6.209 decaf::util::Date Class Reference

Wrapper class around a time value in milliseconds.

`#include <src/main/decaf/util/Date.h>`Inheritance diagram for decaf::util::Date:

Public Member Functions

- **Date** ()
  Default constructor - sets time to the current System time, rounded to the nearest millisecond.
- **Date** (long long milliseconds)
  Constructs the date with a given time value.
- **Date** (const **Date** &source)
  Copy constructor.
- **Date** & **operator**= (const **Date** &value)
  *Assigns the value of one **Date** (p. 1304) object to another.*
- virtual ~**Date** ()
- long long **getTime** () const
  Gets the underlying time.
- void **setTime** (long long milliseconds)
  Sets the underlying time.
- bool **after** (const **Date** &when) const
  Determines whether or not this date falls after the specified time.
- bool **before** (const **Date** &when) const
  Determines whether or not this date falls before the specified time.
- std::string **toString** () const
  *Converts this **Date** (p. 1304) object to a String of the form:.*
- virtual int **compareTo** (const **Date** &value) const
- virtual bool **equals** (const **Date** &value) const
- virtual bool **operator**== (const **Date** &value) const
- virtual bool **operator**< (const **Date** &value) const

6.209.1 Detailed Description

Wrapper class around a time value in milliseconds. This class is comparable to Java's java.util.Date class.

Since:

1.0

6.209.2 Constructor & Destructor Documentation

6.209.2.1 decaf::util::Date::Date ()

Default constructor - sets time to the current System time, rounded to the nearest millisecond.

6.209.2.2 decaf::util::Date::Date (long long *milliseconds*)

Constructs the date with a given time value.

Parameters:

milliseconds The time in milliseconds;

6.209.2.3 decaf::util::Date::Date (const Date & *source*)

Copy constructor.

Parameters:

source The **Date** (p. 1304) instance to copy into this one.

6.209.2.4 virtual decaf::util::Date::~Date () [virtual]

6.209.3 Member Function Documentation

6.209.3.1 bool decaf::util::Date::after (const Date & *when*) const

Determines whether or not this date falls after the specified time.

Parameters:

when The date to compare

Returns:

true if this date falls after when.

6.209.3.2 bool decaf::util::Date::before (const Date & *when*) const

Determines whether or not this date falls before the specified time.

Parameters:

when The date to compare

Returns:

true if this date falls before when.

6.209.3.3 virtual int decaf::util::Date::compareTo (const Date & *value*) const [virtual]

6.209.3.4 virtual bool decaf::util::Date::equals (const Date & *value*) const [virtual]

6.209.3.5 long long decaf::util::Date::getTime () const

Gets the underlying time.

Returns:

The underlying time value in milliseconds.

6.209.3.6 virtual bool decaf::util::Date::operator< (const Date & *value*) const [virtual]

6.209.3.7 Date& decaf::util::Date::operator= (const Date & *value*)

Assigns the value of one **Date** (p. 1304) object to another.

Parameters:

value The value to be copied into this **Date** (p. 1304) object.

Returns:

reference to this object with the newly assigned value.

6.209.3.8 virtual bool decaf::util::Date::operator== (const Date & *value*) const [virtual]

6.209.3.9 void decaf::util::Date::setTime (long long *milliseconds*)

Sets the underlying time.

Parameters:

milliseconds The underlying time value in milliseconds.

6.209.3.10 std::string decaf::util::Date::toString () const

Converts this **Date** (p. 1304) object to a String of the form:. dow mon dd hh:mm:ss zzz yyyy where:

- dow is the day of the week (Sun, Mon, Tue, Wed, Thu, Fri, Sat).
- mon is the month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec).
- dd is the day of the month (01 through 31), as two decimal digits.
- hh is the hour of the day (00 through 23), as two decimal digits.

- mm is the minute within the hour (00 through 59), as two decimal digits.
- ss is the second within the minute (00 through 61, as two decimal digits.
- zzz is the time zone (and may reflect daylight saving time). Standard time zone abbreviations include those recognized by the method parse. If time zone information is not available, then zzz is empty - that is, it consists of no characters at all.
- yyyy is the year, as four decimal digits.

Returns:

the String representation of the **Date** (p. 1304) object.

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Date.h**

6.210 decaf::internal::DecafRuntime Class Reference

Handles APR initialization and termination.

`#include <src/main/decaf/internal/DecafRuntime.h>`Inheritance diagram for decaf::internal::DecafRuntime:

Public Member Functions

- **DecafRuntime** ()

  Initializes the APR Runtime for a library.

- virtual ~**DecafRuntime** ()

  Terminates the APR Runtime for a library.

- apr_pool_t * **getGlobalPool** () const

  Grants access to the Global APR Pool instance that should be used when creating new threads.

- **decaf::util::concurrent::Mutex** * **getGlobalLock** ()

  Gets a pointer to the Decaf Runtime's Global Lock object, this can be used by Decaf APIs to synchronize around certain actions such as adding or acquiring a resource that must be Thread safe.

6.210.1 Detailed Description

Handles APR initialization and termination.

6.210.2 Constructor & Destructor Documentation

6.210.2.1 decaf::internal::DecafRuntime::DecafRuntime ()

Initializes the APR Runtime for a library.

6.210.2.2 virtual decaf::internal::DecafRuntime::~DecafRuntime () [virtual]

Terminates the APR Runtime for a library.

6.210.3 Member Function Documentation

6.210.3.1 decaf::util::concurrent::Mutex* decaf::internal::DecafRuntime::getGlobalLock ()

Gets a pointer to the Decaf Runtime's Global Lock object, this can be used by Decaf APIs to synchronize around certain actions such as adding or acquiring a resource that must be Thread safe. The pointer returned is owned by the Decaf runtime and should not be deleted or copied by the caller.

Returns:

a pointer to the Decaf Runtime's global Lock instance.

6.210.3.2 apr_pool_t* decaf::internal::DecafRuntime::getGlobalPool () const

Grants access to the Global APR Pool instance that should be used when creating new threads.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**DecafRuntime.h**

6.211 activemq::threads::DedicatedTaskRunner Class Reference

`#include <src/main/activemq/threads/DedicatedTaskRunner.h>`Inheritance diagram for activemq::threads::DedicatedTaskRunner:

Public Member Functions

- **DedicatedTaskRunner** (**Task** *task)
- virtual ~**DedicatedTaskRunner** ()
- virtual void **start** ()

  Starts the task runner.

- virtual bool **isStarted** () const

  true if the start method has been called.

- virtual void **shutdown** (long long timeout)

  Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

- virtual void **shutdown** ()

  Shutdown once the task has finished and the TaskRunner's thread has exited.

- virtual void **wakeup** ()

  *Signal the **TaskRunner** (p. 2990) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2989) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.

6.211.1 Constructor & Destructor Documentation

6.211.1.1 activemq::threads::DedicatedTaskRunner::DedicatedTaskRunner (Task * *task*)

6.211.1.2 virtual activemq::threads::DedicatedTaskRunner::~DedicatedTaskRunner () `[virtual]`

6.211.2 Member Function Documentation

6.211.2.1 virtual bool activemq::threads::DedicatedTaskRunner::isStarted () const `[virtual]`

true if the start method has been called.

Implements **activemq::threads::TaskRunner** (p. 2990).

6.211.2.2 virtual void activemq::threads::DedicatedTaskRunner::run () [protected, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2622).

6.211.2.3 virtual void activemq::threads::DedicatedTaskRunner::shutdown () [virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implements **activemq::threads::TaskRunner** (p. 2990).

6.211.2.4 virtual void activemq::threads::DedicatedTaskRunner::shutdown (long long *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters:

timeout - Time in Milliseconds to wait for the task to stop.

Implements **activemq::threads::TaskRunner** (p. 2991).

6.211.2.5 virtual void activemq::threads::DedicatedTaskRunner::start () [virtual]

Starts the task runner. Prior to call this method tasks can be added to a Runner, but no executions will occur. The start method will create the background Thread(s) which do the work for this task runner.

Implements **activemq::threads::TaskRunner** (p. 2991).

6.211.2.6 virtual void activemq::threads::DedicatedTaskRunner::wakeup () [virtual]

Signal the **TaskRunner** (p. 2990) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2989) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 2991).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**DedicatedTaskRunner.h**

6.212 decaf::internal::security::provider::DefaultMessageDigestProviderS Class Reference

Decaf's Default Message Digest Security **provider** (p. 105) used to create instances of the built-in Message Digest algorithm SPI classes.

`#include <src/main/decaf/internal/security/provider/DefaultMessageDigestProviderService.h>`Inherit diagram for decaf::internal::security::provider::DefaultMessageDigestProviderService:

Public Member Functions

- **DefaultMessageDigestProviderService** (const **decaf::security::Provider** *provider, const std::string &algorithmName)
- virtual ~**DefaultMessageDigestProviderService** ()
- virtual **decaf::security::SecuritySpi** * **newInstance** ()

  Return a new instance of the implementation described by this service.

6.212.1 Detailed Description

Decaf's Default Message Digest Security **provider** (p. 105) used to create instances of the built-in Message Digest algorithm SPI classes.

Since:

1.0

6.212.2 Constructor & Destructor Documentation

6.212.2.1 decaf::internal::security::provider::DefaultMessageDigestProviderService::DefaultMessageI (const decaf::security::Provider * *provider*, const std::string & *algorithmName*)

6.212.2.2 virtual decaf::internal::security::provider::DefaultMessageDigestProviderService::~DefaultMessag () `[virtual]`

6.212.3 Member Function Documentation

6.212.3.1 virtual decaf::security::SecuritySpi* decaf::internal::security::provider::DefaultMessageDigestProviderService::newInstance () `[virtual]`

Return a new instance of the implementation described by this service. The **security** (p. 104) **provider** (p. 105) framework uses this method to construct implementations. Applications will typically not need to call it.

Returns:

a new instance of the SecuritySpi provided by this ProviderService.

Implements **decaf::security::ProviderService** (p. 2506).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/security/provider/**DefaultMessageDigestProviderService.h**

6.213 activemq::core::policies::DefaultPrefetchPolicy Class Reference

`#include <src/main/activemq/core/policies/DefaultPrefetchPolicy.h>`Inheritance diagram for activemq::core::policies::DefaultPrefetchPolicy:

Public Member Functions

- **DefaultPrefetchPolicy** ()
- virtual ~**DefaultPrefetchPolicy** ()
- virtual void **setDurableTopicPrefetch** (int value)

  Sets the amount of prefetched messages for a Durable Topic.

- virtual int **getDurableTopicPrefetch** () const

  Gets the amount of messages to prefetch for a Durable Topic.

- virtual void **setQueuePrefetch** (int value)

  Sets the amount of prefetched messages for a Queue.

- virtual int **getQueuePrefetch** () const

  Gets the amount of messages to prefetch for a Queue.

- virtual void **setQueueBrowserPrefetch** (int value)

  Sets the amount of prefetched messages for a Queue Browser.

- virtual int **getQueueBrowserPrefetch** () const

  Gets the amount of messages to prefetch for a Queue Browser.

- virtual void **setTopicPrefetch** (int value)

  Sets the amount of prefetched messages for a Topic.

- virtual int **getTopicPrefetch** () const

  Gets the amount of messages to prefetch for a Topic.

- virtual int **getMaxPrefetchLimit** (int value) const

  Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

- virtual **PrefetchPolicy** * **clone** () const

  Clone the Policy and return a new pointer to that clone.

Static Public Attributes

- static int **MAX_PREFETCH_SIZE**
- static int **DEFAULT_DURABLE_TOPIC_PREFETCH**
- static int **DEFAULT_QUEUE_PREFETCH**
- static int **DEFAULT_QUEUE_BROWSER_PREFETCH**
- static int **DEFAULT_TOPIC_PREFETCH**

6.213.1 Constructor & Destructor Documentation

6.213.1.1 activemq::core::policies::DefaultPrefetchPolicy::DefaultPrefetchPolicy ()

6.213.1.2 virtual activemq::core::policies::DefaultPrefetchPolicy::~DefaultPrefetchPolicy () [virtual]

6.213.2 Member Function Documentation

6.213.2.1 virtual PrefetchPolicy* activemq::core::policies::DefaultPrefetchPolicy::clone () const [virtual]

Clone the Policy and return a new pointer to that clone.

Returns:

pointer to a new **PrefetchPolicy** (p. 2397) instance that is a clone of this one.

Implements **activemq::core::PrefetchPolicy** (p. 2398).

6.213.2.2 virtual int activemq::core::policies::DefaultPrefetchPolicy::getDurableTopicPrefetch () const [inline, virtual]

Gets the amount of messages to prefetch for a Durable Topic.

Returns:

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 2399).

6.213.2.3 virtual int activemq::core::policies::DefaultPrefetchPolicy::getMaxPrefetchLimit (int *value*) const [inline, virtual]

Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

Returns:

the allowable value for a prefetch limit, either requested or the max.

Implements **activemq::core::PrefetchPolicy** (p. 2399).

6.213.2.4 virtual int activemq::core::policies::DefaultPrefetchPolicy::getQueueBrowserPrefetch () const [inline, virtual]

Gets the amount of messages to prefetch for a Queue Browser.

Returns:

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 2399).

6.213.2.5 virtual int activemq::core::policies::DefaultPrefetchPolicy::getQueuePrefetch () const [inline, virtual]

Gets the amount of messages to prefetch for a Queue.

Returns:

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 2399).

6.213.2.6 virtual int activemq::core::policies::DefaultPrefetchPolicy::getTopicPrefetch () const [inline, virtual]

Gets the amount of messages to prefetch for a Topic.

Returns:

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 2399).

6.213.2.7 virtual void activemq::core::policies::DefaultPrefetchPolicy::setDurableTopicPrefetch (int *value*) [inline, virtual]

Sets the amount of prefetched messages for a Durable Topic.

Parameters:

value The number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 2400).

6.213.2.8 virtual void activemq::core::policies::DefaultPrefetchPolicy::setQueueBrowserPrefetch (int *value*) [inline, virtual]

Sets the amount of prefetched messages for a Queue Browser.

Parameters:

value The number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 2400).

6.213.2.9 virtual void activemq::core::policies::DefaultPrefetchPolicy::setQueuePrefetch (int *value*) [inline, virtual]

Sets the amount of prefetched messages for a Queue.

Parameters:

value The number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 2400).

6.213.2.10 virtual void activemq::core::policies::DefaultPrefetchPolicy::setTopicPrefetch (int *value*) [inline, virtual]

Sets the amount of prefetched messages for a Topic.

Parameters:

value The number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 2400).

6.213.3 Field Documentation

6.213.3.1 int activemq::core::policies::DefaultPrefetchPolicy::DEFAULT_DURABLE_TOPIC_PREFETCH [static]

6.213.3.2 int activemq::core::policies::DefaultPrefetchPolicy::DEFAULT_QUEUE_BROWSER_PREFETCH [static]

6.213.3.3 int activemq::core::policies::DefaultPrefetchPolicy::DEFAULT_QUEUE_PREFETCH [static]

6.213.3.4 int activemq::core::policies::DefaultPrefetchPolicy::DEFAULT_TOPIC_PREFETCH [static]

6.213.3.5 int activemq::core::policies::DefaultPrefetchPolicy::MAX_PREFETCH_SIZE [static]

The documentation for this class was generated from the following file:

- src/main/activemq/core/policies/**DefaultPrefetchPolicy.h**

6.214 decaf::internal::security::provider::DefaultProvider Class Reference

Implements the Security Provider interface for the Decaf library.

`#include <src/main/decaf/internal/security/provider/DefaultProvider.h>`Inheritance diagram for decaf::internal::security::provider::DefaultProvider:

Public Member Functions

- virtual ~**DefaultProvider** ()

Protected Member Functions

- **DefaultProvider** ()
- virtual void **initialize** ()

Friends

- class **decaf::internal::security::SecurityRuntime**

6.214.1 Detailed Description

Implements the Security Provider interface for the Decaf library.

Since:

1.0

6.214.2 Constructor & Destructor Documentation

6.214.2.1 decaf::internal::security::provider::DefaultProvider::DefaultProvider () [protected]

6.214.2.2 virtual decaf::internal::security::provider::DefaultProvider::~DefaultProvider () [virtual]

6.214.3 Member Function Documentation

6.214.3.1 virtual void decaf::internal::security::provider::DefaultProvider::initialize () [protected, virtual]

Reimplemented from **decaf::security::Provider** (p. 2501).

6.214.4 Friends And Related Function Documentation

6.214.4.1 friend class decaf::internal::security::SecurityRuntime [friend]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/security/provider/**DefaultProvider.h**

6.215 activemq::core::policies::DefaultRedeliveryPolicy Class Reference

`#include <src/main/activemq/core/policies/DefaultRedeliveryPolicy.h>`Inheritance diagram for activemq::core::policies::DefaultRedeliveryPolicy:

Public Member Functions

- **DefaultRedeliveryPolicy** ()
- virtual ~**DefaultRedeliveryPolicy** ()
- virtual double **getBackOffMultiplier** () const
- virtual void **setBackOffMultiplier** (double value)

  Sets the Back-Off Multiplier for Message Redelivery.

- virtual short **getCollisionAvoidancePercent** () const
- virtual void **setCollisionAvoidancePercent** (short value)
- virtual long long **getInitialRedeliveryDelay** () const

  Gets the initial time that redelivery of messages is delayed.

- virtual void **setInitialRedeliveryDelay** (long long value)

  Sets the initial time that redelivery will be delayed.

- virtual long long **getRedeliveryDelay** () const

  Gets the time that redelivery of messages is delayed.

- virtual void **setRedeliveryDelay** (long long value)

  Sets the time that redelivery will be delayed.

- virtual int **getMaximumRedeliveries** () const

  Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

- virtual void **setMaximumRedeliveries** (int value)

  Sets the Maximum allowable redeliveries for a Message.

- virtual bool **isUseCollisionAvoidance** () const
- virtual void **setUseCollisionAvoidance** (bool value)
- virtual bool **isUseExponentialBackOff** () const
- virtual void **setUseExponentialBackOff** (bool value)
- virtual long long **getNextRedeliveryDelay** (long long previousDelay)

  Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

- virtual **RedeliveryPolicy** * **clone** () const

  Create a copy of this Policy and return it.

6.215.1 Constructor & Destructor Documentation

6.215.1.1 activemq::core::policies::DefaultRedeliveryPolicy::DefaultRedeliveryPolicy ()

6.215.1.2 virtual activemq::core::policies::DefaultRedeliveryPolicy::~DefaultRedeliveryPolicy () [virtual]

6.215.2 Member Function Documentation

6.215.2.1 virtual RedeliveryPolicy* activemq::core::policies::DefaultRedeliveryPolicy::clone () const [virtual]

Create a copy of this Policy and return it.

Returns:

pointer to a new **RedeliveryPolicy** (p. 2542) that is a copy of this one.

Implements **activemq::core::RedeliveryPolicy** (p. 2543).

6.215.2.2 virtual double activemq::core::policies::DefaultRedeliveryPolicy::getBackOffMultiplier () const [inline, virtual]

Returns:

The value of the Back-Off Multiplier for Message Redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 2544).

6.215.2.3 virtual short activemq::core::policies::DefaultRedeliveryPolicy::getCollisionAvoidancePercent () const [virtual]

Returns:

the currently set Collision Avoidance percentage.

Implements **activemq::core::RedeliveryPolicy** (p. 2544).

6.215.2.4 virtual long long activemq::core::policies::DefaultRedeliveryPolicy::getInitialRedeliveryDelay () const [inline, virtual]

Gets the initial time that redelivery of messages is delayed.

Returns:

the time in milliseconds that redelivery is delayed initially.

Implements **activemq::core::RedeliveryPolicy** (p. 2544).

6.215.2.5 virtual int activemq::core::policies::DefaultRedeliveryPolicy::getMaximumRedeliveries () const [inline, virtual]

Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

Returns:

maximum allowed redeliveries for a message.

Implements **activemq::core::RedeliveryPolicy** (p. 2544).

6.215.2.6 virtual long long activemq::core::policies::DefaultRedeliveryPolicy::getNextRedeliveryDelay (long long *previousDelay*) [virtual]

Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

Parameters:

previousDelay The last delay that was used between message redeliveries.

Returns:

the new delay to use before attempting another redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 2544).

6.215.2.7 virtual long long activemq::core::policies::DefaultRedeliveryPolicy::getRedeliveryDelay () const [inline, virtual]

Gets the time that redelivery of messages is delayed.

Returns:

the time in milliseconds that redelivery is delayed.

Implements **activemq::core::RedeliveryPolicy** (p. 2545).

6.215.2.8 virtual bool activemq::core::policies::DefaultRedeliveryPolicy::isUseCollisionAvoidance () const [inline, virtual]

Returns:

whether or not collision avoidance is enabled for this Policy.

Implements **activemq::core::RedeliveryPolicy** (p. 2545).

6.215.2.9 virtual bool activemq::core::policies::DefaultRedeliveryPolicy::isUseExponentialBackOff () const [inline, virtual]

Returns:

whether or not the exponential back off option is enabled.

Implements **activemq::core::RedeliveryPolicy** (p. 2545).

6.215.2.10 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setBackOffMultiplier (double *value*) [inline, virtual]

Sets the Back-Off Multiplier for Message Redelivery.

Parameters:

value The new value for the back-off multiplier.

Implements **activemq::core::RedeliveryPolicy** (p. 2545).

6.215.2.11 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setCollisionAvoidancePercent (short *value*) [virtual]

Parameters:

value The collision avoidance percentage setting.

Implements **activemq::core::RedeliveryPolicy** (p. 2546).

6.215.2.12 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setInitialRedeliveryDelay (long long *value*) [inline, virtual]

Sets the initial time that redelivery will be delayed.

Parameters:

value Time in Milliseconds to wait before starting redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 2546).

6.215.2.13 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setMaximumRedeliveries (int *maximumRedeliveries*) [inline, virtual]

Sets the Maximum allowable redeliveries for a Message.

Parameters:

maximumRedeliveries The maximum number of times that a message will be redelivered.

Implements **activemq::core::RedeliveryPolicy** (p. 2546).

6.215.2.14 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setRedeliveryDelay (long long *value*) [inline, virtual]

Sets the time that redelivery will be delayed.

Parameters:

value Time in Milliseconds to wait before the next redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 2546).

6.215.2.15 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setUseCollisionAvoidance (bool *value*) [inline, virtual]

Parameters:

value Enable or Disable collision avoidance for this Policy.

Implements **activemq::core::RedeliveryPolicy** (p. 2546).

6.215.2.16 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setUseExponentialBackOff (bool *value*) [inline, virtual]

Parameters:

value Enable or Disable the exponential back off multiplier option.

Implements **activemq::core::RedeliveryPolicy** (p. 2547).

The documentation for this class was generated from the following file:

- src/main/activemq/core/policies/**DefaultRedeliveryPolicy.h**

6.216 decaf::internal::security::provider::DefaultSecureRandomProviderS Class Reference

Decaf's Default Secure Random Security **provider** (p. 105) used to create instances of the built-in Secure Random algorithm SPI classes.

`#include <src/main/decaf/internal/security/provider/DefaultSecureRandomProviderService.h>`Inherita diagram for decaf::internal::security::provider::DefaultSecureRandomProviderService:

Public Member Functions

- **DefaultSecureRandomProviderService** (const **decaf::security::Provider** *provider, const std::string &algorithmName)
- virtual ~**DefaultSecureRandomProviderService** ()
- virtual **decaf::security::SecuritySpi** * **newInstance** ()

  Return a new instance of the implementation described by this service.

6.216.1 Detailed Description

Decaf's Default Secure Random Security **provider** (p. 105) used to create instances of the built-in Secure Random algorithm SPI classes.

Since:

1.0

6.216.2 Constructor & Destructor Documentation

6.216.2.1 decaf::internal::security::provider::DefaultSecureRandomProviderService::DefaultSecureRa (const decaf::security::Provider * *provider*, const std::string & *algorithmName*)

6.216.2.2 virtual decaf::internal::security::provider::DefaultSecureRandomProviderService::~DefaultSecureI () `[virtual]`

6.216.3 Member Function Documentation

6.216.3.1 virtual decaf::security::SecuritySpi* decaf::internal::security::provider::DefaultSecureRandomProviderService::newInstance () `[virtual]`

Return a new instance of the implementation described by this service. The **security** (p. 104) **provider** (p. 105) framework uses this method to construct implementations. Applications will typically not need to call it.

Returns:

a new instance of the SecuritySpi provided by this ProviderService.

Implements **decaf::security::ProviderService** (p. 2506).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/security/provider/**DefaultSecureRandomProviderService.h**

6.217 decaf::internal::net::DefaultServerSocketFactory Class Reference

Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.

`#include <src/main/decaf/internal/net/DefaultServerSocketFactory.h>`Inheritance diagram for decaf::internal::net::DefaultServerSocketFactory:

Public Member Functions

- **DefaultServerSocketFactory** ()
- virtual ~**DefaultServerSocketFactory** ()
- virtual **decaf::net::ServerSocket** * **createServerSocket** ()

  Create a new ***ServerSocket*** *(p. 2659) that is unbound.*
  The ***ServerSocket*** *(p. 2659) will have been configured with the defaults from the factory.*

  Returns:

  new ***ServerSocket*** *(p. 2659) pointer that is owned by the caller.*

  Exceptions:

  IOException *if the* ***ServerSocket*** *(p. 2659) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** * **createServerSocket** (int port)

  Create a new ***ServerSocket*** *(p. 2659) that is bound to the given port.*
  The ***ServerSocket*** *(p. 2659) will have been configured with the defaults from the factory.*

  Parameters:

  port *The port to bind the* ***ServerSocket*** *(p. 2659) to.*

  Returns:

  new ***ServerSocket*** *(p. 2659) pointer that is owned by the caller.*

  Exceptions:

  IOException *if the* ***ServerSocket*** *(p. 2659) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** * **createServerSocket** (int port, int backlog)

  Create a new ***ServerSocket*** *(p. 2659) that is bound to the given port.*
  The ***ServerSocket*** *(p. 2659) will have been configured with the defaults from the factory. The* ***ServerSocket*** *(p. 2659) will use the specified connection backlog setting.*

  Parameters:

  port *The port to bind the* ***ServerSocket*** *(p. 2659) to.*
  backlog *The number of pending connect request the* ***ServerSocket*** *(p. 2659) can queue.*

  Returns:

  new ***ServerSocket*** *(p. 2659) pointer that is owned by the caller.*

  Exceptions:

  IOException *if the* ***ServerSocket*** *(p. 2659) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** * **createServerSocket** (int port, int backlog, const **decaf::net::InetAddress** *address)

Create a new ***ServerSocket*** *(p. 2659) that is bound to the given port.*

The* ***ServerSocket*** *(p. 2659) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the* ***ServerSocket*** *(p. 2659) will listen on all interfaces.*

Parameters:

port *The port to bind the* ***ServerSocket*** *(p. 2659) to.*
backlog *The number of pending connect request the* ***ServerSocket*** *(p. 2659) can queue.*
address *The address of the interface on the local machine to bind to.*

Returns:

new ***ServerSocket*** *(p. 2659) pointer that is owned by the caller.*

Exceptions:

IOException *if the* ***ServerSocket*** *(p. 2659) cannot be created for some reason.*

6.217.1 Detailed Description

Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.

Since:

1.0

6.217.2 Constructor & Destructor Documentation

6.217.2.1 decaf::internal::net::DefaultServerSocketFactory::DefaultServerSocketFactory ()

6.217.2.2 virtual decaf::internal::net::DefaultServerSocketFactory::~DefaultServerSocketFactory () [virtual]

6.217.3 Member Function Documentation

6.217.3.1 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int *port*, int *backlog*, const decaf::net::InetAddress * *address*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 2659) will listen on all interfaces.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The number of pending connect request the **ServerSocket** (p. 2659) can queue.

address The address of the interface on the local machine to bind to.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2669).

6.217.3.2 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int *port*, int *backlog*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will use the specified connection backlog setting.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The number of pending connect request the **ServerSocket** (p. 2659) can queue.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2669).

6.217.3.3 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int *port*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2670).

6.217.3.4 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket () [virtual]

Create a new **ServerSocket** (p. 2659) that is unbound.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Reimplemented from **decaf::net::ServerSocketFactory** (p. 2670).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**DefaultServerSocketFactory.h**

6.218 decaf::internal::net::DefaultSocketFactory Class Reference

SocketFactory implementation that is used to create Sockets.

Creates a new ***Socket*** *(p. 2770) object and connects it to the specified remote host and port using the configuration of this* ***SocketFactory*** *(p. 2789).*

Parameters:

host *The host name or IP address to connect the socket to.*
port *The port on the remote host to connect to.*

Returns:

a new ***Socket*** *(p. 2770) object, caller must free this object when done.*

Exceptions:

IOException *if an I/O error occurs while creating the* ***Socket*** *(p. 2770) object.*
UnknownHostException *(p. 3154) if the host name is not known.*

- virtual **decaf::net::Socket** * **createSocket** (const std::string &name, int port, const **decaf::net::InetAddress** *ifAddress, int localPort)

  Creates a new ***Socket*** *(p. 2770) object and connects it to the specified remote host and port using the configuration of this* ***SocketFactory*** *(p. 2789).*

  Parameters:

  host *The host name or IP address to connect the socket to.*
  port *The port on the remote host to connect to.*
  ifAddress *The address on the local machine to bind the* ***Socket*** *(p. 2770) to.*
  localPort *The local port to bind the* ***Socket*** *(p. 2770) to.*

  Returns:

  a new ***Socket*** *(p. 2770) object, caller must free this object when done.*

  Exceptions:

  IOException *if an I/O error occurs while creating the* ***Socket*** *(p. 2770) object.*
  UnknownHostException *(p. 3154) if the host name is not known.*

6.218.1 Detailed Description

SocketFactory implementation that is used to create Sockets.

Since:

1.0

6.218.2 Constructor & Destructor Documentation

6.218.2.1 decaf::internal::net::DefaultSocketFactory::DefaultSocketFactory ()

6.218.2.2 virtual decaf::internal::net::DefaultSocketFactory::~DefaultSocketFactory () [virtual]

6.218.3 Member Function Documentation

6.218.3.1 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const std::string & *name*, int *port*, const decaf::net::InetAddress * *ifAddress*, int *localPort*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 2770) to.

localPort The local port to bind the **Socket** (p. 2770) to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2790).

6.218.3.2 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const std::string & *name*, int *port*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2790).

6.218.3.3 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const decaf::net::InetAddress * *host*, int *port*, const decaf::net::InetAddress * *ifAddress*, int *localPort*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

The **Socket** (p. 2770) will be bound to the specified local address and port.

