transport::getTransportListener () const [pure virtual]

Gets the observer of asynchronous events from this **transport** (p. 72).

Returns:

the listener of **transport** (p. 72) events.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1496), **activemq::transport::IOTransport** (p. 1794), **activemq::transport::mock::MockTransport** (p. 2225), and **activemq::transport::TransportFilter** (p. 3139).

6.655.3.4 virtual Pointer<wireformat::WireFormat> activemq::transport::Transport::getWireFormat () const [pure virtual]

Gets the WireFormat instance that is in use by this **transport** (p. 72). In the case of nested **transport** (p. 72) this method delegates down to the lowest level **transport** (p. 72) that actually maintains a WireFormat info instance.

Returns:

The WireFormat the object used to encode / decode **commands** (p. 61).

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1496), **activemq::transport::IOTransport** (p. 1794), **activemq::transport::mock::MockTransport** (p. 2226), and **activemq::transport::TransportFilter** (p. 3140).

6.655.3.5 virtual bool activemq::transport::Transport::isClosed () const [pure virtual]

Has the **Transport** (p. 3125) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3125)

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1497), **activemq::transport::IOTransport** (p. 1794), **activemq::transport::mock::MockTransport** (p. 2226), and **activemq::transport::TransportFilter** (p. 3140).

6.655.3.6 virtual bool activemq::transport::Transport::isConnected () const [pure virtual]

Is the **Transport** (p. 3125) Connected to its Broker.

Returns:

true if a connection has been made.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1497), **activemq::transport::IOTransport** (p. 1794), **activemq::transport::mock::MockTransport** (p. 2226), **activemq::transport::tcp::TcpTransport** (p. 3008), and **activemq::transport::TransportFilter** (p. 3140).

6.655.3.7 virtual bool activemq::transport::Transport::isFaultTolerant () const [pure virtual]

Is this **Transport** (p. 3125) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3125) is fault tolerant.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1497), **activemq::transport::IOTransport** (p. 1794), **activemq::transport::mock::MockTransport** (p. 2227), **activemq::transport::tcp::TcpTransport** (p. 3008), and **activemq::transport::TransportFilter** (p. 3140).

6.655.3.8 virtual bool activemq::transport::Transport::isReconnectSupported () const [pure virtual]

Returns:

true if reconnect is supported.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1498), **activemq::transport::IOTransport** (p. 1795), **activemq::transport::mock::MockTransport** (p. 2227), and **activemq::transport::TransportFilter** (p. 3140).

6.655.3.9 virtual bool activemq::transport::Transport::isUpdateURIsSupported () const [pure virtual]

Returns:

true if updating uris is supported.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1498), **activemq::transport::IOTransport** (p. 1795), **activemq::transport::mock::MockTransport** (p. 2227), and **activemq::transport::TransportFilter** (p. 3141).

6.655.3.10 virtual Transport* activemq::transport::Transport::narrow (const std::type_info & *typeId*) [pure virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3125) to allow a higher level **transport** (p. 72) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1499), **activemq::transport::IOTransport** (p. 1795), **activemq::transport::mock::MockTransport** (p. 2228), and **activemq::transport::TransportFilter** (p. 3141).

6.655.3.11 virtual void activemq::transport::Transport::oneway (const Pointer< Command > *command*) [pure virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2615), **activemq::transport::failover::FailoverTransport** (p. 1499), **activemq::transport::inactivity::InactivityMonitor** (p. 1668), **activemq::transport::IOTransport** (p. 1795), **activemq::transport::logging::LoggingTransport** (p. 1952), **activemq::transport::mock::MockTransport** (p. 2228), **activemq::transport::TransportFilter** (p. 3141), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2340).

6.655.3.12 virtual void activemq::transport::Transport::reconnect (const decaf::net::URI & *uri*) [pure virtual]

reconnect to another location

Parameters:

uri The new URI to connect this **Transport** (p. 3125) to.

Exceptions:

IOException on failure or if reconnect is not supported.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1499), and **activemq::transport::TransportFilter** (p. 3142).

6.655.3.13 virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > *command*, unsigned int *timeout*) [pure virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command The command to be sent.

timeout The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2615), **activemq::transport::failover::FailoverTransport** (p. 1500), **activemq::transport::IOTransport** (p. 1796), **activemq::transport::logging::LoggingTransport** (p. 1952), **activemq::transport::mock::MockTransport** (p. 2228), **activemq::transport::TransportFilter** (p. 3142), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2341).

6.655.3.14 virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > *command*) [pure virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2616), **activemq::transport::failover::FailoverTransport** (p. 1500), **activemq::transport::IOTransport** (p. 1796), **activemq::transport::logging::LoggingTransport** (p. 1953), **activemq::transport::mock::MockTransport** (p. 2229), **activemq::transport::TransportFilter** (p. 3143), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2341).

6.655.3.15 virtual void activemq::transport::Transport::setTransportListener (TransportListener * *listener*) [pure virtual]

Sets the observer of asynchronous events from this **transport** (p. 72).

Parameters:

listener the listener of **transport** (p. 72) events.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1502), **activemq::transport::IOTransport** (p. 1797), **activemq::transport::mock::MockTransport** (p. 2231), and **activemq::transport::TransportFilter** (p. 3143).

6.655.3.16 virtual void activemq::transport::Transport::setWireFormat (const Pointer< wireformat::WireFormat > *wireFormat*) [pure virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 61).

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1503), **activemq::transport::IOTransport** (p. 1797), **activemq::transport::mock::MockTransport** (p. 2231), and **activemq::transport::TransportFilter** (p. 3144).

6.655.3.17 virtual void activemq::transport::Transport::start () [pure virtual]

Starts the **Transport** (p. 3125), the send methods of a **Transport** (p. 3125) will throw an exception if used before the **Transport** (p. 3125) is started.

Exceptions:

IOException if and error occurs while starting the **Transport** (p. 3125).

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1503), **activemq::transport::IOTransport** (p. 1797), **activemq::transport::mock::MockTransport** (p. 2231), and **activemq::transport::TransportFilter** (p. 3144).

6.655.3.18 virtual void activemq::transport::Transport::stop () [pure virtual]

Stops the **Transport** (p. 3125).

Exceptions:

IOException if an error occurs while stopping the **transport** (p. 72).

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1503), **activemq::transport::IOTransport** (p. 1798), **activemq::transport::mock::MockTransport** (p. 2232), and **activemq::transport::TransportFilter** (p. 3144).

6.655.3.19 virtual void activemq::transport::Transport::updateURIs (bool *rebalance*, const decaf::util::List< decaf::net::URI > & *uris*) [pure virtual]

Updates the set of URIs the **Transport** (p. 3125) can connect to. If the **Transport** (p. 3125) doesn't support updating its URIs then an IOException is thrown.

Parameters:

rebalance Indicates if a forced reconnection should be performed as a result of the update.

uris The new list of URIs that can be used for connection.

Exceptions:

IOException if an error occurs or updates aren't supported.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1504), and **activemq::transport::TransportFilter** (p. 3144).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**Transport.h**

6.656 activemq::transport::TransportFactory Class Reference

Defines the interface for Factories that create Transports or TransportFilters.

`#include <src/main/activemq/transport/TransportFactory.h>`Inheritance diagram for activemq::transport::TransportFactory:

Public Member Functions

- virtual ~**TransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (const **decaf::net::URI** &location)=0

  *Creates a fully configured **Transport** (p. 3125) instance which could be a chain of filters and transports.*

- virtual **Pointer**< **Transport** > **createComposite** (const **decaf::net::URI** &location)=0

  *Creates a slimed down **Transport** (p. 3125) instance which can be used in composite **transport** (p. 72) instances.*

6.656.1 Detailed Description

Defines the interface for Factories that create Transports or TransportFilters. The factory should be able to create either a completely configured **Transport** (p. 3125) meaning that it has all the appropriate filters wrapping it, or it should be able to create a slimed down version that is used in composite transports like Failover or Fanout.

Since:

3.0

6.656.2 Constructor & Destructor Documentation

6.656.2.1 virtual activemq::transport::TransportFactory::~TransportFactory () [inline, virtual]

6.656.3 Member Function Documentation

6.656.3.1 virtual Pointer<Transport> activemq::transport::TransportFactory::create (const decaf::net::URI & *location*) [pure virtual]

Creates a fully configured **Transport** (p. 3125) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1506), **activemq::transport::mock::MockTransportFactory** (p. 2233), and **activemq::transport::tcp::TcpTransportFactory** (p. 3010).

6.656.3.2 virtual Pointer<Transport> activemq::transport::TransportFactory::createComposite (const decaf::net::URI & *location*) [pure virtual]

Creates a slimed down **Transport** (p. 3125) instance which can be used in composite **transport** (p. 72) instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1506), **activemq::transport::mock::MockTransportFactory** (p. 2234), and **activemq::transport::tcp::TcpTransportFactory** (p. 3011).

  *Listener of this **transport** (p. 72).*

6.657.1 Detailed Description

A filter on the **transport** (p. 72) layer. **Transport** (p. 3125) filters implement the **Transport** (p. 3125) interface and optionally delegate calls to another **Transport** (p. 3125) object.

Since:

1.0

6.657.2 Constructor & Destructor Documentation

6.657.2.1 activemq::transport::TransportFilter::TransportFilter (const Pointer< Transport > *next*)

Constructor.

Parameters:

next - the next **Transport** (p. 3125) in the chain

6.657.2.2 virtual activemq::transport::TransportFilter::~TransportFilter () [virtual]

6.657.3 Member Function Documentation

6.657.3.1 virtual void activemq::transport::TransportFilter::afterNextIsStarted () [inline, protected, virtual]

Subclasses can override this method to do their own post startup work. This method will always be called after the doStart() method and the next transport's own **start()** (p. 3144) methods have been successfully run.

Reimplemented in **activemq::transport::inactivity::InactivityMonitor** (p. 1667), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2340).

6.657.3.2 virtual void activemq::transport::TransportFilter::afterNextIsStopped () [inline, protected, virtual]

Subclasses can override this method to do their own stop work. This method is always called after all the next transports have been stopped to prevent this **transport** (p. 72) for destroying resources needed by the lower level transports.

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3006), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2340).

6.657.3.3 virtual Pointer<FutureResponse> activemq::transport::TransportFilter::asyncRequest (const Pointer< Command > *command*, const Pointer< ResponseCallback > *responseCallback*) [inline, virtual]

Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.

Parameters:

command The Command object that is to sent out.

responseCallback A callback object that will be notified once a response to the command is received.

Returns:

A **FutureResponse** (p. 1573) instance that can be queried for the Response to the Command.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3126).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2614).

6.657.3.4 virtual void activemq::transport::TransportFilter::beforeNextIsStarted () [inline, protected, virtual]

Subclasses can override this method to do their own startup work. This method will always be called before the next **transport** (p. 72) in the chain is called in order to allow this **transport** (p. 72) a chance to initialize required resources.

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3007).

6.657.3.5 virtual void activemq::transport::TransportFilter::beforeNextIsStopped () [inline, protected, virtual]

Subclasses can override this method to do their own pre-stop work. This method will always be called before the next transport's own **stop()** (p. 3144) method or this filter's own doStop()

method is called.

Reimplemented in **activemq::transport::inactivity::InactivityMonitor** (p. 1667).

6.657.3.6 void activemq::transport::TransportFilter::checkClosed () const [protected]

Throws an IOException if this filter chain has already been closed.

6.657.3.7 void activemq::transport::TransportFilter::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

IOException if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 967).

6.657.3.8 virtual void activemq::transport::TransportFilter::doClose () [inline, protected, virtual]

Subclasses can override this method to do their own close work. This method is always called after all the next transports have been closed to prevent this **transport** (p. 72) for destroying resources needed by the lower level transports.

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2614), **activemq::transport::inactivity::InactivityMonitor** (p. 1667), and **activemq::transport::tcp::TcpTransport** (p. 3008).

6.657.3.9 virtual std::string activemq::transport::TransportFilter::getRemoteAddress () const [inline, virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3127).

6.657.3.10 virtual TransportListener* activemq::transport::TransportFilter::getTransportListener () const [inline, virtual]

Gets the observer of asynchronous events from this **transport** (p. 72).

Returns:

the listener of **transport** (p. 72) events.

Implements **activemq::transport::Transport** (p. 3127).

6.657.3.11 virtual Pointer<wireformat::WireFormat> activemq::transport::TransportFilter::getWireFormat () const [virtual]

Gets the WireFormat instance that is in use by this **transport** (p. 72). In the case of nested **transport** (p. 72) this method delegates down to the lowest level **transport** (p. 72) that actually maintains a WireFormat info instance.

Returns:

The WireFormat the object used to encode / decode **commands** (p. 61).

Implements **activemq::transport::Transport** (p. 3127).

6.657.3.12 virtual bool activemq::transport::TransportFilter::isClosed () const [virtual]

Has the **Transport** (p. 3125) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3125)

Implements **activemq::transport::Transport** (p. 3128).

6.657.3.13 virtual bool activemq::transport::TransportFilter::isConnected () const [inline, virtual]

Is the **Transport** (p. 3125) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3128).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3008).

6.657.3.14 virtual bool activemq::transport::TransportFilter::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3125) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3125) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3128).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3008).

6.657.3.15 virtual bool activemq::transport::TransportFilter::isReconnectSupported () const [inline, virtual]

Returns:

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 3128).

6.657.3.16 virtual bool activemq::transport::TransportFilter::isUpdateURIsSupported () const [inline, virtual]

Returns:

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 3129).

6.657.3.17 virtual Transport* activemq::transport::TransportFilter::narrow (const std::type_info & *typeId*) [virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3125) to allow a higher level **transport** (p. 72) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3129).

6.657.3.18 virtual void activemq::transport::TransportFilter::onCommand (const Pointer< Command > *command*) [virtual]

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Implements **activemq::transport::TransportListener** (p. 3146).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2615), **activemq::transport::inactivity::InactivityMonitor** (p. 1668), **activemq::transport::logging::LoggingTransport** (p. 1952), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2340).

6.657.3.19 virtual void activemq::transport::TransportFilter::oneway (const Pointer< Command > *command*) [inline, virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3129).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2615), **activemq::transport::inactivity::InactivityMonitor** (p. 1668), **activemq::transport::logging::LoggingTransport** (p. 1952), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2340).

6.657.3.20 virtual void activemq::transport::TransportFilter::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 72).

Parameters:

ex The exception to handle.

Implements **activemq::transport::TransportListener** (p. 3147).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2615), **activemq::transport::inactivity::InactivityMonitor** (p. 1668), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2341).

6.657.3.21 virtual void activemq::transport::TransportFilter::reconnect (const decaf::net::URI & *uri*) [virtual]

reconnect to another location

Parameters:

uri The new URI to connect this **Transport** (p. 3125) to.

Exceptions:

IOException on failure or if reconnect is not supported.

Implements **activemq::transport::Transport** (p. 3130).

6.657.3.22 virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > *command*, unsigned int *timeout*) [inline, virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command The command to be sent.

timeout The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3130).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2615), **activemq::transport::logging::LoggingTransport** (p. 1952), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2341).

6.657.3.23 virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > *command*) [inline, virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3130).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2616), **activemq::transport::logging::LoggingTransport** (p. 1953), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2341).

6.657.3.24 virtual void activemq::transport::TransportFilter::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous events from this **transport** (p. 72).

Parameters:

listener the listener of **transport** (p. 72) events.

Implements **activemq::transport::Transport** (p. 3131).

6.657.3.25 virtual void activemq::transport::TransportFilter::setWireFormat (const Pointer< wireformat::WireFormat > *wireFormat*) [virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 61).

Implements **activemq::transport::Transport** (p. 3131).

6.657.3.26 void activemq::transport::TransportFilter::start () [virtual]

Starts the **Transport** (p. 3125), the send methods of a **Transport** (p. 3125) will throw an exception if used before the **Transport** (p. 3125) is started.

Exceptions:

IOException if and error occurs while starting the **Transport** (p. 3125).

Implements **activemq::transport::Transport** (p. 3131).

6.657.3.27 void activemq::transport::TransportFilter::stop () [virtual]

Stops the **Transport** (p. 3125).

Exceptions:

IOException if an error occurs while stopping the **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3132).

6.657.3.28 virtual void activemq::transport::TransportFilter::transportInterrupted () [virtual]

The **transport** (p. 72) has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3147).

6.657.3.29 virtual void activemq::transport::TransportFilter::transportResumed () [virtual]

The **transport** (p. 72) has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3147).

6.657.3.30 virtual void activemq::transport::TransportFilter::updateURIs (bool *rebalance*, const decaf::util::List< decaf::net::URI > & *uris*) [inline, virtual]

Updates the set of URIs the **Transport** (p. 3125) can connect to. If the **Transport** (p. 3125) doesn't support updating its URIs then an IOException is thrown.

Parameters:

rebalance Indicates if a forced reconnection should be performed as a result of the update.

uris The new list of URIs that can be used for connection.

Exceptions:

IOException if an error occurs or updates aren't supported.

Implements **activemq::transport::Transport** (p. 3132).

6.657.4 Field Documentation

6.657.4.1 TransportListener* activemq::transport::TransportFilter::listener [protected]

Listener of this **transport** (p. 72).

6.657.4.2 Pointer<Transport> activemq::transport::TransportFilter::next [protected]

The **transport** (p. 72) that this filter wraps around.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportFilter.h**

6.658 activemq::transport::TransportListener Class Reference

A listener of asynchronous **exceptions** (p. 67) from a command **transport** (p. 72) object.

`#include <src/main/activemq/transport/TransportListener.h>`Inheritance diagram for activemq::transport::TransportListener:

Public Member Functions

- virtual ~**TransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > command)=0

  Event handler for the receipt of a command.

- virtual void **onException** (const **decaf::lang::Exception** &ex)=0

  *Event handler for an exception from a command **transport** (p. 72).*

- virtual void **transportInterrupted** ()=0

  *The **transport** (p. 72) has suffered an interruption from which it hopes to recover.*

- virtual void **transportResumed** ()=0

  *The **transport** (p. 72) has resumed after an interruption.*

6.658.1 Detailed Description

A listener of asynchronous **exceptions** (p. 67) from a command **transport** (p. 72) object.

6.658.2 Constructor & Destructor Documentation

6.658.2.1 virtual activemq::transport::TransportListener::~TransportListener () `[inline, virtual]`

6.658.3 Member Function Documentation

6.658.3.1 virtual void activemq::transport::TransportListener::onCommand (const Pointer< Command > *command*) `[pure virtual]`

Event handler for the receipt of a command. The **transport** (p. 72) passes off all received **commands** (p. 61) to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3125) deletes the command upon receipt.

Parameters:

command The received command object.

Implemented in **activemq::core::ActiveMQConnection** (p. 256), **activemq::transport::correlator::ResponseCorrelator** (p. 2615), **activemq::transport::DefaultTransportListener** (p. 1348), **activemq::transport::failover::FailoverTransportListener** (p. 1509), **activemq::transport::inactivity::InactivityMonitor** (p. 1668), **activemq::transport::logging::LoggingTransport** (p. 1952), **activemq::transport::mock::InternalCommandListener** (p. 1764), **activemq::transport::TransportFilter** (p. 3141), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2340).

6.658.3.2 virtual void activemq::transport::TransportListener::onException (const decaf::lang::Exception & *ex*) [pure virtual]

Event handler for an exception from a command **transport** (p. 72).

Parameters:

ex The exception being propagated to this listener to handle.

Implemented in **activemq::core::ActiveMQConnection** (p. 256), **activemq::transport::correlator::ResponseCorrelator** (p. 2615), **activemq::transport::failover::BackupTransport** (p. 628), **activemq::transport::failover::FailoverTransportListener** (p. 1509), **activemq::transport::inactivity::InactivityMonitor** (p. 1668), **activemq::transport::TransportFilter** (p. 3142), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2341).

6.658.3.3 virtual void activemq::transport::TransportListener::transportInterrupted () [pure virtual]

The **transport** (p. 72) has suffered an interruption from which it hopes to recover.

Implemented in **activemq::core::ActiveMQConnection** (p. 266), **activemq::transport::DefaultTransportListener** (p. 1349), **activemq::transport::failover::FailoverTransportListener** (p. 1509), and **activemq::transport::TransportFilter** (p. 3144).

6.658.3.4 virtual void activemq::transport::TransportListener::transportResumed () [pure virtual]

The **transport** (p. 72) has resumed after an interruption.

Implemented in **activemq::core::ActiveMQConnection** (p. 266), **activemq::transport::DefaultTransportListener** (p. 1349), **activemq::transport::failover::FailoverTransportListener** (p. 1509), and **activemq::transport::TransportFilter** (p. 3144).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportListener.h**

6.659 activemq::transport::TransportRegistry Class Reference

Registry of all **Transport** (p. 3125) Factories that are available to the client at runtime.

`#include <src/main/activemq/transport/TransportRegistry.h>`

Public Member Functions

- virtual ~**TransportRegistry** ()
- **TransportFactory** * **findFactory** (const std::string &name) const

  *Gets a Registered **TransportFactory** (p. 3133) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **TransportFactory** *factory)

  *Registers a new **TransportFactory** (p. 3133) with this Registry.*

- void **unregisterFactory** (const std::string &name)

  Unregisters the Factory with the given name and deletes that instance of the Factory.

- void **unregisterAllFactories** ()

  Removes all Factories and deletes the instances of the Factory objects.

- std::vector< std::string > **getTransportNames** () const

  Retrieves a list of the names of all the Registered Transport's in this Registry.

Static Public Member Functions

- static **TransportRegistry** & **getInstance** ()

  *Gets the single instance of the **TransportRegistry** (p. 3148).*

Friends

- class **activemq::library::ActiveMQCPP**

6.659.1 Detailed Description

Registry of all **Transport** (p. 3125) Factories that are available to the client at runtime. New Transport's must have a factory registered here before a connection attempt is made.

Since:

3.0

6.659.2 Constructor & Destructor Documentation

6.659.2.1 virtual activemq::transport::TransportRegistry::~TransportRegistry () [virtual]

6.659.3 Member Function Documentation

6.659.3.1 TransportFactory* activemq::transport::TransportRegistry::findFactory (const std::string & *name*) const

Gets a Registered **TransportFactory** (p. 3133) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters:

name The name of the Factory to find in the Registry.

Returns:

the Factory registered under the given name.

Exceptions:

NoSuchElementException if no factory is registered with that name.

6.659.3.2 static TransportRegistry& activemq::transport::TransportRegistry::getInstance () [static]

Gets the single instance of the **TransportRegistry** (p. 3148).

Returns:

reference to the single instance of this Registry

6.659.3.3 std::vector<std::string> activemq::transport::TransportRegistry::getTransportNames () const

Retrieves a list of the names of all the Registered Transport's in this Registry.

Returns:

stl vector of strings with all the **Transport** (p. 3125) names registered.

6.659.3.4 void activemq::transport::TransportRegistry::registerFactory (const std::string & *name*, TransportFactory * *factory*)

Registers a new **TransportFactory** (p. 3133) with this Registry. If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters:

name The name of the new Factory to register.

factory The new Factory to add to the Registry.

Exceptions:

IllegalArgumentException is name is the empty string.

NullPointerException if the Factory is Null.

6.659.3.5 void activemq::transport::TransportRegistry::unregisterAllFactories ()

Removes all Factories and deletes the instances of the Factory objects.

6.659.3.6 void activemq::transport::TransportRegistry::unregisterFactory (const std::string & *name*)

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters:

name Name of the Factory to unregister and destroy

6.659.4 Friends And Related Function Documentation

6.662 decaf::lang::Thread::UncaughtExceptionHandler Class Reference

Interface for handlers invoked when a **Thread** (p. 3016) abruptly terminates due to an uncaught exception.

`#include <src/main/decaf/lang/Thread.h>`

Public Member Functions

- virtual ~**UncaughtExceptionHandler** ()
- virtual void **uncaughtException** (const **Thread** *thread, const **Throwable** &error)=0

  Method invoked when the given thread terminates due to the given uncaught exception.

6.662.1 Detailed Description

Interface for handlers invoked when a **Thread** (p. 3016) abruptly terminates due to an uncaught exception.

6.662.2 Constructor & Destructor Documentation

6.662.2.1 virtual decaf::lang::Thread::UncaughtExceptionHandler::~UncaughtExceptionHandler () [inline, virtual]

6.662.3 Member Function Documentation

6.662.3.1 virtual void decaf::lang::Thread::UncaughtExceptionHandler::uncaughtException (const Thread * *thread*, const Throwable & *error*) [pure virtual]

Method invoked when the given thread terminates due to the given uncaught exception. This method is defined to indicate that it will not throw an exception, throwing and exception from this method will on most systems result in a segmentation fault.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Thread.h**

6.663 decaf::net::UnknownHostException Class Reference

`#include <src/main/decaf/net/UnknownHostException.h>`Inheritance diagram for decaf::net::UnknownHostException:

Public Member Functions

- **UnknownHostException** ()

  Default Constructor.

- **UnknownHostException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **UnknownHostException** (const **UnknownHostException** &ex)

  Copy Constructor.

- **UnknownHostException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **UnknownHostException** (const std::exception *cause)

  Constructor.

- **UnknownHostException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **UnknownHostException** * **clone** () const

  Clones this exception.

- virtual ~**UnknownHostException** () throw ()

6.663.1 Constructor & Destructor Documentation

6.663.1.1 decaf::net::UnknownHostException::UnknownHostException ()

Default Constructor.

6.663.1.2 decaf::net::UnknownHostException::UnknownHostException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.663.1.3 decaf::net::UnknownHostException::UnknownHostException (const UnknownHostException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.663.1.4 decaf::net::UnknownHostException::UnknownHostException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.663.1.5 decaf::net::UnknownHostException::UnknownHostException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.663.1.6 decaf::net::UnknownHostException::UnknownHostException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.663.1.7 virtual decaf::net::UnknownHostException::~UnknownHostException () throw () [virtual]

6.663.2 Member Function Documentation

6.663.2.1 virtual UnknownHostException* decaf::net::UnknownHostException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1788).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**UnknownHostException.h**

Public Member Functions

- **UnknownServiceException** ()

  Default Constructor.

- **UnknownServiceException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **UnknownServiceException** (const **UnknownServiceException** &ex)

  Copy Constructor.

- **UnknownServiceException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **UnknownServiceException** (const std::exception *cause)

  Constructor.

- **UnknownServiceException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **UnknownServiceException** * **clone** () const

  Clones this exception.

- virtual ~**UnknownServiceException** () throw ()

6.664.1 Constructor & Destructor Documentation

6.664.1.1 decaf::net::UnknownServiceException::UnknownServiceException ()

Default Constructor.

6.664.1.2 decaf::net::UnknownServiceException::UnknownServiceException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.664.1.3 decaf::net::UnknownServiceException::UnknownServiceException (const UnknownServiceException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.664.1.4 decaf::net::UnknownServiceException::UnknownServiceException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.664.1.5 decaf::net::UnknownServiceException::UnknownServiceException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.664.1.6 decaf::net::UnknownServiceException::UnknownServiceException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.664.1.7 virtual decaf::net::UnknownServiceException::~UnknownServiceException () throw () [virtual]

6.664.2 Member Function Documentation

6.664.2.1 virtual UnknownServiceException* decaf::net::UnknownServiceException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1788).

The documentation for this class was generated from the following file:

6.665.2 Constructor & Destructor Documentation

6.665.2.1 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException ()

Default Constructor.

6.665.2.2 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.665.2.3 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const UnsupportedEncodingException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.665.2.4 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.665.2.5 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.665.2.6 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.665.2.7 virtual decaf::io::UnsupportedEncodingException::~UnsupportedEncodingException () throw () [virtual]

6.665.3 Member Function Documentation

6.665.3.1 virtual UnsupportedEncodingException* decaf::io::UnsupportedEncodingException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1788).

The documentation for this class was generated from the following file:

6.666 decaf::lang::exceptions::UnsupportedOperationException Class Reference

`#include <src/main/decaf/lang/exceptions/UnsupportedOperationException.h>`Inheritance diagram for decaf::lang::exceptions::UnsupportedOperationException:

Public Member Functions

- **UnsupportedOperationException** ()
  Default Constructor.
- **UnsupportedOperationException** (const **Exception** &ex)
  Conversion Constructor from some other ***Exception*** *(*p. *1458**).*
- **UnsupportedOperationException** (const **UnsupportedOperationException** &ex)
  Copy Constructor.
- **UnsupportedOperationException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- **UnsupportedOperationException** (const std::exception *cause)
  Constructor.
- **UnsupportedOperationException** (const char *file, const int lineNumber, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnsupportedOperationException** * **clone** () const
  Clones this exception.
- virtual ~**UnsupportedOperationException** () throw ()

6.666.1 Constructor & Destructor Documentation

6.666.1.1 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio ()

Default Constructor.

6.666.1.2 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex An exception that should become this type of **Exception** (p. 1458)

6.666.1.3 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const UnsupportedOperationException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of **Exception** (p. 1458)

6.666.1.4 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.666.1.5 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.666.1.6 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.666.1.7 virtual decaf::lang::exceptions::UnsupportedOperationException::~UnsupportedOperationExcept () throw () [virtual]

6.666.2 Member Function Documentation

6.666.2.1 virtual UnsupportedOperationException* decaf::lang::exceptions::UnsupportedOperationException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

Reimplemented in **decaf::nio::ReadOnlyBufferException** (p. 2537).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**UnsupportedOperationException.h**

6.667 cms::UnsupportedOperationException Class Reference

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

`#include <src/main/cms/UnsupportedOperationException.h>`Inheritance diagram for cms::UnsupportedOperationException:

Public Member Functions

- **UnsupportedOperationException** ()
- **UnsupportedOperationException** (const **UnsupportedOperationException** &ex)
- **UnsupportedOperationException** (const std::string &message)
- **UnsupportedOperationException** (const std::string &message, const std::exception *cause)
- **UnsupportedOperationException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**UnsupportedOperationException** () throw ()
- virtual **UnsupportedOperationException** * **clone** ()

  *Creates a cloned version of this **CMSException** (p. 979) instance.*

6.667.1 Detailed Description

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

Since:

2.0

6.667.2 Constructor & Destructor Documentation

6.667.2.1 cms::UnsupportedOperationException::UnsupportedOperationException ()

6.667.2.2 cms::UnsupportedOperationException::UnsupportedOperationException (const UnsupportedOperationException & *ex*)

6.667.2.3 cms::UnsupportedOperationException::UnsupportedOperationException (const std::string & *message*)

6.667.2.4 cms::UnsupportedOperationException::UnsupportedOperationException (const std::string & *message*, const std::exception * *cause*)

6.667.2.5 cms::UnsupportedOperationException::UnsupportedOperationException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.667.2.6 virtual cms::UnsupportedOperationException::~UnsupportedOperationException () throw () [virtual]

6.667.3 Member Function Documentation

6.667.3.1 virtual UnsupportedOperationException* cms::UnsupportedOperationException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

The documentation for this class was generated from the following file:

- src/main/cms/**UnsupportedOperationException.h**

6.668 decaf::net::URI Class Reference

This class represents an instance of a **URI** (p. 3168) as defined by RFC 2396.

`#include <src/main/decaf/net/URI.h>`Inheritance diagram for decaf::net::URI:

Public Member Functions

- **URI** ()

  Default Constructor, same as calling a Constructor with all fields empty.

- **URI** (const **URI** &uri)

  *Constructs a **URI** (p. 3168) as a copy of another **URI** (p. 3168).*

- **URI** (const std::string &uri)

  *Constructs a **URI** (p. 3168) from the given string.*

- **URI** (const std::string &scheme, const std::string &ssp, const std::string &fragment)

  *Constructs a **URI** (p. 3168) from the given components.*

- **URI** (const std::string &scheme, const std::string &userInfo, const std::string &host, int port, const std::string &path, const std::string &query, const std::string &fragment)

  *Constructs a **URI** (p. 3168) from the given components.*

- **URI** (const std::string &scheme, const std::string &host, const std::string &path, const std::string &fragment)

  *Constructs a **URI** (p. 3168) from the given components.*

- **URI** (const std::string &scheme, const std::string &authority, const std::string &path, const std::string &query, const std::string &fragment)

  *Constructs a **URI** (p. 3168) from the given components.*

- virtual ~**URI** ()
- virtual int **compareTo** (const **URI** &value) const

  Compares this object with the specified object for order.

- virtual bool **equals** (const **URI** &value) const
- virtual bool **operator==** (const **URI** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **URI** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **getAuthority** () const
- std::string **getFragment** () const
- std::string **getHost** () const
- std::string **getPath** () const
- int **getPort** () const

- std::string **getQuery** () const
- std::string **getScheme** () const
- std::string **getUserInfo** () const
- std::string **getRawAuthority** () const

  *Returns the raw authority component of this **URI** (p. 3168).*

- std::string **getRawFragment** () const

  *Returns the raw fragment component of this **URI** (p. 3168).*

- std::string **getRawPath** () const

  *Returns the raw path component of this **URI** (p. 3168).*

- std::string **getRawQuery** () const

  *Returns the raw query component of this **URI** (p. 3168).*

- std::string **getRawSchemeSpecificPart** () const

  *Returns the raw scheme-specific part of this **URI** (p. 3168).*

- std::string **getSchemeSpecificPart** () const

  *Returns the decoded scheme-specific part of this **URI** (p. 3168).*

- std::string **getRawUserInfo** () const

  *Returns the raw user-information component of this **URI** (p. 3168).*

- bool **isAbsolute** () const

  *Tells whether or not this **URI** (p. 3168) is absolute.*

- bool **isOpaque** () const

  *Tells whether or not this **URI** (p. 3168) is opaque.*

- **URI normalize** () const

  Normalizes this URI's path.

- **URI parseServerAuthority** () const

  Attempts to parse this URI's authority component, if defined, into user-information, host, and port components.

- **URI relativize** (const **URI** &uri) const

  *Relativizes the given **URI** (p. 3168) against this **URI** (p. 3168).*

- **URI resolve** (const std::string &str) const

  *Constructs a new **URI** (p. 3168) by parsing the given string and then resolving it against this **URI** (p. 3168).*

- **URI resolve** (const **URI** &uri) const

  *Resolves the given **URI** (p. 3168) against this **URI** (p. 3168).*

- std::string **toString** () const

  *Returns the content of this **URI** (p. 3168) as a string.*

- **URL toURL** () const

  *Constructs a **URL** (p. 3210) from this **URI** (p. 3168).*

Static Public Member Functions

- static **URI create** (const std::string uri)

  *Creates a **URI** (p. 3168) by parsing the given string.*

6.668.1 Detailed Description

This class represents an instance of a **URI** (p. 3168) as defined by RFC 2396.

6.668.2 Constructor & Destructor Documentation

6.668.2.1 decaf::net::URI::URI ()

Default Constructor, same as calling a Constructor with all fields empty.

6.668.2.2 decaf::net::URI::URI (const URI & *uri*)

Constructs a **URI** (p. 3168) as a copy of another **URI** (p. 3168).

Parameters:

uri - uri to copy

Exceptions:

URISyntaxException *(p. 3198)* if the **URI** (p. 3168) passed is malformed.

6.668.2.3 decaf::net::URI::URI (const std::string & *uri*)

Constructs a **URI** (p. 3168) from the given string.

Parameters:

uri - string uri to parse.

Exceptions:

URISyntaxException *(p. 3198)* if the **URI** (p. 3168) passed is malformed.

6.668.2.4 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *ssp*, const std::string & *fragment*)

Constructs a **URI** (p. 3168) from the given components.

Parameters:

scheme - the uri scheme

ssp - Scheme specific part

fragment - Fragment

Exceptions:

URISyntaxException *(p. 3198)* if the **URI** (p. 3168) passed is malformed.

6.668.2.5 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *userInfo*, const std::string & *host*, int *port*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*)

Constructs a **URI** (p. 3168) from the given components.

Parameters:

scheme - Scheme name

userInfo - User name and authorization information

host - Host name

port - Port number

path - Path

query - Query

fragment - Fragment

Exceptions:

URISyntaxException *(p. 3198)* if the **URI** (p. 3168) passed is malformed.

6.668.2.6 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *host*, const std::string & *path*, const std::string & *fragment*)

Constructs a **URI** (p. 3168) from the given components.

Parameters:

scheme - Scheme name

host - Host name

path - Path

fragment - Fragment

Exceptions:

URISyntaxException *(p. 3198)* if the **URI** (p. 3168) passed is malformed.

6.668.2.7 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *authority*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*)

Constructs a **URI** (p. 3168) from the given components.

Parameters:

scheme - Scheme name

authority - Authority

path - Path

query - Query

fragment - Fragment

Exceptions:

URISyntaxException *(p. 3198)* if the **URI** (p. 3168) passed is malformed.

6.668.2.8 virtual decaf::net::URI::~URI () [inline, virtual]

6.668.3 Member Function Documentation

6.668.3.1 virtual int decaf::net::URI::compareTo (const URI & *value*) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the value to compare to this one.

Returns:

zero if equal minus one if less than and one if greater than.

6.668.3.2 static URI decaf::net::URI::create (const std::string *uri*) [static]

Creates a **URI** (p. 3168) by parsing the given string. This convenience factory method works as if by invoking the URI(string) constructor; any **URISyntaxException** (p. 3198) thrown by the constructor is caught and wrapped in a new IllegalArgumentException object, which is then thrown.

Parameters:

uri - **URI** (p. 3168) string to parse

Exceptions:

IllegalArgumentException

6.668.3.3 virtual bool decaf::net::URI::equals (const URI & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.668.3.4 std::string decaf::net::URI::getAuthority () const

Returns:

the decoded authority component of this **URI** (p. 3168).

6.668.3.5 std::string decaf::net::URI::getFragment () const

Returns:

the decoded fragment component of this **URI** (p. 3168).

6.668.3.6 std::string decaf::net::URI::getHost () const

Returns:

the host component of this **URI** (p. 3168).

6.668.3.7 std::string decaf::net::URI::getPath () const

Returns:

the path component of this **URI** (p. 3168).

6.668.3.8 int decaf::net::URI::getPort () const

Returns:

the port component of this **URI** (p. 3168).

6.668.3.9 std::string decaf::net::URI::getQuery () const

Returns:

the query component of this **URI** (p. 3168).

6.668.3.10 std::string decaf::net::URI::getRawAuthority () const

Returns the raw authority component of this **URI** (p. 3168). The authority component of a **URI** (p. 3168), if defined, only contains the commercial-at character ('@') and characters in the unreserved, punct, escaped, and other categories. If the authority is server-based then it is further constrained to have valid user-information, host, and port components.

Returns:

the raw authority component of the **URI** (p. 3168)

6.668.3.11 std::string decaf::net::URI::getRawFragment () const

Returns the raw fragment component of this **URI** (p. 3168). The fragment component of a **URI** (p. 3168), if defined, only contains legal **URI** (p. 3168) characters.

Returns:

the raw fragment component of this **URI** (p. 3168)

6.668.3.12 std::string decaf::net::URI::getRawPath () const

Returns the raw path component of this **URI** (p. 3168). The path component of a **URI** (p. 3168), if defined, only contains the slash character ('/'), the commercial-at character ('@'), and characters in the unreserved, punct, escaped, and other categories.

Returns:

the raw path component of this **URI** (p. 3168)

6.668.3.13 std::string decaf::net::URI::getRawQuery () const

Returns the raw query component of this **URI** (p. 3168). The query component of a **URI** (p. 3168), if defined, only contains legal **URI** (p. 3168) characters.

Returns:

the raw query component of the **URI** (p. 3168).

6.668.3.14 std::string decaf::net::URI::getRawSchemeSpecificPart () const

Returns the raw scheme-specific part of this **URI** (p. 3168). The scheme-specific part is never undefined, though it may be empty. The scheme-specific part of a **URI** (p. 3168) only contains legal **URI** (p. 3168) characters.

Returns:

the raw scheme special part of the uri

6.668.3.15 std::string decaf::net::URI::getRawUserInfo () const

Returns the raw user-information component of this **URI** (p. 3168). The user-information component of a **URI** (p. 3168), if defined, only contains characters in the unreserved, punct, escaped, and other categories.

Returns:

the raw user-information component of the **URI** (p. 3168)

6.668.3.16 std::string decaf::net::URI::getScheme () const

Returns:

the scheme component of this **URI** (p. 3168)

6.668.3.17 std::string decaf::net::URI::getSchemeSpecificPart () const

Returns the decoded scheme-specific part of this **URI** (p. 3168). The string returned by this method is equal to that returned by the getRawSchemeSpecificPart method except that all sequences of escaped octets are decoded.

Returns:

the raw scheme specific part of the uri.

6.668.3.18 std::string decaf::net::URI::getUserInfo () const

Returns:

the user info component of this **URI** (p. 3168)

6.668.3.19 bool decaf::net::URI::isAbsolute () const

Tells whether or not this **URI** (p. 3168) is absolute. A **URI** (p. 3168) is absolute if, and only if, it has a scheme component.

Returns:

true if, and only if, this **URI** (p. 3168) is absolute

6.668.3.20 bool decaf::net::URI::isOpaque () const

Tells whether or not this **URI** (p. 3168) is opaque. A **URI** (p. 3168) is opaque if, and only if, it is absolute and its scheme-specific part does not begin with a slash character ('/'). An opaque **URI** (p. 3168) has a scheme, a scheme-specific part, and possibly a fragment; all other components are undefined.

Returns:

true if, and only if, this **URI** (p. 3168) is opaque

6.668.3.21 URI decaf::net::URI::normalize () const

Normalizes this URI's path. If this **URI** (p. 3168) is opaque, or if its path is already in normal form, then this **URI** (p. 3168) is returned. Otherwise a new **URI** (p. 3168) is constructed that is identical to this **URI** (p. 3168) except that its path is computed by normalizing this URI's path in a manner consistent with RFC 2396, section 5.2, step 6, sub-steps c through f; that is:

1. All "." segments are removed. 2. If a ".." segment is preceded by a non-".." segment then both of these segments are removed. This step is repeated until it is no longer applicable. 3. If

the path is relative, and if its first segment contains a colon character (':'), then a "." segment is prepended. This prevents a relative **URI** (p. 3168) with a path such as "a:b/c/d" from later being re-parsed as an opaque **URI** (p. 3168) with a scheme of "a" and a scheme-specific part of "b/c/d". (Deviation from RFC 2396)

A normalized path will begin with one or more ".." segments if there were insufficient non-".." segments preceding them to allow their removal. A normalized path will begin with a "." segment if one was inserted by step 3 above. Otherwise, a normalized path will not contain any "." or ".." segments.

Returns:

A **URI** (p. 3168) equivalent to this **URI** (p. 3168), but whose path is in normal form

6.668.3.22 virtual bool decaf::net::URI::operator< (const URI & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.668.3.23 virtual bool decaf::net::URI::operator== (const URI & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.668.3.24 URI decaf::net::URI::parseServerAuthority () const

Attempts to parse this URI's authority component, if defined, into user-information, host, and port components. If this URI's authority component has already been recognized as being server-based then it will already have been parsed into user-information, host, and port components. In this case, or if this **URI** (p. 3168) has no authority component, this method simply returns this **URI** (p. 3168).

Otherwise this method attempts once more to parse the authority component into user-information, host, and port components, and throws an exception describing why the authority component could not be parsed in that way.

Returns:

A **URI** (p. 3168) whose authority field has been parsed as a server-based authority

Exceptions:

URISyntaxException *(p. 3198)* - If the authority component of this **URI** (p. 3168) is defined but cannot be parsed as a server-based authority.

6.668.3.25 URI decaf::net::URI::relativize (const URI & *uri*) const

Relativizes the given **URI** (p. 3168) against this **URI** (p. 3168). The relativization of the given **URI** (p. 3168) against this **URI** (p. 3168) is computed as follows:

1. If either this **URI** (p. 3168) or the given **URI** (p. 3168) are opaque, or if the scheme and authority components of the two URIs are not identical, or if the path of this **URI** (p. 3168) is not a prefix of the path of the given **URI** (p. 3168), then the given **URI** (p. 3168) is returned. 2. Otherwise a new relative hierarchical **URI** (p. 3168) is constructed with query and fragment components taken from the given **URI** (p. 3168) and with a path component computed by removing this URI's path from the beginning of the given URI's path.

Parameters:

uri - The **URI** (p. 3168) to be relativized against this **URI** (p. 3168)

Returns:

The resulting **URI** (p. 3168)

6.668.3.26 URI decaf::net::URI::resolve (const URI & *uri*) const

Resolves the given **URI** (p. 3168) against this **URI** (p. 3168). If the given **URI** (p. 3168) is already absolute, or if this **URI** (p. 3168) is opaque, then a copy of the given **URI** (p. 3168) is returned.

If the given URI's fragment component is defined, its path component is empty, and its scheme, authority, and query components are undefined, then a **URI** (p. 3168) with the given fragment but with all other components equal to those of this **URI** (p. 3168) is returned. This allows a **URI** (p. 3168) representing a standalone fragment reference, such as "#foo", to be usefully resolved against a base **URI** (p. 3168).

Otherwise this method constructs a new hierarchical **URI** (p. 3168) in a manner consistent with RFC 2396, section 5.2; that is:

1. A new **URI** (p. 3168) is constructed with this URI's scheme and the given URI's query and fragment components. 2. If the given **URI** (p. 3168) has an authority component then the new URI's authority and path are taken from the given **URI** (p. 3168). 3. Otherwise the new URI's authority component is copied from this **URI** (p. 3168), and its path is computed as follows:

1. If the given URI's path is absolute then the new URI's path is taken from the given **URI** (p. 3168). 2. Otherwise the given URI's path is relative, and so the new URI's path is computed by resolving the path of the given **URI** (p. 3168) against the path of this **URI** (p. 3168). This is done by concatenating all but the last segment of this URI's path, if any, with the given URI's path and then normalizing the result as if by invoking the normalize method.

The result of this method is absolute if, and only if, either this **URI** (p. 3168) is absolute or the given **URI** (p. 3168) is absolute.