Parameters:

host The host to connect the socket to.

port The port on the remote host to connect to.
ifAddress The address on the local machine to bind the **Socket** (p. 2770) to.
localPort The local port to bind the **Socket** (p. 2770) to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.
UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2791).

6.218.3.4 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const decaf::net::InetAddress * *host*, int *port*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host to connect the socket to.
port The port on the remote host to connect to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.
UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2791).

6.218.3.5 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket () [virtual]

Creates an unconnected **Socket** (p. 2770) object.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if the **Socket** (p. 2770) cannot be created.

Reimplemented from **decaf::net::SocketFactory** (p. 2792).

The documentation for this class was generated from the following file:

  Exceptions:

  IOException *if the* ***ServerSocket*** *(p. 2659) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** * **createServerSocket** (int port, int backlog)

  Create a new ***ServerSocket*** *(p. 2659) that is bound to the given port.*
  The ***ServerSocket*** *(p. 2659) will have been configured with the defaults from the factory. The* ***ServerSocket*** *(p. 2659) will use the specified connection backlog setting.*
  Parameters:

  port *The port to bind the* ***ServerSocket*** *(p. 2659) to.*
  backlog *The number of pending connect request the* ***ServerSocket*** *(p. 2659) can queue.*
  Returns:

  new ***ServerSocket*** *(p. 2659) pointer that is owned by the caller.*
  Exceptions:

  IOException *if the* ***ServerSocket*** *(p. 2659) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** * **createServerSocket** (int port, int backlog, const **decaf::net::InetAddress** *address)

*Create a new **ServerSocket** (p. 2659) that is bound to the given port.*
*The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 2659) will listen on all interfaces.*

Parameters:

port *The port to bind the **ServerSocket** (p. 2659) to.*
backlog *The number of pending connect request the **ServerSocket** (p. 2659) can queue.*
address *The address of the interface on the local machine to bind to.*

Returns:

*new **ServerSocket** (p. 2659) pointer that is owned by the caller.*

Exceptions:

IOException *if the **ServerSocket** (p. 2659) cannot be created for some reason.*

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

Returns the list of cipher suites which are enabled by default.
Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns:

an STL vector containing the list of cipher suites enabled by default.

See also:

getSupportedCipherSuites() (p. 2827)

- virtual std::vector< std::string > **getSupportedCipherSuites** ()

Returns the names of the cipher suites which could be enabled for use on an SSL connection.
Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns:

an STL vector containing the list of supported cipher suites.

See also:

getDefaultCipherSuites() (p. 2827)

6.220.1 Detailed Description

Default implementation of the SSLServerSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

Since:

1.0

6.220.2 Constructor & Destructor Documentation

6.220.2.1 decaf::internal::net::ssl::DefaultSSLServerSocketFactory::DefaultSSLServerSocketFactory (const std::string & *errorMessage*)

6.220.2.2 virtual decaf::internal::net::ssl::DefaultSSLServerSocketFactory::~DefaultSSLServerSocketFactory () [virtual]

6.220.3 Member Function Documentation

6.220.3.1 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int *port*, int *backlog*, const decaf::net::InetAddress * *address*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 2659) will listen on all interfaces.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The number of pending connect request the **ServerSocket** (p. 2659) can queue.

address The address of the interface on the local machine to bind to.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2669).

6.220.3.2 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int *port*, int *backlog*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will use the specified connection backlog setting.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The number of pending connect request the **ServerSocket** (p. 2659) can queue.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2669).

6.220.3.3 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int *port*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2670).

6.220.3.4 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket () [virtual]

Create a new **ServerSocket** (p. 2659) that is unbound.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Reimplemented from **decaf::net::ServerSocketFactory** (p. 2670).

6.220.3.5 virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLServerSocketFactory::getDefaultCipherSuites () [virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns:

an STL vector containing the list of cipher suites enabled by default.

See also:

getSupportedCipherSuites() (p. 2827)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 2827).

6.220.3.6 virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLServerSocketFactory::getSupportedCipherSuites () [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns:

an STL vector containing the list of supported cipher suites.

See also:

getDefaultCipherSuites() (p. 2827)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 2827).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/**DefaultSSLServerSocketFactory.h**

6.221 decaf::internal::net::ssl::DefaultSSLSocketFactory Class Reference

Default implementation of the SSLSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

  See also:

  getDefaultCipherSuites() *(p. 2839)*

- virtual **decaf::net::Socket** * **createSocket** (**decaf::net::Socket** *socket, std::string host, int port, bool autoClose)

Returns a socket layered over an existing socket connected to the named host, at the given port. This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters:

socket *The existing socket to layer over.*
host *The server host the original* ***Socket*** *(p. 2770) is connected to.*
port *The server port the original* ***Socket*** *(p. 2770) is connected to.*
autoClose *Should the layered over* ***Socket*** *(p. 2770) be closed when the topmost socket is closed.*

Returns:

a new ***Socket*** *(p. 2770) instance that wraps the given* ***Socket*** *(p. 2770).*

Exceptions:

IOException *if an I/O exception occurs while performing this operation.*
UnknownHostException *(p. 3154) if the host is unknown.*

6.221.1 Detailed Description

Default implementation of the SSLSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

Since:

1.0

6.221.2 Constructor & Destructor Documentation

6.221.2.1 decaf::internal::net::ssl::DefaultSSLSocketFactory::DefaultSSLSocketFactory (const std::string & *errorMessage*)

6.221.2.2 virtual decaf::internal::net::ssl::DefaultSSLSocketFactory::~DefaultSSLSocketFactory () [virtual]

6.221.3 Member Function Documentation

6.221.3.1 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (decaf::net::Socket * *socket*, std::string *host*, int *port*, bool *autoClose*) [virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters:

socket The existing socket to layer over.

host The server host the original **Socket** (p. 2770) is connected to.

port The server port the original **Socket** (p. 2770) is connected to.

autoClose Should the layered over **Socket** (p. 2770) be closed when the topmost socket is closed.

Returns:

a new **Socket** (p. 2770) instance that wraps the given **Socket** (p. 2770).

Exceptions:

IOException if an I/O exception occurs while performing this operation.

UnknownHostException (p. *3154*) if the host is unknown.

Implements **decaf::net::ssl::SSLSocketFactory** (p. 2838).

6.221.3.2 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const std::string & *name*, int *port*, const decaf::net::InetAddress * *ifAddress*, int *localPort*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 2770) to.

localPort The local port to bind the **Socket** (p. 2770) to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException (p. *3154*) if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2790).

6.221.3.3 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const std::string & *name*, int *port*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2790).

6.221.3.4 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host*, int *port*, const decaf::net::InetAddress * *ifAddress*, int *localPort*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

The **Socket** (p. 2770) will be bound to the specified local address and port.

Parameters:

host The host to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 2770) to.

localPort The local port to bind the **Socket** (p. 2770) to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2791).

6.221.3.5 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host*, int *port*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host to connect the socket to.

port The port on the remote host to connect to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2791).

6.221.3.6 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket () [virtual]

Creates an unconnected **Socket** (p. 2770) object.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if the **Socket** (p. 2770) cannot be created.

Reimplemented from **decaf::net::SocketFactory** (p. 2792).

6.221.3.7 virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLSocketFactory::getDefaultCipherSuites () [virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns:

an STL vector containing the list of cipher suites enabled by default.

See also:

getSupportedCipherSuites() (p. 2839)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 2839).

6.221.3.8 virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLSocketFactory::getSupportedCipherSuites () [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns:

an STL vector containing the list of supported cipher suites.

See also:

getDefaultCipherSuites() (p. 2839)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 2839).

6.222 activemq::transport::DefaultTransportListener Class Reference

A Utility class that create empty implementations for the **TransportListener** (p. 3146) interface so that a subclass only needs to override the one's its interested.

`#include <src/main/activemq/transport/DefaultTransportListener.h>`Inheritance diagram for activemq::transport::DefaultTransportListener:

Public Member Functions

- virtual ~**DefaultTransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > command AMQCPP_UNUSED)

  Event handler for the receipt of a command.

- virtual void **onException** (const **decaf::lang::Exception** &ex AMQCPP_UNUSED)

  *Event handler for an exception from a command **transport** (p. 72).*

- virtual void **transportInterrupted** ()

  *The **transport** (p. 72) has suffered an interruption from which it hopes to recover.*

- virtual void **transportResumed** ()

  *The **transport** (p. 72) has resumed after an interruption.*

6.222.1 Detailed Description

A Utility class that create empty implementations for the **TransportListener** (p. 3146) interface so that a subclass only needs to override the one's its interested.

6.222.2 Constructor & Destructor Documentation

6.222.2.1 virtual activemq::transport::DefaultTransportListener::~DefaultTransportListener () `[virtual]`

6.222.3 Member Function Documentation

6.222.3.1 virtual void activemq::transport::DefaultTransportListener::onCommand (const Pointer< Command > command *AMQCPP_UNUSED*) `[inline, virtual]`

Event handler for the receipt of a command. The **transport** (p. 72) passes off all received **commands** (p. 61) to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3125) deletes the command upon receipt.

Parameters:

command the received command object.

Implements **activemq::transport::TransportListener** (p. 3146).

Reimplemented in **activemq::transport::mock::InternalCommandListener** (p. 1764).

6.222.3.2 virtual void activemq::transport::DefaultTransportListener::onException (const decaf::lang::Exception &ex *AMQCPP_UNUSED*) [inline, virtual]

Event handler for an exception from a command **transport** (p. 72).

Parameters:

ex The exception.

6.222.3.3 virtual void activemq::transport::DefaultTransportListener::transportInterrupted () [inline, virtual]

The **transport** (p. 72) has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3147).

6.222.3.4 virtual void activemq::transport::DefaultTransportListener::transportResumed () [inline, virtual]

The **transport** (p. 72) has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3147).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**DefaultTransportListener.h**

6.223 decaf::util::zip::Deflater Class Reference

This class compresses data using the *DEFLATE* algorithm (see `specification`).

`#include <src/main/decaf/util/zip/Deflater.h>`

Public Member Functions

- **Deflater** (int level, bool nowrap=false)
  Creates a new compressor using the specified compression level.
- **Deflater** ()
  Creates a new compressor with the default compression level.
- virtual ~**Deflater** ()
- void **setInput** (const unsigned char *buffer, int size, int offset, int length)
  Sets input data for compression.
- void **setInput** (const std::vector< unsigned char > &buffer, int offset, int length)
  Sets input data for compression.
- void **setInput** (const std::vector< unsigned char > &buffer)
  Sets input data for compression.
- void **setDictionary** (const unsigned char *buffer, int size, int offset, int length)
  Sets preset dictionary for compression.
- void **setDictionary** (const std::vector< unsigned char > &buffer, int offset, int length)
  Sets preset dictionary for compression.
- void **setDictionary** (const std::vector< unsigned char > &buffer)
  Sets preset dictionary for compression.
- void **setStrategy** (int strategy)
  Sets the compression strategy to the specified value.
- void **setLevel** (int level)
  Sets the compression level to the specified value.
- bool **needsInput** () const
- void **finish** ()
  When called, indicates that compression should end with the current contents of the input buffer.
- bool **finished** () const
- int **deflate** (unsigned char *buffer, int size, int offset, int length)
  Fills specified buffer with compressed data.
- int **deflate** (std::vector< unsigned char > &buffer, int offset, int length)
  Fills specified buffer with compressed data.

- int **deflate** (std::vector< unsigned char > &buffer)

  Fills specified buffer with compressed data.

- long long **getAdler** () const
- long long **getBytesRead** () const
- long long **getBytesWritten** () const
- void **reset** ()

  Resets deflater so that a new set of input data can be processed.

- void **end** ()

  Closes the compressor and discards any unprocessed input.

Static Public Attributes

- static const int **BEST_SPEED**

  Compression level for fastest compression.

- static const int **BEST_COMPRESSION**

  Compression level for best compression.

- static const int **DEFAULT_COMPRESSION**

  Default compression level.

- static const int **DEFLATED**

  Compression method for the deflate algorithm (the only one currently supported).

- static const int **NO_COMPRESSION**

  Compression level for no compression.

- static const int **FILTERED**

  Compression strategy best used for data consisting mostly of small values with a somewhat random distribution.

- static const int **HUFFMAN_ONLY**

  Compression strategy for Huffman coding only.

- static const int **DEFAULT_STRATEGY**

  Default compression strategy.

6.223.1 Detailed Description

This class compresses data using the *DEFLATE* algorithm (see `specification`). Basically this class is part of the API to the stream based ZLIB compression library and is used as such by **DeflaterOutputStream** (p. 1359) and its descendants.

The typical usage of a **Deflater** (p. 1350) instance outside this package consists of a specific call to one of its constructors before being passed to an instance of **DeflaterOutputStream** (p. 1359).

See also:

DeflaterOutputStream (p. 1359)
Inflater (p. 1691)

Since:

1.0

6.223.2 Constructor & Destructor Documentation

6.223.2.1 decaf::util::zip::Deflater::Deflater (int *level*, bool *nowrap* = `false`)

Creates a new compressor using the specified compression level. If 'nowrap' is true then the ZLIB header and checksum fields will not be used in order to support the compression format used in both GZIP and PKZIP.

Parameters:

level The compression level to use (0-9).

nowrap If true uses GZip compatible compression (defaults to false).

6.223.2.2 decaf::util::zip::Deflater::Deflater ()

Creates a new compressor with the default compression level. Compressed data will be generated in ZLIB format.

6.223.2.3 virtual decaf::util::zip::Deflater::~Deflater () `[virtual]`

6.223.3 Member Function Documentation

6.223.3.1 int decaf::util::zip::Deflater::deflate (std::vector< unsigned char > & *buffer*)

Fills specified buffer with compressed data. Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 1354) should be called in order to determine if more input data is required.

Parameters:

buffer The Buffer to write the compressed data to.

Returns:

the actual number of bytes of compressed data.

Exceptions:

IllegalStateException if in the end state.

6.223.3.2 int decaf::util::zip::Deflater::deflate (std::vector< unsigned char > & *buffer*, int *offset*, int *length*)

Fills specified buffer with compressed data. Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 1354) should be called in order to determine if more input data is required.

Parameters:

buffer The Buffer to write the compressed data to.

offset The position in the Buffer to start writing at.

length The maximum number of byte of data to write.

Returns:

the actual number of bytes of compressed data.

Exceptions:

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

6.223.3.3 int decaf::util::zip::Deflater::deflate (unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Fills specified buffer with compressed data. Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 1354) should be called in order to determine if more input data is required.

Parameters:

buffer The Buffer to write the compressed data to.

size The size of the passed buffer.

offset The position in the Buffer to start writing at.

length The maximum number of byte of data to write.

Returns:

the actual number of bytes of compressed data.

Exceptions:

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

6.223.3.4 void decaf::util::zip::Deflater::end ()

Closes the compressor and discards any unprocessed input. This method should be called when the compressor is no longer being used, but will also be called automatically by the destructor. Once this method is called, the behavior of the **Deflater** (p. 1350) object is undefined.

6.223.3.5 void decaf::util::zip::Deflater::finish ()

When called, indicates that compression should end with the current contents of the input buffer.

6.223.3.6 bool decaf::util::zip::Deflater::finished () const

Returns:

true if the end of the compressed data output stream has been reached.

6.223.3.7 long long decaf::util::zip::Deflater::getAdler () const

Returns:

the ADLER-32 value of the uncompressed data.

Exceptions:

IllegalStateException if in the end state.

6.223.3.8 long long decaf::util::zip::Deflater::getBytesRead () const

Returns:

the total number of uncompressed bytes input so far.

Exceptions:

IllegalStateException if in the end state.

6.223.3.9 long long decaf::util::zip::Deflater::getBytesWritten () const

Returns:

the total number of compressed bytes output so far.

Exceptions:

IllegalStateException if in the end state.

6.223.3.10 bool decaf::util::zip::Deflater::needsInput () const

Returns:

true if the input data buffer is empty and **setInput()** (p. 1356) should be called in order to provide more input

6.223.3.11 void decaf::util::zip::Deflater::reset ()

Resets deflater so that a new set of input data can be processed. Keeps current compression level and strategy settings.

Exceptions:

IllegalStateException if in the end state.

6.223.3.12 void decaf::util::zip::Deflater::setDictionary (const std::vector< unsigned char > & *buffer*)

Sets preset dictionary for compression. A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p. 1695), **Inflater.getAdler()** (p. 1693) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters:

buffer The buffer containing the preset dictionary.

Exceptions:

IllegalStateException if in the end state.

6.223.3.13 void decaf::util::zip::Deflater::setDictionary (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*)

Sets preset dictionary for compression. A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p. 1695), **Inflater.getAdler()** (p. 1693) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters:

buffer The buffer containing the preset dictionary.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions:

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

6.223.3.14 void decaf::util::zip::Deflater::setDictionary (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Sets preset dictionary for compression. A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p. 1695), **Inflater.getAdler()** (p. 1693) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters:

buffer The buffer containing the preset dictionary.

size The size of the passed dictionary buffer.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions:

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

6.223.3.15 void decaf::util::zip::Deflater::setInput (const std::vector< unsigned char > & *buffer*)

Sets input data for compression. This should be called whenever **needsInput()** (p. 1354) returns true indicating that more input data is required.

Parameters:

buffer The Buffer to read in for compression.

Exceptions:

IllegalStateException if in the end state.

6.223.3.16 void decaf::util::zip::Deflater::setInput (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*)

Sets input data for compression. This should be called whenever **needsInput()** (p. 1354) returns true indicating that more input data is required.

Parameters:

buffer The Buffer to read in for compression.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions:

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

6.223.3.17 void decaf::util::zip::Deflater::setInput (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Sets input data for compression. This should be called whenever **needsInput()** (p. 1354) returns true indicating that more input data is required.

Parameters:

buffer The Buffer to read in for compression.

size The size in bytes of the buffer passed.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions:

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

6.223.3.18 void decaf::util::zip::Deflater::setLevel (int *level*)

Sets the compression level to the specified value.

Parameters:

level The new Compression level to use.

Exceptions:

IllegalArgumentException if the level value is invalid.

IllegalStateException if in the end state.

6.223.3.19 void decaf::util::zip::Deflater::setStrategy (int *strategy*)

Sets the compression strategy to the specified value.

Parameters:

strategy The new Compression strategy to use.

Exceptions:

IllegalArgumentException if the strategy value is invalid.

IllegalStateException if in the end state.

6.223.4 Field Documentation

6.223.4.1 const int decaf::util::zip::Deflater::BEST_COMPRESSION [static]

Compression level for best compression.

6.223.4.2 const int decaf::util::zip::Deflater::BEST_SPEED [static]

Compression level for fastest compression.

6.223.4.3 const int decaf::util::zip::Deflater::DEFAULT_COMPRESSION [static]

Default compression level.

6.223.4.4 const int decaf::util::zip::Deflater::DEFAULT_STRATEGY [static]

Default compression strategy.

6.223.4.5 const int decaf::util::zip::Deflater::DEFLATED [static]

Compression method for the deflate algorithm (the only one currently supported).

6.223.4.6 const int decaf::util::zip::Deflater::FILTERED [static]

Compression strategy best used for data consisting mostly of small values with a somewhat random distribution. Forces more Huffman coding and less string matching.

6.223.4.7 const int decaf::util::zip::Deflater::HUFFMAN_ONLY [static]

Compression strategy for Huffman coding only.

6.223.4.8 const int decaf::util::zip::Deflater::NO_COMPRESSION [static]

Compression level for no compression.

6.224.1 Detailed Description

Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream.

Since:

1.0

6.224.2 Constructor & Destructor Documentation

6.224.2.1 decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (decaf::io::OutputStream * *outputStream*, bool *own* = `false`)

Creates a new DeflateOutputStream with a Default **Deflater** (p. 1350) and buffer size.

Parameters:

outputStream The OutputStream instance to wrap.

own Should this filter take ownership of the OutputStream pointer (default is false).

6.224.2.2 decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (decaf::io::OutputStream * *outputStream*, Deflater * *deflater*, bool *own* = `false`, bool *ownDeflater* = `false`)

Creates a new DeflateOutputStream with a user supplied **Deflater** (p. 1350) and a default buffer size. When the user supplied a **Deflater** (p. 1350) instance the DeflaterOutpotStream does not take ownership of the **Deflater** (p. 1350) pointer unless the ownDeflater parameter is set to true, the caller is still responsible for deleting the **Deflater** (p. 1350) when ownDeflater is false.

Parameters:

outputStream The OutputStream instance to wrap.

deflater The user supplied **Deflater** (p. 1350) to use for compression. (

own Should this filter take ownership of the OutputStream pointer (default is false).

ownDeflater Should the filter take ownership of the passed **Deflater** (p. 1350) object (default is false).

Exceptions:

NullPointerException if the **Deflater** (p. 1350) given is NULL.

6.224.2.3 decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (decaf::io::OutputStream * *outputStream*, Deflater * *deflater*, int *bufferSize*, bool *own* = `false`, bool *ownDeflater* = `false`)

Creates a new DeflateOutputStream with a user supplied **Deflater** (p. 1350) and specified buffer size. When the user supplied a **Deflater** (p. 1350) instance the DeflaterOutpotStream does not take ownership of the **Deflater** (p. 1350) pointer unless the ownDeflater parameter is set to true, otherwise the caller is still responsible for deleting the **Deflater** (p. 1350).

Parameters:

outputStream The OutputStream instance to wrap.

deflater The user supplied **Deflater** (p. 1350) to use for compression.

bufferSize The size of the input buffer.

own Should this filter take ownership of the OutputStream pointer (default is false).

ownDeflater Should the filter take ownership of the passed **Deflater** (p. 1350) object (default is false).

Exceptions:

NullPointerException if the **Deflater** (p. 1350) given is NULL.

IllegalArgumentException if bufferSize is 0.

6.224.2.4 virtual decaf::util::zip::DeflaterOutputStream::~DeflaterOutputStream () `[virtual]`

6.224.3 Member Function Documentation

6.224.3.1 virtual void decaf::util::zip::DeflaterOutputStream::close () `[virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions:

IOException *(p. 1787)* if an error occurs while closing.

The default implementation of this method does nothing.

The close method of **FilterOutputStream** (p. 1527) calls its flush method, and then calls the close method of its underlying output stream. Finishes writing any remaining data to the OutputStream then closes the stream.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1528).

6.224.3.2 virtual void decaf::util::zip::DeflaterOutputStream::deflate () [protected, virtual]

Writes a buffers worth of compressed data to the wrapped OutputStream.

6.224.3.3 virtual void decaf::util::zip::DeflaterOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

6.224.3.4 virtual void decaf::util::zip::DeflaterOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1529).

6.224.3.5 virtual void decaf::util::zip::DeflaterOutputStream::finish () [virtual]

Finishes writing any remaining data to the wrapped OutputStream but does not close it upon completion.

Exceptions:

IOException if an I/O error occurs.

6.224.4 Field Documentation

6.224.4.1 std::vector<unsigned char> decaf::util::zip::DeflaterOutputStream::buf [protected]

The Buffer to use for.

6.224.4.2 const std::size_t decaf::util::zip::DeflaterOutputStream::DEFAULT_BUFFER_SIZE [static, protected]

6.224.4.3 Deflater* decaf::util::zip::DeflaterOutputStream::deflater [protected]

The **Deflater** (p. 1350) for this stream.

6.224.4.4 bool decaf::util::zip::DeflaterOutputStream::isDone [protected]

6.224.4.5 bool decaf::util::zip::DeflaterOutputStream::ownDeflater [protected]

6.225 decaf::util::concurrent::Delayed Class Reference

A mix-in style interface for marking objects that should be acted upon after a given delay.

`#include <src/main/decaf/util/concurrent/Delayed.h>`Inheritance diagram for decaf::util::concurrent::Delayed:

Public Member Functions

- virtual ~**Delayed** ()
- virtual long long **getDelay** (const **TimeUnit** &unit)=0

  Returns the remaining delay associated with this object, in the given time unit.

6.225.1 Detailed Description

A mix-in style interface for marking objects that should be acted upon after a given delay. An implementation of this interface must define a Comparable methods that provides an ordering consistent with its getDelay method.

6.225.2 Constructor & Destructor Documentation

6.225.2.1 virtual decaf::util::concurrent::Delayed::~Delayed () `[inline, virtual]`

6.225.3 Member Function Documentation

6.225.3.1 virtual long long decaf::util::concurrent::Delayed::getDelay (const TimeUnit & *unit*) `[pure virtual]`

Returns the remaining delay associated with this object, in the given time unit.

Parameters:

unit The time unit

Returns:

the remaining delay; zero or negative values indicate that the delay has already elapsed

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Delayed.h**

6.226 cms::DeliveryMode Class Reference

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

`#include <src/main/cms/DeliveryMode.h>`

Public Types

- enum **DELIVERY_MODE** { **PERSISTENT** = 0, **NON_PERSISTENT** = 1 }

  *Enumeration values for **Message** (p. 2090) Delivery Mode.*

Public Member Functions

- virtual ~**DeliveryMode** ()

6.226.1 Detailed Description

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages. When a client sends a `cms::Message (p. 2090)` it can mark the **Message** (p. 2090) as either Persistent or Non-Persistent. If the client feels that the **Message** (p. 2090) cannot be lost in transit it should mark it as Persistent, otherwise if it is allowable for a **Message** (p. 2090) to occasionally be lost it can mark it as Non-Persistent. This allows the Provider to balance make tradeoffs between balance and **Message** (p. 2090) throughput.

The **DeliveryMode** (p. 1364) covers only the transport of the **Message** (p. 2090) for sending client to its destination and doesn't apply to the receiving **Message** (p. 2090) consumer. The receiving Consumer can drop Message's based on configuration such as memory limits or **Message** (p. 2090) filtering.

A message is guaranteed to be delivered once and only once by a CMS provider if the delivery mode of the message is PERSISTENT and the configuration of the **Message** (p. 2090) consumer allows for it.

Since:

1.0

6.226.2 Member Enumeration Documentation

6.226.2.1 enum cms::DeliveryMode::DELIVERY_MODE

Enumeration values for **Message** (p. 2090) Delivery Mode.

Enumerator:

PERSISTENT

NON_PERSISTENT

6.226.3 Constructor & Destructor Documentation

6.226.3.1 virtual cms::DeliveryMode::~DeliveryMode () [virtual]

The documentation for this class was generated from the following file:

6.227 decaf::util::Deque< E > Class Template Reference

Defines a 'Double ended Queue' interface that allows for insertion and removal of elements from both ends.

`#include <src/main/decaf/util/Deque.h>`Inheritance diagram for decaf::util::Deque< E >:

Public Member Functions

- virtual ~**Deque** ()
- virtual void **addFirst** (const E &element)=0

  *Inserts an element onto the front of the **Deque** (p. 1366) if possible without violating the implementations capacity restrictions.*

- virtual void **addLast** (const E &element)=0

  *Inserts an element onto the end of the **Deque** (p. 1366) if possible without violating the implementations capacity restrictions.*

- virtual bool **offerFirst** (const E &element)=0

  *This method attempts to insert the given element into the **Deque** (p. 1366) at the front end.*

- virtual bool **offerLast** (const E &element)=0

  *This method attempts to insert the given element into the **Deque** (p. 1366) at the end.*

- virtual E **removeFirst** ()=0

  *Removes the topmost element from the **Deque** (p. 1366) and returns it.*

- virtual E **removeLast** ()=0

  *Removes the last element from the **Deque** (p. 1366) and returns it.*

- virtual bool **pollFirst** (E &element)=0

  *Removes the first element from the **Deque** (p. 1366) assigns it to the element reference passed.*

- virtual bool **pollLast** (E &element)=0

  *Removes the last element from the **Deque** (p. 1366) assigns it to the element reference passed.*

- virtual E & **getFirst** ()=0

  *Attempts to fetch a reference to the first element in the **Deque** (p. 1366).*

- virtual const E & **getFirst** () const =0
- virtual E & **getLast** ()=0

  *Attempts to fetch a reference to the last element in the **Deque** (p. 1366).*

- virtual const E & **getLast** () const =0
- virtual bool **peekFirst** (E &value) const =0

  *Retrieves the first element contained in this **Deque** (p. 1366) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 1366).*

- virtual bool **peekLast** (E &value) const =0

*Retrieves the last element contained in this **Deque** (p. 1366) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 1366).*

- virtual bool **removeFirstOccurrence** (const E &value)=0

  *Removes the first occurrence of the specified element from this **Deque** (p. 1366).*

- virtual bool **removeLastOccurrence** (const E &value)=0

  *Removes the last occurrence of the specified element from this **Deque** (p. 1366).*

- virtual void **push** (const E &element)=0

  Pushes an element onto the stack represented by this deque (in other words, at the head of this deque) if it is possible to do so immediately without violating capacity restrictions, otherwise it throwing an IllegalStateException if no space is currently available.

- virtual E **pop** ()=0

  *Treats this **Deque** (p. 1366) as a stack and attempts to pop an element off the top.*

- virtual **Iterator**< E > * **descendingIterator** ()=0

  *Provides an **Iterator** (p. 1802) over this **Collection** (p. 1006) that traverses the element in reverse order.*

- virtual **Iterator**< E > * **descendingIterator** () const =0

6.227.1 Detailed Description

template<typename E> class decaf::util::Deque< E >

Defines a 'Double ended Queue' interface that allows for insertion and removal of elements from both ends. Generally there is no limit on the number of elements that can be placed into a **Deque** (p. 1366).

Unlike a **List** (p. 1902) the **Deque** (p. 1366) doesn't provide index element based access, however methods are provided to grant access to interior elements.

Since:

1.0

6.227.2 Constructor & Destructor Documentation

6.227.2.1 template<typename E> virtual decaf::util::Deque< E >::~Deque () [inline, virtual]

6.227.3 Member Function Documentation

6.227.3.1 template<typename E> virtual void decaf::util::Deque< E >::addFirst (const E & *element*) [pure virtual]

Inserts an element onto the front of the **Deque** (p. 1366) if possible without violating the implementations capacity restrictions. For a capacity restricted **Deque** (p. 1366) it is preferable to call offerFirst instead.

Parameters:

element The element to be placed at the front of the **Deque** (p. 1366).

Exceptions:

IllegalStateException if the element cannot be added at this time due to capacity restrictions

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1887), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1887), **decaf::util::LinkedList< CompositeTask * >** (p. 1887), **decaf::util::LinkedList< URI >** (p. 1887), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1887), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1887), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1887), **decaf::util::LinkedList< decaf::net::URI >** (p. 1887), **decaf::util::LinkedList< Pointer< Command > >** (p. 1887), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1887), **decaf::util::LinkedList< cms::Destination * >** (p. 1887), **decaf::util::LinkedList< cms::Session * >** (p. 1887), and **decaf::util::LinkedList< cms::Connection * >** (p. 1887).

6.227.3.2 template<typename E> virtual void decaf::util::Deque< E >::addLast (const E & *element*) [pure virtual]

Inserts an element onto the end of the **Deque** (p. 1366) if possible without violating the implementations capacity restrictions. For a capacity restricted **Deque** (p. 1366) it is preferable to call offerLast instead.

Parameters:

element The element to be placed at the end of the **Deque** (p. 1366).

Exceptions:

IllegalStateException if the element cannot be added at this time due to capacity restrictions

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1888), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1888), **decaf::util::LinkedList< CompositeTask * >** (p. 1888), **decaf::util::LinkedList< URI >** (p. 1888), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1888), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1888), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1888), **decaf::util::LinkedList< decaf::net::URI >** (p. 1888), **decaf::util::LinkedList< Pointer< Command > >** (p. 1888), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1888), **decaf::util::LinkedList< cms::Destination * >** (p. 1888), **decaf::util::LinkedList< cms::Session * >** (p. 1888), and **decaf::util::LinkedList< cms::Connection * >** (p. 1888).

6.227.3.3 template<typename E> virtual Iterator<E>* decaf::util::Deque< E >::descendingIterator () const [pure virtual]

Implemented in **decaf::util::LinkedList< E >** (p. 1889), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1889), **decaf::util::LinkedList< CompositeTask * >** (p. 1889), **decaf::util::LinkedList< URI >** (p. 1889), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1889), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1889), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1889), **decaf::util::LinkedList< decaf::net::URI >** (p. 1889), **decaf::util::LinkedList< Pointer< Command > >** (p. 1889), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1889), **decaf::util::LinkedList< cms::Destination * >** (p. 1889), **decaf::util::LinkedList< cms::Session * >** (p. 1889), and **decaf::util::LinkedList< cms::Connection * >** (p. 1889).

6.227.3.4 template<typename E> virtual Iterator<E>* decaf::util::Deque< E >::descendingIterator () [pure virtual]

Provides an **Iterator** (p. 1802) over this **Collection** (p. 1006) that traverses the element in reverse order.

Returns:

a new **Iterator** (p. 1802) instance that moves from last to first.

Implemented in **decaf::util::LinkedList< E >** (p. 1890), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1890), **decaf::util::LinkedList< CompositeTask * >** (p. 1890), **decaf::util::LinkedList< URI >** (p. 1890), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1890), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1890), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1890), **decaf::util::LinkedList< decaf::net::URI >** (p. 1890), **decaf::util::LinkedList< Pointer< Command > >** (p. 1890), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1890), **decaf::util::LinkedList< cms::Destination * >** (p. 1890), **decaf::util::LinkedList< cms::Session * >** (p. 1890), and **decaf::util::LinkedList< cms::Connection * >** (p. 1890).

6.227.3.5 template<typename E> virtual const E& decaf::util::Deque< E >::getFirst () const [pure virtual]

Implemented in **decaf::util::LinkedList< E >** (p. 1891), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1891), **decaf::util::LinkedList< CompositeTask * >** (p. 1891), **decaf::util::LinkedList< URI >** (p. 1891), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1891), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1891), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1891), **decaf::util::LinkedList< decaf::net::URI >** (p. 1891), **decaf::util::LinkedList< Pointer< Command > >** (p. 1891), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1891), **decaf::util::LinkedList< cms::Destination * >** (p. 1891), **decaf::util::LinkedList< cms::Session * >** (p. 1891), and **decaf::util::LinkedList< cms::Connection * >** (p. 1891).

6.227.3.6 template<typename E> virtual E& decaf::util::Deque< E >::getFirst () [pure virtual]

Attempts to fetch a reference to the first element in the **Deque** (p. 1366). This method does not remove the element from the **Deque** (p. 1366) but simply returns a reference to it.

Returns:

reference to the first element in the **Deque** (p. 1366).

Exceptions:

NoSuchElementException *(p. 2260)* if the **Deque** (p. 1366) is empty.

Implemented in **decaf::util::LinkedList< E >** (p. 1891), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1891), **decaf::util::LinkedList< CompositeTask * >** (p. 1891), **decaf::util::LinkedList< URI >** (p. 1891), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1891), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1891), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1891), **decaf::util::LinkedList< decaf::net::URI >** (p. 1891), **decaf::util::LinkedList< Pointer< Command > >** (p. 1891), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1891), **decaf::util::LinkedList< cms::Destination * >** (p. 1891), **decaf::util::LinkedList< cms::Session * >** (p. 1891), and **decaf::util::LinkedList< cms::Connection * >** (p. 1891).

6.227.3.7 template<typename E> virtual const E& decaf::util::Deque< E >::getLast () const [pure virtual]

Implemented in **decaf::util::LinkedList< E >** (p. 1891), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1891), **decaf::util::LinkedList< CompositeTask * >** (p. 1891), **decaf::util::LinkedList< URI >** (p. 1891), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1891), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1891), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1891), **decaf::util::LinkedList< decaf::net::URI >** (p. 1891), **decaf::util::LinkedList< Pointer< Command > >** (p. 1891), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1891), **decaf::util::LinkedList< cms::Destination * >** (p. 1891), **decaf::util::LinkedList< cms::Session * >** (p. 1891), and **decaf::util::LinkedList< cms::Connection * >** (p. 1891).

6.227.3.8 template<typename E> virtual E& decaf::util::Deque< E >::getLast () [pure virtual]

Attempts to fetch a reference to the last element in the **Deque** (p. 1366). This method does not remove the element from the **Deque** (p. 1366) but simply returns a reference to it.

Returns:

reference to the last element in the **Deque** (p. 1366).

Exceptions:

NoSuchElementException *(p. 2260)* if the **Deque** (p. 1366) is empty.

Implemented in **decaf::util::LinkedList< E >** (p. 1891), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1891), **decaf::util::LinkedList< CompositeTask * >** (p. 1891), **decaf::util::LinkedList< URI >** (p. 1891), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1891), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1891), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1891), **decaf::util::LinkedList< decaf::net::URI >** (p. 1891), **decaf::util::LinkedList< Pointer< Command > >** (p. 1891), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1891), **decaf::util::LinkedList< cms::Destination * >** (p. 1891), **decaf::util::LinkedList< cms::Session * >** (p. 1891), and **decaf::util::LinkedList< cms::Connection * >** (p. 1891).

6.227.3.9 template<typename E> virtual bool decaf::util::Deque< E >::offerFirst (const E & *element*) [pure virtual]

This method attempts to insert the given element into the **Deque** (p. 1366) at the front end. Unlike the addFirst method that throws an exception if it cannot insert the element due to capacity restrictions etc this method returns false if it cannot insert the element.

Parameters:

element The element to add to this **Deque** (p. 1366).

Returns:

true if the element was added, false otherwise.

Exceptions:

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1893), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1893), **decaf::util::LinkedList< CompositeTask * >** (p. 1893), **decaf::util::LinkedList< URI >** (p. 1893), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1893), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1893), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1893), **decaf::util::LinkedList< decaf::net::URI >** (p. 1893), **decaf::util::LinkedList< Pointer< Command > >** (p. 1893), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1893), **decaf::util::LinkedList< cms::Destination * >** (p. 1893), **decaf::util::LinkedList< cms::Session * >** (p. 1893), and **decaf::util::LinkedList< cms::Connection * >** (p. 1893).

6.227.3.10 template<typename E> virtual bool decaf::util::Deque< E >::offerLast (const E & *element*) [pure virtual]

This method attempts to insert the given element into the **Deque** (p. 1366) at the end. Unlike the addLast method that throws an exception if it cannot insert the element due to capacity restrictions etc this method returns false if it cannot insert the element.

Parameters:

element The element to add to this **Deque** (p. 1366).

Returns:

true if the element was added, false otherwise.

Exceptions:

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1894), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1894), **decaf::util::LinkedList< CompositeTask * >** (p. 1894), **decaf::util::LinkedList< URI >** (p. 1894), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1894), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1894), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1894), **decaf::util::LinkedList< decaf::net::URI >** (p. 1894), **decaf::util::LinkedList< Pointer< Command > >** (p. 1894), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1894), **decaf::util::LinkedList< cms::Destination * >** (p. 1894), **decaf::util::LinkedList< cms::Session * >** (p. 1894), and **decaf::util::LinkedList< cms::Connection * >** (p. 1894).

6.227.3.11 template<typename E> virtual bool decaf::util::Deque< E >::peekFirst (E & *value*) const [pure virtual]

Retrieves the first element contained in this **Deque** (p. 1366) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 1366). If this call is successful it returns true. Unlike getFirst this method does not throw an exception if the **Deque** (p. 1366) is empty.

Returns:

true if an element was assigned to the reference passed, false otherwise.

Implemented in **decaf::util::LinkedList< E >** (p. 1895), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1895), **decaf::util::LinkedList< CompositeTask * >** (p. 1895), **decaf::util::LinkedList< URI >** (p. 1895), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1895), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1895), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1895), **decaf::util::LinkedList< decaf::net::URI >** (p. 1895), **decaf::util::LinkedList< Pointer< Command > >** (p. 1895), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1895), **decaf::util::LinkedList< cms::Destination * >** (p. 1895), **decaf::util::LinkedList< cms::Session * >** (p. 1895), and **decaf::util::LinkedList< cms::Connection * >** (p. 1895).

6.227.3.12 template<typename E> virtual bool decaf::util::Deque< E >::peekLast (E & *value*) const [pure virtual]

Retrieves the last element contained in this **Deque** (p. 1366) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 1366). If this call is successful it returns true. Unlike getLast this method does not throw an exception if the **Deque** (p. 1366) is empty.

Returns:

true if an element was assigned to the reference passed, false otherwise.

Implemented in **decaf::util::LinkedList< E >** (p. 1895), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1895), **decaf::util::LinkedList< CompositeTask * >** (p. 1895), **decaf::util::LinkedList< URI >** (p. 1895), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1895), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1895), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1895), **decaf::util::LinkedList< decaf::net::URI >** (p. 1895), **decaf::util::LinkedList< Pointer< Command > >** (p. 1895), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1895), **decaf::util::LinkedList< cms::Destination * >** (p. 1895), **decaf::util::LinkedList< cms::Session * >** (p. 1895), and **decaf::util::LinkedList< cms::Connection * >** (p. 1895).

6.227.3.13 template<typename E> virtual bool decaf::util::Deque< E >::pollFirst (E & *element*) [pure virtual]

Removes the first element from the **Deque** (p. 1366) assigns it to the element reference passed.

Parameters:

element Reference to an variable that can be assigned the value of the head of this **Deque** (p. 1366).

Returns:

true if an element was available to remove, false otherwise.

Implemented in **decaf::util::LinkedList< E >** (p. 1896), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1896), **decaf::util::LinkedList< CompositeTask * >** (p. 1896), **decaf::util::LinkedList< URI >** (p. 1896), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1896), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1896), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1896), **decaf::util::LinkedList< decaf::net::URI >** (p. 1896), **decaf::util::LinkedList< Pointer< Command > >** (p. 1896), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1896), **decaf::util::LinkedList< cms::Destination * >** (p. 1896), **decaf::util::LinkedList< cms::Session * >** (p. 1896), and **decaf::util::LinkedList< cms::Connection * >** (p. 1896).

6.227.3.14 template<typename E> virtual bool decaf::util::Deque< E >::pollLast (E & *element*) [pure virtual]

Removes the last element from the **Deque** (p. 1366) assigns it to the element reference passed.

Parameters:

element Reference to an variable that can be assigned the value of the tail of this **Deque** (p. 1366).

Returns:

true if an element was available to remove, false otherwise.

Implemented in **decaf::util::LinkedList< E >** (p. 1896), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1896), **decaf::util::LinkedList< CompositeTask * >** (p. 1896), **decaf::util::LinkedList< URI >** (p. 1896), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1896), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1896), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1896), **decaf::util::LinkedList< decaf::net::URI >** (p. 1896), **decaf::util::LinkedList< Pointer< Command > >** (p. 1896), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1896), **decaf::util::LinkedList< cms::Destination * >** (p. 1896), **decaf::util::LinkedList< cms::Session * >** (p. 1896), and **decaf::util::LinkedList< cms::Connection * >** (p. 1896).

6.227.3.15 template<typename E> virtual E decaf::util::Deque< E >::pop () [pure virtual]

Treats this **Deque** (p. 1366) as a stack and attempts to pop an element off the top. If there's no element to pop then a NuSuchElementException is thrown, otherwise the top element is removed and assigned to the reference passed.

This operation performs the same basic function as the removeFirst method.

Returns:

the element at the front of this deque which would be the top of a stack.

Exceptions:

NoSuchElementException *(p. 2260)* if there is nothing on the top of the stack.

Implemented in **decaf::util::LinkedList< E >** (p. 1896), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1896), **decaf::util::LinkedList< CompositeTask * >** (p. 1896), **decaf::util::LinkedList< URI >** (p. 1896), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1896), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1896), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1896), **decaf::util::LinkedList< decaf::net::URI >** (p. 1896), **decaf::util::LinkedList< Pointer< Command > >** (p. 1896), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1896), **decaf::util::LinkedList< cms::Destination * >** (p. 1896), **decaf::util::LinkedList< cms::Session * >** (p. 1896), and **decaf::util::LinkedList< cms::Connection * >** (p. 1896).

6.227.3.16 template<typename E> virtual void decaf::util::Deque< E >::push (const E & *element*) [pure virtual]

Pushes an element onto the stack represented by this deque (in other words, at the head of this deque) if it is possible to do so immediately without violating capacity restrictions, otherwise it throwing an IllegalStateException if no space is currently available. This method performs the same basic operation as the addFirst method.

Parameters:

element The element to be pushed onto the **Deque** (p. 1366).

Exceptions:

IllegalStateException if the element cannot be added at this time due to capacity restrictions

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1897), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1897), **decaf::util::LinkedList< CompositeTask * >** (p. 1897), **decaf::util::LinkedList< URI >** (p. 1897), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1897), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1897), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1897), **decaf::util::LinkedList< decaf::net::URI >** (p. 1897), **decaf::util::LinkedList< Pointer< Command > >** (p. 1897), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1897), **decaf::util::LinkedList< cms::Destination * >** (p. 1897), **decaf::util::LinkedList< cms::Session * >** (p. 1897), and **decaf::util::LinkedList< cms::Connection * >** (p. 1897).

6.227.3.17 template<typename E> virtual E decaf::util::Deque< E >::removeFirst () [pure virtual]

Removes the topmost element from the **Deque** (p. 1366) and returns it. Unlike the pollFirst method this method throws a NuSuchElementException if the **Deque** (p. 1366) is empty.

Returns:

the element at the Head of the **Deque** (p. 1366).

Exceptions:

NoSuchElementException *(p. 2260)* if the **Deque** (p. 1366) is empty.

Implemented in **decaf::util::LinkedList< E >** (p. 1898), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1898), **decaf::util::LinkedList< CompositeTask * >** (p. 1898), **decaf::util::LinkedList< URI >** (p. 1898), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1898), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1898), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1898), **decaf::util::LinkedList< decaf::net::URI >** (p. 1898), **decaf::util::LinkedList< Pointer< Command > >** (p. 1898), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1898), **decaf::util::LinkedList< cms::Destination * >** (p. 1898), **decaf::util::LinkedList< cms::Session * >** (p. 1898), and **decaf::util::LinkedList< cms::Connection * >** (p. 1898).

6.227.3.18 template<typename E> virtual bool decaf::util::Deque< E >::removeFirstOccurrence (const E & *value*) [pure virtual]

Removes the first occurrence of the specified element from this **Deque** (p. 1366). If there is no matching element then the **Deque** (p. 1366) is left unchanged.

Parameters:

value The value to be removed from this **Deque** (p. 1366).

Returns:

true if the **Deque** (p. 1366) was modified as a result of this operation.

Exceptions:

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

Implemented in **decaf::util::LinkedList< E >** (p. 1898), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1898), **decaf::util::LinkedList< CompositeTask * >** (p. 1898), **decaf::util::LinkedList< URI >** (p. 1898), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1898), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1898), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1898), **decaf::util::LinkedList< decaf::net::URI >** (p. 1898), **decaf::util::LinkedList< Pointer< Command > >** (p. 1898), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1898), **decaf::util::LinkedList< cms::Destination * >** (p. 1898), **decaf::util::LinkedList< cms::Session * >** (p. 1898), and **decaf::util::LinkedList< cms::Connection * >** (p. 1898).

6.227.3.19 template<typename E> virtual E decaf::util::Deque< E >::removeLast () [pure virtual]

Removes the last element from the **Deque** (p. 1366) and returns it. Unlike the pollLast method this method throws a NuSuchElementException if the **Deque** (p. 1366) is empty.

Returns:

the element at the Tail of the **Deque** (p. 1366).

Exceptions:

NoSuchElementException *(p. 2260)* if the **Deque** (p. 1366) is empty.

Implemented in **decaf::util::LinkedList< E >** (p. 1899), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1899), **decaf::util::LinkedList< CompositeTask * >** (p. 1899), **decaf::util::LinkedList< URI >** (p. 1899), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1899), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1899), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1899), **decaf::util::LinkedList< decaf::net::URI >** (p. 1899), **decaf::util::LinkedList< Pointer< Command > >** (p. 1899), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1899), **decaf::util::LinkedList< cms::Destination * >** (p. 1899), **decaf::util::LinkedList< cms::Session * >** (p. 1899), and **decaf::util::LinkedList< cms::Connection * >** (p. 1899).

6.227.3.20 template<typename E> virtual bool decaf::util::Deque< E >::removeLastOccurrence (const E & *value*) [pure virtual]

Removes the last occurrence of the specified element from this **Deque** (p. 1366). If there is no matching element then the **Deque** (p. 1366) is left unchanged.

Parameters:

value The value to be removed from this **Deque** (p. 1366).

Returns:

true if the **Deque** (p. 1366) was modified as a result of this operation.

Exceptions:

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

Implemented in **decaf::util::LinkedList< E >** (p. 1899), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1899), **decaf::util::LinkedList< CompositeTask * >** (p. 1899), **decaf::util::LinkedList< URI >** (p. 1899), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1899), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1899), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1899), **decaf::util::LinkedList< decaf::net::URI >** (p. 1899), **decaf::util::LinkedList< Pointer< Command > >** (p. 1899), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1899), **decaf::util::LinkedList< cms::Destination * >** (p. 1899), **decaf::util::LinkedList< cms::Session * >** (p. 1899), and **decaf::util::LinkedList< cms::Connection * >** (p. 1899).

6.228 cms::Destination Class Reference

A **Destination** (p. 1377) object encapsulates a provider-specific address.

`#include <src/main/cms/Destination.h>`Inheritance diagram for cms::Destination:

Public Types

- enum **DestinationType** { **TOPIC**, **QUEUE**, **TEMPORARY_TOPIC**, **TEMPORARY_QUEUE** }

Public Member Functions

- virtual ~**Destination** ()
- virtual **DestinationType** **getDestinationType** () const =0

  *Retrieve the **Destination** (p. 1377) Type for this **Destination** (p. 1377).*

- virtual **cms::Destination** * **clone** () const =0

  Creates a new instance of this destination type that is a copy of this one, and returns it.

- virtual void **copy** (const **cms::Destination** &source)=0

  *Copies the contents of the given **Destination** (p. 1377) object to this one.*

- virtual bool **equals** (const **cms::Destination** &other) const =0

  *Compares two **Destination** (p. 1377) instances to determine if they represent the same logic **Destination** (p. 1377).*

- virtual const **CMSProperties** & **getCMSProperties** () const =0

  Retrieve any properties that might be part of the destination that was specified.

6.228.1 Detailed Description

A **Destination** (p. 1377) object encapsulates a provider-specific address. There is no standard definition of a **Destination** (p. 1377) address, each provider can provide its own definition and there can be configuration data attached to the **Destination** (p. 1377) address.

All CMS **Destination** (p. 1377) objects support concurrent use.

Since:

1.0

6.228.2 Member Enumeration Documentation

6.228.2.1 enum cms::Destination::DestinationType

Enumerator:

TOPIC

QUEUE

TEMPORARY_TOPIC

TEMPORARY_QUEUE

6.228.3 Constructor & Destructor Documentation

6.228.3.1 virtual cms::Destination::~Destination () [virtual]

6.228.4 Member Function Documentation

6.228.4.1 virtual cms::Destination* cms::Destination::clone () const [pure virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implemented in **activemq::commands::ActiveMQQueue** (p. 422), **activemq::commands::ActiveMQTempQueue** (p. 503), **activemq::commands::ActiveMQTempTopic** (p. 511), and **activemq::commands::ActiveMQTopic** (p. 528).

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setCMSDestination(), and activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setCMSReplyTo().

6.228.4.2 virtual void cms::Destination::copy (const cms::Destination & *source*) [pure virtual]

Copies the contents of the given **Destination** (p. 1377) object to this one.

Parameters:

source The source **Destination** (p. 1377) object.

6.228.4.3 virtual bool cms::Destination::equals (const cms::Destination & *other*) const [pure virtual]

Compares two **Destination** (p. 1377) instances to determine if they represent the same logic **Destination** (p. 1377).

Parameters:

other The other destination to compare this one to.

Returns:

true if the two destinations are the same.

6.228.4.4 virtual const CMSProperties& cms::Destination::getCMSProperties () const [pure virtual]

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

A {const} reference to a **CMSProperties** (p. 985) object.

Implemented in **activemq::commands::ActiveMQQueue** (p. 423), **activemq::commands::ActiveMQTempQueue** (p. 504), **activemq::commands::ActiveMQTempTopic** (p. 512), and **activemq::commands::ActiveMQTopic** (p. 529).

6.228.4.5 virtual DestinationType cms::Destination::getDestinationType () const [pure virtual]

Retrieve the **Destination** (p. 1377) Type for this **Destination** (p. 1377).

Returns:

The **Destination** (p. 1377) Type

Implemented in **activemq::commands::ActiveMQQueue** (p. 423), **activemq::commands::ActiveMQTempQueue** (p. 505), **activemq::commands::ActiveMQTempTopic** (p. 513), and **activemq::commands::ActiveMQTopic** (p. 529).

6.229 cms::DestinationEvent Class Reference

An event class that is used to wrap information related to **Destination** (p. 1377) add and remove events from the CMS Provider.

`#include <src/main/cms/DestinationEvent.h>`Inheritance diagram for cms::DestinationEvent:

Public Member Functions

- virtual ~**DestinationEvent** ()
- virtual const **cms::Destination** * **getDestination** () const =0

  Returns the destination that this event is related to, the returned destination remains the property of this event and should be cloned if the caller wishes to store it beyond the lifetime of this event object.

- virtual bool **isAddOperation** () const =0

  *Returns true if this events represents the addition of a **Destination** (p. 1377).*

- virtual bool **isRemoveOperation** () const =0

  *Returns true if this events represents the removal of a **Destination** (p. 1377).*

6.229.1 Detailed Description

An event class that is used to wrap information related to **Destination** (p. 1377) add and remove events from the CMS Provider.

Since:

3.2

6.229.2 Constructor & Destructor Documentation

6.229.2.1 virtual cms::DestinationEvent::~DestinationEvent () [virtual]

6.229.3 Member Function Documentation

6.229.3.1 virtual const cms::Destination* cms::DestinationEvent::getDestination () const [pure virtual]

Returns the destination that this event is related to, the returned destination remains the property of this event and should be cloned if the caller wishes to store it beyond the lifetime of this event object.

Returns:

a **cms::Destination** (p. 1377) instance that this event relates to.

Implemented in **activemq::core::ActiveMQDestinationEvent** (p. 331).

6.229.3.2 virtual bool cms::DestinationEvent::isAddOperation () const [pure virtual]

Returns true if this events represents the addition of a **Destination** (p. 1377).

Returns:

true if this events represents the addition of a **Destination** (p. 1377).

Implemented in **activemq::core::ActiveMQDestinationEvent** (p. 332).

6.229.3.3 virtual bool cms::DestinationEvent::isRemoveOperation () const [pure virtual]

Returns true if this events represents the removal of a **Destination** (p. 1377).

Returns:

true if this events represents the removal of a **Destination** (p. 1377).

Implemented in **activemq::core::ActiveMQDestinationEvent** (p. 332).

6.231.1 Constructor & Destructor Documentation

6.231.1.1 activemq::commands::DestinationInfo::DestinationInfo ()

6.231.1.2 virtual activemq::commands::DestinationInfo::~DestinationInfo () [virtual]

6.231.2 Member Function Documentation

6.231.2.1 virtual DestinationInfo* activemq::commands::DestinationInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.231.2.2 virtual void activemq::commands::DestinationInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.231.2.3 virtual bool activemq::commands::DestinationInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.231.2.4 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath () [virtual]

6.231.2.5 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath () const [virtual]

6.231.2.6 virtual Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId () [virtual]

6.231.2.7 virtual const Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId () const [virtual]

6.231.2.8 virtual unsigned char activemq::commands::DestinationInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.231.2.9 virtual Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination () [virtual]

6.231.2.10 virtual const Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination () const [virtual]

6.231.2.11 virtual unsigned char activemq::commands::DestinationInfo::getOperationType () const [virtual]

6.231.2.12 virtual long long activemq::commands::DestinationInfo::getTimeout () const [virtual]

6.231.2.13 virtual void activemq::commands::DestinationInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.231.2.14 virtual void activemq::commands::DestinationInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.231.2.15 virtual void activemq::commands::DestinationInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.231.2.16 virtual void activemq::commands::DestinationInfo::setOperationType (unsigned char *operationType*) [virtual]

6.231.2.17 virtual void activemq::commands::DestinationInfo::setTimeout (long long *timeout*) [virtual]

6.231.2.18 virtual std::string activemq::commands::DestinationInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.231.2.19 virtual Pointer<Command> activemq::commands::DestinationInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.231.3 Field Documentation

6.231.3.1 std::vector< decaf::lang::Pointer<BrokerId> > activemq::commands::DestinationInfo::brokerPath [protected]

6.231.3.2 Pointer<ConnectionId> activemq::commands::DestinationInfo::connectionId [protected]

6.231.3.3 Pointer<ActiveMQDestination> activemq::commands::DestinationInfo::destination [protected]

6.232 activemq::wireformat::openwire::marshal::generated::DestinationI Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **DestinationInfoMarshaller** (p. 1388).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/DestinationInfoMarshaller.h>`In
diagram for activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller:

Public Member Functions

- **DestinationInfoMarshaller** ()
- virtual ~**DestinationInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.232.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **DestinationInfoMarshaller** (p. 1388). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.232.2 Constructor & Destructor Documentation

6.232.2.1 activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::Destinati() [inline]

6.232.2.2 virtual activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::~Destina() [inline, virtual]

6.232.3 Member Function Documentation

6.232.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::createObjec() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.232.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::getDataStru() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.232.3.3 virtual void activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::looseMarsh(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.232.3.4 virtual void activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::looseUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.232.3.5 virtual int activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::tightMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.232.3.6 virtual void activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::tightMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.232.3.7 virtual void activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::tightUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**DestinationInfoMarshaller.h**

6.233 cms::DestinationListener Class Reference

A listener class that the client can implement to receive events related to **Destination** (p. 1377) addition or removal on the CMS Provider.

`#include <src/main/cms/DestinationListener.h>`

Public Member Functions

- virtual ~**DestinationListener** ()
- virtual void **onDestinationEvent** (**cms::DestinationEvent** *event)=0

  Event call-back method that provides a pointer to an Event object which contains information on destination add / remove activity on the CMS Provider.

6.233.1 Detailed Description

A listener class that the client can implement to receive events related to **Destination** (p. 1377) addition or removal on the CMS Provider.

Since:

3.2

6.233.2 Constructor & Destructor Documentation

6.233.2.1 virtual cms::DestinationListener::~DestinationListener () [virtual]

6.233.3 Member Function Documentation

6.233.3.1 virtual void cms::DestinationListener::onDestinationEvent (cms::DestinationEvent * *event*) [pure virtual]

Event call-back method that provides a pointer to an Event object which contains information on destination add / remove activity on the CMS Provider. The passed object remains the property of the caller and should never be deleted by the event listener implementation.

Parameters:

event The destination event that triggers this call-back.

The documentation for this class was generated from the following file:

- src/main/cms/**DestinationListener.h**

6.234 activemq::cmsutil::DestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

`#include <src/main/activemq/cmsutil/DestinationResolver.h>`Inheritance diagram for activemq::cmsutil::DestinationResolver:

Public Member Functions

- virtual ~**DestinationResolver** ()
- virtual void **init** (**ResourceLifecycleManager** *mgr)=0

  Initializes this destination resolver for use.

- virtual void **destroy** ()=0

  Destroys any allocated resources.

- virtual **cms::Destination** * **resolveDestinationName** (**cms::Session** *session, const std::string &destName, bool pubSubDomain)=0

  Resolves the given name to a destination.

6.234.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.234.2 Constructor & Destructor Documentation

6.234.2.1 virtual activemq::cmsutil::DestinationResolver::~DestinationResolver () [virtual]

6.234.3 Member Function Documentation

6.234.3.1 virtual void activemq::cmsutil::DestinationResolver::destroy () [pure virtual]

Destroys any allocated resources.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1447).

6.234.3.2 virtual void activemq::cmsutil::DestinationResolver::init (ResourceLifecycleManager * *mgr*) [pure virtual]

Initializes this destination resolver for use. Ensures that any previously allocated resources are first destroyed (e.g. calls **destroy()** (p. 1393)).

Parameters:

mgr the resource lifecycle manager.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1448).

6.234.3.3 virtual cms::Destination* activemq::cmsutil::DestinationResolver::resolveDestinationName (cms::Session * *session*, const std::string & *destName*, bool *pubSubDomain*) [pure virtual]

Resolves the given name to a destination. If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters:

session the session for which to retrieve resolve the destination.

destName the name to be resolved.

pubSubDomain If true, the name will be resolved to a Topic, otherwise a Queue.

Returns:

the resolved destination

Exceptions:

cms::CMSException *(*p. ***979)*** if resolution failed.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1448).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**DestinationResolver.h**

6.235 cms::DestinationSource Class Reference

Provides an object that will provide a snapshot view of Destinations that exist on the **Message** (p. 2090) provider.