Parameters:

uri - The **URI** (p. 3168) to be resolved against this **URI** (p. 3168)

Returns:

The resulting **URI** (p. 3168)

6.668.3.27 URI decaf::net::URI::resolve (const std::string & *str*) const

Constructs a new **URI** (p. 3168) by parsing the given string and then resolving it against this **URI** (p. 3168). This convenience method works as if invoking it were equivalent to evaluating the expression resolve(URI::create(str)).

Parameters:

str - The string to be parsed into a **URI** (p. 3168)

Returns:

The resulting **URI** (p. 3168)

Exceptions:

IllegalArgumentException - If the given string violates RFC 2396

6.668.3.28 std::string decaf::net::URI::toString () const

Returns the content of this **URI** (p. 3168) as a string. If this **URI** (p. 3168) was created by invoking one of the constructors in this class then a string equivalent to the original input string, or to the string computed from the originally-given components, as appropriate, is returned. Otherwise this **URI** (p. 3168) was created by normalization, resolution, or relativization, and so a string is constructed from this URI's components according to the rules specified in RFC 2396, section 5.2, step 7.

Returns:

the string form of this **URI** (p. 3168)

6.668.3.29 URL decaf::net::URI::toURL () const

Constructs a **URL** (p. 3210) from this **URI** (p. 3168). This convenience method works as if invoking it were equivalent to evaluating the expression new **URL** (p. 3210)(this.toString()) after first checking that this **URI** (p. 3168) is absolute.

Returns:

A **URL** (p. 3210) constructed from this **URI** (p. 3168)

Exceptions:

IllegalArgumentException - If this **URL** (p. 3210) is not absolute

MalformedURLException *(p. 2005)* - If a protocol handler for the **URL** (p. 3210) could not be found, or if some other error occurred while constructing the **URL** (p. 3210)

6.669 decaf::internal::net::URIEncoderDecoder Class Reference

`#include <src/main/decaf/internal/net/URIEncoderDecoder.h>`

Public Member Functions

- **URIEncoderDecoder** ()
- virtual ~**URIEncoderDecoder** ()

Static Public Member Functions

- static void **validate** (const std::string &s, const std::string &legal)

  Validate a string by checking if it contains any characters other than:.

- static void **validateSimple** (const std::string &s, const std::string &legal)

  Validate a string by checking if it contains any characters other than:.

- static std::string **quoteIllegal** (const std::string &s, const std::string &legal)

  All characters except letters ('a'.

- static std::string **encodeOthers** (const std::string &s)

  Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

- static std::string **decode** (const std::string &s)

  Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type using the UTF-8 encoding scheme.

6.669.1 Constructor & Destructor Documentation

6.669.1.1 decaf::internal::net::URIEncoderDecoder::URIEncoderDecoder ()

6.669.1.2 virtual decaf::internal::net::URIEncoderDecoder::~URIEncoderDecoder () `[inline, virtual]`

6.669.2 Member Function Documentation

6.669.2.1 static std::string decaf::internal::net::URIEncoderDecoder::decode (const std::string & *s*) `[static]`

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type using the UTF-8 encoding scheme. " and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A%20B%20C %24%25" -> "A B C $%"

Parameters:

s - The encoded string.

Returns:

The decoded version.

6.669.2.2 static std::string decaf::internal::net::URIEncoderDecoder::encodeOthers (const std::string & *s*) [static]

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved. They are converted into their hexidecimal value prepended by ".

For example: Euro currency symbol -> "%E2%82%AC".

Parameters:

s - the string to be converted

Returns:

the converted string

6.669.2.3 static std::string decaf::internal::net::URIEncoderDecoder::quoteIllegal (const std::string & *s*, const std::string & *legal*) [static]

All characters except letters ('a'. .'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexidecimal value prepended by ".

For example: '#' -> 23

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars, are preserved.

Parameters:

s - the string to be converted

legal - the characters allowed to be preserved in the string s

Returns:

converted string

6.669.2.4 static void decaf::internal::net::URIEncoderDecoder::validate (const std::string & *s*, const std::string & *legal*) [static]

Validate a string by checking if it contains any characters other than:. 1. letters ('a'..'z', 'A'..'Z') 2. numbers ('0'..'9') 3. characters in the legalset parameter 4. characters that are not ISO Control or are not ISO Space characters)

Parameters:

s - the string to be validated

legal - the characters allowed in the string s

Exceptions:

URISyntaxException if the uri string is not well formed.

6.669.2.5 static void decaf::internal::net::URIEncoderDecoder::validateSimple (const std::string & *s*, const std::string & *legal*) [static]

Validate a string by checking if it contains any characters other than:. 1. letters ('a'..'z', 'A'..'Z') 2. numbers ('0'..'9') 3. characters in the legalset parameter

Parameters:

s - the string to be validated

legal - the characters allowed in the string s

Exceptions:

URISyntaxException if the uri string is not well formed.

The documentation for this class was generated from the following file:

6.670 decaf::internal::net::URIHelper Class Reference

Helper class used by the URI classes in encoding and decoding of URI's.

`#include <src/main/decaf/internal/net/URIHelper.h>`

Public Member Functions

- **URIHelper** (const std::string &unreserved, const std::string &punct, const std::string &reserved, const std::string &someLegal, const std::string &allLegal)

  *Setup the **URIHelper** (p. 3183) with values assigned to the various fields that are used in the validation process.*

- **URIHelper** ()

  Sets up the filter strings with sane defaults.

- virtual ~**URIHelper** ()
- **URIType parseURI** (const std::string &uri, bool forceServer)

  Parse the passed in URI.

- void **validateScheme** (const std::string &uri, const std::string &scheme, int index)

  Validate the schema portin of the URI.

- void **validateSsp** (const std::string &uri, const std::string &ssp, std::size_t index)

  Validate that the URI Ssp Segment contains no invalid encodings.

- void **validateAuthority** (const std::string &uri, const std::string &authority, std::size_t index)

  Validate that the URI Authority Segment contains no invalid encodings.

- void **validatePath** (const std::string &uri, const std::string &path, std::size_t index)

  Validate that the URI Path Segment contains no invalid encodings.

- void **validateQuery** (const std::string &uri, const std::string &query, std::size_t index)

  Validate that the URI Query Segment contains no invalid encodings.

- void **validateFragment** (const std::string &uri, const std::string &fragment, std::size_t index)

  Validate that the URI fragment contains no invalid encodings.

- **URIType parseAuthority** (bool forceServer, const std::string &authority)

  determine the host, port and user-info if the authority parses successfully to a server based authority

- void **validateUserinfo** (const std::string &uri, const std::string &userinfo, std::size_t index)

  Check the supplied user info for validity.

- bool **isValidHost** (bool forceServer, const std::string &host)

  distinguish between IPv4, IPv6, domain name and validate it based on its type

- bool **isValidDomainName** (const std::string &host)

  Validates the string past to determine if it is a well formed domain name.

- bool **isValidIPv4Address** (const std::string &host)

  Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.

- bool **isValidIP6Address** (const std::string &ipAddress)

  Determines if the given address is valid according to the IPv6 spec.

- bool **isValidIP4Word** (const std::string &word)

  Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

- bool **isValidHexChar** (char c)

  Determines if the given char is a valid Hex char.

6.670.1 Detailed Description

Helper class used by the URI classes in encoding and decoding of URI's.

6.670.2 Constructor & Destructor Documentation

6.670.2.1 decaf::internal::net::URIHelper::URIHelper (const std::string & *unreserved*, const std::string & *punct*, const std::string & *reserved*, const std::string & *someLegal*, const std::string & *allLegal*)

Setup the **URIHelper** (p. 3183) with values assigned to the various fields that are used in the validation process. The defaults are overridden by these values.

Parameters:

unreserved - characters not reserved for use.

punct - allowable punctuation symbols.

reserved - characters not allowed for general use in the URI.

someLegal - characters that are legal in certain cases.

allLegal - characters that are always legal.

6.670.2.2 decaf::internal::net::URIHelper::URIHelper ()

Sets up the filter strings with sane defaults.

6.670.2.3 virtual decaf::internal::net::URIHelper::~URIHelper () [inline, virtual]

6.670.3 Member Function Documentation

6.670.3.1 bool decaf::internal::net::URIHelper::isValidDomainName (const std::string & *host*)

Validates the string past to determine if it is a well formed domain name.

Parameters:

host - domain name to validate.

Returns:

true if host is well formed.

6.670.3.2 bool decaf::internal::net::URIHelper::isValidHexChar (char *c*)

Determines if the given char is a valid Hex char. Valid chars are A-F (upper or lower case) and 0-9.

Parameters:

c - char to inspect

Returns:

true if c is a valid hex char.

6.670.3.3 bool decaf::internal::net::URIHelper::isValidHost (bool *forceServer*, const std::string & *host*)

distinguish between IPv4, IPv6, domain name and validate it based on its type

Parameters:

forceServer - true if the forceServer mode should be active.

host - Host string to validate.

Returns:

true if the host value if a valid domain name.

Exceptions:

URISyntaxException if the host is invalid and forceServer is true.

6.670.3.4 bool decaf::internal::net::URIHelper::isValidIP4Word (const std::string & *word*)

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

Parameters:

word - string value to check.

Returns:

true if the word is a valid IPv4 word.

6.670.3.5 bool decaf::internal::net::URIHelper::isValidIP6Address (const std::string & *ipAddress*)

Determines if the given address is valid according to the IPv6 spec.

Parameters:

ipAddress - string ip address value to validate.

Returns:

true if the address string is valid.

6.670.3.6 bool decaf::internal::net::URIHelper::isValidIPv4Address (const std::string & *host*)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9. and XXX is not greater than 255.

Parameters:

host - IPv4 address string to parse.

Returns:

true if host is a well formed IPv4 address.

6.670.3.7 URIType decaf::internal::net::URIHelper::parseAuthority (bool *forceServer*, const std::string & *authority*)

determine the host, port and user-info if the authority parses successfully to a server based authority behavior in error cases: if forceServer is true, throw URISyntaxException with the proper diagnostic messages. if forceServer is false assume this is a registry based uri, and just return leaving the host, port and user-info fields undefined.

and there are some error cases where URISyntaxException is thrown regardless of the forceServer parameter e.g. mal-formed ipv6 address

Parameters:

forceServer

authority

Returns:

a **URIType** (p. 3202) instance containing the parsed data.

Exceptions:

URISyntaxException

6.670.3.8 URIType decaf::internal::net::URIHelper::parseURI (const std::string & *uri*, bool *forceServer*)

Parse the passed in URI.

Parameters:

uri - the URI to Parse

forceServer - if true invalid URI data throws an Exception

Returns:

a **URIType** (p. 3202) instance containing the parsed data.

Exceptions:

URISyntaxException if forceServer is true and the URI is invalid.

6.670.3.9 void decaf::internal::net::URIHelper::validateAuthority (const std::string & *uri*, const std::string & *authority*, std::size_t *index*)

Validate that the URI Authority Segment contains no invalid encodings.

Parameters:

uri - the full uri.

authority - the Authority to check.

index - position in the uri where Authority starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.670.3.10 void decaf::internal::net::URIHelper::validateFragment (const std::string & *uri*, const std::string & *fragment*, std::size_t *index*)

Validate that the URI fragment contains no invalid encodings.

Parameters:

uri - the full uri.

fragment - the fragment to check.

index - position in the uri where fragment starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.670.3.11 void decaf::internal::net::URIHelper::validatePath (const std::string & *uri*, const std::string & *path*, std::size_t *index*)

Validate that the URI Path Segment contains no invalid encodings.

Parameters:

uri - the full uri.

path - the path to check.

index - position in the uri where path starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.670.3.12 void decaf::internal::net::URIHelper::validateQuery (const std::string & *uri*, const std::string & *query*, std::size_t *index*)

Validate that the URI Query Segment contains no invalid encodings.

Parameters:

uri - the full uri.

query - the query to check.

index - position in the uri where fragment starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.670.3.13 void decaf::internal::net::URIHelper::validateScheme (const std::string & *uri*, const std::string & *scheme*, int *index*)

Validate the schema portin of the URI.

Parameters:

uri - the URI to check.

scheme - the schema section of the URI.

index - index in uri where schema starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.670.3.14 void decaf::internal::net::URIHelper::validateSsp (const std::string & *uri*, const std::string & *ssp*, std::size_t *index*)

Validate that the URI Ssp Segment contains no invalid encodings.

Parameters:

uri - the full uri.

ssp - the SSP to check.

index - position in the uri where Ssp starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.670.3.15 void decaf::internal::net::URIHelper::validateUserinfo (const std::string & *uri*, const std::string & *userinfo*, std::size_t *index*)

Check the supplied user info for validity.

Parameters:

uri - the uri to parse.

userinfo - supplied user info

index - index into the URI string where the data is located.

Returns:

true if valid

Exceptions:

URISyntaxException if an error occurs

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**URIHelper.h**

6.671 activemq::transport::failover::URIPool Class Reference

`#include <src/main/activemq/transport/failover/URIPool.h>`

Public Member Functions

- **URIPool** ()

  Create an Empty URI Pool.

- **URIPool** (const **decaf::util::List**< **decaf::net::URI** > &uris)

  Creates a new URI Pool using the given list as the initial Free List.

- **URIPool** (const **URIPool** &uris)

  Creates a new URI Pool which will be a copy of the given URI Pool.

- **URIPool** & **operator**= (const **URIPool** &uris)

  Assignment operator, copies the contents of the given ***URIPool*** *(p. 3190) into this one.*

- ~**URIPool** ()
- const **decaf::util::List**< **decaf::net::URI** > & **getURIList** () const

  Gets a static view of the URI List contained in this URI Pool.

- bool **isEmpty** () const
- const **decaf::net::URI** & **getPriorityURI** () const

  Returns the URI that is considered to be this Pools Priority URI, this is always the first URI in the list of URIs that this pool was created with.

- void **setPriorityURI** (const **decaf::net::URI** &uri)

  Sets the URI that is considered this Pool's priority URI.

- **decaf::net::URI getURI** ()

  Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.

- bool **addURI** (const **decaf::net::URI** &uri)

  Adds a URI to the free list, callers that have previously taken one using the ***getURI*** *method should always return the URI when they close the resource that was connected to that URI.*

- bool **addURIs** (const **decaf::util::List**< **decaf::net::URI** > &uris)

  Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

- bool **removeURI** (const **decaf::net::URI** &uri)

  Remove a given URI from the Free List.

- bool **isRandomize** () const

  Is the URI that is given randomly picked from the pool or is each one taken in sequence.

- void **setRandomize** (bool value)

Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

- bool **contains** (const **decaf::net::URI** &uri) const

  Returns true if the given URI is contained in this set of URIs.

- bool **isPriority** (const **decaf::net::URI** &uri) const

  Returns true if the URI given is the first in the list of URIs contained in this pool.

- void **clear** ()

  Remove all URIs from the pool.

- bool **equals** (const **URIPool** &other) const

  *Compares the URIs in this set to that of another **URIPool** (p. 3190).*

6.671.1 Constructor & Destructor Documentation

6.671.1.1 activemq::transport::failover::URIPool::URIPool ()

Create an Empty URI Pool.

6.671.1.2 activemq::transport::failover::URIPool::URIPool (const decaf::util::List< decaf::net::URI > & *uris*)

Creates a new URI Pool using the given list as the initial Free List.

Parameters:

uris - List of URI to place in the Pool.

6.671.1.3 activemq::transport::failover::URIPool::URIPool (const URIPool & *uris*)

Creates a new URI Pool which will be a copy of the given URI Pool.

Parameters:

uris The **URIPool** (p. 3190) instance to copy.

6.671.1.4 activemq::transport::failover::URIPool::~URIPool ()

6.671.2 Member Function Documentation

6.671.2.1 bool activemq::transport::failover::URIPool::addURI (const decaf::net::URI & *uri*)

Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.

Parameters:

uri - a URI previously taken from the pool.

Returns:

true if the URI was added or false if its already in the list.

6.671.2.2 bool activemq::transport::failover::URIPool::addURIs (const decaf::util::List< decaf::net::URI > & *uris*)

Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

Parameters:

uris - List of URIs to add into the Pool.

Returns:

true if any URI was added or false if they were already in the list.

6.671.2.3 void activemq::transport::failover::URIPool::clear ()

Remove all URIs from the pool.

6.671.2.4 bool activemq::transport::failover::URIPool::contains (const decaf::net::URI & *uri*) const

Returns true if the given URI is contained in this set of URIs.

Returns:

true if the URI is in the list.

6.671.2.5 bool activemq::transport::failover::URIPool::equals (const URIPool & *other*) const

Compares the URIs in this set to that of another **URIPool** (p. 3190).

Returns:

true if the **URIPool** (p. 3190) instance contains the same values.

6.671.2.6 const decaf::net::URI& activemq::transport::failover::URIPool::getPriorityURI () const [inline]

Returns the URI that is considered to be this Pools Priority URI, this is always the first URI in the list of URIs that this pool was created with.

6.671.2.7 decaf::net::URI activemq::transport::failover::URIPool::getURI ()

Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException. Receiving the exception is not an indication that a URI won't be available in the future, the caller should react accordingly.

Returns:

the next free URI in the Pool.

Exceptions:

NoSuchElementException if there are none free currently.

6.671.2.8 const decaf::util::List<decaf::net::URI>& activemq::transport::failover::URIPool::getURIList () const [inline]

Gets a static view of the URI List contained in this URI Pool.

Returns:

a static reference to this Pools list of URIs.

6.671.2.9 bool activemq::transport::failover::URIPool::isEmpty () const

Returns:

true if this URI Pool is empty.

6.671.2.10 bool activemq::transport::failover::URIPool::isPriority (const decaf::net::URI & *uri*) const

Returns true if the URI given is the first in the list of URIs contained in this pool.

Returns:

true if the URI is index 0 in the URI list.

6.671.2.11 bool activemq::transport::failover::URIPool::isRandomize () const [inline]

Is the URI that is given randomly picked from the pool or is each one taken in sequence.

Returns:

true if URI gets are random.

6.671.2.12 URIPool& activemq::transport::failover::URIPool::operator= (const URIPool & *uris*)

Assignment operator, copies the contents of the given **URIPool** (p. 3190) into this one.

Parameters:

uris The **URIPool** (p. 3190) whose contents are to be copied.

6.671.2.13 bool activemq::transport::failover::URIPool::removeURI (const decaf::net::URI & *uri*)

Remove a given URI from the Free List.

Parameters:

uri The URI to find and remove from the free list

Returns:

true if the URI was removed or false if no change was made.

6.671.2.14 void activemq::transport::failover::URIPool::setPriorityURI (const decaf::net::URI & *uri*) [inline]

Sets the URI that is considered this Pool's priority URI.

Parameters:

uri The configured priority URI for this pool.

6.671.2.15 void activemq::transport::failover::URIPool::setRandomize (bool *value*) [inline]

Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

Parameters:

value - true indicates URI gets are random.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**URIPool.h**

6.672 activemq::util::URISupport Class Reference

`#include <src/main/activemq/util/URISupport.h>`

Static Public Member Functions

- static void **parseURL** (const std::string &**URI**, **decaf::util::Properties** &properties)

  Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

- static **CompositeData parseComposite** (const **URI** &uri)

  Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

- static **decaf::util::Properties parseQuery** (std::string query)

  Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

- static void **parseQuery** (std::string query, **decaf::util::Properties** *properties)

  Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

- static std::string **createQueryString** (const **Properties** &options)

  Given a properties object create a string that can be appended to a URI as a valid Query string.

6.672.1 Member Function Documentation

6.672.1.1 static std::string activemq::util::URISupport::createQueryString (const Properties & *options*) [static]

Given a properties object create a string that can be appended to a URI as a valid Query string.

Parameters:

options Properties object containing key / value query values.

Returns:

a valid URI query string.

Exceptions:

URISyntaxException if the string in the Properties object can't be encoded into a valid URI Query string.

6.672.1.2 static CompositeData activemq::util::URISupport::parseComposite (const URI & *uri*) [static]

Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

Parameters:

uri - The Composite URI to parse.

Returns:

a new **CompositeData** (p. 1043) object with the parsed data

Exceptions:

URISyntaxException if the URI is not well formed.

6.672.1.3 static void activemq::util::URISupport::parseQuery (std::string *query*, decaf::util::Properties * *properties*) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters:

query - the query string to parse.

properties - object pointer to get the parsed output.

Exceptions:

IllegalArgumentException if the Query string is not well formed.

6.672.1.4 static decaf::util::Properties activemq::util::URISupport::parseQuery (std::string *query*) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters:

query The query string to parse and extract the encoded properties.

Returns:

Properties object with the parsed output.

Exceptions:

IllegalArgumentException if the Query string is not well formed.

6.672.1.5 static void activemq::util::URISupport::parseURL (const std::string & *URI*, decaf::util::Properties & *properties*) [static]

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

Parameters:

URI a Broker URI to parse

properties a Properties object to set the parsed values in

Exceptions:

IllegalArgumentException if the passed URI is invalid

6.673 decaf::net::URISyntaxException Class Reference

`#include <src/main/decaf/net/URISyntaxException.h>`Inheritance diagram for decaf::net::URISyntaxException:

Public Member Functions

- **URISyntaxException** ()
  Default Constructor.
- **URISyntaxException** (const Exception &ex)
  Conversion Constructor from some other Exception.
- **URISyntaxException** (const **URISyntaxException** &ex)
  Copy Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const std::exception *cause)
  Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const char *msg)
  Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const char *file, const int lineNumber, const std::string &input, const std::string &reason)
  Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const char *file, const int lineNumber, const std::string &input, const std::string &reason, int index)
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **URISyntaxException** * **clone** () const
  Clones this exception.
- virtual ~**URISyntaxException** () throw ()
- std::string **getInput** () const
- std::string **getReason** () const
- int **getIndex** () const

6.673.1 Constructor & Destructor Documentation

6.673.1.1 decaf::net::URISyntaxException::URISyntaxException ()

Default Constructor.

6.673.1.2 decaf::net::URISyntaxException::URISyntaxException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.673.1.3 decaf::net::URISyntaxException::URISyntaxException (const URISyntaxException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.673.1.4 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.673.1.5 decaf::net::URISyntaxException::URISyntaxException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.673.1.6 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const char * *msg*)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.673.1.7 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::string & *input*, const std::string & *reason*)

Constructor - Initializes the file name and line number where this message occurred. Sets the input string that caused the error and the reason for the error.

Parameters:

file The file name where exception occurs.

lineNumber The line number where the exception occurred.

input The **URL** (p. 3210) that caused the exception.

reason The reason for the failure.

6.673.1.8 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::string & *input*, const std::string & *reason*, int *index*)

Constructor - Initializes the file name and line number where this message occurred. Sets the input string that caused the error and the reason for the error.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

input The input **URI** (p. 3168) that caused the exception

reason The reason for the failure.

index The index in the **URI** (p. 3168) string where the error occurred.

6.673.1.9 virtual decaf::net::URISyntaxException::~URISyntaxException () throw () [virtual]

6.673.2 Member Function Documentation

6.673.2.1 virtual URISyntaxException* decaf::net::URISyntaxException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::lang::Exception** (p. 1460).

6.673.2.2 int decaf::net::URISyntaxException::getIndex () const [inline]

Returns:

the index in the input string where the error occured or -1

6.673.2.3 std::string decaf::net::URISyntaxException::getInput () const [inline]

Returns:

the Input string that cause this exception or ""

6.673.2.4 std::string decaf::net::URISyntaxException::getReason () const [inline]

Returns:

the Reason given for this failure, or ""

The documentation for this class was generated from the following file:

6.674 decaf::internal::net::URIType Class Reference

Basic type object that holds data that composes a given URI.

`#include <src/main/decaf/internal/net/URIType.h>`

Public Member Functions

- **URIType** (const std::string &source)
- **URIType** ()
- virtual ~**URIType** ()
- std::string **getSource** () const

  *Gets the source URI string that was parsed to obtain this **URIType** (p. 3202) instance and the resulting data,.*

- void **setSource** (const std::string &source)

  *Sets the source URI string that was parsed to obtain this **URIType** (p. 3202) instance and the resulting data,.*

- std::string **getScheme** () const

  Gets the Scheme of the URI, e.g.

- void **setScheme** (const std::string &scheme)

  Sets the Scheme of the URI, e.g.

- std::string **getSchemeSpecificPart** () const

  Gets the Scheme Specific Part of the URI.

- void **setSchemeSpecificPart** (const std::string &schemeSpecificPart)

  Sets the Scheme Specific Part of the URI.

- std::string **getAuthority** () const

  Gets the Authority of the URI.

- void **setAuthority** (const std::string &authority)

  Sets the Authority of the URI.

- std::string **getUserInfo** () const

  Gets the user info part of the URI, e.g.

- void **setUserInfo** (const std::string &userinfo)

  Sets the user info part of the URI, e.g.

- std::string **getHost** () const

  Gets the Host name part of the URI.

- void **setHost** (const std::string &host)

  Sets the Host name part of the URI.

- int **getPort** () const

Gets the port part of the URI.

- void **setPort** (int port)

  Sets the port part of the URI.

- std::string **getPath** () const

  Gets the Path part of the URI.

- void **setPath** (const std::string &path)

  Sets the Path part of the URI.

- std::string **getQuery** () const

  Gets the Query part of the URI.

- void **setQuery** (const std::string &query)

  Sets the Query part of the URI.

- std::string **getFragment** () const

  Gets the Fragment part of the URI.

- void **setFragment** (const std::string &fragment)

  Sets the Fragment part of the URI.

- bool **isOpaque** () const

  Gets if the URI is Opaque.

- void **setOpaque** (bool opaque)

  Sets if the URI is Opaque.

- bool **isAbsolute** () const

  Gets if the URI is Absolute.

- void **setAbsolute** (bool absolute)

  Sets if the URI is Absolute.

- bool **isServerAuthority** () const

  Gets if the URI is a Server Authority.

- void **setServerAuthority** (bool serverAuthority)

  Sets if the URI is a Server Authority.

- bool **isValid** () const

  Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

- void **setValid** (bool valid)

  Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

6.674.1 Detailed Description

Basic type object that holds data that composes a given URI.

6.674.2 Constructor & Destructor Documentation

6.674.2.1 decaf::internal::net::URIType::URIType (const std::string & *source*) [inline]

6.674.2.2 decaf::internal::net::URIType::URIType () [inline]

6.674.2.3 virtual decaf::internal::net::URIType::~URIType () [inline, virtual]

6.674.3 Member Function Documentation

6.674.3.1 std::string decaf::internal::net::URIType::getAuthority () const [inline]

Gets the Authority of the URI.

Returns:

Authority part string.

6.674.3.2 std::string decaf::internal::net::URIType::getFragment () const [inline]

Gets the Fragment part of the URI.

Returns:

Fragment part string.

6.674.3.3 std::string decaf::internal::net::URIType::getHost () const [inline]

Gets the Host name part of the URI.

Returns:

Host name part string.

6.674.3.4 std::string decaf::internal::net::URIType::getPath () const [inline]

Gets the Path part of the URI.

Returns:

Path part string.

6.674.3.5 int decaf::internal::net::URIType::getPort () const [inline]

Gets the port part of the URI.

Returns:

port part string, -1 if not set.

6.674.3.6 std::string decaf::internal::net::URIType::getQuery () const [inline]

Gets the Query part of the URI.

Returns:

Query part string.

6.674.3.7 std::string decaf::internal::net::URIType::getScheme () const [inline]

Gets the Scheme of the URI, e.g. scheme ("http"/"ftp"/...).

Returns:

scheme part string.

6.674.3.8 std::string decaf::internal::net::URIType::getSchemeSpecificPart () const [inline]

Gets the Scheme Specific Part of the URI.

Returns:

scheme specific part string.

6.674.3.9 std::string decaf::internal::net::URIType::getSource () const [inline]

Gets the source URI string that was parsed to obtain this **URIType** (p. 3202) instance and the resulting data,.

Returns:

the source URI string

6.674.3.10 std::string decaf::internal::net::URIType::getUserInfo () const [inline]

Gets the user info part of the URI, e.g. user name, as in `http://user:passwd@host:port/`

Returns:

user info part string.

6.674.3.11 bool decaf::internal::net::URIType::isAbsolute () const [inline]

Gets if the URI is Absolute.

Returns:

true if Absolute.

6.674.3.12 bool decaf::internal::net::URIType::isOpaque () const [inline]

Gets if the URI is Opaque.

Returns:

true if opaque.

6.674.3.13 bool decaf::internal::net::URIType::isServerAuthority () const [inline]

Gets if the URI is a Server Authority.

Returns:

true if Server Authority.

6.674.3.14 bool decaf::internal::net::URIType::isValid () const [inline]

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Returns:

true if the **URIType** (p. 3202) contains valid data.

6.674.3.15 void decaf::internal::net::URIType::setAbsolute (bool *absolute*) [inline]

Sets if the URI is Absolute.

Parameters:

absolute - true if Absolute.

6.674.3.16 void decaf::internal::net::URIType::setAuthority (const std::string & *authority*) [inline]

Sets the Authority of the URI.

Parameters:

authority Authority part string.

6.674.3.17 void decaf::internal::net::URIType::setFragment (const std::string & *fragment*) [inline]

Sets the Fragment part of the URI.

Parameters:

fragment - Fragment part string.

6.674.3.18 void decaf::internal::net::URIType::setHost (const std::string & *host*) [inline]

Sets the Host name part of the URI.

Parameters:

host - Host name part string.

6.674.3.19 void decaf::internal::net::URIType::setOpaque (bool *opaque*) [inline]

Sets if the URI is Opaque.

Parameters:

opaque true if opaque.

6.674.3.20 void decaf::internal::net::URIType::setPath (const std::string & *path*) [inline]

Sets the Path part of the URI.

Parameters:

path - Path part string.

6.674.3.21 void decaf::internal::net::URIType::setPort (int *port*) [inline]

Sets the port part of the URI.

Parameters:

port - port part string, -1 if not set.

6.674.3.22 void decaf::internal::net::URIType::setQuery (const std::string & *query*) [inline]

Sets the Query part of the URI.

Parameters:

query - Query part string.

6.674.3.23 void decaf::internal::net::URIType::setScheme (const std::string & *scheme*) [inline]

Sets the Scheme of the URI, e.g. scheme ("http"/"ftp"/...).

Parameters:

scheme - scheme part string.

6.674.3.24 void decaf::internal::net::URIType::setSchemeSpecificPart (const std::string & *schemeSpecificPart*) [inline]

Sets the Scheme Specific Part of the URI.

Parameters:

schemeSpecificPart - scheme specific part string.

6.674.3.25 void decaf::internal::net::URIType::setServerAuthority (bool *serverAuthority*) [inline]

Sets if the URI is a Server Authority.

Parameters:

serverAuthority - true if Server Authority.

6.674.3.26 void decaf::internal::net::URIType::setSource (const std::string & *source*) [inline]

Sets the source URI string that was parsed to obtain this **URIType** (p. 3202) instance and the resulting data,.

Parameters:

source - the source URI string

6.674.3.27 void decaf::internal::net::URIType::setUserInfo (const std::string & *userinfo*) [inline]

Sets the user info part of the URI, e.g. user name, as in `http://user:passwd@host:port/`

Parameters:

userinfo - user info part string.

6.674.3.28 void decaf::internal::net::URIType::setValid (bool *valid*) [inline]

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Parameters:

valid - true if the **URIType** (p. 3202) contains valid data.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**URIType.h**

6.675 decaf::net::URL Class Reference

Class **URL** (p. 3210) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

`#include <src/main/decaf/net/URL.h>`

Public Member Functions

- **URL** ()
- **URL** (const std::string &url)
- virtual ~**URL** ()

6.675.1 Detailed Description

Class **URL** (p. 3210) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web. A resource can be something as simple as a file or a directory, or it can be a reference to a more complicated object, such as a query to a database or to a search engine. More information on the types of URLs and their formats can be found at:

`http://www.ksc.nasa.gov/facts/internet/url-primer.html`

In general, a **URL** (p. 3210) can be broken into several parts. The previous example of a **URL** (p. 3210) indicates that the protocol to use is http (HyperText Transfer Protocol) and that the information resides on a host machine named www.ksc.nasa.gov. The information on that host machine is named /facts/internet/url-primer.html. The exact meaning of this name on the host machine is both protocol dependent and host dependent. The information normally resides in a file, but it could be generated on the fly. This component of the **URL** (p. 3210) is called the path component.

A **URL** (p. 3210) can optionally specify a "port", which is the port number to which the TCP connection is made on the remote host machine. If the port is not specified, the default port for the protocol is used instead. For example, the default port for http is 80. An alternative port could be specified as:

`http://www.ksc.nasa.gov:80/facts/internet/url-primer.html`

The syntax of **URL** (p. 3210) is defined by RFC 2396: Uniform Resource Identifiers (**URI** (p. 3168)): Generic Syntax, amended by RFC 2732: Format for Literal IPv6 Addresses in URLs. The Literal IPv6 address format also supports scope_ids. The syntax and usage of scope_ids is described here.

A **URL** (p. 3210) may have appended to it a "fragment", also known as a "ref" or a "reference". The fragment is indicated by the sharp sign character "#" followed by more characters. For example,

`http://www.apache.org/cms/index.html#chapter1`

This fragment is not technically part of the **URL** (p. 3210). Rather, it indicates that after the specified resource is retrieved, the application is specifically interested in that part of the document that has the tag chapter1 attached to it. The meaning of a tag is resource specific.

An application can also specify a "relative URL", which contains only enough information to reach the resource relative to another **URL** (p. 3210). Relative URLs are frequently used within HTML pages. For example, if the contents of the **URL** (p. 3210):

`http://www.apache.org/cms/index.html`

contained within it the relative **URL** (p. 3210):

FAQ.html

it would be a shorthand for:

`http://www.apache.org/cms/FAQ.html`

The relative **URL** (p. 3210) need not specify all the components of a **URL** (p. 3210). If the protocol, host name, or port number is missing, the value is inherited from the fully specified **URL** (p. 3210). The file component must be specified. The optional fragment is not inherited.

The **URL** (p. 3210) class does not itself encode or decode any **URL** (p. 3210) components according to the escaping mechanism defined in RFC2396. It is the responsibility of the caller to encode any fields, which need to be escaped prior to calling **URL** (p. 3210), and also to decode any escaped fields, that are returned from **URL** (p. 3210). Furthermore, because **URL** (p. 3210) has no knowledge of **URL** (p. 3210) escaping, it does not recognise equivalence between the encoded or decoded form of the same **URL** (p. 3210). For example, the two URLs:

`http://foo.com/hello` world/ and `http://foo.com/hello%20world`

would be considered not equal to each other.

Note, the **URI** (p. 3168) class does perform escaping of its component fields in certain circumstances. The recommended way to manage the encoding and decoding of URLs is to use **URI** (p. 3168), and to convert between these two classes using toURI() and **URI.toURL()** (p. 3178).

The **URLEncoder** (p. 3213) and **URLDecoder** (p. 3212) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

6.675.2 Constructor & Destructor Documentation

6.675.2.1 decaf::net::URL::URL ()

6.675.2.2 decaf::net::URL::URL (const std::string & *url*)

6.675.2.3 virtual decaf::net::URL::~URL () `[inline, virtual]`

Public Member Functions

- virtual ~**URLDecoder** ()

Static Public Member Functions

- static std::string **decode** (const std::string &value)

  Decodes the string argument which is assumed to be encoded in the ***x-www-form-urlencoded*** *MIME content type.*

6.676.1 Constructor & Destructor Documentation

6.676.1.1 virtual decaf::net::URLDecoder::~URLDecoder () [inline, virtual]

6.676.2 Member Function Documentation

6.676.2.1 static std::string decaf::net::URLDecoder::decode (const std::string & *value*) [static]

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type. '+' will be converted to space, '' and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C $%"

Parameters:

value - string The encoded string.

Returns:

The decoded version as a string.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**URLDecoder.h**

6.677 decaf::net::URLEncoder Class Reference

`#include <src/main/decaf/net/URLEncoder.h>`

Public Member Functions

- virtual ~**URLEncoder** ()

Static Public Member Functions

- static std::string **encode** (const std::string &value)

  This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` *MIME content type.*

6.677.1 Constructor & Destructor Documentation

6.677.1.1 virtual decaf::net::URLEncoder::~URLEncoder () [inline, virtual]

6.677.2 Member Function Documentation

6.677.2.1 static std::string decaf::net::URLEncoder::encode (const std::string & *value*) [static]

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type. All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '*', '_' are converted into their hexidecimal value prepended by ''.

For example: '#' -> 23

In addition, spaces are substituted by '+'

Parameters:

value - the string to be converted

Returns:

the converted string

The documentation for this class was generated from the following file:

- src/main/decaf/net/**URLEncoder.h**

6.678 activemq::util::Usage Class Reference

`#include <src/main/activemq/util/Usage.h>`Inheritance diagram for activemq::util::Usage:

Public Member Functions

- virtual ~**Usage** ()
- virtual void **waitForSpace** ()=0

  *Waits forever for more space to be returned to this **Usage** (p. 3214) Manager.*

- virtual void **waitForSpace** (unsigned int timeout)=0

  *Waits for more space to be returned to this **Usage** (p. 3214) Manager, times out when the given time span in milliseconds elapses.*

- virtual void **enqueueUsage** (unsigned long long value)=0

  Tries to increase the usage by value amount but blocks if this object is currently full.

- virtual void **increaseUsage** (unsigned long long value)=0

  Increases the usage by the value amount.

- virtual void **decreaseUsage** (unsigned long long value)=0

  Decreases the usage by the value amount.

- virtual bool **isFull** () const =0

  *Returns true if this **Usage** (p. 3214) instance is full, i.e.*

6.678.1 Constructor & Destructor Documentation

6.678.1.1 virtual activemq::util::Usage::~Usage () [virtual]

6.678.2 Member Function Documentation

6.678.2.1 virtual void activemq::util::Usage::decreaseUsage (unsigned long long *value*) [pure virtual]

Decreases the usage by the value amount.

Parameters:

value Amount of space to return to the pool

Implemented in **activemq::util::MemoryUsage** (p. 2069).

6.678.2.2 virtual void activemq::util::Usage::enqueueUsage (unsigned long long *value*) [pure virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters:

value Amount of usage in bytes to add.

Implemented in **activemq::util::MemoryUsage** (p. 2069).

6.678.2.3 virtual void activemq::util::Usage::increaseUsage (unsigned long long *value*) [pure virtual]

Increases the usage by the value amount.

Parameters:

value Amount of usage to add.

Implemented in **activemq::util::MemoryUsage** (p. 2070).

6.678.2.4 virtual bool activemq::util::Usage::isFull () const [pure virtual]

Returns true if this **Usage** (p. 3214) instance is full, i.e. **Usage** (p. 3214) >= 100%

Returns:

true if **Usage** (p. 3214) is at the Full point.

Implemented in **activemq::util::MemoryUsage** (p. 2070).

6.678.2.5 virtual void activemq::util::Usage::waitForSpace (unsigned int *timeout*) [pure virtual]

Waits for more space to be returned to this **Usage** (p. 3214) Manager, times out when the given time span in milliseconds elapses.

Parameters:

timeout The time to wait for more space.

Implemented in **activemq::util::MemoryUsage** (p. 2070).

6.678.2.6 virtual void activemq::util::Usage::waitForSpace () [pure virtual]

Waits forever for more space to be returned to this **Usage** (p. 3214) Manager.

Implemented in **activemq::util::MemoryUsage** (p. 2071).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**Usage.h**

6.679 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

`#include <src/main/decaf/io/UTFDataFormatException.h>`Inheritance diagram for decaf::io::UTFDataFormatException:

Public Member Functions

- **UTFDataFormatException** ()
  Default Constructor.
- **UTFDataFormatException** (const **lang::Exception** &ex)
  Copy Constructor.
- **UTFDataFormatException** (const **UTFDataFormatException** &ex)

  Constructor.
- virtual **UTFDataFormatException** * **clone** () const
  Clones this exception.
- virtual ~**UTFDataFormatException** () throw ()

6.679.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Since:

1.0

6.679.2 Constructor & Destructor Documentation

6.679.2.1 decaf::io::UTFDataFormatException::UTFDataFormatException ()

Default Constructor.

6.679.2.2 decaf::io::UTFDataFormatException::UTFDataFormatException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.679.2.3 decaf::io::UTFDataFormatException::UTFDataFormatException (const UTFDataFormatException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.679.2.4 decaf::io::UTFDataFormatException::UTFDataFormatException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.679.2.5 decaf::io::UTFDataFormatException::UTFDataFormatException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.679.2.6 decaf::io::UTFDataFormatException::UTFDataFormatException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.679.2.7 virtual decaf::io::UTFDataFormatException::~UTFDataFormatException () throw () [virtual]

6.679.3 Member Function Documentation

6.679.3.1 virtual UTFDataFormatException* decaf::io::UTFDataFormatException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1788).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**UTFDataFormatException.h**

6.680 decaf::util::UUID Class Reference

A class that represents an immutable universally unique identifier (**UUID** (p. 3219)).

`#include <src/main/decaf/util/UUID.h>`Inheritance diagram for decaf::util::UUID:

Public Member Functions

- **UUID** (long long mostSigBits, long long leastSigBits)

  *Constructs a new **UUID** (p. 3219) using the specified data.*

- **UUID** (const **UUID** &source)

  *Create a copy of the source **UUID** (p. 3219).*

- **UUID** & **operator**= (const **UUID** &source)

  *Copy the source **UUID** (p. 3219) and return a reference to this **UUID** (p. 3219) for chaining.*

- virtual ~**UUID** ()
- virtual int **compareTo** (const **UUID** &value) const

  *Compare the given **UUID** (p. 3219) to this one.*

- virtual bool **equals** (const **UUID** &value) const

  *Compares this **UUID** (p. 3219) to the one given, returns true if they are equal.*

- int **hashCode** () const

  *Returns a Hash Code value for this **UUID** (p. 3219).*

- virtual bool **operator**== (const **UUID** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator**< (const **UUID** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const

  *Returns a String object representing this **UUID** (p. 3219).*

- long long **getLeastSignificantBits** () const
- long long **getMostSignificantBits** () const
- long long **node** ()

  *The node value associated with this **UUID** (p. 3219).*

- long long **timestamp** ()

  *The timestamp value associated with this **UUID** (p. 3219).*

- int **clockSequence** ()

  *The clock sequence value associated with this **UUID** (p. 3219).*

- int **variant** ()

  *The variant number associated with this **UUID** (p. 3219).*

- int **version** ()

  *The version number associated with this **UUID** (p. 3219).*

  *Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 3219).*

- static **UUID nameUUIDFromBytes** (const std::vector< char > &name)

  *Static factory to retrieve a type 3 (name based) **UUID** (p. 3219) based on the specified byte array.*

- static **UUID nameUUIDFromBytes** (const char *name, int size)

  *Static factory to retrieve a type 3 (name based) **UUID** (p. 3219) based on the specified byte array.*

- static **UUID fromString** (const std::string &name)

  *Creates a **UUID** (p. 3219) from the string standard representation as described in the **toString()** (p. 3225) method.*

6.680.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 3219)). A **UUID** (p. 3219) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach-Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 3219) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 3219) is as follows: The most significant long consists of the following unsigned fields:

0xFFFFFFFF00000000 time_low 0x00000000FFFF0000 time_mid 0x000000000000F000 version 0x0000000000000FFF time_hi

The least significant long consists of the following unsigned fields:

0xC000000000000000 variant 0x3FFF000000000000 clock_seq 0x0000FFFFFFFFFFFF node

The variant field contains a value which identifies the layout of the **UUID** (p. 3219). The bit layout described above is valid only for a **UUID** (p. 3219) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 3219). There are four different basic types of UUIDs: time-based, DCE **security** (p. 121), name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

6.680.2 Constructor & Destructor Documentation

6.680.2.1 decaf::util::UUID::UUID (long long *mostSigBits*, long long *leastSigBits*)

Constructs a new **UUID** (p. 3219) using the specified data. mostSigBits is used for the most significant 64 bits of the **UUID** (p. 3219) and leastSigBits becomes the least significant 64 bits of the **UUID** (p. 3219).

Parameters:

mostSigBits

leastSigBits

6.680.2.2 decaf::util::UUID::UUID (const UUID & *source*)

Create a copy of the source **UUID** (p. 3219).

Parameters:

source The **UUID** (p. 3219) whose value initializes this **UUID** (p. 3219)

6.680.2.3 virtual decaf::util::UUID::~UUID () [virtual]

6.680.3 Member Function Documentation

6.680.3.1 int decaf::util::UUID::clockSequence ()

The clock sequence value associated with this **UUID** (p. 3219). The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p. 3219). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p. 3219).

The clockSequence value is only meaningful in a time-based **UUID** (p. 3219), which has version type 1. If this **UUID** (p. 3219) is not a time-based **UUID** (p. 3219) then this method throws UnsupportedOperationException.

Returns:

the clockSequeunce associated with a V1 **UUID** (p. 3219)

Exceptions:

UnsupportedOperationException if this **UUID** (p. 3219) version does not support this operation.

6.680.3.2 virtual int decaf::util::UUID::compareTo (const UUID & *value*) const [virtual]

Compare the given **UUID** (p. 3219) to this one.

Parameters:

value - the **UUID** (p. 3219) to compare to

6.680.3.3 virtual bool decaf::util::UUID::equals (const UUID & *value*) const [virtual]

Compares this **UUID** (p. 3219) to the one given, returns true if they are equal.

Parameters:

value The **UUID** (p. 3219) to compare to.

Returns:

true if UUIDs are the same.

6.680.3.4 static UUID decaf::util::UUID::fromString (const std::string & *name*) [static]

Creates a **UUID** (p. 3219) from the string standard representation as described in the **toString()** (p. 3225) method.

Parameters:

name A string to be used to construct a **UUID** (p. 3219).

Returns:

type 3 **UUID** (p. 3219)

Exceptions:

IllegalArgumentException if the **UUID** (p. 3219) string given is invalid.