`#include <src/main/cms/DestinationSource.h>`Inheritance diagram for cms::DestinationSource:

Public Member Functions

- virtual ~**DestinationSource** ()
- virtual void **setListener** (**cms::DestinationListener** *listener)=0

  Sets the current listener of ***Destination*** *(p. 1377) events.*

- virtual **cms::DestinationListener** * **getListener** () const =0

  Gets the currently configured DestiantionListener for this event source.

- virtual std::vector< **cms::Queue** * > **getQueues** () const =0

  Returns a snapshot of the currently known Queues that are active on the CMS provider, this state can change at any time as Destinations are added and deleted from the provider.

- virtual std::vector< **cms::Topic** * > **getTopics** () const =0

  Returns a snapshot of the currently known Queues that are active on the CMS provider, this state can change at any time as Destinations are added and deleted from the provider.

- virtual std::vector< **cms::TemporaryQueue** * > **getTemporaryQueues** () const =0

  Returns a snapshot of the currently known Queues that are active on the CMS provider, this state can change at any time as Destinations are added and deleted from the provider.

- virtual std::vector< **cms::TemporaryTopic** * > **getTemporaryTopics** () const =0

  Returns a snapshot of the currently known Queues that are active on the CMS provider, this state can change at any time as Destinations are added and deleted from the provider.

6.235.1 Detailed Description

Provides an object that will provide a snapshot view of Destinations that exist on the **Message** (p. 2090) provider.

Since:

3.2

6.235.2 Constructor & Destructor Documentation

6.235.2.1 virtual cms::DestinationSource::~DestinationSource () [virtual]

6.235.3 Member Function Documentation

6.235.3.1 virtual cms::DestinationListener* cms::DestinationSource::getListener () const [pure virtual]

Gets the currently configured DestiantionListener for this event source. The event source instance remains active in this **DestinationSource** (p. 1395) until it is removed via a call to setListener(null) and should not be deleted until the client is sure it will not receive any future events.

Returns:

the configured **DestinationListener** (p. 1392) for this event source or null if none.

Implemented in **activemq::core::ActiveMQDestinationSource** (p. 338).

6.235.3.2 virtual std::vector<cms::Queue*> cms::DestinationSource::getQueues () const [pure virtual]

Returns a snapshot of the currently known Queues that are active on the CMS provider, this state can change at any time as Destinations are added and deleted from the provider. The destinations are cloned and placed into the returned vector, the caller is responsible for deleting these cloned objects.

Returns:

an STL vector containing the current list of known Queues.

Implemented in **activemq::core::ActiveMQDestinationSource** (p. 338).

6.235.3.3 virtual std::vector<cms::TemporaryQueue*> cms::DestinationSource::getTemporaryQueues () const [pure virtual]

Returns a snapshot of the currently known Queues that are active on the CMS provider, this state can change at any time as Destinations are added and deleted from the provider. The destinations are cloned and placed into the returned vector, the caller is responsible for deleting these cloned objects.

Returns:

an STL vector containing the current list of known Queues.

Implemented in **activemq::core::ActiveMQDestinationSource** (p. 338).

6.235.3.4 virtual std::vector<cms::TemporaryTopic*> cms::DestinationSource::getTemporaryTopics () const [pure virtual]

Returns a snapshot of the currently known Queues that are active on the CMS provider, this state can change at any time as Destinations are added and deleted from the provider. The destinations

are cloned and placed into the returned vector, the caller is responsible for deleting these cloned objects.

Returns:

an STL vector containing the current list of known Queues.

Implemented in **activemq::core::ActiveMQDestinationSource** (p. 339).

6.235.3.5 virtual std::vector<cms::Topic*> cms::DestinationSource::getTopics () const [pure virtual]

Returns a snapshot of the currently known Queues that are active on the CMS provider, this state can change at any time as Destinations are added and deleted from the provider. The destinations are cloned and placed into the returned vector, the caller is responsible for deleting these cloned objects.

Returns:

an STL vector containing the current list of known Queues.

Implemented in **activemq::core::ActiveMQDestinationSource** (p. 339).

6.235.3.6 virtual void cms::DestinationSource::setListener (cms::DestinationListener * *listener*) [pure virtual]

Sets the current listener of **Destination** (p. 1377) events. This class does not manage the lifetime of the configured listener, the client must ensure that it deletes the listener instance at the appropriate time.

Parameters:

listener The new listener to provide destination events to.

Implemented in **activemq::core::ActiveMQDestinationSource** (p. 339).

The documentation for this class was generated from the following file:

- src/main/cms/**DestinationSource.h**

6.236 decaf::security::DigestException Class Reference

`#include <src/main/decaf/security/DigestException.h>`Inheritance diagram for decaf::security::DigestException:

Public Member Functions

- **DigestException** ()

  Default Constructor.

- **DigestException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **DigestException** (const **DigestException** &ex)

  Copy Constructor.

- **DigestException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **DigestException** (const std::exception *cause)

  Constructor.

- **DigestException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **DigestException** * **clone** () const

  Clones this exception.

- virtual ~**DigestException** () throw ()

6.236.1 Constructor & Destructor Documentation

6.236.1.1 decaf::security::DigestException::DigestException ()

Default Constructor.

6.236.1.2 decaf::security::DigestException::DigestException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.236.1.3 decaf::security::DigestException::DigestException (const DigestException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.236.1.4 decaf::security::DigestException::DigestException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.236.1.5 decaf::security::DigestException::DigestException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.236.1.6 decaf::security::DigestException::DigestException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.236.1.7 virtual decaf::security::DigestException::~DigestException () throw () [virtual]

6.236.2 Member Function Documentation

6.236.2.1 virtual DigestException* decaf::security::DigestException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1585).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**DigestException.h**

6.237 decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy Class Reference

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 3055) this class always destroys the oldest unexecuted task in the **Queue** (p. 2515) and then attempts to execute the rejected task using the passed in executor.

`#include <src/main/decaf/util/concurrent/ThreadPoolExecutor.h>`Inheritance diagram for decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy:

Public Member Functions

- **DiscardOldestPolicy** ()
- virtual ~**DiscardOldestPolicy** ()
- virtual void **rejectedExecution** (**decaf::lang::Runnable** *task, **ThreadPoolExecutor** *executer)

  *Method that may be invoked by a **ThreadPoolExecutor** (p. 3047) when **execute** (p. 3055) cannot accept a task.*

6.237.1 Detailed Description

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 3055) this class always destroys the oldest unexecuted task in the **Queue** (p. 2515) and then attempts to execute the rejected task using the passed in executor.

Since:

1.0

6.237.2 Constructor & Destructor Documentation

6.237.2.1 decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy::DiscardOldestPolicy () [inline]

6.237.2.2 virtual decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy::~DiscardOldestPolicy () [inline, virtual]

6.237.3 Member Function Documentation

6.237.3.1 virtual void decaf::util::concurrent::ThreadPoolExecutor::DiscardOldestPolicy::rejectedExecution (decaf::lang::Runnable * *r*, ThreadPoolExecutor * *executer*) [inline, virtual]

Method that may be invoked by a **ThreadPoolExecutor** (p. 3047) when **execute** (p. 3055) cannot accept a task. This may occur when no more threads or queue slots are available because their bounds would be exceeded, or upon shutdown of the **Executor** (p. 1476).

In the absence of other alternatives, the method may throw an **RejectedExecutionException** (p. 2567), which will be propagated to the caller of **execute** (p. 3055).

Parameters:

r The pointer to the runnable task requested to be executed.

executor The pointer to the executor attempting to execute this task.

Exceptions:

RejectedExecutionException *(p. 2567)* if there is no remedy.

Implements **decaf::util::concurrent::RejectedExecutionHandler** (p. 2570).

References decaf::util::concurrent::ThreadPoolExecutor::execute(), decaf::util::concurrent::ThreadPoolExecutor::getQueue(), decaf::util::concurrent::ThreadPoolExecutor::isShutdown(), and NULL.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadPoolExecutor.h**

6.238 decaf::util::concurrent::ThreadPoolExecutor::DiscardPolicy Class Reference

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 3055) this class always destroys the rejected task and returns quietly.

6.239.1 Constructor & Destructor Documentation

6.239.1.1 activemq::commands::DiscoveryEvent::DiscoveryEvent ()

6.239.1.2 virtual activemq::commands::DiscoveryEvent::~DiscoveryEvent () [virtual]

6.239.2 Member Function Documentation

6.239.2.1 virtual DiscoveryEvent* activemq::commands::DiscoveryEvent::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.239.2.2 virtual void activemq::commands::DiscoveryEvent::copyDataStructure (const DataStructure * *src*) [virtual]

6.239.2.3 virtual bool activemq::commands::DiscoveryEvent::equals (const DataStructure * *value*) const [virtual]

6.239.2.4 virtual std::string& activemq::commands::DiscoveryEvent::getBrokerName () [virtual]

6.239.2.5 virtual const std::string& activemq::commands::DiscoveryEvent::getBrokerName () const [virtual]

6.239.2.6 virtual unsigned char activemq::commands::DiscoveryEvent::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.239.2.7 virtual std::string& activemq::commands::DiscoveryEvent::getServiceName () [virtual]

6.239.2.8 virtual const std::string& activemq::commands::DiscoveryEvent::getServiceName () const [virtual]

6.239.2.9 virtual void activemq::commands::DiscoveryEvent::setBrokerName (const std::string & *brokerName*) [virtual]

6.239.2.10 virtual void activemq::commands::DiscoveryEvent::setServiceName (const std::string & *serviceName*) [virtual]

6.239.2.11 virtual std::string activemq::commands::DiscoveryEvent::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

6.239.3 Field Documentation

6.239.3.1 std::string activemq::commands::DiscoveryEvent::brokerName [protected]

6.239.3.2 const unsigned char activemq::commands::DiscoveryEvent::ID_DISCOVERYEVENT = 40 [static]

6.239.3.3 std::string activemq::commands::DiscoveryEvent::serviceName [protected]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**DiscoveryEvent.h**

6.240 activemq::wireformat::openwire::marshal::generated::DiscoveryEve Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **DiscoveryEventMarshaller** (p. 1407).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/DiscoveryEventMarshaller.h>`Inh
diagram for activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller:

Public Member Functions

- **DiscoveryEventMarshaller** ()
- virtual ~**DiscoveryEventMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.240.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **DiscoveryEventMarshaller** (p. 1407). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.240.2 Constructor & Destructor Documentation

6.240.2.1 activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::Discovery () [inline]

6.240.2.2 virtual activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::~Discover () [inline, virtual]

6.240.3 Member Function Documentation

6.240.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::createObjec () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.240.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::getDataStru () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.240.3.3 virtual void activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::looseMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.240.3.4 virtual void activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::looseUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.240.3.5 virtual int activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::tightMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.240.3.6 virtual void activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::tightMarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.240.3.7 virtual void activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::tightUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

The documentation for this class was generated from the following file:

6.241.3.2 const decaf::lang::Pointer<commands::Message>& activemq::core::DispatchData::getMessage () `[inline]`

The documentation for this class was generated from the following file:

- src/main/activemq/core/**DispatchData.h**

6.242 activemq::core::Dispatcher Class Reference

Interface for an object responsible for dispatching messages to consumers.

`#include <src/main/activemq/core/Dispatcher.h>`Inheritance diagram for activemq::core::Dispatcher:

Public Member Functions

- virtual ~**Dispatcher** ()
- virtual void **dispatch** (const **decaf::lang::Pointer**< **commands::MessageDispatch** > &message)=0

  Dispatches a message to a particular consumer.

- virtual int **getHashCode** () const =0

  *HashCode method allowing **Dispatcher** (p. 1412) instances to be used in HashMap etc.*

6.242.1 Detailed Description

Interface for an object responsible for dispatching messages to consumers.

6.242.2 Constructor & Destructor Documentation

6.242.2.1 virtual activemq::core::Dispatcher::~Dispatcher () [virtual]

6.242.3 Member Function Documentation

6.242.3.1 virtual void activemq::core::Dispatcher::dispatch (const decaf::lang::Pointer< commands::MessageDispatch > & *message*) [pure virtual]

Dispatches a message to a particular consumer.

Parameters:

message The message to be dispatched to a waiting consumer.

Implemented in **activemq::core::AdvisoryConsumer** (p. 556), **activemq::core::kernels::ActiveMQConsumerKernel** (p. 309), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 463).

6.242.3.2 virtual int activemq::core::Dispatcher::getHashCode () const [pure virtual]

HashCode method allowing **Dispatcher** (p. 1412) instances to be used in HashMap etc.

Returns:

hash value for this **Dispatcher** (p. 1412).

Implemented in **activemq::core::AdvisoryConsumer** (p. 556), **activemq::core::kernels::ActiveMQConsumerKernel** (p. 310), and **activemq::core::kernels::ActiveMQSessionKernel** (p. 464).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**Dispatcher.h**

6.243 decaf::lang::Double Class Reference

`#include <src/main/decaf/lang/Double.h>`Inheritance diagram for decaf::lang::Double:

Public Member Functions

- **Double** (double value)

  *Constructs a new instance of a **Double** (p. 1414) object and assigns it the given value.*

- **Double** (const std::string &value)

  *Constructs a new **Double** (p. 1414) and attempts to convert the given string to a double value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted double.*

- virtual ~**Double** ()
- virtual int **compareTo** (const **Double** &d) const

  *Compares this **Double** (p. 1414) instance with another.*

- bool **equals** (const **Double** &d) const
- virtual bool **operator==** (const **Double** &d) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Double** &d) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const double &d) const

  *Compares this **Double** (p. 1414) instance with another.*

- bool **equals** (const double &d) const
- virtual bool **operator==** (const double &d) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const double &d) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

- bool **isInfinite** () const
- bool **isNaN** () const

Static Public Member Functions

- static int **compare** (double d1, double d2)

  Compares the two specified double values.

- static long long **doubleToLongBits** (double value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.

- static long long **doubleToRawLongBits** (double value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.

- static bool **isInfinite** (double value)
- static bool **isNaN** (double value)
- static double **longBitsToDouble** (long long bits)

  Returns the double value corresponding to a given bit representation.

- static double **parseDouble** (const std::string value)

  *Returns a new double initialized to the value represented by the specified string, as performed by the valueOf method of class **Double** (p. 1414).*

- static std::string **toHexString** (double value)

  Returns a hexadecimal string representation of the double argument.

- static std::string **toString** (double value)

  Returns a string representation of the double argument.

- static **Double valueOf** (double value)

  *Returns a **Double** (p. 1414) instance representing the specified double value.*

- static **Double valueOf** (const std::string &value)

  *Returns a **Double** (p. 1414) instance that wraps a primtive double which is parsed from the string value passed.*

Static Public Attributes

- static const int **SIZE**
  The size in bits of the primitive int type.
- static const double **MAX_VALUE**
  The maximum value that the primitive type can hold.
- static const double **MIN_VALUE**
  The minimum value that the primitive type can hold.
- static const double **NaN**
  *Constant for the Not a **Number** (p. 2269) Value.*
- static const double **POSITIVE_INFINITY**
  Constant for Positive Infinity.
- static const double **NEGATIVE_INFINITY**
  Constant for Negative Infinitiy.

6.243.1 Constructor & Destructor Documentation

6.243.1.1 decaf::lang::Double::Double (double *value*)

Constructs a new instance of a **Double** (p. 1414) object and assigns it the given value.

Parameters:

value The primitive type to wrap.

6.243.1.2 decaf::lang::Double::Double (const std::string & *value*)

Constructs a new **Double** (p. 1414) and attempts to convert the given string to a double value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted double.

Parameters:

value The string to convert to a primitive type to wrap.

Exceptions:

NumberFormatException if the string is not a a valid double.

6.243.1.3 virtual decaf::lang::Double::~Double () [inline, virtual]

6.243.2 Member Function Documentation

6.243.2.1 virtual unsigned char decaf::lang::Double::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2269).

6.243.2.2 static int decaf::lang::Double::compare (double *d1*, double *d2*) [static]

Compares the two specified double values. The sign of the integer value returned is the same as that of the integer that would be returned by the call: new Double(d1).compareTo(new Double(d2))

Parameters:

d1 - the first double to compare

d2 - the second double to compare

Returns:

the value 0 if d1 is numerically equal to d2; a value less than 0 if d1 is numerically less than d2; and a value greater than 0 if d1 is numerically greater than d2.

6.243.2.3 virtual int decaf::lang::Double::compareTo (const double & *d*) const [virtual]

Compares this **Double** (p. 1414) instance with another.

Parameters:

d - the **Double** (p. 1414) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< double >** (p. 1037).

6.243.2.4 virtual int decaf::lang::Double::compareTo (const Double & *d*) const [virtual]

Compares this **Double** (p. 1414) instance with another.

Parameters:

d - the **Double** (p. 1414) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

6.243.2.5 static long long decaf::lang::Double::doubleToLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout. Bit 63 (the bit that is selected by the mask 0x8000000000000000L) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000L. If the argument is negative infinity, the result is 0xfff0000000000000L. If the argument is NaN, the result is 0x7ff8000000000000L.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToLongBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters:

value - double to be converted

Returns:

the long long bits that make up the double

Referenced by decaf::util::HashCode< double >::operator()().

6.243.2.6 static long long decaf::lang::Double::doubleToRawLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values. Bit 63 (the bit that is selected by the mask 0x8000000000000000LL) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000LL. If the argument is negative infinity, the result is 0xfff0000000000000LL. If the argument is NaN, the result is the long integer representing the actual NaN value. Unlike the doubleToLongBits method, doubleToRawLongBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToRawLongBits.

Parameters:

value - double to be converted

Returns:

the long long bits that make up the double

6.243.2.7 virtual double decaf::lang::Double::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.243.2.8 bool decaf::lang::Double::equals (const double & *d*) const [inline, virtual]

Parameters:

d - the **Double** (p. 1414) object to compare against.

Returns:

true if the two **Double** (p. 1414) Objects have the same value.

Implements **decaf::lang::Comparable< double >** (p. 1038).

6.243.2.9 bool decaf::lang::Double::equals (const Double & *d*) const [inline]

Parameters:

d - the **Double** (p. 1414) object to compare against.

Returns:

true if the two **Double** (p. 1414) Objects have the same value.

6.243.2.10 virtual float decaf::lang::Double::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.243.2.11 virtual int decaf::lang::Double::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.243.2.12 static bool decaf::lang::Double::isInfinite (double *value*) [static]

Parameters:

value - The double to check.

Returns:

true if the double is equal to infinity.

6.243.2.13 bool decaf::lang::Double::isInfinite () const

Returns:

true if the double is equal to positive infinity.

6.243.2.14 static bool decaf::lang::Double::isNaN (double *value*) [static]

Parameters:

value - The double to check.

Returns:

true if the double is equal to NaN.

6.243.2.15 bool decaf::lang::Double::isNaN () const

Returns:

true if the double is equal to NaN.

6.243.2.16 static double decaf::lang::Double::longBitsToDouble (long long *bits*) [static]

Returns the double value corresponding to a given bit representation. The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "double format" bit layout.

If the argument is 0x7ff0000000000000L, the result is positive infinity. If the argument is 0xfff0000000000000L, the result is negative infinity. If the argument is any value in the range 0x7ff0000000000001L through 0x7fffffffffffffffL or in the range 0xfff0000000000001L through 0xffffffffffffffffL, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Double.doubleToRawLongBits** (p. 1418) method.

Parameters:

bits - the long long bits to convert to double

Returns:

the double converted from the bits

6.243.2.17 virtual long long decaf::lang::Double::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.243.2.18 virtual bool decaf::lang::Double::operator< (const double & *d*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< double >** (p. 1038).

6.243.2.19 virtual bool decaf::lang::Double::operator< (const Double & *d*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.243.2.20 virtual bool decaf::lang::Double::operator== (const double & *d*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< double >** (p. 1038).

6.243.2.21 virtual bool decaf::lang::Double::operator== (const Double & *d*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.243.2.22 static double decaf::lang::Double::parseDouble (const std::string *value*) [static]

Returns a new double initialized to the value represented by the specified string, as performed by the valueOf method of class **Double** (p. 1414).

Parameters:

value - The string to parse to an double

Returns:

a double parsed from the passed string

Exceptions:

NumberFormatException

6.243.2.23 virtual short decaf::lang::Double::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2271).

6.243.2.24 static std::string decaf::lang::Double::toHexString (double *value*) [static]

Returns a hexadecimal string representation of the double argument. All characters mentioned below are ASCII characters.

∗ If the argument is NaN, the result is the string "NaN". ∗ Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces

the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a double value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p. 1750) on the exponent value. o If m is a double value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters:

value - The double to convert to a string

Returns:

the Hex formatted double string.

6.243.2.25 static std::string decaf::lang::Double::toString (double *value*) [static]

Returns a string representation of the double argument. All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10-3 but less than 107, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m is less than 10-3 or greater than or equal to 107, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10n <= m < 10n+1; then let a be the mathematically exact quotient of m and 10n so that 1 <= a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1750).

Parameters:

value - The double to convert to a string

Returns:

the formatted double string.

6.243.2.26 std::string decaf::lang::Double::toString () const

Returns:

this **Double** (p. 1414) Object as a **String** (p. 2935) Representation

6.243.2.27 static Double decaf::lang::Double::valueOf (const std::string & *value*) [static]

Returns a **Double** (p. 1414) instance that wraps a primtive double which is parsed from the string value passed.

Parameters:

value - the string to parse

Returns:

a new **Double** (p. 1414) instance wrapping the double parsed from value

Exceptions:

NumberFormatException on error.

6.243.2.28 static Double decaf::lang::Double::valueOf (double *value*) [static]

Returns a **Double** (p. 1414) instance representing the specified double value.

Parameters:

value - double to wrap

Returns:

new **Double** (p. 1414) instance wrapping the primitive value

6.243.3 Field Documentation

6.243.3.1 const double decaf::lang::Double::MAX_VALUE [static]

The maximum value that the primitive type can hold.

6.243.3.2 const double decaf::lang::Double::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.243.3.3 const double decaf::lang::Double::NaN [static]

Constant for the Not a **Number** (p. 2269) Value.

6.243.3.4 const double decaf::lang::Double::NEGATIVE_INFINITY [static]

Constant for Negative Infinitiy.

6.243.3.5 const double decaf::lang::Double::POSITIVE_INFINITY [static]

Constant for Positive Infinity.

6.243.3.6 const int decaf::lang::Double::SIZE [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Double.h**

6.244 decaf::internal::nio::DoubleArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/DoubleArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::DoubleArrayBuffer:

Public Member Functions

- **DoubleArrayBuffer** (int capacity, bool readOnly=false)

  *Creates a **DoubleArrayBuffer** (p. 1426) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **DoubleArrayBuffer** (double *array, int size, int offset, int length, bool readOnly=false)

  *Creates a **DoubleArrayBuffer** (p. 1426) object that wraps the given array.*

- **DoubleArrayBuffer** (const **decaf::lang::Pointer**< **ByteArrayAdapter** > &array, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **DoubleArrayBuffer** (const **DoubleArrayBuffer** &other)

  *Create a **DoubleArrayBuffer** (p. 1426) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**DoubleArrayBuffer** ()
- virtual double * **array** ()

  Returns the double array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  *the array that backs this **Buffer** (p. 735).*

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  The offset into the backing array where index zero starts.

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual DoubleBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only double buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
Returns:

The new, read-only double buffer which the caller then owns.

- virtual DoubleBuffer & **compact** ()

Compacts this buffer.
*The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.
Returns:

*a reference to this **DoubleBuffer** (p. 1435).*
Exceptions:

***ReadOnlyBufferException** (p. 2535) if this buffer is read-only.*

- virtual DoubleBuffer * **duplicate** ()

Creates a new double buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
The new buffer will be read-only if, and only if, this buffer is read-only.
Returns:

*a new double **Buffer** (p. 735) which the caller owns.*

- virtual double **get** ()

Relative get method.
Reads the value at this buffer's current position, and then increments the position.
Returns:

the double at the current position.
Exceptions:

***BufferUnderflowException** (p. 763) if there no more data to return.*

- virtual double **get** (int index) const

Absolute get method.
Reads the value at the given index.
Parameters:

***index** The index in the **Buffer** (p. 735) where the double is to be read.*
Returns:

the double that is located at the given index.

Exceptions:

IndexOutOfBoundsException *if index is not smaller than the buffer's limit*

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible double array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.
  Returns:

  true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.
  Returns:

  true if, and only if, this buffer is read-only.

- virtual DoubleBuffer & **put** (double value)

  Writes the given doubles into this buffer at the current position, and then increments the position.
  Parameters:

  value *The doubles value to be written.*
  Returns:

  a reference to this buffer.
  Exceptions:

  BufferOverflowException *(*p. ***760****)* *if this buffer's current position is not smaller than its limit.*
  ReadOnlyBufferException *(*p. ***2535****)* *if this buffer is read-only.*

- virtual DoubleBuffer & **put** (int index, double value)

  Writes the given doubles into this buffer at the given index.
  Parameters:

  index *The position in the* ***Buffer*** *(*p. *735) to write the data.*
  value *The doubles to write.*
  Returns:

  a reference to this buffer
  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or the index is negative.*
  ReadOnlyBufferException *(*p. ***2535****)* *if this buffer is read-only.*

- virtual DoubleBuffer * **slice** () const

  Creates a new ***DoubleBuffer*** *(*p. *1435) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the newly create ***DoubleBuffer*** *(*p. *1435) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **DoubleArrayBuffer** (p. 1426) as Read-Only or not Read-Only.*

6.244.1 Constructor & Destructor Documentation

6.244.1.1 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (int *capacity*, bool *readOnly* = `false`)

Creates a **DoubleArrayBuffer** (p. 1426) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

IllegalArguementException if the capacity value is negative.

6.244.1.2 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (double * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **DoubleArrayBuffer** (p. 1426) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.244.1.3 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset. The capacity and limit of the new **DoubleArrayBuffer** (p. 1426) will be that of the remaining capacity of the passed buffer.

Parameters:

array The ByteArrayAdapter to wrap.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if array is NULL

IndexOutOfBoundsException if offset + length is greater than array size.

6.244.1.4 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (const DoubleArrayBuffer & *other*)

Create a **DoubleArrayBuffer** (p. 1426) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters:

other The **DoubleArrayBuffer** (p. 1426) this one is to mirror.

6.244.1.5 virtual decaf::internal::nio::DoubleArrayBuffer::~DoubleArrayBuffer () [virtual]

6.244.2 Member Function Documentation

6.244.2.1 virtual double* decaf::internal::nio::DoubleArrayBuffer::array () [virtual]

Returns the double array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 1438).

6.244.2.2 virtual int decaf::internal::nio::DoubleArrayBuffer::arrayOffset () [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(*p. *2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 1438).

6.244.2.3 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only double buffer which the caller then owns.

Implements **decaf::nio::DoubleBuffer** (p. 1438).

6.244.2.4 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::compact () [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **DoubleBuffer** (p. 1435).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::DoubleBuffer** (p. 1439).

6.244.2.5 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::duplicate () [virtual]

Creates a new double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new double **Buffer** (p. 735) which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1439).

6.244.2.6 virtual double decaf::internal::nio::DoubleArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the double is to be read.

Returns:

the double that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit

Implements **decaf::nio::DoubleBuffer** (p. 1440).

6.244.2.7 virtual double decaf::internal::nio::DoubleArrayBuffer::get () [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns:

the double at the current position.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there no more data to return.

Implements **decaf::nio::DoubleBuffer** (p. 1441).

6.244.2.8 virtual bool decaf::internal::nio::DoubleArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible double array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::DoubleBuffer** (p. 1441).

6.244.2.9 virtual bool decaf::internal::nio::DoubleArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 738).

6.244.2.10 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (int *index*, double *value*) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or the index is negative.

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only.

Implements **decaf::nio::DoubleBuffer** (p. 1441).

6.244.2.11 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (double *value*) [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value The doubles value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::DoubleBuffer** (p. 1442).

6.244.2.12 virtual void decaf::internal::nio::DoubleArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **DoubleArrayBuffer** (p. 1426) as Read-Only or not Read-Only.

Parameters:

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.244.2.13 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::slice () const [virtual]

Creates a new **DoubleBuffer** (p. 1435) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **DoubleBuffer** (p. 1435) which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1443).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**DoubleArrayBuffer.h**

6.245 decaf::nio::DoubleBuffer Class Reference

This class defines four categories of operations upon double buffers:.

Protected Member Functions

- **DoubleBuffer** (int capacity)

  *Creates a **DoubleBuffer*** (p. *1435*) *object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.245.1 Detailed Description

This class defines four categories of operations upon double buffers:. o Absolute and relative get and put methods that read and write single doubles; o Relative bulk get methods that transfer contiguous sequences of doubles from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of doubles from a double array or some other double buffer into this buffer o Methods for compacting, duplicating, and slicing a double buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing double array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

Since:

1.0

6.245.2 Constructor & Destructor Documentation

6.245.2.1 decaf::nio::DoubleBuffer::DoubleBuffer (int *capacity*) [protected]

Creates a **DoubleBuffer** (p. 1435) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity The size and limit of the **Buffer** (p. 735) in doubles

Exceptions:

IllegalArguementException if capacity is negative.

6.245.2.2 virtual decaf::nio::DoubleBuffer::~DoubleBuffer () [inline, virtual]

6.245.3 Member Function Documentation

6.245.3.1 static DoubleBuffer* decaf::nio::DoubleBuffer::allocate (int *capacity*) [static]

Allocates a new **DoubleBuffer** (p. 1435). The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity The size of the Double buffer in doubles.

Returns:

the **DoubleBuffer** (p. 1435) that was allocated, caller owns.

Exceptions:

IllegalArgumentException is the capacity value is negative.

6.245.3.2 virtual double* decaf::nio::DoubleBuffer::array () [pure virtual]

Returns the double array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1430).

6.245.3.3 virtual int decaf::nio::DoubleBuffer::arrayOffset () [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1431).

6.245.3.4 virtual DoubleBuffer* decaf::nio::DoubleBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only double buffer which the caller then owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1431).

6.245.3.5 virtual DoubleBuffer& decaf::nio::DoubleBuffer::compact () [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **DoubleBuffer** (p. 1435).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1431).

6.245.3.6 virtual int decaf::nio::DoubleBuffer::compareTo (const DoubleBuffer & *value*) const [virtual]

6.245.3.7 virtual DoubleBuffer* decaf::nio::DoubleBuffer::duplicate () [pure virtual]

Creates a new double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new double **Buffer** (p. 735) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1432).

6.245.3.8 virtual bool decaf::nio::DoubleBuffer::equals (const DoubleBuffer & *value*) const [virtual]

6.245.3.9 DoubleBuffer& decaf::nio::DoubleBuffer::get (double * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method. This method transfers doubles from this buffer into the given destination array. If there are fewer doubles remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 740), then no bytes are transferred and a **BufferUnderflowException** (p. 763) is thrown.

Otherwise, this method copies length doubles from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer The pointer to an allocated buffer to fill.

size The size of the buffer passed.

offset The position in the buffer to start filling.

length The amount of data to put in the passed buffer.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are fewer than length doubles remaining in this buffer

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.245.3.10 DoubleBuffer& decaf::nio::DoubleBuffer::get (std::vector< double > *buffer*)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. ***763)*** iIf there are fewer than length doubles remaining in this buffer

6.245.3.11 virtual double decaf::nio::DoubleBuffer::get (int *index*) const [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the double is to be read.

Returns:

the double that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1432).

6.245.3.12 virtual double decaf::nio::DoubleBuffer::get () [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the double at the current position.

Exceptions:

BufferUnderflowException *(*p. *763)* if there no more data to return.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1432).

6.245.3.13 virtual bool decaf::nio::DoubleBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible double array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1433).

6.245.3.14 virtual bool decaf::nio::DoubleBuffer::operator< (const DoubleBuffer & *value*) const [virtual]

6.245.3.15 virtual bool decaf::nio::DoubleBuffer::operator== (const DoubleBuffer & *value*) const [virtual]

6.245.3.16 virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (int *index*, double *value*) [pure virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or the index is negative.

ReadOnlyBufferException *(*p. *2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1433).

6.245.3.17 virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (double *value*) [pure virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value The doubles value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1434).

6.245.3.18 DoubleBuffer& decaf::nio::DoubleBuffer::put (std::vector< double > & *buffer*)

This method transfers the entire content of the given source doubles array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters:

buffer The buffer whose contents are copied to this **DoubleBuffer** (p. 1435).

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if there is insufficient space in this buffer.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

6.245.3.19 DoubleBuffer& decaf::nio::DoubleBuffer::put (const double * *buffer*, int *size*, int *offset*, int *length*)

This method transfers doubles into this buffer from the given source array. If there are more doubles to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 740), then no doubles are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer The array from which doubles are to be read.

size The size of the buffer passed.

offset The offset within the array of the first char to be read.

length The number of doubles to be read from the given array.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if there is insufficient space in this buffer

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.245.3.20 DoubleBuffer& decaf::nio::DoubleBuffer::put (DoubleBuffer & *src*)

This method transfers the doubles remaining in the given source buffer into this buffer. If there are more doubles remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 740), then no doubles are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies n = src.remaining() doubles from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src The buffer to take doubles from an place in this one.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if there is insufficient space in this buffer for the remaining doubles in the source buffer

IllegalArgumentException if the source buffer is this buffer.

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only.

6.245.3.21 virtual DoubleBuffer* decaf::nio::DoubleBuffer::slice () const [pure virtual]

Creates a new **DoubleBuffer** (p. 1435) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **DoubleBuffer** (p. 1435) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1434).

6.245.3.22 virtual std::string decaf::nio::DoubleBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.245.3.23 static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (std::vector< double > & *buffer*) [static]

Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1435). The new buffer will be backed by the given double array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **DoubleBuffer** (p. 1435) that is backed by buffer, caller owns.

6.245.3.24 static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (double * *array*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new **DoubleBuffer** (p. 1435). The new buffer will be backed by the given double array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array The array that will back the new buffer.

size The size of the passed in array.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new **DoubleBuffer** (p. 1435) that is backed by buffer, caller owns.

Exceptions:

NullPointerException if the array pointer is NULL.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.247 activemq::cmsutil::DynamicDestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

`#include <src/main/activemq/cmsutil/DynamicDestinationResolver.h>`Inheritance diagram for activemq::cmsutil::DynamicDestinationResolver:

Data Structures

- class **SessionResolver**

  Manages maps of names to topics and queues for a single session.

Public Member Functions

- **DynamicDestinationResolver** ()
- virtual ~**DynamicDestinationResolver** ()
- virtual void **init** (**ResourceLifecycleManager** *mgr)

  Initializes this destination resolver for use.

- virtual void **destroy** ()

  Destroys any allocated resources.

- virtual **cms::Destination** * **resolveDestinationName** (**cms::Session** *session, const std::string &destName, bool pubSubDomain)

  Resolves the given name to a destination.

6.247.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.247.2 Constructor & Destructor Documentation

6.247.2.1 activemq::cmsutil::DynamicDestinationResolver::DynamicDestinationResolver ()

6.247.2.2 virtual activemq::cmsutil::DynamicDestinationResolver::~DynamicDestinationResolver () `[virtual]`

6.247.3 Member Function Documentation

6.247.3.1 virtual void activemq::cmsutil::DynamicDestinationResolver::destroy () `[virtual]`

Destroys any allocated resources.

Implements **activemq::cmsutil::DestinationResolver** (p. 1393).

6.247.3.2 virtual void activemq::cmsutil::DynamicDestinationResolver::init (ResourceLifecycleManager * *mgr*) [inline, virtual]

Initializes this destination resolver for use. Ensures that any previously allocated resources are first destroyed (e.g. calls **destroy()** (p. 1447)).

Parameters:

mgr the resource lifecycle manager.

Implements **activemq::cmsutil::DestinationResolver** (p. 1393).

6.247.3.3 virtual cms::Destination* activemq::cmsutil::DynamicDestinationResolver::resolveDestinationName (cms::Session * *session*, const std::string & *destName*, bool *pubSubDomain*) [virtual]

Resolves the given name to a destination. If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters:

session the session for which to retrieve resolve the destination.

destName the name to be resolved.

pubSubDomain If true, the name will be resolved to a Topic, otherwise a Queue.

Returns:

the resolved destination

Exceptions:

cms::CMSException (p. ***979***) if resolution failed.

Implements **activemq::cmsutil::DestinationResolver** (p. 1394).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**DynamicDestinationResolver.h**

6.248 decaf::internal::security::Engine Class Reference

The **Engine** (p. 1449) class serves as a convenience class for classes in the Decaf Security package.

`#include <src/main/decaf/internal/security/Engine.h>`

Public Member Functions

- **Engine** (const std::string &serviceName)
- virtual ~**Engine** ()
- std::string **getServiceName** () const

  *Returns the name of the service type that this **Engine** (p. 1449) will be a builder of SecuritySpi instances for.*

- const **decaf::security::Provider** * **getProvider** () const

  *Returns the Provider associated with this **Engine** (p. 1449).*

- **decaf::security::SecuritySpi** * **newInstance** (const std::string &algorithmName)

  Return a new instance of the SercuritySpi implementation that is named by this engine's serviceName and the passed algorithmName.

6.248.1 Detailed Description

The **Engine** (p. 1449) class serves as a convenience class for classes in the Decaf Security package. An engine can be created for a given service type, "MessageDigest" for instance and reused to create different algorithms for that type. The **Engine** (p. 1449) class takes care of the details of looking up a ProviderService in the Security Runtime, using correct locking and exception handling so that the higher level classes don't need to implement that logic over again.

6.248.2 Constructor & Destructor Documentation

6.248.2.1 decaf::internal::security::Engine::Engine (const std::string & *serviceName*)

6.248.2.2 virtual decaf::internal::security::Engine::~Engine () `[virtual]`

6.248.3 Member Function Documentation

6.248.3.1 const decaf::security::Provider* decaf::internal::security::Engine::getProvider () const `[inline]`

Returns the Provider associated with this **Engine** (p. 1449). The pointer returned by this method remains the property of the Security framework and should be deleted by the calling application at any time.

Returns:

the **provider** (p. 105) associated with this MessageDigest.

6.248.3.2 std::string decaf::internal::security::Engine::getServiceName () const [inline]

Returns the name of the service type that this **Engine** (p. 1449) will be a builder of SecuritySpi instances for.

Returns:

the service class name of this engine, e.g. MessageDigest.

6.248.3.3 decaf::security::SecuritySpi* decaf::internal::security::Engine::newInstance (const std::string & *algorithmName*)

Return a new instance of the SercuritySpi implementation that is named by this engine's serviceName and the passed algorithmName.

Returns:

a new instance of the SecuritySpi provided by serviceName.algorithmName

The documentation for this class was generated from the following file:

- src/main/decaf/internal/security/**Engine.h**

6.249 cms::EnhancedConnection Class Reference

An enhanced CMS **Connection** (p. 1089) instance that provides additional features above the default required features of a CMS **Connection** (p. 1089) instance.

`#include <src/main/cms/EnhancedConnection.h>`Inheritance diagram for cms::EnhancedConnection:

Public Member Functions

- virtual ~**EnhancedConnection** ()
- virtual **cms::DestinationSource** * **getDestinationSource** ()=0

  *Returns the **DestinationSource** (p. 1395)} object which can be used to listen to destinations being created or destroyed or to enquire about the current destinations available on the message Provider.*

6.249.1 Detailed Description

An enhanced CMS **Connection** (p. 1089) instance that provides additional features above the default required features of a CMS **Connection** (p. 1089) instance.

Since:

3.2

6.249.2 Constructor & Destructor Documentation

6.249.2.1 virtual cms::EnhancedConnection::~EnhancedConnection () [virtual]

6.249.3 Member Function Documentation

6.249.3.1 virtual cms::DestinationSource* cms::EnhancedConnection::getDestinationSource () [pure virtual]

Returns the **DestinationSource** (p. 1395)} object which can be used to listen to destinations being created or destroyed or to enquire about the current destinations available on the message Provider.

Returns:

a new instance of a **DestinationSource** (p. 1395) that is owned by the caller.

Exceptions:

CMSException *(p. **979**)* if an error occurs while creating the destination source.

Implemented in **activemq::core::ActiveMQConnection** (p. 248).

The documentation for this class was generated from the following file:

- src/main/cms/**EnhancedConnection.h**

6.250 decaf::io::EOFException Class Reference

`#include <src/main/decaf/io/EOFException.h>`Inheritance diagram for decaf::io::EOFException:

Public Member Functions

- **EOFException** ()

  Default Constructor.

- **EOFException** (const **lang::Exception** &ex)

  Copy Constructor.

- **EOFException** (const **EOFException** &ex)

  Copy Constructor.

- **EOFException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **EOFException** (const std::exception *cause)

  Constructor.

- **EOFException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor.

- virtual **EOFException** * **clone** () const

  Clones this exception.

- virtual ~**EOFException** () throw ()

6.250.1 Constructor & Destructor Documentation

6.250.1.1 decaf::io::EOFException::EOFException ()

Default Constructor.

6.250.1.2 decaf::io::EOFException::EOFException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.250.1.3 decaf::io::EOFException::EOFException (const EOFException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.250.1.4 decaf::io::EOFException::EOFException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.250.1.5 decaf::io::EOFException::EOFException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.250.1.6 decaf::io::EOFException::EOFException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.250.1.7 virtual decaf::io::EOFException::~EOFException () throw () [virtual]

6.250.2 Member Function Documentation

6.250.2.1 virtual EOFException* decaf::io::EOFException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1788).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**EOFException.h**

6.251 decaf::util::logging::ErrorManager Class Reference

ErrorManager (p. 1455) objects can be attached to Handlers to process any error that occur on a **Handler** (p. 1590) during Logging.

`#include <src/main/decaf/util/logging/ErrorManager.h>`

Public Member Functions

- **ErrorManager** ()
- virtual ~**ErrorManager** ()
- virtual void **error** (const std::string &message, **decaf::lang::Exception** *ex, int **code**)

  *The error method is called when a **Handler** (p. 1590) failure occurs.*

Static Public Attributes

- static const int **GENERIC_FAILURE**

  GENERIC_FAILURE is used for failure that don't fit into one of the other categories.

- static const int **WRITE_FAILURE**

  WRITE_FAILURE is used when a write to an output stream fails.

- static const int **FLUSH_FAILURE**

  FLUSH_FAILURE is used when a flush to an output stream fails.

- static const int **CLOSE_FAILURE**

  CLOSE_FAILURE is used when a close of an output stream fails.

- static const int **OPEN_FAILURE**

  OPEN_FAILURE is used when an open of an output stream fails.

- static const int **FORMAT_FAILURE**

  FORMAT_FAILURE is used when formatting fails for any reason.

6.251.1 Detailed Description

ErrorManager (p. 1455) objects can be attached to Handlers to process any error that occur on a **Handler** (p. 1590) during Logging. When processing **logging** (p. 135) output, if a **Handler** (p. 1590) encounters problems then rather than throwing an Exception back to the issuer of the **logging** (p. 135) call (who is unlikely to be interested) the **Handler** (p. 1590) should call its associated **ErrorManager** (p. 1455).

Since:

1.0

6.251.2 Constructor & Destructor Documentation

6.251.2.1 decaf::util::logging::ErrorManager::ErrorManager ()

6.251.2.2 virtual decaf::util::logging::ErrorManager::~ErrorManager () [virtual]

6.251.3 Member Function Documentation

6.251.3.1 virtual void decaf::util::logging::ErrorManager::error (const std::string & *message*, decaf::lang::Exception * *ex*, int *code*) [virtual]

The error method is called when a **Handler** (p. 1590) failure occurs. This method may be overridden in subclasses. The default behavior in this base class is that the first call is reported to System.err, and subsequent calls are ignored.

Parameters:

msg - a descriptive string (may be empty)

ex - an exception (may be NULL)

code *(p. **1005**)* - an error **code** (p. 1005) defined in **ErrorManager** (p. 1455)

6.251.4 Field Documentation

6.251.4.1 const int decaf::util::logging::ErrorManager::CLOSE_FAILURE [static]

CLOSE_FAILURE is used when a close of an output stream fails.

6.251.4.2 const int decaf::util::logging::ErrorManager::FLUSH_FAILURE [static]

FLUSH_FAILURE is used when a flush to an output stream fails.

6.251.4.3 const int decaf::util::logging::ErrorManager::FORMAT_FAILURE [static]

FORMAT_FAILURE is used when formatting fails for any reason.

6.251.4.4 const int decaf::util::logging::ErrorManager::GENERIC_FAILURE [static]

GENERIC_FAILURE is used for failure that don't fit into one of the other categories.

6.251.4.5 const int decaf::util::logging::ErrorManager::OPEN_FAILURE [static]

OPEN_FAILURE is used when an open of an output stream fails.

6.251.4.6 const int decaf::util::logging::ErrorManager::WRITE_FAILURE [static]

WRITE_FAILURE is used when a write to an output stream fails.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**ErrorManager.h**

6.252 decaf::lang::Exception Class Reference

`#include <src/main/decaf/lang/Exception.h>`Inheritance diagram for decaf::lang::Exception:

Public Member Functions

- **Exception** ()

  Default Constructor.

- **Exception** (const **Exception** &ex)

  Copy Constructor.

- **Exception** (const std::exception *cause)

  Constructor.

- **Exception** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **Exception** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual ~**Exception** () throw ()
- virtual std::string **getMessage** () const

  Gets the message for this exception.

- virtual const std::exception * **getCause** () const

  Gets the exception that caused this one to be thrown, this allows for chaining of ***exceptions*** *(*p. 116*) in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.*

- virtual void **initCause** (const std::exception *cause)

  Initializes the contained cause exception with the one given.

- virtual const char * **what** () const throw ()

  Implement method from std::exception.

- virtual void **setMessage** (const char *msg,...)

  Sets the cause for this exception.

- virtual void **setMark** (const char *file, const int lineNumber)

  Adds a file/line number to the stack trace.

- virtual **Exception** * **clone** () const

  Clones this exception.

- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const

  Provides the stack trace for every point where this exception was caught, marked, and rethrown.

- virtual void **printStackTrace** () const

  Prints the stack trace to std::err.

- virtual void **printStackTrace** (std::ostream &stream) const

  Prints the stack trace to the given output stream.

- virtual std::string **getStackTraceString** () const

  Gets the stack trace as one contiguous string.

- **Exception** & **operator**= (const **Exception** &ex)

  Assignment operator, copies one ***Exception*** *(p. 1458) to another.*

6.252.1 Constructor & Destructor Documentation

6.252.1.1 decaf::lang::Exception::Exception ()

Default Constructor.

6.252.1.2 decaf::lang::Exception::Exception (const Exception & *ex*)

Copy Constructor.

Parameters:

ex The `Exception` (p. 1458) instance to copy.

6.252.1.3 decaf::lang::Exception::Exception (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the caller must ensure that it passes a valid pointer as this object takes ownership of the exception.

6.252.1.4 decaf::lang::Exception::Exception (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.252.1.5 decaf::lang::Exception::Exception (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.252.1.6 virtual decaf::lang::Exception::~Exception () throw () [virtual]

6.252.2 Member Function Documentation

6.252.2.1 virtual void decaf::lang::Exception::buildMessage (const char * *format*, va_list & *vargs*) [protected, virtual]

6.252.2.2 virtual Exception* decaf::lang::Exception::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

Copy of this **Exception** (p. 1458) object

Implements **decaf::lang::Throwable** (p. 3064).

Reimplemented in **activemq::exceptions::ActiveMQException** (p. 342), **activemq::exceptions::BrokerException** (p. 714), **activemq::exceptions::ConnectionFailedException** (p. 1119), **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2310), **decaf::io::EOFException** (p. 1453), **decaf::io::InterruptedIOException** (p. 1771),

decaf::io::IOException (p. 1788), **decaf::io::UnsupportedEncodingException** (p. 3162), **decaf::io::UTFDataFormatException** (p. 3218), **decaf::lang::exceptions::ClassCastException** (p. 961), **decaf::lang::exceptions::CloneNotSupportedException** (p. 964), **decaf::lang::exceptions::IllegalArgumentException** (p. 1654), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 1657), **decaf::lang::exceptions::IllegalStateException** (p. 1662), **decaf::lang::exceptions::IllegalThreadStateException** (p. 1665), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 1672), **decaf::lang::exceptions::InterruptedException** (p. 1768), **decaf::lang::exceptions::InvalidStateException** (p. 1786), **decaf::lang::exceptions::NegativeArraySizeException** (p. 2243), **decaf::lang::exceptions::NullPointerException** (p. 2268), **decaf::lang::exceptions::NumberFormatException** (p. 2274), **decaf::lang::exceptions::OutOfMemoryError** (p. 2347), **decaf::lang::exceptions::RuntimeException** (p. 2628), **decaf::lang::exceptions::UnsupportedOperationExce** (p. 3165), **decaf::net::BindException** (p. 675), **decaf::net::ConnectException** (p. 1088), **decaf::net::HttpRetryException** (p. 1649), **decaf::net::MalformedURLException** (p. 2007), **decaf::net::NoRouteToHostException** (p. 2256), **decaf::net::PortUnreachableException** (p. 2396), **decaf::net::ProtocolException** (p. 2499), **decaf::net::SocketException** (p. 2788), **decaf::net::SocketTimeoutException** (p. 2809), **decaf::net::UnknownHostException** (p. 3156), **decaf::net::UnknownServiceException** (p. 3159), **decaf::net::URISyntaxException** (p. 3200), **decaf::nio::BufferOverflowException** (p. 762), **decaf::nio::BufferUnderflowException** (p. 765), **decaf::nio::InvalidMarkException** (p. 1781), **decaf::nio::ReadOnlyBufferException** (p. 2537), **decaf::security::cert::CertificateEncodingException** (p. 901), **decaf::security::cert::CertificateException** (p. 904), **decaf::security::cert::CertificateExpiredException** (p. 907), **decaf::security::cert::CertificateNotYetValidException** (p. 910), **decaf::security::cert::CertificateParsingException** (p. 913), **decaf::security::DigestException** (p. 1400), **decaf::security::GeneralSecurityException** (p. 1585), **decaf::security::InvalidKeyException** (p. 1778), **decaf::security::KeyException** (p. 1845), **decaf::security::KeyManagementException** (p. 1848), **decaf::security::NoSuchAlgorithmException** (p. 2259), **decaf::security::NoSuchProviderException** (p. 2265), **decaf::security::ProviderException** (p. 2504), **decaf::security::SignatureException** (p. 2758), **decaf::util::concurrent::BrokenBarrierException** (p. 708), **decaf::util::concurrent::CancellationException** (p. 894), **decaf::util::concurrent::ExecutionException** (p. 1475), **decaf::util::concurrent::RejectedExecutionException** (p. 2569), **decaf::util::concurrent::TimeoutException** (p. 3070), **decaf::util::ConcurrentModificationException** (p. 1058), **decaf::util::NoSuchElementException** (p. 2262), **decaf::util::zip::DataFormatException** (p. 1247), and **decaf::util::zip::ZipException** (p. 3299).

6.252.2.3 virtual const std::exception* decaf::lang::Exception::getCause () const [virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of **exceptions** (p. 116) in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns:

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implements **decaf::lang::Throwable** (p. 3065).

6.252.2.4 virtual std::string decaf::lang::Exception::getMessage () const [virtual]

Gets the message for this exception.

Returns:

Text formatted error message

Implements **decaf::lang::Throwable** (p. 3065).

6.252.2.5 virtual std::vector< std::pair< std::string, int> > decaf::lang::Exception::getStackTrace () const [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown. The first item in the returned vector is the first point where the mark was set (e.g. where the exception was created).

Returns:

the stack trace.

Implements **decaf::lang::Throwable** (p. 3065).

6.252.2.6 virtual std::string decaf::lang::Exception::getStackTraceString () const [virtual]

Gets the stack trace as one contiguous string.

Returns:

string with formatted stack trace data.

Implements **decaf::lang::Throwable** (p. 3066).

6.252.2.7 virtual void decaf::lang::Exception::initCause (const std::exception * *cause*) [virtual]

Initializes the contained cause exception with the one given. The caller should ensure that a valid copy of the causal exception is passed as this **Exception** (p. 1458) object will take ownership of the passed pointer. Do not pass a pointer to the address of an exception allocated on the stack or from an exception in a catch block.

Parameters:

cause The exception that was the cause of this one.

Implements **decaf::lang::Throwable** (p. 3066).

6.252.2.8 Exception& decaf::lang::Exception::operator= (const Exception & *ex*)

Assignment operator, copies one **Exception** (p. 1458) to another.

Parameters:

ex const reference to another **Exception** (p. 1458)

6.252.2.9 virtual void decaf::lang::Exception::printStackTrace (std::ostream & *stream*) const [virtual]

Prints the stack trace to the given output stream.

Parameters:

stream the target output stream.

Implements **decaf::lang::Throwable** (p. 3066).

6.252.2.10 virtual void decaf::lang::Exception::printStackTrace () const [virtual]

Prints the stack trace to std::err.

Implements **decaf::lang::Throwable** (p. 3066).

6.252.2.11 virtual void decaf::lang::Exception::setMark (const char * *file*, const int *lineNumber*) [virtual]

Adds a file/line number to the stack trace.

Parameters:

file The name of the file calling this method (use __FILE__).

lineNumber The line number in the calling file (use __LINE__).

Implements **decaf::lang::Throwable** (p. 3066).

Referenced by decaf::util::concurrent::ExecutorService::submit().

6.252.2.12 virtual void decaf::lang::Exception::setMessage (const char * *msg*, ...) [virtual]

Sets the cause for this exception.

Parameters:

msg The format string for the msg.

... The params to format into the string.

6.252.2.13 virtual void decaf::lang::Exception::setStackTrace (const std::vector< std::pair< std::string, int > > & *trace*) [protected, virtual]

6.252.2.14 virtual const char* decaf::lang::Exception::what () const throw () [virtual]

Implement method from std::exception.

Returns:

the const char* of `getMessage()` (p. 1462).

6.253 cms::ExceptionListener Class Reference

If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener (p. 1465)` that is registered with the `Connection (p. 1089)`.

`#include <src/main/cms/ExceptionListener.h>`Inheritance diagram for cms::ExceptionListener:

Public Member Functions

- virtual ~**ExceptionListener** ()
- virtual void **onException** (const **cms::CMSException** &ex)=0

  Called when an exception occurs.

6.253.1 Detailed Description

If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener (p. 1465)` that is registered with the `Connection (p. 1089)`. An exception listener allows a client to be notified of a problem asynchronously. Some connections only consume messages via the asynchronous event mechanism so they would have no other way to learn that their connection has failed.

Since:

1.0

6.255.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::createO

() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.255.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::getData

() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.255.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::looseMa

(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.255.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::looseUn (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619).

6.255.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::tightMa (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619).

6.255.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::tightMa (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2620).

6.255.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::tightUn (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2620).

Default Constructor.

6.256.1.2 decaf::util::concurrent::ExecutionException::ExecutionException (const decaf::lang::Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex - An exception that should become this type of Exception

6.256.1.3 decaf::util::concurrent::ExecutionException::ExecutionException (const ExecutionException & *ex*)

Copy Constructor.

Parameters:

ex - The Exception to copy in this new instance.

6.256.1.4 decaf::util::concurrent::ExecutionException::ExecutionException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.256.1.5 decaf::util::concurrent::ExecutionException::ExecutionException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - The list of primitives that are formatted into the message

6.256.1.6 decaf::util::concurrent::ExecutionException::ExecutionException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.257 decaf::util::concurrent::Executor Class Reference

An object that executes submitted **decaf.lang.Runnable** (p. 2622) tasks.

`#include <src/main/decaf/util/concurrent/Executor.h>`Inheritance diagram for decaf::util::concurrent::Executor:

Public Member Functions

- virtual ~**Executor** ()
- virtual void **execute** (**decaf::lang::Runnable** *command)=0

  This method is the same as calling the two param execute method and passing true as the second argument.

- virtual void **execute** (**decaf::lang::Runnable** *command, bool takeOwnership)=0

  Executes the given command at some time in the future.

6.257.1 Detailed Description

An object that executes submitted **decaf.lang.Runnable** (p. 2622) tasks. This interface provides a way of decoupling task submission from the mechanics of how each task will be run, including details of thread use, scheduling, etc. An `Executor` (p. 1476) is normally used instead of explicitly creating threads. For example, rather than invoking `new Thread(new(RunnableTask())).start()` for each of a set of tasks, you might use:

```
Executor (p. 1476) executor =  anExecutor;
executor->execute( new RunnableTask1() );
executor->execute( new RunnableTask2() );
...
```

However, the `Executor` (p. 1476) interface does not strictly require that execution be asynchronous. In the simplest case, an executor can run the submitted task immediately in the caller's thread:

```
class DirectExecutor : public Executor (p. 1476) {
public:

    void execute( Runnable* r ) {
        r->run();
    }

}
```

More typically, tasks are executed in some thread other than the caller's thread. The executor below spawns a new thread for each task.

```
class ThreadPerTaskExecutor : public Executor (p. 1476) {
public:
    std::vector<Thread*gt; threads;
```

```
    void execute( Runnable* r ) {
        threads.push_back( new Thread( r ) );
        threads.rbegin()->start();
    }

}
```

The `Executor` (p. 1476) implementations provided in this package implement **decaf.util.concurrent.ExecutorService** (p. 1484), which is a more extensive interface. The **decaf.util.concurrent.ThreadPoolExecutor** (p. 3047) class provides an extensible thread pool implementation. The **decaf.util.concurrentExecutor** (p. ??) class provides convenient factory methods for these **Executors** (p. 1479).

Since:

1.0

6.257.2 Constructor & Destructor Documentation

6.257.2.1 virtual decaf::util::concurrent::Executor::~Executor () [inline, virtual]

6.257.3 Member Function Documentation

6.257.3.1 virtual void decaf::util::concurrent::Executor::execute (decaf::lang::Runnable * *command*, bool *takeOwnership*) [pure virtual]

Executes the given command at some time in the future. The command may execute in a new thread, in a pooled thread, or in the calling thread, at the discretion of the `Executor` (p. 1476) implementation.

Parameters:

command The runnable task to be executed.

takeOwnership Indicates if the **Executor** (p. 1476) should assume ownership of the task and delete the pointer once the task has completed.

Exceptions:

RejectedExecutionException *(p. 2567)* if this task cannot be accepted for execution.

NullPointerException if command is null

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 3055).

6.257.3.2 virtual void decaf::util::concurrent::Executor::execute (decaf::lang::Runnable * *command*) [pure virtual]

This method is the same as calling the two param execute method and passing true as the second argument.

Parameters:

command The runnable task to be executed.

Exceptions:

RejectedExecutionException *(p. 2567)* if this task cannot be accepted for execution.
NullPointerException if command is null

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 3055).

The documentation for this class was generated from the following file:

6.258.1 Detailed Description

Implements a set of utilities for use with **Executors** (p. 1479), **ExecutorService** (p. 1484), **ThreadFactory** (p. 3027), and **Callable** (p. 888) types, as well as providing factory methods for instance of these types configured for the most common use cases.

Since:

1.0

6.258.2 Constructor & Destructor Documentation

6.258.2.1 virtual decaf::util::concurrent::Executors::~Executors () [virtual]

6.258.3 Member Function Documentation

6.258.3.1 template<typename E > static Callable<E>* decaf::util::concurrent::Executors::callable (decaf::lang::Runnable * *task*, const E & *result*, bool *owns* = true) [inline, static]

Returns a **Callable** (p. 888) object that, when called, runs the given task and returns the default value of the template type E (or E()).

Parameters:

task The Runnable task that is to be executed.

result The value that is returned from the callable upon completion.

owns Does the callable instance own the given Runnable task pointer, default is true.

Returns:

a new **Callable**<**E**> (p. 888) pointer that is owned by the caller.

Exceptions:

NullPointerException if the Runnable task is NULL

References NULL.

6.258.3.2 template<typename E > static Callable<E>* decaf::util::concurrent::Executors::callable (decaf::lang::Runnable * *task*, bool *owns* = true) [inline, static]

Returns a **Callable** (p. 888) object that, when called, runs the given task and returns the default value of the template type E (or E()).

Parameters:

task The Runnable task that is to be executed.

owns Does the callable instance own the given Runnable task pointer, default is true.

Returns:

a new **Callable<E>** (p. 888) pointer that is owned by the caller.

Exceptions:

NullPointerException if the Runnable task is NULL

References NULL.

6.258.3.3 static ThreadFactory* decaf::util::concurrent::Executors::getDefaultThreadFactory () [static]

Creates and returns a new **ThreadFactory** (p. 3027) that expresses the default behavior for ThreadFactories used in **Executor** (p. 1476) classes. The default factory create a new non-daemon thread with normal priority and a name whose value is equal to pool-N-thread-M, where N is the sequence number of this factory, and M is the sequence number of the thread created by this factory.

Returns:

a new instance of the default thread factory used in **Executors** (p. 1479), the caller takes ownership of the returned pointer.