6.680.3.5 long long decaf::util::UUID::getLeastSignificantBits () const

Returns:

the most significant 64 bits of this UUID's 128 bit value.

6.680.3.6 long long decaf::util::UUID::getMostSignificantBits () const

Returns:

the most significant 64 bits of this UUID's 128 bit value.

6.680.3.7 int decaf::util::UUID::hashCode () const

Returns a Hash Code value for this **UUID** (p. 3219).

Returns:

a Hash Code for this **UUID** (p. 3219)

6.680.3.8 static UUID decaf::util::UUID::nameUUIDFromBytes (const char * *name*, int *size*) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3219) based on the specified byte array.

Parameters:

name A byte array to be used to construct a **UUID** (p. 3219).

size The size of the byte array, or number of bytes to use.

Returns:

type 3 **UUID** (p. 3219)

6.680.3.9 static UUID decaf::util::UUID::nameUUIDFromBytes (const std::vector< char > & *name*) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3219) based on the specified byte array.

Parameters:

name A byte array to be used to construct a **UUID** (p. 3219).

Returns:

type 3 **UUID** (p. 3219)

6.680.3.10 long long decaf::util::UUID::node ()

The node value associated with this **UUID** (p. 3219). The 48 bit node value is constructed from the node field of this **UUID** (p. 3219). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p. 3219) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 3219), which has version type 1. If this **UUID** (p. 3219) is not a time-based **UUID** (p. 3219) then this method throws UnsupportedOperationException.

Returns:

the node value of this **UUID** (p. 3219)

Exceptions:

UnsupportedOperationException if this **UUID** (p. 3219) version does not support this operation.

6.680.3.11 virtual bool decaf::util::UUID::operator< (const UUID & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.680.3.12 UUID& decaf::util::UUID::operator= (const UUID & *source*)

Copy the source **UUID** (p. 3219) and return a reference to this **UUID** (p. 3219) for chaining.

Parameters:

source The **UUID** (p. 3219) whose value replaces the current values in this **UUID** (p. 3219)

Returns:

a reference to this **UUID** (p. 3219)

6.680.3.13 virtual bool decaf::util::UUID::operator== (const UUID & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.680.3.14 static UUID decaf::util::UUID::randomUUID () [static]

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 3219). The **UUID** (p. 3219) is generated using a cryptographically strong pseudo random number generator.

Returns:

type 4 **UUID** (p. 3219)

6.680.3.15 long long decaf::util::UUID::timestamp ()

The timestamp value associated with this **UUID** (p. 3219). The 60 bit timestamp value is constructed from the time_low, time_mid, and time_hi fields of this **UUID** (p. 3219). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p. 3219), which has version type 1. If this **UUID** (p. 3219) is not a time-based **UUID** (p. 3219) then this method throws UnsupportedOperationException.

Returns:

the timestamp associated with a V1 **UUID** (p. 3219)

Exceptions:

UnsupportedOperationException if this **UUID** (p. 3219) version does not support this operation.

6.680.3.16 std::string decaf::util::UUID::toString () const

Returns a String object representing this **UUID** (p. 3219). The **UUID** (p. 3219) string representation is as described by this BNF :

UUID (p. 3219) = <time_low> "-" <time_mid> "-" <time_high_and_version> "-" <variant_and_sequence> "-" <node> time_low = 4*<hexOctet> time_mid = 2*<hexOctet> time_high_and_version = 2*<hexOctet> variant_and_sequence = 2*<hexOctet> node = 6*<hexOctet> hexOctet = <hexDigit><hexDigit> hexDigit = "0" | "1" | "2" | "3" | "4" | "5" | "6" | "7" | "8" | "9" | "a" | "b" | "c" | "d" | "e" | "f" | "A" | "B" | "C" | "D" | "E" | "F"

Returns:

formatted string for this **UUID** (p. 3219)

6.680.3.17 int decaf::util::UUID::variant ()

The variant number associated with this **UUID** (p. 3219). The variant number describes the layout of the **UUID** (p. 3219). The variant number has the following meaning:

* 0 Reserved for NCS backward compatibility * 2 The Leach-Salz variant (used by this class) * 6 Reserved, Microsoft Corporation backward compatibility * 7 Reserved for future definition

Returns:

the variant associated with a V1 **UUID** (p. 3219)

Exceptions:

UnsupportedOperationException if this **UUID** (p. 3219) version does not support this operation.

6.680.3.18 int decaf::util::UUID::version ()

The version number associated with this **UUID** (p. 3219). The version number describes how this **UUID** (p. 3219) was generated. The version number has the following meaning:

* 1 Time-based **UUID** (p. 3219) * 2 DCE **security** (p. 121) **UUID** (p. 3219) * 3 Name-based **UUID** (p. 3219) * 4 Randomly generated **UUID** (p. 3219)

Returns:

the version associated with a V1 **UUID** (p. 3219)

Exceptions:

UnsupportedOperationException if this **UUID** (p. 3219) version does not support this operation.

The documentation for this class was generated from the following file:

6.681 activemq::wireformat::WireFormat Class Reference

Provides a mechanism to marshal **commands** (p. 61) into and out of packets or into and out of streams, Channels and Datagrams.

`#include <src/main/activemq/wireformat/WireFormat.h>`Inheritance diagram for activemq::wireformat::WireFormat:

Public Member Functions

- virtual ~**WireFormat** ()
- virtual void **marshal** (const **Pointer**< **commands::Command** > command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)=0

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)=0

  Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

- virtual void **setVersion** (int version)=0

  Set the Version.

- virtual int **getVersion** () const =0

  Get the Version.

- virtual bool **hasNegotiator** () const =0

  *Returns true if this **WireFormat** (p. 3227) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual bool **inReceive** () const =0

  Indicates if the WireFromat object is in the process of receiving a message.

- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > transport)=0

  If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

6.681.1 Detailed Description

Provides a mechanism to marshal **commands** (p. 61) into and out of packets or into and out of streams, Channels and Datagrams.

6.681.2 Constructor & Destructor Documentation

6.681.2.1 virtual activemq::wireformat::WireFormat::~WireFormat () [virtual]

6.681.3 Member Function Documentation

6.681.3.1 virtual Pointer<transport::Transport> activemq::wireformat::WireFormat::createNegotiator (const Pointer< transport::Transport > *transport*) [pure virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters:

transport *(p. 72)* The Transport to Wrap the Negotiator around.

Returns:

new instance of a **WireFormatNegotiator** (p. 3247) as a **Pointer<Transport>** (p. 2370).

Exceptions:

UnsupportedOperationException if the **WireFormat** (p. 3227) doesn't have a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2327), and **activemq::wireformat::stomp::StompWireFormat** (p. 2914).

6.681.3.2 virtual int activemq::wireformat::WireFormat::getVersion () const [pure virtual]

Get the Version.

Returns:

the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2329), and **activemq::wireformat::stomp::StompWireFormat** (p. 2915).

6.681.3.3 virtual bool activemq::wireformat::WireFormat::hasNegotiator () const [pure virtual]

Returns true if this **WireFormat** (p. 3227) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 3227) provides a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2329), and **activemq::wireformat::stomp::StompWireFormat** (p. 2915).

6.681.3.4 virtual bool activemq::wireformat::WireFormat::inReceive () const [pure virtual]

Indicates if the WireFromat object is in the process of receiving a message. This is useful for monitoring inactivity and the **WireFormat** (p. 3227) is processing a large message which takes longer than some configured timeout to unmarshal, the inactivity monitor can query the **WireFormat** (p. 3227) instance to determine if its busy or not and not mark the connection as inactive if so.

Returns:

true if the **WireFormat** (p. 3227) object is unmarshaling a message.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2330), and **activemq::wireformat::stomp::StompWireFormat** (p. 2916).

6.681.3.5 virtual void activemq::wireformat::WireFormat::marshal (const Pointer< commands::Command > *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) [pure virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal

transport *(p. 72)* The Transport that called this method.

out The output stream to write the command to.

Exceptions:

IOException if an I/O error occurs.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2331), and **activemq::wireformat::stomp::StompWireFormat** (p. 2916).

6.681.3.6 virtual void activemq::wireformat::WireFormat::setVersion (int *version*) [pure virtual]

Set the Version.

Parameters:

version the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2334), and **activemq::wireformat::stomp::StompWireFormat** (p. 2917).

6.681.3.7 virtual Pointer<commands::Command> activemq::wireformat::WireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) [pure virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form. Returns a Pointer to the newly unmarshaled Command.

Parameters:

transport *(p. 72)* Pointer to the **transport** (p. 72) that is making this request.

in The input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException if an I/O error occurs.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2335), and **activemq::wireformat::stomp::StompWireFormat** (p. 2917).

The documentation for this class was generated from the following file:

6.682 activemq::wireformat::WireFormatFactory Class Reference

The **WireFormatFactory** (p. 3231) is the interface that all **WireFormatFactory** (p. 3231) classes must extend.

`#include <src/main/activemq/wireformat/WireFormatFactory.h>`Inheritance diagram for activemq::wireformat::WireFormatFactory:

Public Member Functions

- virtual ~**WireFormatFactory** ()
- virtual **Pointer**< **WireFormat** > **createWireFormat** (const **decaf::util::Properties** &properties)=0

  *Creates a new **WireFormat** (p. 3227) Object passing it a set of properties from which it can obtain any optional settings.*

6.682.1 Detailed Description

The **WireFormatFactory** (p. 3231) is the interface that all **WireFormatFactory** (p. 3231) classes must extend. The Factory creates a **WireFormat** (p. 3227) Object based on the properties that are set in the passed `Properties` object.

6.682.2 Constructor & Destructor Documentation

6.682.2.1 virtual activemq::wireformat::WireFormatFactory::~WireFormatFactory () [virtual]

6.682.3 Member Function Documentation

6.682.3.1 virtual Pointer<WireFormat> activemq::wireformat::WireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) [pure virtual]

Creates a new **WireFormat** (p. 3227) Object passing it a set of properties from which it can obtain any optional settings.

Parameters:

properties The Properties for this **WireFormat** (p. 3227).

Returns:

Pointer to a new instance of a **WireFormat** (p. 3227) object.

Exceptions:

IllegalStateException if the factory has not been initialized.

Implemented in **activemq::wireformat::openwire::OpenWireFormatFactory** (p. 2337), and **activemq::wireformat::stomp::StompWireFormatFactory** (p. 2918).

The documentation for this class was generated from the following file:

6.683 activemq::commands::WireFormatInfo Class Reference

`#include <src/main/activemq/commands/WireFormatInfo.h>`Inheritance diagram for activemq::commands::WireFormatInfo:

Public Member Functions

- **WireFormatInfo** ()
- virtual ~**WireFormatInfo** ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **DataStructure** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual bool **isMarshalAware** () const

  Determine if the class implementing this interface is really wanting to be told about marshaling.

- virtual **decaf::lang::Pointer**< **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

- int **getVersion** () const

  Get the current Wireformat Version.

- void **setVersion** (int version)

  Set the current Wireformat Version.

- long long **getMaxInactivityDuration** () const

  Returns the currently configured Max Inactivity duration.

- void **setMaxInactivityDuration** (long long maxInactivityDuration)

  Sets the Max inactivity duration value.

- long long **getMaxInactivityDurationInitalDelay** () const

  Returns the currently configured Max Inactivity Intial Delay duration.

- void **setMaxInactivityDurationInitalDelay** (long long maxInactivityDurationInitalDelay)

  Sets the Max inactivity initial delay duration value.

- bool **isStackTraceEnabled** () const

  Checks if the stackTraceEnabled flag is on.

- void **setStackTraceEnabled** (bool stackTraceEnabled)

  Sets if the stackTraceEnabled flag is on.

- bool **isTcpNoDelayEnabled** () const

  Checks if the tcpNoDelayEnabled flag is on.

- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)

  Sets if the tcpNoDelayEnabled flag is on.

- bool **isCacheEnabled** () const

  Checks if the cacheEnabled flag is on.

- void **setCacheEnabled** (bool cacheEnabled)

  Sets if the cacheEnabled flag is on.

- int **getCacheSize** () const

  Gets the Cache Size setting.

- void **setCacheSize** (int value)

  Sets the Cache Size setting.

- bool **isTightEncodingEnabled** () const

  Checks if the tightEncodingEnabled flag is on.

- void **setTightEncodingEnabled** (bool tightEncodingEnabled)

  Sets if the tightEncodingEnabled flag is on.

- bool **isSizePrefixDisabled** () const

  Checks if the sizePrefixDisabled flag is on.

- void **setSizePrefixDisabled** (bool sizePrefixDisabled)

  Sets if the sizePrefixDisabled flag is on.

- const std::vector< unsigned char > & **getMagic** () const

  Get the Magic field.

- void **setMagic** (const std::vector< unsigned char > &magic)

  Sets the value of the magic field.

- const std::vector< unsigned char > & **getMarshalledProperties** () const

  Get the marshalledProperties field.

- void **setMarshalledProperties** (const std::vector< unsigned char > &marshalledProperties)

  Sets the value of the marshalledProperties field.

- virtual const **util::PrimitiveMap** & **getProperties** () const

  Gets the Properties for this ***Command*** *(*p. *1019**).*

- virtual **util::PrimitiveMap** & **getProperties** ()

  Gets the Properties for this ***Command*** *(*p. *1019**).*

- virtual void **setProperties** (const **util::PrimitiveMap** &map)

  Sets the Properties for this ***Command*** *(*p. *1019**).*

- bool **isValid** () const

  Determines if we think this is a Valid ***WireFormatInfo*** *(*p. *3233**) command.*

- virtual bool **isWireFormatInfo** () const
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED)
- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED)

Static Public Attributes

- static const unsigned char **ID_WIREFORMATINFO** = 1

6.683.1 Constructor & Destructor Documentation

6.683.1.1 activemq::commands::WireFormatInfo::WireFormatInfo ()

6.683.1.2 virtual activemq::commands::WireFormatInfo::~WireFormatInfo () [virtual]

6.683.2 Member Function Documentation

6.683.2.1 virtual void activemq::commands::WireFormatInfo::afterUnmarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [virtual]

Reimplemented from **activemq::commands::BaseDataStructure** (p. 669).

6.683.2.2 virtual void activemq::commands::WireFormatInfo::beforeMarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [virtual]

Reimplemented from **activemq::commands::BaseDataStructure** (p. 670).

6.683.2.3 virtual DataStructure* activemq::commands::WireFormatInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.683.2.4 virtual void activemq::commands::WireFormatInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.683.2.5 virtual bool activemq::commands::WireFormatInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.683.2.6 int activemq::commands::WireFormatInfo::getCacheSize () const

Gets the Cache Size setting.

Returns:

currently set cache size.

6.683.2.7 virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.683.2.8 const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic () const [inline]

Get the Magic field.

Returns:

const reference to a std::vector<char>

6.683.2.9 const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshalledProperties () const [inline]

Get the marshalledProperties field.

Returns:

const reference to a std::vector<char>

6.683.2.10 long long activemq::commands::WireFormatInfo::getMaxInactivityDuration () const

Returns the currently configured Max Inactivity duration.

Returns:

the set inactivity duration value.

6.683.2.11 long long activemq::commands::WireFormatInfo::getMaxInactivityDurationInitalDelay () const

Returns the currently configured Max Inactivity Intial Delay duration.

Returns:

the set inactivity duration initial delay value.

6.683.2.12 virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties () [inline, virtual]

Gets the Properties for this **Command** (p. 1019).

Returns:

the Properties object for this **Command** (p. 1019).

6.683.2.13 virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties () const [inline, virtual]

Gets the Properties for this **Command** (p. 1019).

Returns:

the Properties object for this **Command** (p. 1019).

6.683.2.14 int activemq::commands::WireFormatInfo::getVersion () const [inline]

Get the current Wireformat Version.

Returns:

int that identifies the version

6.683.2.15 bool activemq::commands::WireFormatInfo::isCacheEnabled () const

Checks if the cacheEnabled flag is on.

Returns:

true if the flag is on.

6.683.2.16 virtual bool activemq::commands::WireFormatInfo::isMarshalAware () const [inline, virtual]

Determine if the class implementing this interface is really wanting to be told about marshaling. Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns:

true if this class cares about marshaling.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 670).

6.683.2.17 bool activemq::commands::WireFormatInfo::isSizePrefixDisabled () const

Checks if the sizePrefixDisabled flag is on.

Returns:

true if the flag is on.

6.683.2.18 bool activemq::commands::WireFormatInfo::isStackTraceEnabled () const

Checks if the stackTraceEnabled flag is on.

Returns:

true if the flag is on.

6.683.2.19 bool activemq::commands::WireFormatInfo::isTcpNoDelayEnabled () const

Checks if the tcpNoDelayEnabled flag is on.

Returns:

true if the flag is on.

6.683.2.20 bool activemq::commands::WireFormatInfo::isTightEncodingEnabled () const

Checks if the tightEncodingEnabled flag is on.

Returns:

true if the flag is on.

6.683.2.21 bool activemq::commands::WireFormatInfo::isValid () const

Determines if we think this is a Valid **WireFormatInfo** (p. 3233) command.

Returns:

true if its valid.

6.683.2.22 virtual bool activemq::commands::WireFormatInfo::isWireFormatInfo () const [inline, virtual]

Returns:

answers true to the isWireFormatInfo query

Reimplemented from **activemq::commands::BaseCommand** (p. 640).

6.683.2.23 void activemq::commands::WireFormatInfo::setCacheEnabled (bool *cacheEnabled*)

Sets if the cacheEnabled flag is on.

Parameters:

cacheEnabled - true to turn flag is on

6.683.2.24 void activemq::commands::WireFormatInfo::setCacheSize (int *value*)

Sets the Cache Size setting.

Parameters:

value - value to set to the cache size.

6.683.2.25 void activemq::commands::WireFormatInfo::setMagic (const std::vector< unsigned char > & *magic*) [inline]

Sets the value of the magic field.

Parameters:

magic - const std::vector<char>

6.683.2.26 void activemq::commands::WireFormatInfo::setMarshalledProperties (const std::vector< unsigned char > & *marshalledProperties*) [inline]

Sets the value of the marshalledProperties field.

Parameters:

marshalledProperties The Byte Array vector that contains the marshaled form of the **Message** (p. 2072) properties, this is the data sent over the wire.

6.683.2.27 void activemq::commands::WireFormatInfo::setMaxInactivityDuration (long long *maxInactivityDuration*)

Sets the Max inactivity duration value.

Parameters:

maxInactivityDuration - max time a client can be inactive.

6.683.2.28 void activemq::commands::WireFormatInfo::setMaxInactivityDurationInitalDelay (long long *maxInactivityDurationInitalDelay*)

Sets the Max inactivity initial delay duration value.

Parameters:

maxInactivityDurationInitalDelay - time before the inactivity delay is checked.

6.683.2.29 virtual void activemq::commands::WireFormatInfo::setProperties (const util::PrimitiveMap & *map*) [inline, virtual]

Sets the Properties for this **Command** (p. 1019).

Parameters:

map - PrimtiveMap to copy

6.683.2.30 void activemq::commands::WireFormatInfo::setSizePrefixDisabled (bool *sizePrefixDisabled*)

Sets if the sizePrefixDisabled flag is on.

Parameters:

sizePrefixDisabled - true to turn flag is on

6.683.2.31 void activemq::commands::WireFormatInfo::setStackTraceEnabled (bool *stackTraceEnabled*)

Sets if the stackTraceEnabled flag is on.

Parameters:

stackTraceEnabled - ture to turn flag is on

6.683.2.32 void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled (bool *tcpNoDelayEnabled*)

Sets if the tcpNoDelayEnabled flag is on.

Parameters:

tcpNoDelayEnabled - ture to turn flag is on

6.683.2.33 void activemq::commands::WireFormatInfo::setTightEncodingEnabled (bool *tightEncodingEnabled*)

Sets if the tightEncodingEnabled flag is on.

Parameters:

tightEncodingEnabled - true to turn flag is on

6.683.2.34 void activemq::commands::WireFormatInfo::setVersion (int *version*) [inline]

Set the current Wireformat Version.

Parameters:

version - int that identifies the version

6.683.2.35 virtual std::string activemq::commands::WireFormatInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.683.2.36 virtual decaf::lang::Pointer<commands::Command> activemq::commands::WireFormatInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.683.3 Field Documentation

6.683.3.1 const unsigned char activemq::commands::WireFormatInfo::ID_WIREFORMATINFO = 1 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**WireFormatInfo.h**

6.684 activemq::wireformat::openwire::marshal::generated::WireFormatI Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **WireFormatInfoMarshaller** (p. 3243).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/WireFormatInfoMarshaller.h>`Inh
diagram for activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller:

Public Member Functions

- **WireFormatInfoMarshaller** ()
- virtual ~**WireFormatInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.684.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **WireFormatInfoMarshaller** (p. 3243). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.684.2 Constructor & Destructor Documentation

6.684.2.1 activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::WireFor
() [inline]

6.684.2.2 virtual activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::~WireFo
() [inline, virtual]

6.684.3 Member Function Documentation

6.684.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::createObje
() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.684.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::getDataStr
() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.684.3.3 virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::looseMarsh
(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.684.3.4 virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::looseUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.684.3.5 virtual int activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.684.3.6 virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.684.3.7 virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**WireFormatInfoMarshaller.h**

6.685 activemq::wireformat::WireFormatNegotiator Class Reference

Defines a **WireFormatNegotiator** (p. 3247) which allows a **WireFormat** (p. 3227) to.

`#include <src/main/activemq/wireformat/WireFormatNegotiator.h>`Inheritance diagram for activemq::wireformat::WireFormatNegotiator:

Public Member Functions

- **WireFormatNegotiator** (const **Pointer**< **transport::Transport** > **next**)
  *Creates a new instance of a **WireFormat** (p. 3227) Negotiator wrapping the Transport passed.*
- virtual ~**WireFormatNegotiator** ()

6.685.1 Detailed Description

Defines a **WireFormatNegotiator** (p. 3247) which allows a **WireFormat** (p. 3227) to.

6.685.2 Constructor & Destructor Documentation

6.685.2.1 activemq::wireformat::WireFormatNegotiator::WireFormatNegotiator (const Pointer< transport::Transport > *next*) [inline]

Creates a new instance of a **WireFormat** (p. 3227) Negotiator wrapping the Transport passed.

Parameters:

next The next Transport in the chain

6.685.2.2 virtual activemq::wireformat::WireFormatNegotiator::~WireFormatNegotiator () [virtual]

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatNegotiator.h**

6.686 activemq::wireformat::WireFormatRegistry Class Reference

Registry of all **WireFormat** (p. 3227) Factories that are available to the client at runtime.

`#include <src/main/activemq/wireformat/WireFormatRegistry.h>`

Public Member Functions

- virtual ~**WireFormatRegistry** ()
- **WireFormatFactory** * **findFactory** (const std::string &name) const

  *Gets a Registered **WireFormatFactory** (p. 3231) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **WireFormatFactory** *factory)

  *Registers a new **WireFormatFactory** (p. 3231) with this Registry.*

- void **unregisterFactory** (const std::string &name)

  Unregisters the Factory with the given name and deletes that instance of the Factory.