6.258.3.4 static ExecutorService* decaf::util::concurrent::Executors::newFixedThreadPool (int *nThreads*, ThreadFactory * *threadFactory*) [static]

Creates a new **ThreadPoolExecutor** (p. 3047) with a fixed number of threads to process incoming tasks. The thread pool will use an unbounded queue to store pending tasks. At any given time the maximum threads in the pool will be equal to the number given to this factory method. If a thread in the pool dies a new one will be spawned to take its place in the pool. Tasks that are submitted when all pooled threads are busy will be held until a thread is freed if the pool has allocated its assigned number of threads already.

Parameters:

nThreads The number of threads to assign as the max for the new **ExecutorService** (p. 1484).

threadFactory Instance of a **ThreadFactory** (p. 3027) that will be used by the **Executor** (p. 1476) to spawn new worker threads. This parameter cannot be NULL.

Returns:

pointer to a new **ExecutorService** (p. 1484) that is owned by the caller.

Exceptions:

NullPointerException if threadFactory is NULL.

IllegalArgumentException if nThreads is less than or equal to zero.

6.258.3.5 static ExecutorService* decaf::util::concurrent::Executors::newFixedThreadPool (int *nThreads*) [static]

Creates a new **ThreadPoolExecutor** (p. 3047) with a fixed number of threads to process incoming tasks. The thread pool will use an unbounded queue to store pending tasks. At any given time the maximum threads in the pool will be equal to the number given to this factory method. If a thread in the pool dies a new one will be spawned to take its place in the pool. Tasks that are submitted when all pooled threads are busy will be held until a thread is freed if the pool has allocated its assigned number of threads already.

Parameters:

nThreads The number of threads to assign as the max for the new **ExecutorService** (p. 1484).

Returns:

pointer to a new **ExecutorService** (p. 1484) that is owned by the caller.

Exceptions:

IllegalArgumentException if nThreads is less than or equal to zero.

6.258.3.6 static ExecutorService* decaf::util::concurrent::Executors::newSingleThreadExecutor (ThreadFactory * *threadFactory*) [static]

Creates an **Executor** (p. 1476) that uses a single worker thread operating off an unbounded queue owned by the executor. If the Executor's single thread should terminate for some reason such as failure during the execution of a task, a new Thread will be created if the **Executor** (p. 1476) has not been shutdown and there are more tasks in the queue. The **Executor** (p. 1476) returned from this method is owned by the caller but unlike the **Executor** (p. 1476) returned from the method newFixedThreadPool(1) this one cannot be reconfigurable to use more threads later on.

Parameters:

threadFactory Instance of a **ThreadFactory** (p. 3027) that will be used by the **Executor** (p. 1476) to spawn new worker threads. This parameter cannot be NULL and ownership passes to the **Executor** (p. 1476).

Returns:

a new **Executor** (p. 1476) pointer that is owned by the caller.

Exceptions:

NullPointerException if threadFactory is NULL.

6.258.3.7 static ExecutorService* decaf::util::concurrent::Executors::newSingleThreadExecutor () [static]

Creates an **Executor** (p. 1476) that uses a single worker thread operating off an unbounded queue owned by the executor. If the Executor's single thread should terminate for some reason such as failure during the execution of a task, a new Thread will be created if the **Executor** (p. 1476) has not been shutdown and there are more tasks in the queue. The **Executor** (p. 1476) returned from this method is owned by the caller but unlike the **Executor** (p. 1476) returned from the method newFixedThreadPool(1) this one cannot be reconfigurable to use more threads later on.

Returns:

a new **Executor** (p. 1476) pointer that is owned by the caller.

6.258.3.8 static ExecutorService* decaf::util::concurrent::Executors::unconfigurableExecutorService (ExecutorService * *executor*) [static]

Returns a new **ExecutorService** (p. 1484) derived instance that wraps and takes ownership of the given **ExecutorService** (p. 1484) pointer. The returned **ExecutorService** (p. 1484) delegates all calls to the wrapped **ExecutorService** (p. 1484) instance but does not allow any configuration changes. This method provides a means of locking an **ExecutorService** (p. 1484) instance configuration and prevents changes that might be accomplished with casting.

Parameters:

executor The **ExecutorService** (p. 1484) pointer to wrap and take ownership of.

Returns:

a new **ExecutorService** (p. 1484) pointer that is owned by the caller.

Exceptions:

NullPointerException if **ExecutorService** (p. 1484) is NULL.

6.258.4 Friends And Related Function Documentation

  Future< E > * **submit** (**decaf::lang::Runnable** *task, bool takeOwnership=true)

  Submits a Runnable object for execution.

Protected Member Functions

- virtual void **doSubmit** (**FutureType** *future)=0

*Perform the actual submit of a **FutureType** (p. 1581) instance, the caller is responsible for creating the properly typed Future<E> object and returning that to its caller.*

6.259.1 Detailed Description

An **Executor** (p. 1476) that provides methods to manage termination and methods that can produce a **Future** (p. 1571) for tracking progress of one or more asynchronous tasks. An **ExecutorService** (p. 1484) can be shut down, which will cause it to reject new tasks. Two different methods are provided for shutting down an **ExecutorService** (p. 1484). The **shutdown()** (p. 1486) method will allow previously submitted tasks to execute before terminating, while the **shutdownNow()** (p. 1486) method prevents waiting tasks from starting and attempts to stop currently executing tasks. Upon termination, an executor has no tasks actively executing, no tasks awaiting execution, and no new tasks can be submitted. An unused **ExecutorService** (p. 1484) should be shut down to allow reclamation of its resources.

Method submit extends base method **Executor.execute** (p. 1477)(**decaf.lang.Runnable** (p. 2622)) by creating and returning a **Future** (p. 1571) that can be used to cancel execution and/or wait for completion. Methods invokeAny and invokeAll perform the most commonly useful forms of bulk execution, executing a collection of tasks and then waiting for at least one, or all, to complete. (Class ExecutorCompletionService can be used to write customized variants of these methods.)

The **Executors** (p. 1479) class provides factory methods for the executor services provided in this package.

Since:

1.0

6.259.2 Constructor & Destructor Documentation

6.259.2.1 virtual decaf::util::concurrent::ExecutorService::~ExecutorService () [inline, virtual]

6.259.3 Member Function Documentation

6.259.3.1 virtual bool decaf::util::concurrent::ExecutorService::awaitTermination (long long *timeout*, const TimeUnit & *unit*) [pure virtual]

The caller will block until the executor has completed termination meaning all tasks that where scheduled before shutdown have now completed and the executor is ready for deletion. If the timeout period elapses before the executor reaches the terminated state then this method return false to indicate it has not terminated.

Parameters:

timeout The amount of time to wait before abandoning the wait for termination.

unit The unit of time that the timeout value represents.

Returns:

true if the executor terminated or false if the timeout expired.

Exceptions:

InterruptedException if this call is interrupted while awaiting termination.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 3054).

6.259.3.2 virtual void decaf::util::concurrent::ExecutorService::doSubmit (FutureType * *future*) [protected, pure virtual]

Perform the actual submit of a **FutureType** (p. 1581) instance, the caller is responsible for creating the properly typed Future<E> object and returning that to its caller. The pointer provided is the property of this **Executor** (p. 1476) and must be deleted by this executor once its completed.

Parameters:

future Pointer to a base **FutureType** (p. 1581) instance that is to be submitted to the **Executor** (p. 1476).

Implemented in **decaf::util::concurrent::AbstractExecutorService** (p. 154).

6.259.3.3 virtual bool decaf::util::concurrent::ExecutorService::isShutdown () const [pure virtual]

Returns whether this executor has been shutdown or not.

Returns:

true if this executor has been shutdown.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 3058).

6.259.3.4 virtual bool decaf::util::concurrent::ExecutorService::isTerminated () const [pure virtual]

Returns whether all tasks have completed after this executor was shut down.

Returns:

true if all tasks have completed after a request to shut down was made.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 3058).

6.259.3.5 virtual void decaf::util::concurrent::ExecutorService::shutdown () [pure virtual]

Performs an orderly shutdown of this **Executor** (p. 1476). Previously queued tasks are allowed to complete but no new tasks are accepted for execution. Calling this method more than once has no affect on this executor.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 3061).

6.259.3.6 virtual ArrayList<decaf::lang::Runnable*> decaf::util::concurrent::ExecutorService::shutdownNow () [pure virtual]

Attempts to stop all currently executing tasks and returns an **ArrayList** (p. 585) containing the Runnables that did not get executed, these object become the property of the caller and are not deleted by this class, they are removed from the work queue and forgotten about. There is no guarantee that this method will halt execution of currently executing tasks.

Returns:

an **ArrayList** (p. 585) containing all Runnable instance that were still waiting to be executed by this class, call now owns those pointers.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 3061).

6.259.3.7 template<typename E > Future<E>* decaf::util::concurrent::ExecutorService::submit (decaf::lang::Runnable * *task*, bool *takeOwnership* = true) [inline]

Submits a Runnable object for execution. A **Future** (p. 1571) object is created and returned that will return the default value of the template type upon completion. The caller owns the returned pointer and is responsible for deleting it. The returned value is a proxy to the actual **FutureTask** (p. 1575) that is submitted for execution so is legal for the caller to delete this value before its execution has completed.

Parameters:

task Pointer to a Runnable object that will be executed by this **ExecutorService** (p. 1484).

takeOwnership Boolean value indicating if the **Executor** (p. 1476) now owns the pointer to the task.

Returns:

a new **Future** (p. 1571)<?> pointer that is owned by the caller.

Exceptions:

RejectedExecutionException *(p. 2567)* if the task cannot be scheduled for execution

NullPointerException if the Runnable pointer passed is NULL.

References DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, decaf::lang::Pointer< T, REFCOUNTER >::get(), decaf::lang::Pointer< T, REFCOUNTER >::release(), and decaf::lang::Exception::setMark().

6.259.3.8 template<typename E > Future<E>* decaf::util::concurrent::ExecutorService::submit (decaf::lang::Runnable * *task*, const E & *result*, bool *takeOwnership* = true) [inline]

Submits a Runnable task for execution and returns a **Future** (p. 1571) representing that task. The Future's `get` method will return the given result upon successful completion. The caller owns the returned pointer and is responsible for deleting it. The returned value is a proxy to the actual **FutureTask** (p. 1575) that is submitted for execution so is legal for the caller to delete this value before its execution has completed.

Parameters:

task The pointer to the task to submit.

result The result to return

takeOwnership Boolean value indicating if the **Executor** (p. 1476) now owns the pointer to the task.

Returns:

a **Future** (p. 1571)<?> pointer representing pending completion of the task,

Exceptions:

RejectedExecutionException *(p. 2567)* if the task cannot be scheduled for execution

NullPointerException if the task is null

References DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, decaf::lang::Pointer< T, REFCOUNTER >::get(), decaf::lang::Pointer< T, REFCOUNTER >::release(), and decaf::lang::Exception::setMark().

6.259.3.9 template<typename E > Future<E>* decaf::util::concurrent::ExecutorService::submit (Callable< E > * *task*, bool *takeOwnership* = true) [inline]

Submits a value-returning task for execution and returns a **Future** (p. 1571) pointer representing the pending results of the task. The Future's `get` method will return the task's result upon successful completion. The caller owns the returned pointer and is responsible for deleting it. The returned value is a proxy to the actual **FutureTask** (p. 1575) that is submitted for execution so is legal for the caller to delete this value before its execution has completed.

Parameters:

task Pointer to the **Callable** (p. 888)<?> task to submit.

takeOwnership Boolean value indicating if the **Executor** (p. 1476) now owns the pointer to the task.

Returns:

a **Future** (p. 1571)<?> pointer representing pending completion of the task.

Exceptions:

RejectedExecutionException *(p. 2567)* if the task cannot be scheduled for execution

NullPointerException if the task is null

References DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, decaf::lang::Pointer< T, REFCOUNTER >::get(), decaf::lang::Pointer< T, REFCOUNTER >::release(), and decaf::lang::Exception::setMark().

6.261 activemq::transport::failover::FailoverTransport Class Reference

`#include <src/main/activemq/transport/failover/FailoverTransport.h>`Inheritance diagram for activemq::transport::failover::FailoverTransport:

Public Member Functions

- **FailoverTransport** ()
- virtual ~**FailoverTransport** ()
- void **reconnect** (bool rebalance)

  *Indicates that the **Transport** (p. 3125) needs to reconnect to another URI in its list.*

- void **add** (bool rebalance, const std::string &uri)

  *Adds a New URI to the List of URIs this **transport** (p. 72) can Connect to.*

- virtual void **addURI** (bool rebalance, const **List**< **decaf::net::URI** > &uris)

  *Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3125) is a composite of.*

- virtual void **removeURI** (bool rebalance, const **List**< **decaf::net::URI** > &uris)

  *Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3125) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3125) should result in that **Transport** (p. 3125) being disposed of.*

- virtual void **start** ()

  *Starts the **Transport** (p. 3125), the send methods of a **Transport** (p. 3125) will throw an exception if used before the **Transport** (p. 3125) is started.*

- virtual void **stop** ()

  *Stops the **Transport** (p. 3125).*

- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual void **oneway** (const **Pointer**< **Command** > command)

  Sends a one-way command.

- virtual **Pointer**< **FutureResponse** > **asyncRequest** (const **Pointer**< **Command** > command, const **Pointer**< **ResponseCallback** > responseCallback)

  *Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.*

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > command)

  Sends the given command to the broker and then waits for the response.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > command, unsigned int timeout)

Sends the given command to the broker and then waits for the response.

- virtual **Pointer< wireformat::WireFormat > getWireFormat** () const

  Gets the WireFormat instance that is in use by this ***transport*** *(p. 72).*

- virtual void **setWireFormat** (const **Pointer< wireformat::WireFormat >** wireFormat AMQCPP_UNUSED)

  Sets the WireFormat instance to use.

- virtual void **setTransportListener** (**TransportListener** *listener)

  Sets the observer of asynchronous events from this ***transport*** *(p. 72).*

- virtual **TransportListener** * **getTransportListener** () const

  Gets the observer of asynchronous events from this ***transport*** *(p. 72).*

- virtual bool **isFaultTolerant** () const

  Is this ***Transport*** *(p. 3125) fault tolerant, meaning that it will reconnect to a broker on disconnect.*

- virtual bool **isConnected** () const

  Is the ***Transport*** *(p. 3125) Connected to its Broker.*

- virtual bool **isClosed** () const

  Has the ***Transport*** *(p. 3125) been shutdown and no longer usable.*

- bool **isInitialized** () const
- void **setInitialized** (bool value)
- virtual **Transport** * **narrow** (const std::type_info &typeId)

  Narrows down a Chain of Transports to a specific ***Transport*** *(p. 3125) to allow a higher level* ***transport*** *(p. 72) to skip intermediate Transports in certain circumstances.*

- virtual std::string **getRemoteAddress** () const
- virtual void **reconnect** (const **decaf::net::URI** &uri)

  reconnect to another location

- virtual void **updateURIs** (bool rebalance, const **decaf::util::List< decaf::net::URI >** &uris)

  Updates the set of URIs the ***Transport*** *(p. 3125) can connect to.*

- virtual bool **isPending** () const
- virtual bool **iterate** ()

  Performs the actual Reconnect operation for the ***FailoverTransport*** *(p. 1490), when a connection is made this method returns false to indicate it doesn't need to run again, otherwise it returns true to indicate its still trying to connect.*

6.261.1.2 virtual activemq::transport::failover::FailoverTransport::~FailoverTransport () [virtual]

6.261.2 Member Function Documentation

6.261.2.1 void activemq::transport::failover::FailoverTransport::add (bool *rebalance*, const std::string & *uri*)

Adds a New URI to the List of URIs this **transport** (p. 72) can Connect to.

Parameters:

rebalance Should the **transport** (p. 72) reconnect to a different broker to balance load.

uri A String version of a URI to add to the URIs to **failover** (p. 74) to.

6.261.2.2 virtual void activemq::transport::failover::FailoverTransport::addURI (bool *rebalance*, const List< decaf::net::URI > & *uris*) [virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3125) is a composite of.

Parameters:

rebalance Indicates if the addition should cause a forced reconnect or not.

uris The new URI set to add to the set this composite maintains.

Implements **activemq::transport::CompositeTransport** (p. 1049).

6.261.2.3 virtual Pointer<FutureResponse> activemq::transport::failover::FailoverTransport::asyncRequest (const Pointer< Command > *command*, const Pointer< ResponseCallback > *responseCallback*) [virtual]

Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.

Parameters:

command The Command object that is to sent out.

responseCallback A callback object that will be notified once a response to the command is received.

Returns:

A **FutureResponse** (p. 1573) instance that can be queried for the Response to the Command.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3126).

6.261.2.4 virtual void activemq::transport::failover::FailoverTransport::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

IOException if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 967).

6.261.2.5 long long activemq::transport::failover::FailoverTransport::getBackOffMultiplier () const

6.261.2.6 int activemq::transport::failover::FailoverTransport::getBackupPoolSize () const

6.261.2.7 long long activemq::transport::failover::FailoverTransport::getInitialReconnectDelay () const

6.261.2.8 int activemq::transport::failover::FailoverTransport::getMaxCacheSize () const

6.261.2.9 int activemq::transport::failover::FailoverTransport::getMaxPullCacheSize () const

6.261.2.10 int activemq::transport::failover::FailoverTransport::getMaxReconnectAttempts () const

6.261.2.11 long long activemq::transport::failover::FailoverTransport::getMaxReconnectDelay () const

6.261.2.12 const decaf::util::List<decaf::net::URI>& activemq::transport::failover::FailoverTransport::getPriorityURIs () const

6.261.2.13 long long activemq::transport::failover::FailoverTransport::getReconnectDelay () const

6.261.2.14 virtual std::string activemq::transport::failover::FailoverTransport::getRemoteAddress () const [virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3127).

6.261.2.15 int activemq::transport::failover::FailoverTransport::getStartupMaxReconnectAttempts () const

6.261.2.16 long long activemq::transport::failover::FailoverTransport::getTimeout () const

6.261.2.17 virtual TransportListener* activemq::transport::failover::FailoverTransport::getTransportListener () const [virtual]

Gets the observer of asynchronous events from this **transport** (p. 72).

Returns:

the listener of **transport** (p. 72) events.

Implements **activemq::transport::Transport** (p. 3127).

6.261.2.18 virtual Pointer<wireformat::WireFormat> activemq::transport::failover::FailoverTransport::getWireFormat () const [virtual]

Gets the WireFormat instance that is in use by this **transport** (p. 72). In the case of nested **transport** (p. 72) this method delegates down to the lowest level **transport** (p. 72) that actually maintains a WireFormat info instance.

Returns:

The WireFormat the object used to encode / decode **commands** (p. 61).

Implements **activemq::transport::Transport** (p. 3127).

6.261.2.19 void activemq::transport::failover::FailoverTransport::handleConnectionControl (const Pointer< Command > *control*) [protected]

Called when the Broker sends a ConnectionControl command which could signal that this Client needs to reconnect in order to rebalance the connections on a Broker or the set of Known brokers has changed.

Parameters:

control The ConnectionControl command sent from the Broker.

6.261.2.20 void activemq::transport::failover::FailoverTransport::handleTransportFailure (const decaf::lang::Exception & *error*) [protected]

Called when this class' **TransportListener** (p. 3146) is notified of a Failure.

Parameters:

error - The CMS Exception that was thrown.

Exceptions:

Exception if an error occurs.

6.261.2.21 bool activemq::transport::failover::FailoverTransport::isBackup () const

6.261.2.22 virtual bool activemq::transport::failover::FailoverTransport::isClosed () const [virtual]

Has the **Transport** (p. 3125) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3125)

Implements **activemq::transport::Transport** (p. 3128).

6.261.2.23 virtual bool activemq::transport::failover::FailoverTransport::isConnected () const [virtual]

Is the **Transport** (p. 3125) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3128).

6.261.2.24 bool activemq::transport::failover::FailoverTransport::isConnectedToPriority () const

6.261.2.25 virtual bool activemq::transport::failover::FailoverTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3125) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3125) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3128).

6.261.2.26 bool activemq::transport::failover::FailoverTransport::isInitialized () const

6.261.2.27 virtual bool activemq::transport::failover::FailoverTransport::isPending () const [virtual]

Returns:

true if there is a need for the iterate method to be called by this classes task runner.

Implements **activemq::threads::CompositeTask** (p. 1045).

6.261.2.28 bool activemq::transport::failover::FailoverTransport::isPriorityBackup () const

6.261.2.29 bool activemq::transport::failover::FailoverTransport::isRandomize () const

6.261.2.30 bool activemq::transport::failover::FailoverTransport::isRebalanceUpdateURIs () const

6.261.2.31 bool activemq::transport::failover::FailoverTransport::isReconnectSupported () const [virtual]

Returns:

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 3128).

6.261.2.32 bool activemq::transport::failover::FailoverTransport::isTrackMessages () const

6.261.2.33 bool activemq::transport::failover::FailoverTransport::isTrackTransactionProducers () const

6.261.2.34 bool activemq::transport::failover::FailoverTransport::isUpdateURIsSupported () const [virtual]

Returns:

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 3129).

6.261.2.35 bool activemq::transport::failover::FailoverTransport::isUseExponentialBackOff () const

6.261.2.36 virtual bool activemq::transport::failover::FailoverTransport::iterate () [virtual]

Performs the actual Reconnect operation for the **FailoverTransport** (p. 1490), when a connection is made this method returns false to indicate it doesn't need to run again, otherwise it returns true to indicate its still trying to connect.

Returns:

false to indicate a connection, true to indicate it needs to try again.

Implements **activemq::threads::Task** (p. 2989).

6.261.2.37 virtual Transport* activemq::transport::failover::FailoverTransport::narrow (const std::type_info & *typeId*) [virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3125) to allow a higher level **transport** (p. 72) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3129).

6.261.2.38 virtual void activemq::transport::failover::FailoverTransport::oneway (const Pointer< Command > *command*) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3129).

6.261.2.39 virtual void activemq::transport::failover::FailoverTransport::reconnect (const decaf::net::URI & *uri*) [virtual]

reconnect to another location

Parameters:

uri The new URI to connect this **Transport** (p. 3125) to.

Exceptions:

IOException on failure or if reconnect is not supported.

Implements **activemq::transport::Transport** (p. 3130).

6.261.2.40 void activemq::transport::failover::FailoverTransport::reconnect (bool *rebalance*)

Indicates that the **Transport** (p. 3125) needs to reconnect to another URI in its list.

Parameters:

rebalance Indicates if the current connection should be broken and reconnected.

6.261.2.41 virtual void activemq::transport::failover::FailoverTransport::removeURI (bool *rebalance*, const List< decaf::net::URI > & *uris*) [virtual]

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3125) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3125) should result in that **Transport** (p. 3125) being disposed of.

Parameters:

rebalance Indicates if the removal should cause a forced reconnect or not.

uris The new URI set to remove to the set this composite maintains.

Implements **activemq::transport::CompositeTransport** (p. 1050).

6.261.2.42 virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > *command*, unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command The command to be sent.

timeout The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3130).

6.261.2.43 virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3130).

6.261.2.44 void activemq::transport::failover::FailoverTransport::restoreTransport (const Pointer< Transport > *transport*) [protected]

Given a **Transport** (p. 3125) restore the **state** (p. 70) of the Client's connection to the Broker using the data accumulated in the State Tracker.

Parameters:

transport (p. 72) The new **Transport** (p. 3125) connected to the Broker.

Exceptions:

IOException if an errors occurs while restoring the old **state** (p. 70).

6.261.2.45 void activemq::transport::failover::FailoverTransport::setBackOffMultiplier (long long *value*)

6.261.2.46 void activemq::transport::failover::FailoverTransport::setBackup (bool *value*)

6.261.2.47 void activemq::transport::failover::FailoverTransport::setBackupPoolSize (int *value*)

6.261.2.48 void activemq::transport::failover::FailoverTransport::setConnectionInterruptProcessingComplet (const Pointer< commands::ConnectionId > *connectionId*)

6.261.2.49 void activemq::transport::failover::FailoverTransport::setInitialized (bool *value*)

6.261.2.50 void activemq::transport::failover::FailoverTransport::setInitialReconnectDelay (long long *value*)

6.261.2.51 void activemq::transport::failover::FailoverTransport::setMaxCacheSize (int *value*)

6.261.2.52 void activemq::transport::failover::FailoverTransport::setMaxPullCacheSize (int *value*)

6.261.2.53 void activemq::transport::failover::FailoverTransport::setMaxReconnectAttempts (int *value*)

6.261.2.54 void activemq::transport::failover::FailoverTransport::setMaxReconnectDelay (long long *value*)

6.261.2.55 void activemq::transport::failover::FailoverTransport::setPriorityBackup (bool *priorityBackup*)

6.261.2.56 void activemq::transport::failover::FailoverTransport::setPriorityURIs (const std::string & *priorityURIs*)

6.261.2.57 void activemq::transport::failover::FailoverTransport::setRandomize (bool *value*)

6.261.2.58 void activemq::transport::failover::FailoverTransport::setRebalanceUpdateURIs (bool *rebalanceUpdateURIs*)

6.261.2.59 void activemq::transport::failover::FailoverTransport::setReconnectDelay (long long *value*)

6.261.2.60 void activemq::transport::failover::FailoverTransport::setReconnectSupported (bool *value*)

6.261.2.61 void activemq::transport::failover::FailoverTransport::setStartupMaxReconnectAttempts (int *value*)

6.261.2.62 void activemq::transport::failover::FailoverTransport::setTimeout (long long *value*)

Parameters:

listener the listener of **transport** (p. 72) events.

Implements **activemq::transport::Transport** (p. 3131).

6.261.2.66 void activemq::transport::failover::FailoverTransport::setUpdateURIsSupported (bool *value*)

6.261.2.67 void activemq::transport::failover::FailoverTransport::setUseExponentialBackOff (bool *value*)

6.261.2.68 virtual void activemq::transport::failover::FailoverTransport::setWireFormat (const Pointer< wireformat::WireFormat > wireFormat *wireFormat*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 61).

Implements **activemq::transport::Transport** (p. 3131).

6.261.2.69 virtual void activemq::transport::failover::FailoverTransport::start () [virtual]

Starts the **Transport** (p. 3125), the send methods of a **Transport** (p. 3125) will throw an exception if used before the **Transport** (p. 3125) is started.

Exceptions:

IOException if and error occurs while starting the **Transport** (p. 3125).

Implements **activemq::transport::Transport** (p. 3131).

6.261.2.70 virtual void activemq::transport::failover::FailoverTransport::stop () [virtual]

Stops the **Transport** (p. 3125).

Exceptions:

IOException if an error occurs while stopping the **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3132).

6.261.2.71 virtual void activemq::transport::failover::FailoverTransport::updateURIs (bool *rebalance*, const decaf::util::List< decaf::net::URI > & *uris*) [virtual]

Updates the set of URIs the **Transport** (p. 3125) can connect to. If the **Transport** (p. 3125) doesn't support updating its URIs then an IOException is thrown.

Parameters:

rebalance Indicates if a forced reconnection should be performed as a result of the update.

uris The new list of URIs that can be used for connection.

Exceptions:

IOException if an error occurs or updates aren't supported.

Implements **activemq::transport::Transport** (p. 3132).

6.261.3 Friends And Related Function Documentation

6.261.3.1 friend class BackupTransportPool [friend]

6.261.3.2 friend class FailoverTransportListener [friend]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransport.h**

6.262 activemq::transport::failover::FailoverTransportFactory Class Reference

Creates an instance of a **FailoverTransport** (p. 1490).

`#include <src/main/activemq/transport/failover/FailoverTransportFactory.h>`Inheritance diagram for activemq::transport::failover::FailoverTransportFactory:

Public Member Functions

- virtual ~**FailoverTransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (const **decaf::net::URI** &location)

  *Creates a fully configured **Transport** (p. 3125) instance which could be a chain of filters and transports.*

- virtual **Pointer**< **Transport** > **createComposite** (const **decaf::net::URI** &location)

  *Creates a slimed down **Transport** (p. 3125) instance which can be used in composite **transport** (p. 72) instances.*

Protected Member Functions

6.262.1 Detailed Description

Creates an instance of a **FailoverTransport** (p. 1490).

Since:

3.0

6.262.2 Constructor & Destructor Documentation

6.262.2.1 virtual activemq::transport::failover::FailoverTransportFactory::~FailoverTransportFactory () [inline, virtual]

6.262.3 Member Function Documentation

6.262.3.1 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::create (const decaf::net::URI & *location*) [virtual]

Creates a fully configured **Transport** (p. 3125) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3133).

6.262.3.2 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::createComposite (const decaf::net::URI & *location*) [virtual]

Creates a slimed down **Transport** (p. 3125) instance which can be used in composite **transport** (p. 72) instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3134).

6.262.3.3 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::doCreateComposite (const decaf::net::URI & *location*, const decaf::util::Properties & *properties*) [protected, virtual]

Creates a slimed down **Transport** (p. 3125) instance which can be used in composite **transport** (p. 72) instances.

Parameters:

location - URI location to connect to.

properties - Properties to apply to the **transport** (p. 72).

Returns:

Pointer to a new **FailoverTransport** (p. 1490) instance.

Exceptions:

ActiveMQexception if an error occurs

- src/main/activemq/transport/failover/**FailoverTransportFactory.h**

6.263 activemq::transport::failover::FailoverTransportListener Class Reference

Utility class used by the **Transport** (p. 3125) to perform the work of responding to events from the active **Transport** (p. 3125).

`#include <src/main/activemq/transport/failover/FailoverTransportListener.h>`Inheritance diagram for activemq::transport::failover::FailoverTransportListener:

Public Member Functions

- **FailoverTransportListener** (**FailoverTransport** *parent)
- virtual ~**FailoverTransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > command)

  Event handler for the receipt of a command.

- virtual void **onException** (const **decaf::lang::Exception** &ex)

  Event handler for an exception from a command ***transport*** *(p. 72).*

- virtual void **transportInterrupted** ()

  The ***transport*** *(p. 72) has suffered an interruption from which it hopes to recover.*

- virtual void **transportResumed** ()

  The ***transport*** *(p. 72) has resumed after an interruption.*

6.263.1 Detailed Description

Utility class used by the **Transport** (p. 3125) to perform the work of responding to events from the active **Transport** (p. 3125).

Since:

3.0

6.263.2 Constructor & Destructor Documentation

6.263.2.1 activemq::transport::failover::FailoverTransportListener::FailoverTransportListener (FailoverTransport * *parent*)

6.263.2.2 virtual activemq::transport::failover::FailoverTransportListener::~FailoverTransportListener () [virtual]

6.263.3 Member Function Documentation

6.263.3.1 virtual void activemq::transport::failover::FailoverTransportListener::onCommand (const Pointer< Command > *command*) [virtual]

Event handler for the receipt of a command. The **transport** (p. 72) passes off all received **commands** (p. 61) to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3125) deletes the command upon receipt.

Parameters:

command the received command object.

Implements **activemq::transport::TransportListener** (p. 3146).

6.263.3.2 virtual void activemq::transport::failover::FailoverTransportListener::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 72).

Parameters:

ex The exception.

Implements **activemq::transport::TransportListener** (p. 3147).

6.263.3.3 virtual void activemq::transport::failover::FailoverTransportListener::transportInterrupted () [virtual]

The **transport** (p. 72) has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3147).

6.263.3.4 virtual void activemq::transport::failover::FailoverTransportListener::transportResumed () [virtual]

The **transport** (p. 72) has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3147).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransportListener.h**

6.264 activemq::core::FifoMessageDispatchChannel Class Reference

`#include <src/main/activemq/core/FifoMessageDispatchChannel.h>`Inheritance diagram for activemq::core::FifoMessageDispatchChannel:

Public Member Functions

- **FifoMessageDispatchChannel** ()
- virtual ~**FifoMessageDispatchChannel** ()
- virtual void **enqueue** (const **Pointer**< **MessageDispatch** > &message)

  Add a Message to the Channel behind all pending message.

- virtual void **enqueueFirst** (const **Pointer**< **MessageDispatch** > &message)

  Add a message to the front of the Channel.

- virtual bool **isEmpty** () const
- virtual bool **isClosed** () const
- virtual bool **isRunning** () const
- virtual **Pointer**< **MessageDispatch** > **dequeue** (long long timeout)

  Used to get an enqueued message.

- virtual **Pointer**< **MessageDispatch** > **dequeueNoWait** ()

  Used to get an enqueued message if there is one queued right now.

- virtual **Pointer**< **MessageDispatch** > **peek** () const

  Peek in the Queue and return the first message in the Channel without removing it from the channel.

- virtual void **start** ()

  Starts dispatch of messages from the Channel.

- virtual void **stop** ()

  Stops dispatch of message from the Channel.

- virtual void **close** ()

  Close this channel no messages will be dispatched after this method is called.

- virtual void **clear** ()

  Clear the Channel, all pending messages are removed.

- virtual int **size** () const
- virtual std::vector< **Pointer**< **MessageDispatch** > > **removeAll** ()

  Remove all messages that are currently in the Channel and return them as a list of Messages.

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.264.1 Constructor & Destructor Documentation

6.264.1.1 activemq::core::FifoMessageDispatchChannel::FifoMessageDispatchChannel ()

6.264.1.2 virtual activemq::core::FifoMessageDispatchChannel::~FifoMessageDispatchChannel () [virtual]

6.264.2 Member Function Documentation

6.264.2.1 virtual void activemq::core::FifoMessageDispatchChannel::clear () [virtual]

Clear the Channel, all pending messages are removed.

Implements **activemq::core::MessageDispatchChannel** (p. 2151).

6.264.2.2 virtual void activemq::core::FifoMessageDispatchChannel::close () [virtual]

Close this channel no messages will be dispatched after this method is called.

Implements **activemq::core::MessageDispatchChannel** (p. 2151).

6.264.2.3 virtual Pointer<MessageDispatch> activemq::core::FifoMessageDispatchChannel::dequeue (long long *timeout*) [virtual]

Used to get an enqueued message. The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will consumed by this method.

Returns:

null if we timeout or if the consumer is closed.

Exceptions:

ActiveMQException

Implements **activemq::core::MessageDispatchChannel** (p. 2151).

6.264.2.4 virtual Pointer<MessageDispatch> activemq::core::FifoMessageDispatchChannel::dequeueNoWait () [virtual]

Used to get an enqueued message if there is one queued right now. If there is no waiting message than this method returns Null.

Returns:

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 2151).

6.264.2.5 virtual void activemq::core::FifoMessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & *message*) [virtual]

Add a Message to the Channel behind all pending message.

Parameters:

message - The message to add to the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.264.2.6 virtual void activemq::core::FifoMessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & *message*) [virtual]

Add a message to the front of the Channel.

Parameters:

message - The Message to add to the front of the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.264.2.7 virtual bool activemq::core::FifoMessageDispatchChannel::isClosed () const [inline, virtual]

Returns:

has the Queue been closed.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.264.2.8 virtual bool activemq::core::FifoMessageDispatchChannel::isEmpty () const [virtual]

Returns:

true if there are no messages in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.264.2.9 virtual bool activemq::core::FifoMessageDispatchChannel::isRunning () const [inline, virtual]

Returns:

true if the Channel currently running and will dequeue message.

Implements **activemq::core::MessageDispatchChannel** (p. 2152).

6.264.2.10 virtual void activemq::core::FifoMessageDispatchChannel::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

6.264.2.11 virtual void activemq::core::FifoMessageDispatchChannel::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting **threads** (p. 71).

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.264.2.12 virtual void activemq::core::FifoMessageDispatchChannel::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting **threads** (p. 71).

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.264.2.13 virtual Pointer<MessageDispatch> activemq::core::FifoMessageDispatchChannel::peek () const [virtual]

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns:

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.264.2.14 virtual std::vector<Pointer<MessageDispatch> > activemq::core::FifoMessageDispatchChannel::removeAll () [virtual]

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns:

a list of Messages that was previously in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.264.2.15 virtual int activemq::core::FifoMessageDispatchChannel::size () const [virtual]

Returns:

the number of Messages currently in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.264.2.16 virtual void activemq::core::FifoMessageDispatchChannel::start () [virtual]

Starts dispatch of messages from the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.264.2.17 virtual void activemq::core::FifoMessageDispatchChannel::stop () [virtual]

Stops dispatch of message from the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 2153).

6.264.2.18 virtual bool activemq::core::FifoMessageDispatchChannel::tryLock () [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.264.2.19 virtual void activemq::core::FifoMessageDispatchChannel::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.264.2.20 virtual void activemq::core::FifoMessageDispatchChannel::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.264.2.21 virtual void activemq::core::FifoMessageDispatchChannel::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.264.2.22 virtual void activemq::core::FifoMessageDispatchChannel::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**FifoMessageDispatchChannel.h**

6.265 decaf::io::FileDescriptor Class Reference

This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.

`#include <src/main/decaf/io/FileDescriptor.h>`Inheritance diagram for decaf::io::FileDescriptor:

Public Member Functions

- **FileDescriptor** ()
- virtual ~**FileDescriptor** ()
- void **sync** ()

  *Force any/all buffered data for this **FileDescriptor** (p. 1518) to be flushed to the underlying device.*

- bool **valid** ()

  Indicates whether the File Descriptor is valid.

Static Public Attributes

- static **FileDescriptor in**

  A handle to the standard input stream.

- static **FileDescriptor out**

  A handle to the standard output stream.

- static **FileDescriptor err**

  A handle to the standard error stream.

Protected Member Functions

- **FileDescriptor** (long value, bool **readonly**)

Protected Attributes

- long **descriptor**
- bool **readonly**

6.265.1 Detailed Description

This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.

Since:

1.0

6.265.2 Constructor & Destructor Documentation

6.265.2.1 decaf::io::FileDescriptor::FileDescriptor (long *value*, bool *readonly*) [protected]

6.265.2.2 decaf::io::FileDescriptor::FileDescriptor ()

6.265.2.3 virtual decaf::io::FileDescriptor::~FileDescriptor () [virtual]

6.265.3 Member Function Documentation

6.265.3.1 void decaf::io::FileDescriptor::sync ()

Force any/all buffered data for this **FileDescriptor** (p. 1518) to be flushed to the underlying device. This method blocks until all data is flushed to the underlying device and is used to place the device into a known state. In the case of data that is buffered at a higher level such as a **BufferedOutputStream** (p. 747) the stream must first be flushed before this method can force the data to be sent to the output device.

6.265.3.2 bool decaf::io::FileDescriptor::valid ()

Indicates whether the File Descriptor is valid.

Returns:

true for a valid descriptor such as open socket or file, false otherwise.

6.265.4 Field Documentation

6.265.4.1 long decaf::io::FileDescriptor::descriptor [protected]

6.265.4.2 FileDescriptor decaf::io::FileDescriptor::err [static]

A handle to the standard error stream. Usually, this file descriptor is not used directly, but rather via the output stream known as System::err.

6.265.4.3 FileDescriptor decaf::io::FileDescriptor::in [static]

A handle to the standard input stream. Usually, this file descriptor is not used directly, but rather via the input stream known as System::in.

6.265.4.4 FileDescriptor decaf::io::FileDescriptor::out [static]

A handle to the standard output stream. Usually, this file descriptor is not used directly, but rather via the output stream known as System::out.

6.265.4.5 bool decaf::io::FileDescriptor::readonly [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/io/**FileDescriptor.h**

6.266 decaf::util::logging::Filter Class Reference

A **Filter** (p. 1520) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.

`#include <src/main/decaf/util/logging/Filter.h>`

Public Member Functions

- virtual ~**Filter** ()
- virtual bool **isLoggable** (const **LogRecord** &record) const =0

  Check if a given log record should be published.

6.266.1 Detailed Description

A **Filter** (p. 1520) can be used to provide fine grain control over what is logged, beyond the control provided by log levels. Each **Logger** (p. 1935) and each **Handler** (p. 1590) can have a filter associated with it. The **Logger** (p. 1935) or **Handler** (p. 1590) will call the isLoggable method to check if a given **LogRecord** (p. 1960) should be published. If isLoggable returns false, the **LogRecord** (p. 1960) will be discarded.

6.266.2 Constructor & Destructor Documentation

6.266.2.1 virtual decaf::util::logging::Filter::~Filter () [inline, virtual]

6.266.3 Member Function Documentation

6.266.3.1 virtual bool decaf::util::logging::Filter::isLoggable (const LogRecord & *record*) const [pure virtual]

Check if a given log record should be published.

Parameters:

record the `LogRecord` (p. 1960) to check.

Returns:

true if the record is loggable.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Filter.h**

6.267 decaf::io::FilterInputStream Class Reference

A **FilterInputStream** (p. 1521) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.

`#include <src/main/decaf/io/FilterInputStream.h>`Inheritance diagram for decaf::io::FilterInputStream:

Public Member Functions

- **FilterInputStream** (**InputStream** ∗**inputStream**, bool **own**=false)

  *Constructor to create a wrapped **InputStream** (p. 1707).*

- virtual ∼**FilterInputStream** ()
- virtual int **available** () const

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.
  Returns:

  the number of bytes available on this input stream.
  Exceptions:

  ***IOException** (p. **1787**) if an I/O error occurs.*

- virtual void **close** ()

  *Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.*
  The default implementation of this method does nothing.
  Exceptions:

  ***IOException** (p. **1787**) if an I/O error occurs while closing the **InputStream** (p. 1707).*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  *The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*
  Parameters:

  ***num** The number of bytes to skip.*
  Returns:

  total bytes skipped
  Exceptions:

  ***IOException** (p. **1787**) if an I/O error occurs.*
  ***UnsupportedOperationException** if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
  If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.
  Calling mark on a closed stream instance should have no effect.
  The default implementation of this method does nothing.
  Parameters:

  readLimit *The max bytes read before marked position is invalid.*

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.
  If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an ***IOException*** *(p. 1787) might be thrown. ∗ If such an* ***IOException*** *(p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*
  If the method markSupported returns false, then: ∗ The call to reset may throw an ***IOException*** *(p. 1787). ∗ If an* ***IOException*** *(p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*
  The default implementation of this method throws an ***IOException*** *(p. 1787).*
  Exceptions:

  IOException *(p.* ***1787****) if an I/O error occurs.*

- virtual bool **markSupported** () const

  Determines if this input stream supports the mark and reset methods.
  Whether or not mark and reset are supported is an invariant property of a particular input stream instance.
  The default implementation of this method returns false.
  Returns:

  true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArray** (unsigned char ∗buffer, int size)
- virtual int **doReadArrayBounded** (unsigned char ∗buffer, int size, int offset, int length)
- virtual bool **isClosed** () const

Protected Attributes

- **InputStream** ∗ **inputStream**
- bool **own**
- volatile bool **closed**

6.267.1 Detailed Description

A **FilterInputStream** (p. 1521) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality. The class **FilterInputStream** (p. 1521) itself simply overrides all methods of **InputStream** (p. 1707) with versions that pass all requests to the contained input stream. Subclasses of **FilterInputStream** (p. 1521) may further override some of these methods and may also provide additional methods and fields.

6.267.2 Constructor & Destructor Documentation

6.267.2.1 decaf::io::FilterInputStream::FilterInputStream (InputStream * *inputStream*, bool *own* = `false`)

Constructor to create a wrapped **InputStream** (p. 1707).

Parameters:

inputStream The stream to wrap and filter.

own Indicates if we own the stream object, defaults to false.

6.267.2.2 virtual decaf::io::FilterInputStream::~FilterInputStream () `[virtual]`

6.267.3 Member Function Documentation

6.267.3.1 virtual int decaf::io::FilterInputStream::available () const `[virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1708).

Reimplemented in **decaf::io::BufferedInputStream** (p. 743), **decaf::io::PushbackInputStream** (p. 2510), and **decaf::util::zip::InflaterInputStream** (p. 1702).

6.267.3.2 virtual void decaf::io::FilterInputStream::close () `[virtual]`

Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs while closing the **InputStream** (p. 1707).

Reimplemented from **decaf::io::InputStream** (p. 1709).

Reimplemented in **decaf::io::BufferedInputStream** (p. 744), and **decaf::util::zip::InflaterInputStream** (p. 1703).

6.267.3.3 virtual int decaf::io::FilterInputStream::doReadArray (unsigned char * *buffer*, int *size*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1709).

6.267.3.4 virtual int decaf::io::FilterInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1709).

Reimplemented in **activemq::io::LoggingInputStream** (p. 1948), **decaf::io::BufferedInputStream** (p. 744), **decaf::io::PushbackInputStream** (p. 2510), **decaf::util::zip::CheckedInputStream** (p. 952), and **decaf::util::zip::InflaterInputStream** (p. 1703).

6.267.3.5 virtual int decaf::io::FilterInputStream::doReadByte () [protected, virtual]

Implements **decaf::io::InputStream** (p. 1710).

Reimplemented in **activemq::io::LoggingInputStream** (p. 1948), **decaf::io::BufferedInputStream** (p. 744), **decaf::io::PushbackInputStream** (p. 2510), **decaf::util::zip::CheckedInputStream** (p. 952), and **decaf::util::zip::InflaterInputStream** (p. 1703).

6.267.3.6 virtual bool decaf::io::FilterInputStream::isClosed () const [protected, virtual]

Returns:

true if this stream has been closed.

6.267.3.7 virtual void decaf::io::FilterInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters:

readLimit The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::InputStream** (p. 1710).

Reimplemented in **decaf::io::BufferedInputStream** (p. 744), **decaf::io::PushbackInputStream** (p. 2511), and **decaf::util::zip::InflaterInputStream** (p. 1703).

6.267.3.8 virtual bool decaf::io::FilterInputStream::markSupported () const [virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns:

true if this stream instance supports marks

Reimplemented from **decaf::io::InputStream** (p. 1710).

Reimplemented in **decaf::io::BufferedInputStream** (p. 744), **decaf::io::PushbackInputStream** (p. 2511), and **decaf::util::zip::InflaterInputStream** (p. 1704).

6.267.3.9 virtual void decaf::io::FilterInputStream::reset () [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1787) might be thrown. ∗ If such an **IOException** (p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: ∗ The call to reset may throw an **IOException** (p. 1787). ∗ If an **IOException** (p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1787).

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1713).

Reimplemented in **decaf::io::BufferedInputStream** (p. 745), **decaf::io::PushbackInputStream** (p. 2511), and **decaf::util::zip::InflaterInputStream** (p. 1704).

6.267.3.10 virtual long long decaf::io::FilterInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1713).

Reimplemented in **decaf::io::BufferedInputStream** (p. 745), **decaf::io::PushbackInputStream** (p. 2512), **decaf::util::zip::CheckedInputStream** (p. 952), and **decaf::util::zip::InflaterInputStream** (p. 1705).

6.267.4 Field Documentation

6.267.4.1 volatile bool decaf::io::FilterInputStream::closed [protected]

6.267.4.2 InputStream* decaf::io::FilterInputStream::inputStream [protected]

6.267.4.3 bool decaf::io::FilterInputStream::own [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/io/**FilterInputStream.h**

6.268 decaf::io::FilterOutputStream Class Reference

This class is the superclass of all classes that filter output streams.

`#include <src/main/decaf/io/FilterOutputStream.h>`Inheritance diagram for decaf::io::FilterOutputStream:

Public Member Functions

- **FilterOutputStream** (**OutputStream** ∗**outputStream**, bool **own**=false)

  Constructor, creates a wrapped output stream.

- virtual ∼**FilterOutputStream** ()
- virtual void **flush** ()

  Flushes this stream by writing any buffered output to the underlying stream.
  Exceptions:

  IOException *(*p. ***1787****) if an I/O error occurs.*

  The default implementation of this method does nothing.

- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.
  Exceptions:

  IOException *(*p. ***1787****) if an error occurs while closing.*

  The default implementation of this method does nothing.

- virtual std::string **toString** () const

  Output a String representation of this object.
  The default version of this method just prints the Class Name.
  Returns:

  a string representation of the object.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArray** (const unsigned char ∗buffer, int size)
- virtual void **doWriteArrayBounded** (const unsigned char ∗buffer, int size, int offset, int length)
- virtual bool **isClosed** () const

Protected Attributes

- **OutputStream** ∗ **outputStream**
- bool **own**
- volatile bool **closed**

6.268.1 Detailed Description

This class is the superclass of all classes that filter output streams. These streams sit on top of an already existing output stream (the underlying output stream) which it uses as its basic sink of data, but possibly transforming the data along the way or providing additional functionality.

The class **FilterOutputStream** (p. 1527) itself simply overrides all methods of **OutputStream** (p. 2348) with versions that pass all requests to the underlying output stream. Subclasses of **FilterOutputStream** (p. 1527) may further override some of these methods as well as provide additional methods and fields.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped `InputStream (p. 1707)` is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

DataOutputStream (p. 1276) os = new **DataOutputStream** (p. 1276)(new **OutputStream()** (p. 2349), true)

6.268.2 Constructor & Destructor Documentation

6.268.2.1 decaf::io::FilterOutputStream::FilterOutputStream (OutputStream * *outputStream*, bool *own* = `false`)

Constructor, creates a wrapped output stream.

Parameters:

outputStream the **OutputStream** (p. 2348) to wrap

own If true, this object will control the lifetime of the output stream that it encapsulates.

6.268.2.2 virtual decaf::io::FilterOutputStream::~FilterOutputStream () `[virtual]`

6.268.3 Member Function Documentation

6.268.3.1 virtual void decaf::io::FilterOutputStream::close () `[virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions:

IOException *(p. 1787)* if an error occurs while closing.

The default implementation of this method does nothing. The close method of **FilterOutputStream** (p. 1527) calls its flush method, and then calls the close method of its underlying output stream.

Reimplemented from **decaf::io::OutputStream** (p. 2349).

Reimplemented in **decaf::util::zip::DeflaterOutputStream** (p. 1361).

6.268.3.2 virtual void decaf::io::FilterOutputStream::doWriteArray (const unsigned char * *buffer*, int *size*) `[protected, virtual]`

Reimplemented from **decaf::io::OutputStream** (p. 2350).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 748).

6.268.3.3 virtual void decaf::io::FilterOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2350).

Reimplemented in **activemq::io::LoggingOutputStream** (p. 1949), **decaf::io::BufferedOutputStream** (p. 748), **decaf::io::DataOutputStream** (p. 1277), **decaf::util::zip::CheckedOutputStream** (p. 955), and **decaf::util::zip::DeflaterOutputStream** (p. 1362).

6.268.3.4 virtual void decaf::io::FilterOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2350).

Reimplemented in **activemq::io::LoggingOutputStream** (p. 1950), **decaf::io::BufferedOutputStream** (p. 748), **decaf::io::DataOutputStream** (p. 1277), **decaf::util::zip::CheckedOutputStream** (p. 955), and **decaf::util::zip::DeflaterOutputStream** (p. 1362).

6.268.3.5 virtual void decaf::io::FilterOutputStream::flush () [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions:

IOException *(p. **1787**)* if an I/O error occurs.

The default implementation of this method does nothing. The flush method of **FilterOutputStream** (p. 1527) calls the flush method of its underlying output stream.

Reimplemented from **decaf::io::OutputStream** (p. 2350).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 748).

6.268.3.6 virtual bool decaf::io::FilterOutputStream::isClosed () const [protected, virtual]

Returns:

true if this stream has been closed.

6.268.3.7 virtual std::string decaf::io::FilterOutputStream::toString () const [virtual]

Output a String representation of this object.

The default version of this method just prints the Class Name.

Returns:

a string representation of the object.

The toString method of **FilterOutputStream** (p. 1527) calls the toString method of its underlying output stream.

Reimplemented from **decaf::io::OutputStream** (p. 2351).

6.268.4 Field Documentation

6.268.4.1 volatile bool decaf::io::FilterOutputStream::closed [protected]

6.268.4.2 OutputStream* decaf::io::FilterOutputStream::outputStream [protected]

6.268.4.3 bool decaf::io::FilterOutputStream::own [protected]

The documentation for this class was generated from the following file:

6.269 decaf::lang::Float Class Reference

`#include <src/main/decaf/lang/Float.h>`Inheritance diagram for decaf::lang::Float:

Public Member Functions

- **Float** (float value)
- **Float** (double value)
- **Float** (const std::string &value)
- virtual ~**Float** ()
- virtual int **compareTo** (const **Float** &f) const

  *Compares this **Float** (p. 1531) instance with another.*

- bool **equals** (const **Float** &f) const
- virtual bool **operator==** (const **Float** &f) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Float** &f) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const float &f) const

  *Compares this **Float** (p. 1531) instance with another.*

- bool **equals** (const float &f) const
- virtual bool **operator==** (const float &f) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const float &f) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

- bool **isInfinite** () const
- bool **isNaN** () const

Static Public Member Functions

- static int **compare** (float f1, float f2)

  Compares the two specified double values.

- static int **floatToIntBits** (float value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout.

- static int **floatToRawIntBits** (float value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values.

- static float **intBitsToFloat** (int bits)

  Returns the float value corresponding to a given bit representation.

- static bool **isInfinite** (float value)
- static bool **isNaN** (float value)
- static float **parseFloat** (const std::string &value)

  *Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1531).*

- static std::string **toHexString** (float value)

  Returns a hexadecimal string representation of the float argument.

- static std::string **toString** (float value)

  Returns a string representation of the float argument.

- static **Float valueOf** (float value)

  *Returns a **Float** (p. 1531) instance representing the specified float value.*

- static **Float valueOf** (const std::string &value)

  *Returns a **Float** (p. 1531) instance that wraps a primitive float which is parsed from the string value passed.*

Static Public Attributes

- static const int **SIZE**

  The size in bits of the primitive int type.

- static const float **MAX_VALUE**

  The maximum value that the primitive type can hold.

- static const float **MIN_VALUE**

  The minimum value that the primitive type can hold.

- static const float **NaN**

  *Constant for the Not a **Number** (p. 2269) Value.*

- static const float **POSITIVE_INFINITY**

  Constant for Positive Infinity.

- static const float **NEGATIVE_INFINITY**

  Constant for Negative Infinity.

6.269.1 Constructor & Destructor Documentation

6.269.1.1 decaf::lang::Float::Float (float *value*)

Parameters:

value - the primitive type to wrap

6.269.1.2 decaf::lang::Float::Float (double *value*)

Parameters:

value - the primitive type to wrap

6.269.1.3 decaf::lang::Float::Float (const std::string & *value*)

Parameters:

value - the string to convert to a primitive type to wrap

6.269.1.4 virtual decaf::lang::Float::~Float () [inline, virtual]

6.269.2 Member Function Documentation

6.269.2.1 virtual unsigned char decaf::lang::Float::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2269).

6.269.2.2 static int decaf::lang::Float::compare (float *f1*, float *f2*) [static]

Compares the two specified double values. The sign of the integer value returned is the same as that of the integer that would be returned by the call: Float(f1).compareTo(Float(f2))

Parameters:

f1 - the first double to compare

f2 - the second double to compare

Returns:

the value 0 if d1 is numerically equal to f2; a value less than 0 if f1 is numerically less than f2; and a value greater than 0 if f1 is numerically greater than f2.

6.269.2.3 virtual int decaf::lang::Float::compareTo (const float & *f*) const [virtual]

Compares this **Float** (p. 1531) instance with another.

Parameters:

f - the **Float** (p. 1531) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< float >** (p. 1037).

6.269.2.4 virtual int decaf::lang::Float::compareTo (const Float & *f*) const [virtual]

Compares this **Float** (p. 1531) instance with another.

Parameters:

f - the **Float** (p. 1531) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.269.2.5 virtual double decaf::lang::Float::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.269.2.6 bool decaf::lang::Float::equals (const float & *f*) const [inline, virtual]

Parameters:

f - the **Float** (p. 1531) object to compare against.

Returns:

true if the two **Float** (p. 1531) Objects have the same value.

Implements **decaf::lang::Comparable< float >** (p. 1038).

6.269.2.7 bool decaf::lang::Float::equals (const Float & *f*) const [inline]

Parameters:

f - the **Float** (p. 1531) object to compare against.

Returns:

true if the two **Float** (p. 1531) Objects have the same value.

6.269.2.8 static int decaf::lang::Float::floatToIntBits (float *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout. Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is 0x7fc00000.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p. 1536) method, will produce a floating-point value the same as the argument to floatToIntBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters:

value - the float to convert to int bits

Returns:

the int that holds the float's value

Referenced by decaf::util::HashCode< float >::operator()().

6.269.2.9 static int decaf::lang::Float::floatToRawIntBits (float *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values. Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is the integer representing the actual NaN value. Unlike the floatToIntBits method, intToRawIntBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p. 1536) method, will produce a floating-point value the same as the argument to floatToRawIntBits.

Parameters:

value The float to convert to a raw int.

Returns:

the raw int value of the float

6.269.2.10 virtual float decaf::lang::Float::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.269.2.11 static float decaf::lang::Float::intBitsToFloat (int *bits*) [static]

Returns the float value corresponding to a given bit representation. The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "single format" bit layout.

If the argument is 0x7f800000, the result is positive infinity. If the argument is 0xff800000, the result is negative infinity. If the argument is any value in the range 0x7f800001 through 0x7fffffff or in the range 0xff800001 through 0xffffffff, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Float::floatToRawIntBits** (p. 1535) method.

Parameters:

bits - the bits of the float encoded as a float

Returns:

a new float created from the int bits.

6.269.2.12 virtual int decaf::lang::Float::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.269.2.13 static bool decaf::lang::Float::isInfinite (float *value*) [static]

Parameters:

value - The float to check.

Returns:

true if the float is equal to infinity.

6.269.2.14 bool decaf::lang::Float::isInfinite () const

Returns:

true if the float is equal to positive infinity.

6.269.2.15 static bool decaf::lang::Float::isNaN (float *value*) [static]

Parameters:

value - The float to check.

Returns:

true if the float is equal to NaN.

6.269.2.16 bool decaf::lang::Float::isNaN () const

Returns:

true if the float is equal to NaN.

6.269.2.17 virtual long long decaf::lang::Float::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.269.2.18 virtual bool decaf::lang::Float::operator< (const float & *f*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< float >** (p. 1038).

6.269.2.19 virtual bool decaf::lang::Float::operator< (const Float & *f*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.269.2.20 virtual bool decaf::lang::Float::operator== (const float & *f*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< float >** (p. 1038).

6.269.2.21 virtual bool decaf::lang::Float::operator== (const Float & *f*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.269.2.22 static float decaf::lang::Float::parseFloat (const std::string & *value*) [static]

Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1531).

Parameters:

value - the string to parse

Returns:

a float parsed from the string

Exceptions:

NumberFormatException

6.269.2.23 virtual short decaf::lang::Float::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2271).

6.269.2.24 static std::string decaf::lang::Float::toHexString (float *value*) [static]

Returns a hexadecimal string representation of the float argument. All characters mentioned below are ASCII characters.

∗ If the argument is NaN, the result is the string "NaN". ∗ Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a float value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p. 1750) on the exponent value. o If m is a float value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters:

value - The float to convert to a string

Returns:

the Hex formatted float string.

6.269.2.25 static std::string decaf::lang::Float::toString (float *value*) [static]

Returns a string representation of the float argument. All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10-3 but less than 107, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m is less than 10-3 or greater than or equal to 107, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10n <= m < 10n+1; then let a be the mathematically exact quotient of m and 10n so that 1 <= a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1750).

Parameters:

value - The float to convert to a string

Returns:

the formatted float string.

6.269.2.26 std::string decaf::lang::Float::toString () const

Returns:

this **Float** (p. 1531) Object as a **String** (p. 2935) Representation

6.269.2.27 static Float decaf::lang::Float::valueOf (const std::string & *value*) [static]

Returns a **Float** (p. 1531) instance that wraps a primitive float which is parsed from the string value passed.

Parameters:

value - the string to parse

Returns:

a new **Float** (p. 1531) instance wrapping the float parsed from value

Exceptions:

NumberFormatException on error.

6.269.2.28 static Float decaf::lang::Float::valueOf (float *value*) [static]

Returns a **Float** (p. 1531) instance representing the specified float value.

Parameters:

value - float to wrap

Returns:

new **Float** (p. 1531) instance wrapping the primitive value

6.269.3 Field Documentation

6.269.3.1 const float decaf::lang::Float::MAX_VALUE [static]

The maximum value that the primitive type can hold.

6.269.3.2 const float decaf::lang::Float::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.269.3.3 const float decaf::lang::Float::NaN [static]

Constant for the Not a **Number** (p. 2269) Value.

6.269.3.4 const float decaf::lang::Float::NEGATIVE_INFINITY [static]

Constant for Negative Infinity.

6.269.3.5 const float decaf::lang::Float::POSITIVE_INFINITY [static]

Constant for Positive Infinity.

6.269.3.6 const int decaf::lang::Float::SIZE [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Float.h**

6.270 decaf::internal::nio::FloatArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/FloatArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::FloatArrayBuffer:

Public Member Functions

- **FloatArrayBuffer** (int size, bool readOnly=false)

  *Creates a **FloatArrayBuffer** (p. 1542) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **FloatArrayBuffer** (float *array, int size, int offset, int length, bool readOnly=false)

  *Creates a **FloatArrayBuffer** (p. 1542) object that wraps the given array.*

- **FloatArrayBuffer** (const **decaf::lang::Pointer**< **ByteArrayAdapter** > &array, int offset, int capacity, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **FloatArrayBuffer** (const **FloatArrayBuffer** &other)

  *Create a **FloatArrayBuffer** (p. 1542) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**FloatArrayBuffer** ()
- virtual float * **array** ()

  Returns the float array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  *the array that backs this **Buffer** (p. 735).*

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  The offset into the backing array where index zero starts.