- void **unregisterAllFactories** ()

  Removes all Factories and deletes the instances of the Factory objects.

- std::vector< std::string > **getWireFormatNames** () const

  Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Static Public Member Functions

- static **WireFormatRegistry** & **getInstance** ()

  *Gets the single instance of the **WireFormatRegistry** (p. 3248).*

Friends

- class **activemq::library::ActiveMQCPP**

6.686.1 Detailed Description

Registry of all **WireFormat** (p. 3227) Factories that are available to the client at runtime. New WireFormat's must have a factory registered here before a connection attempt is made.

Since:

3.0

6.686.2 Constructor & Destructor Documentation

6.686.2.1 virtual activemq::wireformat::WireFormatRegistry::~WireFormatRegistry () [virtual]

6.686.3 Member Function Documentation

6.686.3.1 WireFormatFactory* activemq::wireformat::WireFormatRegistry::findFactory (const std::string & *name*) const

Gets a Registered **WireFormatFactory** (p. 3231) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters:

name The name of the Factory to find in the Registry.

Returns:

the Factory registered under the given name.

Exceptions:

NoSuchElementException if no factory is registered with that name.

6.686.3.2 static WireFormatRegistry& activemq::wireformat::WireFormatRegistry::getInstance () [static]

Gets the single instance of the **WireFormatRegistry** (p. 3248).

Returns:

reference to the single instance of this Registry

6.686.3.3 std::vector<std::string> activemq::wireformat::WireFormatRegistry::getWireFormatNames () const

Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Returns:

stl vector of strings with all the **WireFormat** (p. 3227) names registered.

6.686.3.4 void activemq::wireformat::WireFormatRegistry::registerFactory (const std::string & *name*, WireFormatFactory * *factory*)

Registers a new **WireFormatFactory** (p. 3231) with this Registry. If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters:

name The name of the new Factory to register.

factory The new Factory to add to the Registry.

Exceptions:

IllegalArgumentException is name is the empty string.

NullPointerException if the Factory is Null.

6.686.3.5 void activemq::wireformat::WireFormatRegistry::unregisterAllFactories ()

Removes all Factories and deletes the instances of the Factory objects.

6.686.3.6 void activemq::wireformat::WireFormatRegistry::unregisterFactory (const std::string & *name*)

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters:

name Name of the Factory to unregister and destroy

6.686.4 Friends And Related Function Documentation

6.687.3 Member Function Documentation

6.687.3.1 virtual void activemq::transport::inactivity::WriteChecker::run () [virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2622).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/inactivity/**WriteChecker.h**

6.688 decaf::io::Writer Class Reference

`#include <src/main/decaf/io/Writer.h>`Inheritance diagram for decaf::io::Writer:

Public Member Functions

- **Writer** ()
- virtual ~**Writer** ()
- virtual void **write** (char v)

  Writes an single byte char value.

- virtual void **write** (const std::vector< char > &buffer)

  Writes an array of Chars.

- virtual void **write** (const char *buffer, int size)

  Writes a byte array to the output stream.

- virtual void **write** (const char *buffer, int size, int offset, int length)

  Writes a byte array to the output stream.

- virtual void **write** (const std::string &str)

  Writes a string.

- virtual void **write** (const std::string &str, int offset, int length)

  Writes a string.

- virtual **decaf::lang::Appendable** & **append** (char value)

  Appends the specified character to this Appendable.

- virtual **decaf::lang::Appendable** & **append** (const **decaf::lang::CharSequence** *csq)

  Appends the specified character sequence to this Appendable.

- virtual **decaf::lang::Appendable** & **append** (const **decaf::lang::CharSequence** *csq, int start, int end)

  Appends a subsequence of the specified character sequence to this Appendable.

Protected Member Functions

- virtual void **doWriteArrayBounded** (const char *buffer, int size, int offset, int length)=0

  Override this method to customize the functionality of the method write(char buffer, int size, int offset, int length).*

- virtual void **doWriteChar** (char v)
- virtual void **doWriteVector** (const std::vector< char > &buffer)
- virtual void **doWriteArray** (const char *buffer, int size)

- virtual **decaf::lang::Appendable** & **doAppendCharSequence** (const **decaf::lang::CharSequence** *csq)
- virtual **decaf::lang::Appendable** & **doAppendCharSequenceStartEnd** (const **decaf::lang::CharSequence** *csq, int start, int end)

6.688.1 Constructor & Destructor Documentation

6.688.1.1 decaf::io::Writer::Writer ()

6.688.1.2 virtual decaf::io::Writer::~Writer () [virtual]

6.688.2 Member Function Documentation

6.688.2.1 virtual decaf::lang::Appendable& decaf::io::Writer::append (const decaf::lang::CharSequence * *csq*, int *start*, int *end*) [virtual]

Appends a subsequence of the specified character sequence to this Appendable.

Parameters:

csq - The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".

start The index of the first character in the subsequence.

end The index of the character following the last character in the subsequence.

Returns:

a Reference to this Appendable

Exceptions:

Exception if an error occurs.

IndexOutOfBoundsException start is greater than end, or end is greater than csq.length()

Implements **decaf::lang::Appendable** (p. 580).

6.688.2.2 virtual decaf::lang::Appendable& decaf::io::Writer::append (const decaf::lang::CharSequence * *csq*) [virtual]

Appends the specified character sequence to this Appendable.

Parameters:

csq The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".

Returns:

a Reference to this Appendable.

Exceptions:

Exception if an error occurs.

Implements **decaf::lang::Appendable** (p. 581).

6.688.2.3 virtual decaf::lang::Appendable& decaf::io::Writer::append (char *value*) [virtual]

Appends the specified character to this Appendable.

Parameters:

value The character to append.

Returns:

a Reference to this Appendable

Exceptions:

Exception if an error occurs.

Implements **decaf::lang::Appendable** (p. 581).

6.688.2.4 virtual decaf::lang::Appendable& decaf::io::Writer::doAppendChar (char *value*) [protected, virtual]

6.688.2.5 virtual decaf::lang::Appendable& decaf::io::Writer::doAppendCharSequence (const decaf::lang::CharSequence * *csq*) [protected, virtual]

6.688.2.6 virtual decaf::lang::Appendable& decaf::io::Writer::doAppendCharSequenceStartEnd (const decaf::lang::CharSequence * *csq*, int *start*, int *end*) [protected, virtual]

6.688.2.7 virtual void decaf::io::Writer::doWriteArray (const char * *buffer*, int *size*) [protected, virtual]

6.688.2.8 virtual void decaf::io::Writer::doWriteArrayBounded (const char * *buffer*, int *size*, int *offset*, int *length*) [protected, pure virtual]

Override this method to customize the functionality of the method write(char* buffer, int size, int offset, int length). All subclasses must override this method to provide the basic **Writer** (p. 3252) functionality.

Implemented in **decaf::io::OutputStreamWriter** (p. 2356).

6.688.2.9 virtual void decaf::io::Writer::doWriteChar (char *v*) [protected, virtual]

6.688.2.10 virtual void decaf::io::Writer::doWriteString (const std::string & *str*) [protected, virtual]

6.688.2.11 virtual void decaf::io::Writer::doWriteStringBounded (const std::string & *str*, int *offset*, int *length*) [protected, virtual]

6.688.2.12 virtual void decaf::io::Writer::doWriteVector (const std::vector< char > & *buffer*) [protected, virtual]

6.688.2.13 virtual void decaf::io::Writer::write (const std::string & *str*, int *offset*, int *length*) [virtual]

Writes a string.

Parameters:

str The string to be written.

offset The position in the array to start writing from.

length The number of bytes in the array to write.

Exceptions:

IOException *(*p. *1787)* thrown if an error occurs.

IndexOutOfBoundsException if offset+length is greater than the string length.

6.688.2.14 virtual void decaf::io::Writer::write (const std::string & *str*) [virtual]

Writes a string.

Parameters:

str The string to be written.

Exceptions:

IOException *(*p. *1787)* thrown if an error occurs.

6.688.2.15 virtual void decaf::io::Writer::write (const char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Writes a byte array to the output stream.

Parameters:

buffer The byte array to write (cannot be NULL).

size The size in bytes of the buffer passed.

offset The position in the array to start writing from.

length The number of bytes in the array to write.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error occurs.

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if offset + length > size of the buffer.

6.688.2.16 virtual void decaf::io::Writer::write (const char * *buffer*, int *size*) [virtual]

Writes a byte array to the output stream.

Parameters:

buffer The byte array to write (cannot be NULL).

size The size in bytes of the buffer passed.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error occurs.

NullPointerException if buffer is NULL.

6.688.2.17 virtual void decaf::io::Writer::write (const std::vector< char > & *buffer*) [virtual]

Writes an array of Chars.

Parameters:

buffer The array to be written.

Exceptions:

IOException *(*p. ***1787****)* thrown if an error occurs.

6.688.2.18 virtual void decaf::io::Writer::write (char *v*) [virtual]

Writes an single byte char value.

Parameters:

v The value to be written.

Exceptions:

IOException *(*p. ***1787****)* thrown if an error occurs.

6.691 cms::XAConnection Class Reference

The **XAConnection** (p. 3261) interface defines an extended **Connection** (p. 1089) type that is used to create **XASession** (p. 3278) objects.

`#include <src/main/cms/XAConnection.h>`Inheritance diagram for cms::XAConnection:

Public Member Functions

- virtual ~**XAConnection** ()
- virtual **XASession** * **createXASession** ()=0

  *Creates an **XASession** (p. 3278) object.*

6.691.1 Detailed Description

The **XAConnection** (p. 3261) interface defines an extended **Connection** (p. 1089) type that is used to create **XASession** (p. 3278) objects. This is an optional interface and CMS providers are allowed to omit an implementation and instead throw an exception from an **XAConnectionFactory** (p. 3262) stub to indicate that XA is not supported.

Since:

2.3

6.691.2 Constructor & Destructor Documentation

6.691.2.1 virtual cms::XAConnection::~XAConnection () [virtual]

6.691.3 Member Function Documentation

6.691.3.1 virtual XASession* cms::XAConnection::createXASession () [pure virtual]

Creates an **XASession** (p. 3278) object.

Returns:

a newly created **XASession** (p. 3278) instance, caller owns the pointer.

Exceptions:

CMSException *(p. **979**)* If the **XAConnection** (p. 3261) object fails to create the **XASession** (p. 3278) instance due to an internal error.

Implemented in **activemq::core::ActiveMQXAConnection** (p. 544).

The documentation for this class was generated from the following file:

- src/main/cms/**XAConnection.h**

6.692 cms::XAConnectionFactory Class Reference

The **XAConnectionFactory** (p. 3262) interface is specialized interface that defines an **ConnectionFactory** (p. 1114) that creates **Connection** (p. 1089) instance that will participate in XA Transactions.

`#include <src/main/cms/XAConnectionFactory.h>`Inheritance diagram for cms::XAConnectionFactory:

Public Member Functions

- virtual ~**XAConnectionFactory** ()
- virtual **XAConnection** * **createXAConnection** ()=0

  *Creates an **XAConnection** (p. 3261) with the default user name and password.*

- virtual **XAConnection** * **createXAConnection** (const std::string &userName, const std::string &password)=0

  Creates an XA connection with the specified user name and password.

Static Public Member Functions

- static **XAConnectionFactory** * **createCMSXAConnectionFactory** (const std::string &brokerURI)

  *Static method that is used to create a provider specific XA **Connection** (p. 1089) factory.*

6.692.1 Detailed Description

The **XAConnectionFactory** (p. 3262) interface is specialized interface that defines an **ConnectionFactory** (p. 1114) that creates **Connection** (p. 1089) instance that will participate in XA Transactions. Some application provide support for grouping XA capable resource use into a distributed transaction (optional). To include CMS API transactions in a XA transaction, an application requires a XA aware library. A CMS provider exposes its XA support using an **XAConnectionFactory** (p. 3262) object, which an application uses to create **XAConnection** (p. 3261) objects.

The **XAConnectionFactory** (p. 3262) interface is optional. CMS providers are not required to support this interface. This interface is for use by CMS providers to support transactional environments. Client programs are strongly encouraged to use the transactional support available in their environment, rather than use these XA interfaces directly.

Since:

2.3

6.692.2 Constructor & Destructor Documentation

6.692.2.1 virtual cms::XAConnectionFactory::~XAConnectionFactory () [virtual]

6.692.3 Member Function Documentation

6.692.3.1 static XAConnectionFactory* cms::XAConnectionFactory::createCMSXAConnectionFactory (const std::string & *brokerURI*) [static]

Static method that is used to create a provider specific XA **Connection** (p. 1089) factory. The provider implements this method in their library and returns an instance of a **XAConnectionFactory** (p. 3262) derived object. Clients can use this method to remain abstracted from the specific CMS implementation being used.

The XA interfaces are optional in CMS however if a provider chooses to omit them it should still override this method and throw an **UnsupportedOperationException** (p. 3166) to indicate that it doesn't provide this functionality.

Parameters:

brokerURI The remote address to use to connect to the Provider.

Returns:

A pointer to a provider specific implementation of the **XAConnectionFactory** (p. 3262) interface, the caller is responsible for deleting this resource.

Exceptions:

CMSException (p. ***979***) if an internal error occurs while creating the **XAConnectionFactory** (p. 3262).

UnsupportedOperationException (p. ***3166***) if the provider does not support the XA API.

6.692.3.2 virtual XAConnection* cms::XAConnectionFactory::createXAConnection (const std::string & *userName*, const std::string & *password*) [pure virtual]

Creates an XA connection with the specified user name and password. The connection is created in stopped mode just as the standard **ConnectionFactory** (p. 1114) creates a new **Connection** (p. 1089). No messages will be delivered until the **Connection.start** (p. 2852) method is explicitly called.

Returns:

a new **XAConnectionFactory** (p. 3262) instance, the caller owns the returned pointer.

Exceptions:

CMSException (p. ***979***) if an internal error occurs while creating the **Connection** (p. 1089).

CMSSecurityException (p. ***990***) if the client authentication fails because the user name or password are invalid.

Implemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 546).

6.692.3.3 virtual XAConnection* cms::XAConnectionFactory::createXAConnection () [pure virtual]

Creates an **XAConnection** (p. 3261) with the default user name and password. The connection is created in stopped mode just as the standard **Connection** (p. 1089) object is created from the **ConnectionFactory** (p. 1114). No messages will be delivered until the **Connection.start** (p. 2852) method is explicitly called.

Returns:

a new **XAConnectionFactory** (p. 3262) instance, the caller owns the returned pointer.

Exceptions:

CMSException *(p. **979**)* if an internal error occurs while creating the **Connection** (p. 1089).

CMSSecurityException *(p. **990**)* if the client authentication fails because the user name or password are invalid.

Implemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 547).

The documentation for this class was generated from the following file:

- src/main/cms/**XAConnectionFactory.h**

6.693 cms::XAException Class Reference

The **XAException** (p. 3265) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.

Static Public Attributes

- static const int **XA_RBBASE**

  Code which contains the inclusive lower bound of the rollback error codes.

- static const int **XA_RBROLLBACK**

  Code which means that the rollback occurred for an unspecified reason.

- static const int **XA_RBCOMMFAIL**

  Code which means that rollback was caused by a communication failure.

- static const int **XA_RBDEADLOCK**

  Code which means that a failure occurred because a deadlock was detected.

- static const int **XA_RBINTEGRITY**

  Code which means that a condition was detected than implies a violation of the integrity of the resource.

- static const int **XA_RBOTHER**

  Code which means that the Resource Manager rolled back the transaction branch for a reason not separately listed.

- static const int **XA_RBPROTO**

  Code which means that a protocol error occurred in the Resource Manager.

- static const int **XA_RBTIMEOUT**

  Code which means that a transaction branch took too long.

- static const int **XA_RBTRANSIENT**

  Code which means that the caller may retry the transaction branch.

- static const int **XA_RBEND**

  Code which contains the inclusive upper bound of the rollback error codes.

- static const int **XA_NOMIGRATE**

  Code which means that resumption must occur where the suspension occurred.

- static const int **XA_HEURHAZ**

  Code which means that the transaction branch may have been heuristically completed.

- static const int **XA_HEURCOM**

  Code which means that the transaction branch has been heuristically committed.

- static const int **XA_HEURRB**

  Code which means that the transaction branch has been heuristically rolled back.

- static const int **XA_HEURMIX**

  Code which means that the transaction branch has been heuristically committed and rolled back.

- static const int **XA_RETRY**

  Code which means that the method returned with no effect and can be reissued.

- static const int **XA_RDONLY**

  Code which means that the transaction branch was read only and has been committed.

- static const int **XAER_ASYNC**

  Code which means that there is already an asynchronous operation outstanding.

- static const int **XAER_RMERR**

  Code which means that a Resource Manager error has occurred for the transaction branch.

- static const int **XAER_NOTA**

  Code which means that the XID is not valid.

- static const int **XAER_INVAL**

  Code which means that invalid arguments were supplied.

- static const int **XAER_PROTO**

  Code which means that the method was invoked in an improper context.

- static const int **XAER_RMFAIL**

Code which means that the Resource Manager is unavailable.

- static const int **XAER_DUPID**

  Code which means that the XID already exists.

- static const int **XAER_OUTSIDE**

  Work is being done by the Resource Manager outside the boundaries of a global transaction.

6.693.1 Detailed Description

The **XAException** (p. 3265) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.

6.693.3 Member Function Documentation

6.693.3.1 virtual XAException* cms::XAException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

6.693.3.2 int cms::XAException::getErrorCode () const [inline]

Gets the error **code** (p. 1005) that was assigned to this **XAException** (p. 3265).

Returns:

the assigned error **code** (p. 1005).

6.693.3.3 void cms::XAException::setErrorCode (int *errorCode*) [inline]

Sets the error **code** (p. 1005) for this **XAException** (p. 3265).

Parameters:

errorCode The error **code** (p. 1005) to assign to this **XAException** (p. 3265).

6.693.4 Field Documentation

6.693.4.1 const int cms::XAException::XA_HEURCOM [static]

Code which means that the transaction branch has been heuristically committed.

6.693.4.2 const int cms::XAException::XA_HEURHAZ [static]

Code which means that the transaction branch may have been heuristically completed.

6.693.4.3 const int cms::XAException::XA_HEURMIX [static]

Code which means that the transaction branch has been heuristically committed and rolled back.

6.693.4.4 const int cms::XAException::XA_HEURRB [static]

Code which means that the transaction branch has been heuristically rolled back.

6.693.4.5 const int cms::XAException::XA_NOMIGRATE [static]

Code which means that resumption must occur where the suspension occurred.

6.693.4.6 const int cms::XAException::XA_RBBASE [static]

Code which contains the inclusive lower bound of the rollback error codes.

6.693.4.7 const int cms::XAException::XA_RBCOMMFAIL [static]

Code which means that rollback was caused by a communication failure.

6.693.4.8 const int cms::XAException::XA_RBDEADLOCK [static]

Code which means that a failure occurred because a deadlock was detected.

6.693.4.9 const int cms::XAException::XA_RBEND [static]

Code which contains the inclusive upper bound of the rollback error codes.

6.693.4.10 const int cms::XAException::XA_RBINTEGRITY [static]

Code which means that a condition was detected than implies a violation of the integrity of the resource.

6.693.4.11 const int cms::XAException::XA_RBOTHER [static]

Code which means that the Resource Manager rolled back the transaction branch for a reason not separately listed.

6.693.4.12 const int cms::XAException::XA_RBPROTO [static]

Code which means that a protocol error occurred in the Resource Manager.

6.693.4.13 const int cms::XAException::XA_RBROLLBACK [static]

Code which means that the rollback occurred for an unspecified reason.

6.693.4.14 const int cms::XAException::XA_RBTIMEOUT [static]

Code which means that a transaction branch took too long.

6.693.4.15 const int cms::XAException::XA_RBTRANSIENT [static]

Code which means that the caller may retry the transaction branch.

6.693.4.16 const int cms::XAException::XA_RDONLY [static]

Code which means that the transaction branch was read only and has been committed.

6.693.4.17 const int cms::XAException::XA_RETRY [static]

Code which means that the method returned with no effect and can be reissued.

6.693.4.18 const int cms::XAException::XAER_ASYNC [static]

Code which means that there is already an asynchronous operation outstanding.

6.693.4.19 const int cms::XAException::XAER_DUPID [static]

Code which means that the XID already exists.

6.693.4.20 const int cms::XAException::XAER_INVAL [static]

Code which means that invalid arguments were supplied.

6.693.4.21 const int cms::XAException::XAER_NOTA [static]

Code which means that the XID is not valid.

6.693.4.22 const int cms::XAException::XAER_OUTSIDE [static]

Work is being done by the Resource Manager outside the boundaries of a global transaction.

6.693.4.23 const int cms::XAException::XAER_PROTO [static]

Code which means that the method was invoked in an improper context.

6.693.4.24 const int cms::XAException::XAER_RMERR [static]

Code which means that a Resource Manager error has occurred for the transaction branch.

6.693.4.25 const int cms::XAException::XAER_RMFAIL [static]

Code which means that the Resource Manager is unavailable.

The documentation for this class was generated from the following file:

- src/main/cms/**XAException.h**

6.694 cms::XAResource Class Reference

The **XAResource** (p. 3271) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).

`#include <src/main/cms/XAResource.h>`Inheritance diagram for cms::XAResource:

Public Member Functions

- virtual ~**XAResource** ()
- virtual void **commit** (const **Xid** *xid, bool onePhase)=0

  Commits a global transaction.

- virtual void **end** (const **Xid** *xid, int flags)=0

  Ends the work done for a transaction branch.

- virtual void **forget** (const **Xid** *xid)=0

  Informs the Resource Manager that it can forget about a specified transaction branch.

- virtual int **getTransactionTimeout** () const =0

  *Gets the transaction timeout value for this **XAResource** (p. 3271).*

- virtual bool **isSameRM** (const **XAResource** *theXAResource)=0

- virtual int **prepare** (const **Xid** *xid)=0

  Requests the Resource manager to prepare to commit a specified transaction.

- virtual int **recover** (int flag, **Xid** **recovered)=0

  Get a list of prepared transaction branches.

- virtual void **rollback** (const **Xid** *xid)=0

  Requests the Resource Manager to rollback a specified transaction branch.

- virtual bool **setTransactionTimeout** (int seconds)=0

  *Sets the transaction timeout value for this **XAResource** (p. 3271).*

- virtual void **start** (const **Xid** *xid, int flags)=0

  Starts work for a specified transaction branch.

Static Public Attributes

- static const int **TMENDRSCAN**

  Flag to end a recovery scan.

- static const int **TMFAIL**

  Flag to indicate that the caller is dissociation from a transaction branch and that it should be marked rollback only.

- static const int **TMJOIN**

  Flag to indicate that the caller is joining sn existing transaction branch.

- static const int **TMNOFLAGS**

  Flag that indicates that no flags options are selected.

- static const int **TMONEPHASE**

  Flag that indicates the caller is using one-phase commit optimization.

- static const int **TMRESUME**

  Flag that indicates the caller is resuming association with a suspended transaction branch.

- static const int **TMSTARTRSCAN**

  Flag that indicates the start of a recovery scan.

- static const int **TMSUCCESS**

  Flag that indicates the caller is dissociating from a transaction branch.

- static const int **TMSUSPEND**

  Flag that indicates that the caller is suspending (not terminating) its association with a transaction branch.

- static const int **XA_RDONLY**

  Flag that indicates that transaction work has been read only and has been committed normally.

- static const int **XA_OK**

  Flag that indicates that transaction work has been Prepared normally.

6.694.1 Detailed Description

The **XAResource** (p. 3271) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification). The XA interface defines the contract between a Resource Manager and a Transaction Manager in a distributed transaction processing (DTP) environment. A CMS provider implements this interface to support the association between a global transaction and a message broker connection.

The **XAResource** (p. 3271) is exposed to CMS client so that they can proxy calls from the Transaction Manager API of their choosing to the CMS provider. The CMS provider should behave and a standard XA Resource Manager its up to the client however to transmit the Transaction Manager's calls to the CMS provider through this interface.

Since:

2.3

6.694.2 Constructor & Destructor Documentation

6.694.2.1 virtual cms::XAResource::~XAResource () [virtual]

6.694.3 Member Function Documentation

6.694.3.1 virtual void cms::XAResource::commit (const Xid * *xid*, bool *onePhase*) [pure virtual]

Commits a global transaction.

Parameters:

xid the XID which identifies the global transaction.

onePhase true if the resource manager should use a one-phase commit protocol to commit the transaction.

Exceptions:

XAException *(*p. *3265)* if an error occurred.

Possible errors are identified by the errorcode in the **XAException** (p. 3265) and include: XA_-HEURHAZ, XA_HEURCOM, XA_HEURRB, XA_HEURMIX, XAER_RMERR, XAER_-RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO. In addition, one of the XA_RB* errors can occur if the transaction was not committed and onePhase was set to true. On completion of this method, the Resource Manager has rolled back the transaction and released resources held by the transaction.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 537).

6.694.3.2 virtual void cms::XAResource::end (const Xid * *xid*, int *flags*) [pure virtual]

Ends the work done for a transaction branch. The Resource Manager disconnects the XA resource from the transaction branch and allows the transaction to complete.

Parameters:

xid the XID which identifies the global transaction. Should have previously been used as the parameter to a start. method.

flags a flags integer - one of: **XAResource::TMSUCCESS** (p. 3277), **XAResource::TMFAIL** (p. 3277), or **XAResource::TMSUSPEND** (p. 3277).

TMSUCCESS means that this section of work completed successfully.

TMFAIL means that this section of work failed. The Resource Manager can mark the transaction for rollback only.

TMSUSPEND means that this section of work is suspended and not yet complete. The associated transaction context is also suspended and must be restarted with a call to **start(Xid, int)** (p. ??) with the TMRESUME flag.

Exceptions:

XAException *(*p. *3265)* if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, XAER_-PROTO, or XA_RB*.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 538).

6.694.3.3 virtual void cms::XAResource::forget (const Xid * *xid*) [pure virtual]

Informs the Resource Manager that it can forget about a specified transaction branch.

Parameters:

xid the XID which identifies the global transaction.

Exceptions:

XAException *(p. 3265)* if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 538).

6.694.3.4 virtual int cms::XAResource::getTransactionTimeout () const [pure virtual]

Gets the transaction timeout value for this **XAResource** (p. 3271). The default timeout value is the default timeout value set for the Resource Manager.

Returns:

the transaction timeout value for this **XAResource** (p. 3271) in seconds.

Exceptions:

XAException *(p. 3265)* if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 539).

6.694.3.5 virtual bool cms::XAResource::isSameRM (const XAResource * *theXAResource*) [pure virtual]

Returns true if the ResourceManager for this **XAResource** (p. 3271) is the same as the Resource Manager for a supplied **XAResource** (p. 3271).

Parameters:

theXAResource an **XAResource** (p. 3271) object

Returns:

true if the Resource Manager for this **XAResource** (p. 3271) is the same as the Resource Manager for `theXAResource`.

Exceptions:

XAException *(p. 3265)* if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.

6.694.3.6 virtual int cms::XAResource::prepare (const Xid * *xid*) [pure virtual]

Requests the Resource manager to prepare to commit a specified transaction.

Parameters:

xid the XID which identifies the global transaction.

Returns:

an integer: XA_RDONLY or XA_OK. XA_OK implies that the transaction work has been prepared normally, XA_RDONLY implies that the transaction branch is read only and has been committed. If there is a failure which requires a rollback, an **XAException** (p. 3265) is raised.

Exceptions:

XAException *(p. 3265)* if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 540).

6.694.3.7 virtual int cms::XAResource::recover (int *flag*, Xid ** *recovered*) [pure virtual]

Get a list of prepared transaction branches. Typically used by a transaction manager during recovery to find transaction branches that are in prepared or heuristically completed states.

Parameters:

flag an integer. Must be one of: **XAResource::TMSTARTRSCAN** (p. 3277), **XAResource::TMENDRSCAN** (p. 3276), **XAResource::TMNOFLAGS** (p. 3277).

Returns:

an array of zero or more XIDs identifying the transaction branches in the prepared or heuristically completed states.

Exceptions:

XAException *(p. 3265)* if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_INVAL, and XAER_PROTO.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 540).

6.694.3.8 virtual void cms::XAResource::rollback (const Xid * *xid*) [pure virtual]

Requests the Resource Manager to rollback a specified transaction branch.

Parameters:

xid the XID which identifies the transaction branch.

Exceptions:

XAException *(p. 3265)* if an error occurs.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 541).

6.694.3.9 virtual bool cms::XAResource::setTransactionTimeout (int *seconds*) [pure virtual]

Sets the transaction timeout value for this **XAResource** (p. 3271). If the value is set to 0, the default timeout value for the Resource Manager is used.

Parameters:

seconds the new Timeout value in seconds.

Returns:

true if the transaction timeout value has been updated, false otherwise.

Exceptions:

XAException *(p. 3265)* if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 541).

6.694.3.10 virtual void cms::XAResource::start (const Xid * *xid*, int *flags*) [pure virtual]

Starts work for a specified transaction branch.

Parameters:

xid the XID which identifies the transaction branch.

flags an integer. Must be one of **XAResource::TMNOFLAGS** (p. 3277), **XAResource::TMJOIN** (p. 3277), or **XAResource::TMRESUME** (p. 3277).

TMJOIN implies that the start applies to joining a transaction previously passed to the Resource Manager.

TMRESUME implies that the start applies to a suspended transaction that should be restarted.

If TMNOFLAGS is specified, then if the transaction has been previously seen by the Resource Manager, an **XAException** (p. 3265) is raised with the **code** (p. 1005) XAER_DUPID.

Exceptions:

XAException *(p. 3265)* if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 542).

6.694.4 Field Documentation

6.694.4.1 const int cms::XAResource::TMENDRSCAN [static]

Flag to end a recovery scan.

6.694.4.2 const int cms::XAResource::TMFAIL [static]

Flag to indicate that the caller is dissociation from a transaction branch and that it should be marked rollback only.

6.694.4.3 const int cms::XAResource::TMJOIN [static]

Flag to indicate that the caller is joining sn existing transaction branch.

6.694.4.4 const int cms::XAResource::TMNOFLAGS [static]

Flag that indicates that no flags options are selected. (ie a null flag)

6.694.4.5 const int cms::XAResource::TMONEPHASE [static]

Flag that indicates the caller is using one-phase commit optimization.

6.694.4.6 const int cms::XAResource::TMRESUME [static]

Flag that indicates the caller is resuming association with a suspended transaction branch.

6.694.4.7 const int cms::XAResource::TMSTARTRSCAN [static]

Flag that indicates the start of a recovery scan.

6.694.4.8 const int cms::XAResource::TMSUCCESS [static]

Flag that indicates the caller is dissociating from a transaction branch.

6.694.4.9 const int cms::XAResource::TMSUSPEND [static]

Flag that indicates that the caller is suspending (not terminating) its association with a transaction branch.

6.694.4.10 const int cms::XAResource::XA_OK [static]

Flag that indicates that transaction work has been Prepared normally.

6.694.4.11 const int cms::XAResource::XA_RDONLY [static]

Flag that indicates that transaction work has been read only and has been committed normally.

6.695 cms::XASession Class Reference

The **XASession** (p. 3278) interface extends the capability of **Session** (p. 2680) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).

`#include <src/main/cms/XASession.h>`Inheritance diagram for cms::XASession:

Public Member Functions

- virtual ~**XASession** ()
- virtual **XAResource** * **getXAResource** () const =0

  *Returns the XA resource associated with this **Session** (p. 2680) to the caller.*

6.695.1 Detailed Description

The **XASession** (p. 3278) interface extends the capability of **Session** (p. 2680) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional). This support takes the form of a **cms::XAResource** (p. 3271) object. The functionality of this object closely resembles that defined by the standard X/Open XA Resource interface.

An application controls the transactional assignment of an **XASession** (p. 3278) by obtaining its **XAResource** (p. 3271). It uses the **XAResource** (p. 3271) to assign the session to a transaction, prepare and commit work on the transaction, and so on.

An **XAResource** (p. 3271) provides some fairly sophisticated facilities for interleaving work on multiple transactions, recovering a list of transactions in progress, and so on. A XA aware CMS provider must fully implement this functionality.

The **XASession** (p. 3278) instance will behave much like a normal **cms::Session** (p. 2680) however some methods will will not operate as normal, any call to **Session::commit** (p. 2684), or **Session::rollback** (p. 2692) will result in a **CMSException** (p. 979) being thrown. Also when not inside an XA transaction the **MessageConsumer** (p. 2127) will operate as if it were in the AutoAcknowlege mode.

The **XASession** (p. 3278) interface is optional. CMS providers are not required to support this interface. This interface is for use by CMS providers to support transactional environments. Client programs are strongly encouraged to use the transactional support available in their environment, rather than use these XA interfaces directly.

Since:

2.3

6.695.2 Constructor & Destructor Documentation

6.695.2.1 virtual cms::XASession::~XASession () [virtual]

6.695.3 Member Function Documentation

6.695.3.1 virtual XAResource* cms::XASession::getXAResource () const [pure virtual]

Returns the XA resource associated with this **Session** (p. 2680) to the caller. The client can use the provided XA resource to interact with the XA Transaction Manager in use in the client application.

Returns:

an XAResouce instance to the caller, the caller does not own this pointer and should not delete it.

Implemented in **activemq::core::ActiveMQXASession** (p. 549), and **activemq::core::kernels::ActiveMQXASessionKernel** (p. 551).

The documentation for this class was generated from the following file:

6.696.1 Member Typedef Documentation

6.696.1.1 typedef decaf::lang::PointerComparator<XATransactionId> activemq::commands::XATransactionId::COMPARATOR

Reimplemented from **activemq::commands::TransactionId** (p. 3098).

6.696.2 Constructor & Destructor Documentation

6.696.2.1 activemq::commands::XATransactionId::XATransactionId ()

6.696.2.2 activemq::commands::XATransactionId::XATransactionId (const XATransactionId & *other*)

6.696.2.3 activemq::commands::XATransactionId::XATransactionId (const cms::Xid * *xid*)

6.696.2.4 virtual activemq::commands::XATransactionId::~XATransactionId () [virtual]

6.696.3 Member Function Documentation

6.696.3.1 virtual Xid* activemq::commands::XATransactionId::clone () const [virtual]

Creates a Copy of this Xid instance that contains the same id values.

Returns:

a new Xid instance that is equal to this one when compared.

Implements **cms::Xid** (p. 3291).

6.696.3.2 virtual XATransactionId* activemq::commands::XATransactionId::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::TransactionId** (p. 3099).

6.696.3.3 virtual int activemq::commands::XATransactionId::compareTo (const XATransactionId & *value*) const [virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 3099).

6.696.3.4 virtual void activemq::commands::XATransactionId::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 3099).

6.696.3.5 virtual bool activemq::commands::XATransactionId::equals (const XATransactionId & *value*) const [virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 3099).

6.696.3.6 virtual bool activemq::commands::XATransactionId::equals (const Xid * *other*) const [virtual]

6.696.3.7 virtual bool activemq::commands::XATransactionId::equals (const DataStructure * *value*) const [virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 3099).

6.696.3.8 virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () [virtual]

6.696.3.9 virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () const [virtual]

6.696.3.10 virtual int activemq::commands::XATransactionId::getBranchQualifier (unsigned char * *buffer*, int *size*) const [virtual]

Gets the transaction branch qualifier component of the XID. The value of this Xid's branch qualifier is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the branch qualifier then no copy is performed and the method returns -1.

Parameters:

buffer The location in memory to copy the qualifier bytes to.

size The size of the buffer provided.

Returns:

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions:

XAException if the size parameter is less than zero or buffer is NULL.

Implements **cms::Xid** (p. 3291).

6.696.3.11 virtual unsigned char activemq::commands::XATransactionId::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::TransactionId** (p. 3100).

6.696.3.12 virtual int activemq::commands::XATransactionId::getFormatId () const [virtual]

Gets the format identifier component of the XID.

Returns:

an integer containing the format identifier. 0 means the OSI CCR format.

Implements **cms::Xid** (p. 3291).

6.696.3.13 virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId () [virtual]

6.696.3.14 virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId () const [virtual]

6.696.3.15 virtual int activemq::commands::XATransactionId::getGlobalTransactionId (unsigned char * *buffer*, int *size*) const [virtual]

Gets the global transaction id component of the XID. The value of this Xid's transaction id is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the transaction id then no copy is performed and the method returns -1.

Parameters:

buffer The location in memory to copy the transaction id bytes to.

size The size of the buffer provided.

Returns:

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions:

XAException if the size parameter is less than zero or buffer is NULL.

Implements **cms::Xid** (p. 3292).

6.696.3.16 int activemq::commands::XATransactionId::getHashCode () const

Reimplemented from **activemq::commands::TransactionId** (p. 3100).

6.696.3.17 virtual bool activemq::commands::XATransactionId::isXATransactionId () const [inline, virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 3100).

6.696.3.18 virtual bool activemq::commands::XATransactionId::operator< (const XATransactionId & *value*) const [virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 3100).

6.696.3.19 XATransactionId& activemq::commands::XATransactionId::operator= (const XATransactionId & *other*)

Reimplemented from **activemq::commands::TransactionId** (p. 3100).

6.696.3.20 virtual bool activemq::commands::XATransactionId::operator== (const XATransactionId & *value*) const [virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 3100).

6.696.3.21 virtual void activemq::commands::XATransactionId::setBranchQualifier (const std::vector< unsigned char > & *branchQualifier*) [virtual]

6.696.3.22 virtual void activemq::commands::XATransactionId::setFormatId (int *formatId*) [virtual]

6.696.3.23 virtual void activemq::commands::XATransactionId::setGlobalTransactionId (const std::vector< unsigned char > & *globalTransactionId*) [virtual]

6.696.3.24 virtual std::string activemq::commands::XATransactionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::TransactionId** (p. 3101).

6.697.2.2 virtual activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::~XATra () [inline, virtual]

6.697.3 Member Function Documentation

6.697.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::createObj () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.697.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::getDataSt () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.697.3.3 virtual void activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::looseMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3103).

6.697.3.4 virtual void activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::looseUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3103).

6.697.3.5 virtual int activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3104).

6.697.3.6 virtual void activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3104).

6.697.3.7 virtual void activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::tightUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3104).

The documentation for this class was generated from the following file:

  Gets the global transaction id component of the XID.

Static Public Attributes

- static const int **MAXGTRIDSIZE**

  The maximum number of bytes which will be copied into the array passed to getGlobaltransactionId().

- static const int **MAXBQUALSIZE**

  *The maximum number of bytes which will be copied into the array that is passed to **getBranchQualifier()** (p. 3291).*

6.698.1 Detailed Description

An interface which provides a mapping for the X/Open XID transaction identifier structure. The **Xid** (p. 3290) interface is used by the Transaction Manager and the Resource managers. It is not typically used by application programs directly but the application developer must define a mechanism to map the calls and structures used by the Transaction Manager API in use into the format used by the CMS XA interfaces.

Since:

2.3

6.698.2 Constructor & Destructor Documentation

6.698.2.1 cms::Xid::Xid ()

6.698.2.2 virtual cms::Xid::~Xid () [virtual]

6.698.3 Member Function Documentation

6.698.3.1 virtual Xid* cms::Xid::clone () const [pure virtual]

Creates a Copy of this **Xid** (p. 3290) instance that contains the same id values.

Returns:

a new **Xid** (p. 3290) instance that is equal to this one when compared.

Implemented in **activemq::commands::XATransactionId** (p. 3281).

6.698.3.2 virtual bool cms::Xid::equals (const Xid * *other*) const [pure virtual]

Compares this **Xid** (p. 3290) to another and returns true if they are the same.

Returns:

true if both Xid's represent that same id value.

6.698.3.3 virtual int cms::Xid::getBranchQualifier (unsigned char * *buffer*, int *size*) const [pure virtual]

Gets the transaction branch qualifier component of the XID. The value of this Xid's branch qualifier is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the branch qualifier then no copy is performed and the method returns -1.

Parameters:

buffer The location in memory to copy the qualifier bytes to.

size The size of the buffer provided.

Returns:

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions:

XAException *(p. 3265)* if the size parameter is less than zero or buffer is NULL.

Implemented in **activemq::commands::XATransactionId** (p. 3282).

6.698.3.4 virtual int cms::Xid::getFormatId () const [pure virtual]

Gets the format identifier component of the XID.

Returns:

an integer containing the format identifier. 0 means the OSI CCR format.

Implemented in **activemq::commands::XATransactionId** (p. 3283).

6.698.3.5 virtual int cms::Xid::getGlobalTransactionId (unsigned char * *buffer*, int *size*) const [pure virtual]

Gets the global transaction id component of the XID. The value of this Xid's transaction id is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the transaction id then no copy is performed and the method returns -1.

Parameters:

buffer The location in memory to copy the transaction id bytes to.

size The size of the buffer provided.

Returns:

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions:

XAException *(p. 3265)* if the size parameter is less than zero or buffer is NULL.

Implemented in **activemq::commands::XATransactionId** (p. 3283).

6.698.4 Field Documentation

6.698.4.1 const int cms::Xid::MAXBQUALSIZE [static]

The maximum number of bytes which will be copied into the array that is passed to **getBranchQualifier()** (p. 3291).

6.698.4.2 const int cms::Xid::MAXGTRIDSIZE [static]

The maximum number of bytes which will be copied into the array passed to getGlobaltransactionId().

The documentation for this class was generated from the following file:

6.699 decaf::util::logging::XMLFormatter Class Reference

Format a **LogRecord** (p. 1960) into a standard XML format.

`#include <src/main/decaf/util/logging/XMLFormatter.h>`Inheritance diagram for decaf::util::logging::XMLFormatter:

Public Member Functions

- **XMLFormatter** ()
- virtual ~**XMLFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const

  *Converts a **LogRecord** (p. 1960) into an XML string.*

- virtual std::string **getHead** (const **Handler** *handler)

  Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.

- virtual std::string **getTail** (const **Handler** *handler)

  Returns the tail string for a set of log records formatted as XML strings.

6.699.1 Detailed Description

Format a **LogRecord** (p. 1960) into a standard XML format. TODO - Currently only outputs UTF-8 The **XMLFormatter** (p. 3293) can be used with arbitrary character encodings, but it is recommended that it normally be used with UTF-8. The character encoding can be set on the output **Handler** (p. 1590).

Since:

1.0

6.699.2 Constructor & Destructor Documentation

6.699.2.1 decaf::util::logging::XMLFormatter::XMLFormatter ()

6.699.2.2 virtual decaf::util::logging::XMLFormatter::~XMLFormatter () [virtual]

6.699.3 Member Function Documentation

6.699.3.1 virtual std::string decaf::util::logging::XMLFormatter::format (const LogRecord & *record*) const [virtual]

Converts a **LogRecord** (p. 1960) into an XML string.

Parameters:

record The log record to be formatted.

Returns:

the log record formatted as an XML string.

Implements **decaf::util::logging::Formatter** (p. 1569).

6.699.3.2 virtual std::string decaf::util::logging::XMLFormatter::getHead (const Handler * *handler*) [virtual]

Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.

Parameters:

handler The output handler, may be NULL.

Returns:

the header string for log records formatted as XML strings.

6.699.3.3 virtual std::string decaf::util::logging::XMLFormatter::getTail (const Handler * *handler*) [virtual]

Returns the tail string for a set of log records formatted as XML strings.

Parameters:

handler The output handler, may be NULL.

Returns:

the tail string for log records formatted as XML strings.

6.701 decaf::util::zip::ZipException Class Reference

`#include <src/main/decaf/util/zip/ZipException.h>`Inheritance diagram for decaf::util::zip::ZipException:

Public Member Functions

- **ZipException** ()

  Default Constructor.

- **ZipException** (const **lang::Exception** &ex)

  Copy Constructor.

- **ZipException** (const **ZipException** &ex)

  Copy Constructor.

- **ZipException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **ZipException** (const std::exception *cause)

  Constructor.

- **ZipException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor.

- virtual **ZipException** * **clone** () const

  Clones this exception.

- virtual ~**ZipException** () throw ()

6.701.1 Constructor & Destructor Documentation

6.701.1.1 decaf::util::zip::ZipException::ZipException ()

Default Constructor.

6.701.1.2 decaf::util::zip::ZipException::ZipException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.701.1.3 decaf::util::zip::ZipException::ZipException (const ZipException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.701.1.4 decaf::util::zip::ZipException::ZipException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.701.1.5 decaf::util::zip::ZipException::ZipException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.701.1.6 decaf::util::zip::ZipException::ZipException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.701.1.7 virtual decaf::util::zip::ZipException::~ZipException () throw () [virtual]

6.701.2 Member Function Documentation

6.701.2.1 virtual ZipException* decaf::util::zip::ZipException::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1788).

The documentation for this class was generated from the following file:

Defines

- #define **AMQ_CATCH_RETHROW**(type)

  Macro for catching and re-throwing an exception of a given type.

- #define **AMQ_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)

  Macro for catching an exception of one type and then re-throwing as another type.

- #define **AMQ_CATCHALL_THROW**(type)

  A catch-all that throws a known exception.

- #define **AMQ_CATCHALL_NOTHROW**()

  A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

- #define **AMQ_CATCH_NOTHROW**(type)

  Macro for catching and re-throwing an exception of a given type.

7.119.1 Define Documentation

7.119.1.1 #define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)

Value:

```
catch( sourceType& ex ){ \
        targetType target( ex ); \
        target.setMark( __FILE__, __LINE__ ); \
        throw target; \
    }
```

Macro for catching an exception of one type and then re-throwing as another type.

Parameters:

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(), activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(), and activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.119.1.2 #define AMQ_CATCH_NOTHROW(type)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
    }
```

Macro for catching and re-throwing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. ActiveMQException).

7.119.1.3 #define AMQ_CATCH_RETHROW(type)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
        throw; \
    }
```

Macro for catching and re-throwing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. ActiveMQException).

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(), activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(), and activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.119.1.4 #define AMQ_CATCHALL_NOTHROW()

Value:

```
catch( ... ){ \
        activemq::exceptions::ActiveMQException ex( __FILE__, __LINE__, \
            "caught unknown exception, not rethrowing" ); \
    }
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

7.119.1.5 #define AMQ_CATCHALL_THROW(type)

Value:

```
catch( ... ){ \
        type ex( __FILE__, __LINE__, \
            "caught unknown exception" ); \
        throw ex; \
    }
```

A catch-all that throws a known exception.

Parameters:

type the type of exception to be thrown.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(),
activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(),
and activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.120 src/main/decaf/lang/exceptions/ExceptionDefines.h File Reference

Defines

- #define **DECAF_CATCH_RETHROW**(type)
  Macro for catching and rethrowing an exception of a given type.
- #define **DECAF_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)
  Macro for catching an exception of one type and then rethrowing as another type.
- #define **DECAF_CATCHALL_THROW**(type)
  A catch-all that throws a known exception.
- #define **DECAF_CATCHALL_NOTHROW**()
  A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- #define **DECAF_CATCH_NOTHROW**(type)
  Macro for catching and rethrowing an exception of a given type.

7.120.1 Define Documentation

7.120.1.1 #define DECAF_CATCH_EXCEPTION_CONVERT(sourceType, targetType)

Value:

```
catch( sourceType& ex ){ \
        targetType target( ex.clone() ); \
        target.setMark( __FILE__, __LINE__ ); \
        throw target; \
    }
```

Macro for catching an exception of one type and then rethrowing as another type.

Parameters:

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by decaf::util::PriorityQueue< E >::add().

7.120.1.2 #define DECAF_CATCH_NOTHROW(type)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
    }
```

Macro for catching and rethrowing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. Exception).

7.120.1.3 #define DECAF_CATCH_RETHROW(type)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
        throw; \
    }
```

Macro for catching and rethrowing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. Exception).

Referenced by decaf::util::PriorityQueue< E >::add(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::LinkedBlockingQueue(), and decaf::util::concurrent::ExecutorService::submit().

7.120.1.4 #define DECAF_CATCHALL_NOTHROW()

Value:

```
catch( ... ){ \
        lang::Exception ex( __FILE__, __LINE__, \
            "caught unknown exception, not rethrowing" ); \
    }
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::~ArrayList().

7.120.1.5 #define DECAF_CATCHALL_THROW(type)

Value:

```
catch( ... ){ \
        type ex( __FILE__, __LINE__, \
            "caught unknown exception" ); \
        throw ex; \
    }
```

A catch-all that throws a known exception.

Parameters:

type the type of exception to be thrown.

Referenced by decaf::util::PriorityQueue< E >::add(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::LinkedBlockingQueue(), and decaf::util::concurrent::ExecutorService::submit().

#include <activemq/wireformat/WireFormatNegotiator.h>
#include <decaf/io/DataInputStream.h>
#include <decaf/io/DataOutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/lang/Pointer.h>
#include <activemq/util/Config.h>
#include <activemq/commands/Command.h>
#include <activemq/transport/Transport.h>
#include <decaf/lang/exceptions/UnsupportedOperationException.h>
```

Data Structures

- class **activemq::wireformat::WireFormat**

  *Provides a mechanism to marshal **commands** (p. 61) into and out of packets or into and out of streams, Channels and Datagrams.*

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::wireformat**

7.272 src/main/activemq/wireformat/WireFormatFactory.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/wireformat/WireFormat.h>
#include <decaf/util/Properties.h>
#include <decaf/lang/Pointer.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
```

Data Structures

- class **activemq::wireformat::WireFormatFactory**

  *The **WireFormatFactory** (p. 3231) is the interface that all **WireFormatFactory** (p. 3231) classes must extend.*

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::wireformat**

7.273 src/main/activemq/wireformat/WireFormatNegotiator.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/transport/TransportFilter.h>
#include <decaf/lang/Pointer.h>
```

Data Structures

- class **activemq::wireformat::WireFormatNegotiator**

  *Defines a **WireFormatNegotiator*** (p. *3247*) *which allows a **WireFormat*** (p. *3227*) *to.*

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::wireformat**

7.274 src/main/activemq/wireformat/WireFormatRegistry.h File Reference

```
#include <activemq/util/Config.h>

#include <decaf/util/NoSuchElementException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **activemq::wireformat::WireFormatRegistry**

  *Registry of all **WireFormat** (p. 3227) Factories that are available to the client at runtime.*

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::library**
- namespace **activemq::wireformat**

7.275 src/main/cms/AsyncCallback.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/ExceptionListener.h>
```

Data Structures

- class **cms::AsyncCallback**

  Asynchronous event interface for CMS asynchronous operations.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.276 src/main/cms/BytesMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWriteableException.h>
#include <cms/MessageEOFException.h>
#include <cms/MessageFormatException.h>
```

Data Structures

- class **cms::BytesMessage**

  *A **BytesMessage** (p. 857) object is used to send a message containing a stream of unsigned bytes.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.277 src/main/cms/Closeable.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Closeable**

  Interface for a class that implements the close method.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.278 src/main/decaf/io/Closeable.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::io::Closeable**

  Interface for a class that implements the close method.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.279 src/main/cms/CMSException.h File Reference

```
#include <string>
#include <vector>
#include <iostream>
#include <exception>
#include <cms/Config.h>
```

Data Structures

- class **cms::CMSException**

  CMS API Exception that is the base for all exceptions thrown from CMS classes.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.280 src/main/cms/CMSProperties.h File Reference

```
#include <cms/Config.h>
#include <map>
#include <string>
#include <vector>
```

Data Structures

- class **cms::CMSProperties**

  Interface for a Java-like properties object.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.281 src/main/cms/CMSSecurityException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::CMSSecurityException**

  This exception must be thrown when a provider rejects a user name/password submitted by a client.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.282 src/main/cms/Connection.h File Reference

```
#include <cms/Config.h>
#include <cms/Startable.h>
#include <cms/Stoppable.h>
#include <cms/Closeable.h>
#include <cms/Session.h>
#include <cms/ConnectionMetaData.h>
```

Data Structures

- class **cms::Connection**

  The client's connection to its provider.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.283 src/main/cms/ConnectionFactory.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
#include <string>
```

Data Structures

- class **cms::ConnectionFactory**

  Defines the interface for a factory that creates connection objects, the ***Connection*** *(p. 1089) objects returned implement the CMS* ***Connection*** *(p. 1089) interface and hide the CMS Provider specific implementation details behind that interface.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.284 src/main/cms/ConnectionMetaData.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ConnectionMetaData**

  *A **ConnectionMetaData** (p. 1140) object provides information describing the **Connection** (p. 1089) object.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.285 src/main/cms/DeliveryMode.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::DeliveryMode**

  This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.286 src/main/cms/Destination.h File Reference

```
#include <cms/CMSProperties.h>
#include <cms/Config.h>
#include <string>
```

Data Structures

- class **cms::Destination**

  *A **Destination** (p. 1377) object encapsulates a provider-specific address.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.287 src/main/cms/DestinationEvent.h File Reference

`#include <cms/Config.h>`

`#include <cms/Destination.h>`

Data Structures

- class **cms::DestinationEvent**

  An event class that is used to wrap information related to ***Destination*** *(p. 1377) add and remove events from the CMS Provider.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.288 src/main/cms/DestinationListener.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/DestinationEvent.h>
```

Data Structures

- class **cms::DestinationListener**

  A listener class that the client can implement to receive events related to ***Destination*** *(p. 1377) addition or removal on the CMS Provider.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.289 src/main/cms/DestinationSource.h File Reference

```
#include <cms/Config.h>
#include <cms/DestinationListener.h>
#include <cms/Topic.h>
#include <cms/Queue.h>
#include <cms/TemporaryQueue.h>
#include <cms/TemporaryTopic.h>
#include <cms/Startable.h>
#include <cms/Stoppable.h>
```

Data Structures

- class **cms::DestinationSource**

  *Provides an object that will provide a snapshot view of Destinations that exist on the **Message** (p. 2090) provider.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.290 src/main/cms/EnhancedConnection.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/Connection.h>
```

```
#include <cms/DestinationSource.h>
```

Data Structures

- class **cms::EnhancedConnection**

  An enhanced CMS ***Connection*** *(p. 1089) instance that provides additional features above the default required features of a CMS* ***Connection*** *(p. 1089) instance.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.291 src/main/cms/ExceptionListener.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ExceptionListener**

  If a CMS provider detects a serious problem, it notifies the client application through an ***ExceptionListener*** *(p. 1465) that is registered with the* ***Connection*** *(p. 1089).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.292 src/main/cms/IllegalStateException.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::IllegalStateException**

  This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.293 src/main/decaf/lang/exceptions/IllegalStateException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::IllegalStateException**

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

7.294 src/main/cms/InvalidClientIdException.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidClientIdException**

  This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.295 src/main/cms/InvalidDestinationException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::InvalidDestinationException**

  This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.296 src/main/cms/InvalidSelectorException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::InvalidSelectorException**

  This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.297 src/main/cms/MapMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::MapMessage**

  *A **MapMessage** (p. 2024) object is used to send a set of name-value pairs.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.298 src/main/cms/MessageAvailableListener.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::MessageAvailableListener**

  *A listener interface similar to the **MessageListener** (p. 2183) interface.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.299 src/main/cms/MessageConsumer.h File Reference

```
#include <cms/Config.h>
#include <cms/MessageListener.h>
#include <cms/MessageAvailableListener.h>
#include <cms/Message.h>
#include <cms/Closeable.h>
#include <cms/Startable.h>
#include <cms/Stoppable.h>
```

Data Structures

- class **cms::MessageConsumer**

  A client uses a ***MessageConsumer*** *(p. 2127) to received messages from a destination.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.300 src/main/cms/MessageEnumeration.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageEnumeration**

  Defines an object that enumerates a collection of Messages.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.301 src/main/cms/MessageEOFException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::MessageEOFException**

  This exception must be thrown when an unexpected end of stream has been reached when a ***StreamMessage*** *(p. 2923) or* ***BytesMessage*** *(p. 857) is being read.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.302 src/main/cms/MessageFormatException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::MessageFormatException**

  This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.303 src/main/cms/MessageListener.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::MessageListener**

  A `MessageListener` (p. 2183) object is used to receive asynchronously delivered messages.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.304 src/main/cms/MessageNotReadableException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::MessageNotReadableException**

  This exception must be thrown when a CMS client attempts to read a write-only message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.305 src/main/cms/MessageNotWriteableException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::MessageNotWriteableException**

  This exception must be thrown when a CMS client attempts to write to a read-only message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.306 src/main/cms/MessageProducer.h File Reference

```
#include <cms/Config.h>
#include <cms/AsyncCallback.h>
#include <cms/Message.h>
#include <cms/Destination.h>
#include <cms/Closeable.h>
#include <cms/CMSException.h>
#include <cms/InvalidDestinationException.h>
#include <cms/MessageFormatException.h>
#include <cms/UnsupportedOperationException.h>
#include <cms/DeliveryMode.h>
```

Data Structures

- class **cms::MessageProducer**

  A client uses a ***MessageProducer*** *(p. 2192) object to send messages to a* ***Destination*** *(p. 1377).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.307 src/main/cms/MessageTransformer.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::MessageTransformer**

  *Provides an interface for clients to transform **cms::Message** (p. 2090) objects inside the CMS **MessageProducer** (p. 2192) and **MessageConsumer** (p. 2127) objects before the message's are sent or received.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.308 src/main/cms/ObjectMessage.h File Reference

`#include <cms/Config.h>`

`#include <cms/Message.h>`

Data Structures

- class **cms::ObjectMessage**

  Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.309 src/main/cms/Queue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Queue**

  An interface encapsulating a provider-specific queue name.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.310 src/main/decaf/util/Queue.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/Iterator.h>
#include <decaf/util/AbstractCollection.h>
#include <decaf/lang/Exception.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <decaf/util/NoSuchElementException.h>
```

Data Structures

- class **decaf::util::Queue< E >**

  A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**

7.311 src/main/cms/QueueBrowser.h File Reference

```
#include <string>
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Queue.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageEnumeration.h>
```

Data Structures

- class **cms::QueueBrowser**

  This class implements in interface for browsing the messages in a ***Queue*** *(p. 2514) without removing them.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.312 src/main/cms/ResourceAllocationException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ResourceAllocationException**

  This exception is thrown when an operation is invalid because a transaction is in progress.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.313 src/main/cms/Session.h File Reference

```
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Startable.h>
#include <cms/Stoppable.h>
#include <cms/Message.h>
#include <cms/TextMessage.h>
#include <cms/BytesMessage.h>
#include <cms/MapMessage.h>
#include <cms/StreamMessage.h>
#include <cms/MessageProducer.h>
#include <cms/MessageConsumer.h>
#include <cms/Topic.h>
#include <cms/Queue.h>
#include <cms/QueueBrowser.h>
#include <cms/TemporaryTopic.h>
#include <cms/TemporaryQueue.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Session**

  *A **Session** (p. 2680) object is a single-threaded context for producing and consuming messages.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.314 src/main/cms/Startable.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::Startable**

  Interface for a class that implements the start method.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.315 src/main/cms/Stoppable.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Stoppable**

  Interface for a class that implements the stop method.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.316 src/main/cms/StreamMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWriteableException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageEOFException.h>
```

Data Structures

- class **cms::StreamMessage**

  Interface for a ***StreamMessage*** (p. *2923*)*.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.317 src/main/cms/TemporaryQueue.h File Reference

```
#include <cms/Config.h>
#include <cms/Queue.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryQueue**

  *Defines a Temporary **Queue** (p. 2514) based **Destination** (p. 1377).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.318 src/main/cms/TemporaryTopic.h File Reference

```
#include <cms/Config.h>
#include <cms/Topic.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryTopic**

  Defines a Temporary ***Topic*** (p. *3096*) *based* ***Destination*** (p. *1377*).

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.319 src/main/cms/TextMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::TextMessage**

  Interface for a text message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.320 src/main/cms/Topic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Topic**

  An interface encapsulating a provider-specific topic name.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.321 src/main/cms/TransactionInProgressException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::TransactionInProgressException**

  This exception is thrown when an operation is invalid because a transaction is in progress.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.322 src/main/cms/TransactionRolledBackException.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TransactionRolledBackException**

  This exception must be thrown when a call to ***Session.commit*** *(*p. 2684*) results in a rollback of the current transaction.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.323 src/main/cms/UnsupportedOperationException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::UnsupportedOperationException**

  This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.324 src/main/decaf/lang/exceptions/UnsupportedOperationException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::UnsupportedOperationException**

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

7.325 src/main/cms/XAConnection.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
#include <cms/Connection.h>
#include <cms/XASession.h>
```

Data Structures

- class **cms::XAConnection**

  *The **XAConnection** (p. 3261) interface defines an extended **Connection** (p. 1089) type that is used to create **XASession** (p. 3278) objects.*

Namespaces

- namespace **cms**

7.327 src/main/cms/XAException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::XAException**

  *The **XAException** (p. 3265) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.328 src/main/cms/XAResource.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/Xid.h>
```

```
#include <cms/XAException.h>
```

Data Structures

- class **cms::XAResource**

  *The **XAResource** (p. 3271) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.329 src/main/cms/XASession.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/Session.h>
```

```
#include <cms/XAResource.h>
```

Data Structures

- class **cms::XASession**

  *The **XASession** (p. 3278) interface extends the capability of **Session** (p. 2680) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.330 src/main/cms/Xid.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::Xid**

  An interface which provides a mapping for the X/Open XID transaction identifier structure.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.331 src/main/decaf/internal/AprPool.h File Reference

```
#include <decaf/util/Config.h>
```

```
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::AprPool**

  Wraps an APR pool object so that classes in ***decaf*** *(p. 96) can create a static member for use in static methods where apr function calls that need a pool are made.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.406 src/main/decaf/io/BlockingByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <vector>
```

Data Structures

- class **decaf::io::BlockingByteArrayInputStream**

  This is a blocking version of a byte buffer stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.407 src/main/decaf/io/BufferedInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterInputStream.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedInputStream**

  *A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of **io** (p. 110) operations on the input stream.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.408 src/main/decaf/io/BufferedOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h>
```

```
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedOutputStream**

  Wrapper around another output stream that buffers output before writing to the target output stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.409 src/main/decaf/io/ByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <decaf/util/concurrent/Mutex.h>
#include <vector>
```

Data Structures

- class **decaf::io::ByteArrayInputStream**

  *A **ByteArrayInputStream** (p. 823) contains an **internal** (p. 97) buffer that contains bytes that may be read from the stream.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

#include <decaf/util/Config.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::OutputStream**

  Base interface for any class that wants to represent an output stream of bytes.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.425 src/main/decaf/io/OutputStreamWriter.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/Writer.h>
```

Data Structures

- class **decaf::io::OutputStreamWriter**

  A class for turning a character stream into a byte stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.426 src/main/decaf/io/PushbackInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/InputStream.h>
#include <decaf/io/FilterInputStream.h>
```

Data Structures

- class **decaf::io::PushbackInputStream**

  *A **PushbackInputStream** (p. 2508) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

Defines

- #define **WAIT_INFINITE** 0xFFFFFFFF

  The synchronized macro defines a mechanism for synchronizing a section of ***code*** *(p. 1005).*

- #define **synchronized**(W)

7.570.1 Define Documentation

7.570.1.1 #define synchronized(W)

Value:

```
if(false){}                                                    \
        else                                                          \
        for( decaf::util::concurrent::Lock lock_W(W);                 \
             lock_W.isLocked(); lock_W.unlock() )
```

7.570.1.2 #define WAIT_INFINITE 0xFFFFFFFF

The synchronized macro defines a mechanism for synchronizing a section of **code** (p. 1005). The macro must be passed an object that implements the Synchronizable interface.

The macro works by creating a for loop that will loop exactly once, creating a Lock object that is scoped to the loop. Once the loop completes and exits the Lock object goes out of scope releasing the lock on object W. For added safety the if else is used because not all compiles restrict the lifetime of loop variables to the loop, they will however restrict them to the scope of the else.

The macro would be used as follows.

Synchronizable X;

somefunction() { **synchronized(X)** (p. 3890) { // Do something that needs synchronizing. } }

`#include <decaf/util/concurrent/Synchronizable.h>`

`#include <decaf/util/Config.h>`

Data Structures

- class **decaf::util::concurrent::Lock**

  A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**
- namespace **decaf::util::concurrent**

7.586 src/main/decaf/util/concurrent/locks/Lock.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/exceptions/InterruptedException.h>
#include <decaf/lang/exceptions/UnsupportedOperationException.h>
#include <decaf/util/concurrent/locks/Condition.h>
```

Data Structures

- class **decaf::util::concurrent::locks::Lock**

  Lock *(p. 1926) implementations provide more extensive locking operations than can be obtained using synchronized statements.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**
- namespace **decaf::util::concurrent**
- namespace **decaf::util::concurrent::locks**

7.587 src/main/decaf/util/concurrent/locks/AbstractOwnableSynchron File Reference

`#include <decaf/util/Config.h>`

Data Structures

- class **decaf::util::concurrent::locks::AbstractOwnableSynchronizer**

  Base class for ***locks*** *(p. 134) that provide the notion of Ownership, the types of* ***locks*** *(p. 134) that are implemented using this base class would be owned by one specific Thread at any given time.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

```
#include <decaf/util/Config.h>
#include <decaf/util/concurrent/locks/AbstractOwnableSynchronizer.h>
#include <decaf/util/concurrent/locks/Condition.h>
#include <decaf/util/Collection.h>
#include <decaf/lang/Thread.h>
```

Data Structures

- class **decaf::util::concurrent::locks::AbstractQueuedSynchronizer**
- class **decaf::util::concurrent::locks::AbstractQueuedSynchronizer::ConditionObject**

  Condition *(p. 1077) object for this Synchronizer, which serves as the basis for other* ***Lock*** *(p. 1926) objects.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

```
#include <decaf/util/Config.h>
#include <decaf/util/Date.h>
#include <decaf/util/concurrent/TimeUnit.h>
#include <decaf/lang/exceptions/RuntimeException.h>
#include <decaf/lang/exceptions/InterruptedException.h>
#include <decaf/lang/exceptions/IllegalMonitorStateException.h>
```

Data Structures

- class **decaf::util::concurrent::locks::Condition**

  Condition *(p. 1077) factors out the* ***Mutex*** *(p. 2236) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary* ***Lock*** *(p. 1926) implementations.*

#include <decaf/util/ArrayList.h>
#include <decaf/util/Config.h>
#include <vector>
```

Data Structures

- class **decaf::util::concurrent::ThreadPoolExecutor**

  Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

- class **decaf::util::concurrent::ThreadPoolExecutor::AbortPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute*** (p. *3055*) *this class always throws a **RejectedExecutionException*** (p. *2567*).

- class **decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute*** (p. *3055*) *this class will attempt to run the task in the Thread that called the execute method unless the executor is shutdown in which case the task is not run and is destroyed.*

- class **decaf::util::concurrent::ThreadPoolExecutor::DiscardPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute*** (p. *3055*) *this class always destroys the rejected task and returns quietly.*

- class **decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute*** (p. *3055*) *this class always destroys the oldest unexecuted task in the **Queue*** (p. *2515*) *and then attempts to execute the rejected task using the passed in executor.*

#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::Checksum**

  An interface used to represent ***Checksum*** *(p. 956) values in the Zip package.*

- namespace **decaf::util**
- namespace **decaf::util::zip**

7.656 src/main/decaf/util/zip/CRC32.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/zip/Checksum.h>
```

Data Structures

- class **decaf::util::zip::CRC32**

  Class that can be used to compute a CRC-32 checksum for a data stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**
- namespace **decaf::util::zip**

7.657 src/main/decaf/util/zip/DataFormatException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::util::zip::DataFormatException**

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**
- namespace **decaf::util::zip**

7.658 src/main/decaf/util/zip/Deflater.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::Deflater**

  This class compresses data using the DEFLATE algorithm (see `specification`*).*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**
- namespace **decaf::util::zip**

7.659 src/main/decaf/util/zip/DeflaterOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterOutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/util/zip/Deflater.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::DeflaterOutputStream**

  Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**
- namespace **decaf::util::zip**

7.660 src/main/decaf/util/zip/Inflater.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <decaf/util/zip/DataFormatException.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::Inflater**

  This class uncompresses data that was compressed using the DEFLATE algorithm (see `specification`*).*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**
- namespace **decaf::util::zip**

7.661 src/main/decaf/util/zip/InflaterInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterInputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/util/zip/Inflater.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::InflaterInputStream**

  A FilterInputStream that decompresses data read from the wrapped InputStream instance.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**
- namespace **decaf::util::zip**

7.662 src/main/decaf/util/zip/ZipException.h File Reference

```
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::util::zip::ZipException**