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual FloatBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only float buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
Returns:

The new, read-only float buffer which the caller then owns.

- virtual FloatBuffer & **compact** ()

Compacts this buffer.
*The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.
Returns:

*a reference to this **FloatBuffer** (p. 1551).*
Exceptions:

***ReadOnlyBufferException** (p. 2535) if this buffer is read-only*

- virtual FloatBuffer * **duplicate** ()

Creates a new float buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
The new buffer will be read-only if, and only if, this buffer is read-only.
Returns:

*a new float **Buffer** (p. 735) which the caller owns.*

- virtual float **get** ()

Relative get method.
Reads the value at this buffer's current position, and then increments the position.
Returns:

the float at the current position.
Exceptions:

***BufferUnderflowException** (p. 763) if there no more data to return.*

- virtual float **get** (int index) const

Absolute get method.
Reads the value at the given index.
Parameters:

***index** The index in the **Buffer** (p. 735) where the float is to be read*
Returns:

the float that is located at the given index

Exceptions:

IndexOutOfBoundsException *if index is not smaller than the buffer's limit*

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible float array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.
  Returns:

  true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.
  Returns:

  true if, and only if, this buffer is read-only.

- virtual FloatBuffer & **put** (float value)

  Writes the given floats into this buffer at the current position, and then increments the position.
  Parameters:

  value *The floats value to be written.*
  Returns:

  a reference to this buffer.
  Exceptions:

  BufferOverflowException *(*p. 760*)* *if this buffer's current position is not smaller than its limit*
  ReadOnlyBufferException *(*p. 2535*)* *if this buffer is read-only*

- virtual FloatBuffer & **put** (int index, float value)

  Writes the given floats into this buffer at the given index.
  Parameters:

  index *The position in the* ***Buffer*** *(*p. 735*) to write the data.*
  value *The floats to write.*
  Returns:

  a reference to this buffer.
  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
  ReadOnlyBufferException *(*p. 2535*)* *if this buffer is read-only.*

- virtual FloatBuffer * **slice** () const

  Creates a new ***FloatBuffer*** *(*p. 1551*) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the newly create ***FloatBuffer*** *(*p. 1551*) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **FloatArrayBuffer** (p. 1542) as Read-Only.*

6.270.1 Constructor & Destructor Documentation

6.270.1.1 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **FloatArrayBuffer** (p. 1542) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

IllegalArguementException if the capacity value is negative.

6.270.1.2 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (float * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **FloatArrayBuffer** (p. 1542) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.270.1.3 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *capacity*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset. The capacity and limit of the new **FloatArrayBuffer** (p. 1542) will be that of the remaining capacity of the passed buffer.

Parameters:

array The ByteArrayAdapter to wrap.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if array is NULL

IndexOutOfBoundsException if offset + length is greater than array size.

6.270.1.4 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (const FloatArrayBuffer & *other*)

Create a **FloatArrayBuffer** (p. 1542) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters:

other The **FloatArrayBuffer** (p. 1542) this one is to mirror.

6.270.1.5 virtual decaf::internal::nio::FloatArrayBuffer::~FloatArrayBuffer () [virtual]

6.270.2 Member Function Documentation

6.270.2.1 virtual float* decaf::internal::nio::FloatArrayBuffer::array () [virtual]

Returns the float array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1553).

6.270.2.2 virtual int decaf::internal::nio::FloatArrayBuffer::arrayOffset () [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.
UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1554).

6.270.2.3 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only float buffer which the caller then owns.

Implements **decaf::nio::FloatBuffer** (p. 1554).

6.270.2.4 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::compact () [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **FloatBuffer** (p. 1551).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1554).

6.270.2.5 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::duplicate () [virtual]

Creates a new float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new float **Buffer** (p. 735) which the caller owns.

Implements **decaf::nio::FloatBuffer** (p. 1555).

6.270.2.6 virtual float decaf::internal::nio::FloatArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the float is to be read

Returns:

the float that is located at the given index

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit

Implements **decaf::nio::FloatBuffer** (p. 1556).

6.270.2.7 virtual float decaf::internal::nio::FloatArrayBuffer::get () [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns:

the float at the current position.

Exceptions:

BufferUnderflowException *(p. 763)* if there no more data to return.

Implements **decaf::nio::FloatBuffer** (p. 1556).

6.270.2.8 virtual bool decaf::internal::nio::FloatArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible float array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::FloatBuffer** (p. 1557).

6.270.2.9 virtual bool decaf::internal::nio::FloatArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 738).

6.270.2.10 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (int *index*, float *value*) [virtual]

Writes the given floats into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The floats to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::FloatBuffer** (p. 1557).

6.270.2.11 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (float *value*) [virtual]

Writes the given floats into this buffer at the current position, and then increments the position.

Parameters:

value The floats value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1557).

6.270.2.12 virtual void decaf::internal::nio::FloatArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **FloatArrayBuffer** (p. 1542) as Read-Only.

Parameters:

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.270.2.13 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::slice () const [virtual]

Creates a new **FloatBuffer** (p. 1551) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **FloatBuffer** (p. 1551) which the caller owns.

Implements **decaf::nio::FloatBuffer** (p. 1559).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**FloatArrayBuffer.h**

6.271 decaf::nio::FloatBuffer Class Reference

This class defines four categories of operations upon float buffers:.

`#include <src/main/decaf/nio/FloatBuffer.h>`Inheritance diagram for decaf::nio::FloatBuffer:

Public Member Functions

- virtual ~**FloatBuffer** ()
- virtual std::string **toString** () const
- virtual float * **array** ()=0

  Returns the float array that backs this buffer (optional operation).

- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **FloatBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only float buffer that shares this buffer's content.

- virtual **FloatBuffer** & **compact** ()=0

  Compacts this buffer.

- virtual **FloatBuffer** * **duplicate** ()=0

  Creates a new float buffer that shares this buffer's content.

- virtual float **get** ()=0

  Relative get method.

- virtual float **get** (int index) const =0

  Absolute get method.

- **FloatBuffer** & **get** (std::vector< float > buffer)

  Relative bulk get method.

- **FloatBuffer** & **get** (float *buffer, int size, int offset, int length)

  Relative bulk get method.

- virtual bool **hasArray** () const =0

  Tells whether or not this buffer is backed by an accessible float array.

- **FloatBuffer** & **put** (**FloatBuffer** &src)

  This method transfers the floats remaining in the given source buffer into this buffer.

- **FloatBuffer** & **put** (const float *buffer, int size, int offset, int length)

  This method transfers floats into this buffer from the given source array.

- **FloatBuffer** & **put** (std::vector< float > &buffer)

  This method transfers the entire content of the given source floats array into this buffer.

- virtual **FloatBuffer** & **put** (float value)=0

  Writes the given floats into this buffer at the current position, and then increments the position.

- virtual **FloatBuffer** & **put** (int index, float value)=0

  Writes the given floats into this buffer at the given index.

Protected Member Functions

- **FloatBuffer** (int capacity)

  *Creates a **FloatBuffer** (p. 1551) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.271.1 Detailed Description

This class defines four categories of operations upon float buffers:. o Absolute and relative get and put methods that read and write single floats; o Relative bulk get methods that transfer contiguous sequences of floats from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of floats from a float array or some other float buffer into this buffer o Methods for compacting, duplicating, and slicing a float buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing float array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.271.2 Constructor & Destructor Documentation

6.271.2.1 decaf::nio::FloatBuffer::FloatBuffer (int *capacity*) [protected]

Creates a **FloatBuffer** (p. 1551) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity The size and limit of the **Buffer** (p. 735) in floats.

Exceptions:

IllegalArguementException if capacity is negative.

6.271.2.2 virtual decaf::nio::FloatBuffer::~FloatBuffer () [inline, virtual]

6.271.3 Member Function Documentation

6.271.3.1 static FloatBuffer* decaf::nio::FloatBuffer::allocate (int *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity The size of the Double buffer in floats.

Returns:

the **FloatBuffer** (p. 1551) that was allocated, caller owns.

6.271.3.2 virtual float* decaf::nio::FloatBuffer::array () [pure virtual]

Returns the float array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1546).

6.271.3.3 virtual int decaf::nio::FloatBuffer::arrayOffset () [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1546).

6.271.3.4 virtual FloatBuffer* decaf::nio::FloatBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only float buffer which the caller then owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1547).

6.271.3.5 virtual FloatBuffer& decaf::nio::FloatBuffer::compact () [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **FloatBuffer** (p. 1551).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1547).

6.271.3.6 virtual int decaf::nio::FloatBuffer::compareTo (const FloatBuffer & *value*) const [virtual]

6.271.3.7 virtual FloatBuffer* decaf::nio::FloatBuffer::duplicate () [pure virtual]

Creates a new float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new float **Buffer** (p. 735) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1548).

6.271.3.8 virtual bool decaf::nio::FloatBuffer::equals (const FloatBuffer & *value*) const [virtual]

6.271.3.9 FloatBuffer& decaf::nio::FloatBuffer::get (float * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method. This method transfers floats from this buffer into the given destination array. If there are fewer floats remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 740), then no bytes are transferred and a **BufferUnderflowException** (p. 763) is thrown.

Otherwise, this method copies length floats from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer The pointer to an allocated buffer to fill.

size The size of the passed in buffer.

offset The position in the buffer to start filling.

length The amount of data to put in the passed buffer.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(p. 763)* if there are fewer than length floats remaining in this buffer

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.271.3.10 FloatBuffer& decaf::nio::FloatBuffer::get (std::vector< float > *buffer*)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(p. 763)* if there are fewer than length floats remaining in this buffer

6.271.3.11 virtual float decaf::nio::FloatBuffer::get (int *index*) const [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the float is to be read

Returns:

the float that is located at the given index

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1548).

6.271.3.12 virtual float decaf::nio::FloatBuffer::get () [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the float at the current position.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there no more data to return.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1548).

6.271.3.13 virtual bool decaf::nio::FloatBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible float array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1549).

6.271.3.14 virtual bool decaf::nio::FloatBuffer::operator< (const FloatBuffer & *value*) const [virtual]

6.271.3.15 virtual bool decaf::nio::FloatBuffer::operator== (const FloatBuffer & *value*) const [virtual]

6.271.3.16 virtual FloatBuffer& decaf::nio::FloatBuffer::put (int *index*, float *value*) [pure virtual]

Writes the given floats into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The floats to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1549).

6.271.3.17 virtual FloatBuffer& decaf::nio::FloatBuffer::put (float *value*) [pure virtual]

Writes the given floats into this buffer at the current position, and then increments the position.

Parameters:

value The floats value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1549).

6.271.3.18 FloatBuffer& decaf::nio::FloatBuffer::put (std::vector< float > & *buffer*)

This method transfers the entire content of the given source floats array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters:

buffer The buffer whose contents are copied to this **FloatBuffer** (p. 1551)

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if there is insufficient space in this buffer

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only

6.271.3.19 FloatBuffer& decaf::nio::FloatBuffer::put (const float * *buffer*, int *size*, int *offset*, int *length*)

This method transfers floats into this buffer from the given source array. If there are more floats to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 740), then no floats are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer The array from which floats are to be read.

size The size of the passed in buffer.

offset The offset within the array of the first float to be read.

length The number of floats to be read from the given array.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.271.3.20 FloatBuffer& decaf::nio::FloatBuffer::put (FloatBuffer & *src*)

This method transfers the floats remaining in the given source buffer into this buffer. If there are more floats remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 740), then no floats are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies n = src.remaining() floats from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src The buffer to take floats from an place in this one.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer for the remaining floats in the source buffer

IllegalArgumentException if the source buffer is this buffer.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

6.271.3.21 virtual FloatBuffer* decaf::nio::FloatBuffer::slice () const [pure virtual]

Creates a new **FloatBuffer** (p. 1551) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **FloatBuffer** (p. 1551) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1550).

6.271.3.22 virtual std::string decaf::nio::FloatBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.271.3.23 static FloatBuffer* decaf::nio::FloatBuffer::wrap (std::vector< float > & *buffer*) [static]

Wraps the passed STL float Vector in a **FloatBuffer** (p. 1551). The new buffer will be backed by the given float array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **FloatBuffer** (p. 1551) that is backed by buffer, caller owns.

6.271.3.24 static FloatBuffer* decaf::nio::FloatBuffer::wrap (float * *array*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new **FloatBuffer** (p. 1551). The new buffer will be backed by the given float array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array The array that will back the new buffer.

size The size of the array that was passed in.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new **FloatBuffer** (p. 1551) that is backed by buffer, caller owns.

Exceptions:

NullPointerException if the array pointer is NULL.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**FloatBuffer.h**

6.272 decaf::io::Flushable Class Reference

A **Flushable** (p. 1561) is a destination of data that can be flushed.

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **FlushCommand** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- virtual bool **isFlushCommand** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_FLUSHCOMMAND** = 15

6.273.1 Constructor & Destructor Documentation

6.273.1.1 activemq::commands::FlushCommand::FlushCommand ()

6.273.1.2 virtual activemq::commands::FlushCommand::~FlushCommand () [virtual]

6.273.2 Member Function Documentation

6.273.2.1 virtual FlushCommand* activemq::commands::FlushCommand::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.273.2.2 virtual void activemq::commands::FlushCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.273.2.3 virtual bool activemq::commands::FlushCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.273.2.4 virtual unsigned char activemq::commands::FlushCommand::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.273.2.5 virtual bool activemq::commands::FlushCommand::isFlushCommand () const [inline, virtual]

Returns:

an answer of true to the **isFlushCommand()** (p. 1564) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 638).

6.273.2.6 virtual std::string activemq::commands::FlushCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.273.2.7 virtual Pointer<Command> activemq::commands::FlushCommand::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.273.3 Field Documentation

6.273.3.1 const unsigned char activemq::commands::FlushCommand::ID_FLUSHCOMMAND = 15 [static]

() [inline]

6.274.2.2 virtual activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::~FlushC
() [inline, virtual]

6.274.3 Member Function Documentation

6.274.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::createObje
() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.274.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::getDataStr
() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.274.3.3 virtual void activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::looseMarsh
(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.274.3.4 virtual void activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::looseUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.274.3.5 virtual int activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.274.3.6 virtual void activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.274.3.7 virtual void activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::tightUnmar (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.275 decaf::util::logging::Formatter Class Reference

A **Formatter** (p. 1569) provides support for formatting LogRecords.

`#include <src/main/decaf/util/logging/Formatter.h>`Inheritance diagram for decaf::util::logging::Formatter:

Public Member Functions

- virtual ~**Formatter** ()
- virtual std::string **format** (const **LogRecord** &record) const =0

  Format the given log record and return the formatted string.
- virtual std::string **formatMessage** (const **LogRecord** &record) const

  Format the message string from a log record.
- virtual std::string **getHead** (const **Handler** *handler DECAF_UNUSED)

  Return the header string for a set of formatted records.
- virtual std::string **getTail** (const **Handler** *handler DECAF_UNUSED)

  Return the tail string for a set of formatted records.

6.275.1 Detailed Description

A **Formatter** (p. 1569) provides support for formatting LogRecords. Typically each **logging** (p. 135) **Handler** (p. 1590) will have a **Formatter** (p. 1569) associated with it. The **Formatter** (p. 1569) takes a **LogRecord** (p. 1960) and converts it to a string.

Some formatters (such as the **XMLFormatter** (p. 3293)) need to wrap head and tail strings around a set of formatted records. The getHeader and getTail methods can be used to obtain these strings.

6.275.2 Constructor & Destructor Documentation

6.275.2.1 virtual decaf::util::logging::Formatter::~Formatter () `[inline, virtual]`

6.275.3 Member Function Documentation

6.275.3.1 virtual std::string decaf::util::logging::Formatter::format (const LogRecord & *record*) const `[pure virtual]`

Format the given log record and return the formatted string.

Parameters:

record The Log Record to Format

Returns:

the formatted record.

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2759), and **decaf::util::logging::XMLFormatter** (p. 3293).

6.275.3.2 virtual std::string decaf::util::logging::Formatter::formatMessage (const LogRecord & *record*) const [virtual]

Format the message string from a log record.

Parameters:

record The Log Record to Format

Returns:

the formatted message

6.275.3.3 virtual std::string decaf::util::logging::Formatter::getHead (const Handler *handler *DECAF_UNUSED*) [inline, virtual]

Return the header string for a set of formatted records. In the default implementation this method should return empty string.

Parameters:

handler The target handler, can be NULL.

Returns:

the head string.

6.275.3.4 virtual std::string decaf::util::logging::Formatter::getTail (const Handler *handler *DECAF_UNUSED*) [inline, virtual]

Return the tail string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

the tail string

6.276 decaf::util::concurrent::Future< V > Class Template Reference

A **Future** (p. 1571) represents the result of an asynchronous computation.

`#include <src/main/decaf/util/concurrent/Future.h>`Inheritance diagram for decaf::util::concurrent::Future< V >:

Public Member Functions

- virtual ~**Future** ()
- virtual V **get** ()=0

  Waits if necessary for the computation to complete, and then retrieves its result.

- virtual V **get** (long long timeout, const **TimeUnit** &unit)=0

  Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

6.276.1 Detailed Description

template<typename V> class decaf::util::concurrent::Future< V >

A **Future** (p. 1571) represents the result of an asynchronous computation. Methods are provided to check if the computation is complete, to wait for its completion, and to retrieve the result of the computation. The result can only be retrieved using method get when the computation has completed, blocking if necessary until it is ready. Cancellation is performed by the cancel method. Additional methods are provided to determine if the task completed normally or was canceled. Once a computation has completed, the computation cannot be canceled. If you would like to use a **Future** (p. 1571) for the sake of cancellability but not provide a usable result, you can declare types of the form Future<void*> and return null as a result of the underlying task.

Since:

1.0

6.276.2 Constructor & Destructor Documentation

6.276.2.1 template<typename V> virtual decaf::util::concurrent::Future< V >::~Future () [inline, virtual]

6.276.3 Member Function Documentation

6.276.3.1 template<typename V> virtual V decaf::util::concurrent::Future< V >::get (long long *timeout*, const TimeUnit & *unit*) [pure virtual]

Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

Parameters:

timeout The maximum time to wait for this **Future** (p. 1571) to finish.

unit The time unit of the timeout argument.

Returns:

the computed result

Exceptions:

CancellationException *(p. 892)* if the computation was canceled

ExecutionException *(p. 1473)* if the computation threw an exception

InterruptedException if the current thread was interrupted while waiting

TimeoutException *(p. 3068)* if the wait timed out before the future completed.

Implemented in **decaf::util::concurrent::FutureTask< T >** (p. 1578).

6.276.3.2 template<typename V> virtual V decaf::util::concurrent::Future< V >::get () [pure virtual]

Waits if necessary for the computation to complete, and then retrieves its result.

Returns:

the computed result.

Exceptions:

CancellationException *(p. 892)* if the computation was canceled

ExecutionException *(p. 1473)* if the computation threw an exception

InterruptedException if the current thread was interrupted while waiting

Implemented in **decaf::util::concurrent::FutureTask< T >** (p. 1578).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Future.h**

6.277 activemq::transport::FutureResponse Class Reference

A container that holds a response object.

`#include <src/main/activemq/transport/FutureResponse.h>`

Public Member Functions

- **FutureResponse** ()
- **FutureResponse** (const **Pointer**< **ResponseCallback** > responseCallback)
- virtual ~**FutureResponse** ()
- **Pointer**< **Response** > **getResponse** () const

  Getters for the response property.

6.277.3.1 Pointer<Response> activemq::transport::FutureResponse::getResponse (unsigned int *timeout*)

6.277.3.2 Pointer<Response> activemq::transport::FutureResponse::getResponse (unsigned int *timeout*) const

Getters for the response property. Timed Wait.

Parameters:

timeout Time to wait in milliseconds for a Response.

Returns:

the response object for the request

Exceptions:

InterruptedIOException if the wait for response is interrupted.

6.277.3.3 Pointer<Response> activemq::transport::FutureResponse::getResponse ()

6.277.3.4 Pointer<Response> activemq::transport::FutureResponse::getResponse () const

Getters for the response property. Infinite Wait.

Returns:

the response object for the request.

Exceptions:

InterruptedIOException if the wait for response is interrupted.

6.277.3.5 void activemq::transport::FutureResponse::setResponse (Pointer< Response > *response*)

Setter for the response property.

Parameters:

response the response object for the request.

The documentation for this class was generated from the following file:

- **FutureTask** (const **FutureTask**< T > &source)
- **FutureTask**< T > & **operator**= (const **FutureTask**< T > &source)

6.278.1 Detailed Description

template<typename T> class decaf::util::concurrent::FutureTask< T >

A cancellable asynchronous computation. This class provides a base implementation of **Future** (p. 1571), with methods to start and cancel a computation, query to see if the computation is complete, and retrieve the result of the computation. The result can only be retrieved when the computation has completed; the get method will block if the computation has not yet completed. Once the computation has completed, the computation cannot be restarted or canceled.

A **FutureTask** (p. 1575) can be used to wrap a **Callable** (p. 888) or Runnable object. Because **FutureTask** (p. 1575) implements Runnable, a **FutureTask** (p. 1575) can be submitted to an **Executor** (p. 1476) for execution.

In addition to serving as a stand-alone class, this class provides protected functionality that may be useful when creating customized task classes.

Since:

1.0

6.278.2 Constructor & Destructor Documentation

6.278.2.1 template<typename T> decaf::util::concurrent::FutureTask< T >::FutureTask (Callable< T > * *callable*, bool *takeOwnership* = `true`) `[inline]`

Creates a **FutureTask** (p. 1575) instance that will, upon running, execute the given **Callable** (p. 888).

Parameters:

callable The callable task that will be invoked when run.

takeOwnership Boolean value indicating if the **Executor** (p. 1476) now owns the pointer to the task.

Exceptions:

NullPointerException if callable pointer is NULL

References NULL.

6.278.2.2 template<typename T> decaf::util::concurrent::FutureTask< T >::FutureTask (decaf::lang::Runnable * *runnable*, const T & *result*, bool *takeOwnership* = `true`) `[inline]`

Creates a **FutureTask** (p. 1575) that will, upon running, execute the given Runnable, and arrange that the get method will return the given result on successful completion.

Parameters:

runnable The runnable task that the future will execute.

result The result to return on successful completion.

takeOwnership Boolean value indicating if the **Executor** (p. 1476) now owns the pointer to the task.

Exceptions:

NullPointerException if runnable is NULL.

References NULL.

6.278.2.3 template<typename T> virtual decaf::util::concurrent::FutureTask< T >::~FutureTask () `[inline, virtual]`

6.278.2.4 template<typename T> decaf::util::concurrent::FutureTask< T >::FutureTask (const FutureTask< T > & *source*) `[inline]`

6.278.3 Member Function Documentation

6.278.3.1 template<typename T> virtual bool decaf::util::concurrent::FutureTask< T >::cancel (bool *mayInterruptIfRunning*) `[inline, virtual]`

Attempts to cancel execution of this task. This attempt will fail if the task has already completed, has already been canceled, or could not be canceled for some other reason. If successful, and this task has not started when cancel is called, this task should never run. If the task has already started, then the mayInterruptIfRunning parameter determines whether the thread executing this task should be interrupted in an attempt to stop the task.

After this method returns, subsequent calls to **isDone()** (p. 1579) will always return true. Subsequent calls to **isCancelled()** (p. 1579) will always return true if this method returned true.

Parameters:

mayInterruptIfRunning True if the thread executing this task should be interrupted; otherwise, in-progress tasks are allowed to complete.

Returns:

false if the task could not be canceled, typically because it has already completed normally; true otherwise

Implements **decaf::util::concurrent::FutureType** (p. 1581).

6.278.3.2 template<typename T> FutureTask<T>* decaf::util::concurrent::FutureTask< T >::clone () [inline]

6.278.3.3 template<typename T> virtual void decaf::util::concurrent::FutureTask< T >::done () [inline, virtual]

Protected method invoked when this task transitions to state isDone (whether normally or via cancellation). The default implementation does nothing. Subclasses may override this method to invoke completion callbacks or perform bookkeeping. Note that you can query status inside the implementation of this method to determine whether this task has been canceled.

6.278.3.4 template<typename T> virtual T decaf::util::concurrent::FutureTask< T >::get (long long *timeout*, const TimeUnit & *unit*) [inline, virtual]

Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

Parameters:

timeout The maximum time to wait for this **Future** (p. 1571) to finish.

unit The time unit of the timeout argument.

Returns:

the computed result

Exceptions:

CancellationException (p. ***892***) if the computation was canceled

ExecutionException (p. ***1473***) if the computation threw an exception

InterruptedException if the current thread was interrupted while waiting

TimeoutException (p. ***3068***) if the wait timed out before the future completed.

Implements **decaf::util::concurrent::Future< T >** (p. 1571).

6.278.3.5 template<typename T> virtual T decaf::util::concurrent::FutureTask< T >::get () [inline, virtual]

Waits if necessary for the computation to complete, and then retrieves its result.

Returns:

the computed result.

Exceptions:

CancellationException *(p. 892)* if the computation was canceled

ExecutionException *(p. 1473)* if the computation threw an exception

InterruptedException if the current thread was interrupted while waiting

Implements **decaf::util::concurrent::Future< T >** (p. 1572).

6.278.3.6 template<typename T> virtual bool decaf::util::concurrent::FutureTask< T >::isCancelled () const [inline, virtual]

Returns true if this task was canceled before it completed normally.

Returns:

true if this task was canceled before it completed

Implements **decaf::util::concurrent::FutureType** (p. 1582).

6.278.3.7 template<typename T> virtual bool decaf::util::concurrent::FutureTask< T >::isDone () const [inline, virtual]

Returns true if this task completed. Completion may be due to normal termination, an exception, or cancellation -- in all of these cases, this method will return true.

Returns:

true if this task completed

Implements **decaf::util::concurrent::FutureType** (p. 1582).

6.278.3.8 template<typename T> FutureTask<T>& decaf::util::concurrent::FutureTask< T >::operator= (const FutureTask< T > & *source*) [inline]

6.278.3.9 template<typename T> virtual void decaf::util::concurrent::FutureTask< T >::run () [inline, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2622).

6.278.3.10 template<typename T> virtual bool decaf::util::concurrent::FutureTask< T >::runAndReset () [inline, virtual]

Executes the computation without setting its result, and then resets this **Future** (p. 1571) to initial state, failing to do so if the computation encounters an exception or is canceled. This is designed for use with tasks that intrinsically execute more than once.

Returns:

true if successfully run and reset

6.278.3.11 template<typename T> virtual void decaf::util::concurrent::FutureTask< T >::set (const T & *result*) [inline, virtual]

Sets the result of this **Future** (p. 1571) to the given value unless this future has already been set or has been cancelled. This method is invoked internally by the `run` method upon successful completion of the computation.

Parameters:

v The value to return as the result of this **Future** (p. 1571).

6.278.3.12 template<typename T> virtual void decaf::util::concurrent::FutureTask< T >::setException (const decaf::lang::Exception & *error*) [inline, virtual]

Causes this future to report an **ExecutionException** (p. 1473) with the given Exception as its cause, unless this **Future** (p. 1571) has already been set or has been canceled. This method is invoked internally by the run method upon failure of the computation.

Parameters:

error The cause of failure that is thrown from run.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**FutureTask.h**

6.279 decaf::util::concurrent::FutureType Class Reference

`#include <src/main/decaf/util/concurrent/Future.h>`Inheritance diagram for decaf::util::concurrent::FutureType:

Public Member Functions

- virtual ~**FutureType** ()
- virtual bool **cancel** (bool mayInterruptIfRunning)=0

  Attempts to cancel execution of this task.

- virtual bool **isCancelled** () const =0

  Returns true if this task was canceled before it completed normally.

- virtual bool **isDone** () const =0

  Returns true if this task completed.

6.279.1 Constructor & Destructor Documentation

6.279.1.1 virtual decaf::util::concurrent::FutureType::~FutureType () [inline, virtual]

6.279.2 Member Function Documentation

6.279.2.1 virtual bool decaf::util::concurrent::FutureType::cancel (bool *mayInterruptIfRunning*) [pure virtual]

Attempts to cancel execution of this task. This attempt will fail if the task has already completed, has already been canceled, or could not be canceled for some other reason. If successful, and this task has not started when cancel is called, this task should never run. If the task has already started, then the mayInterruptIfRunning parameter determines whether the thread executing this task should be interrupted in an attempt to stop the task.

After this method returns, subsequent calls to **isDone()** (p. 1582) will always return true. Subsequent calls to **isCancelled()** (p. 1582) will always return true if this method returned true.

Parameters:

mayInterruptIfRunning True if the thread executing this task should be interrupted; otherwise, in-progress tasks are allowed to complete.

Returns:

false if the task could not be canceled, typically because it has already completed normally; true otherwise

Implemented in **decaf::util::concurrent::FutureTask< T >** (p. 1577).

6.279.2.2 virtual bool decaf::util::concurrent::FutureType::isCancelled () const [pure virtual]

Returns true if this task was canceled before it completed normally.

Returns:

true if this task was canceled before it completed

Implemented in **decaf::util::concurrent::FutureTask< T >** (p. 1579).

6.279.2.3 virtual bool decaf::util::concurrent::FutureType::isDone () const [pure virtual]

Returns true if this task completed. Completion may be due to normal termination, an exception, or cancellation -- in all of these cases, this method will return true.

Returns:

true if this task completed

Implemented in **decaf::util::concurrent::FutureTask< T >** (p. 1579).

The documentation for this class was generated from the following file:

6.280 decaf::security::GeneralSecurityException Class Reference

`#include <src/main/decaf/security/GeneralSecurityException.h>`Inheritance diagram for decaf::security::GeneralSecurityException:

Public Member Functions

- **GeneralSecurityException** ()
  Default Constructor.
- **GeneralSecurityException** (const **decaf::lang::Exception** &ex)
  Conversion Constructor from some other Exception.
- **GeneralSecurityException** (const **GeneralSecurityException** &ex)
  Copy Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- **GeneralSecurityException** (const std::exception *cause)
  Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **GeneralSecurityException** * **clone** () const
  Clones this exception.
- virtual ~**GeneralSecurityException** () throw ()

6.280.1 Constructor & Destructor Documentation

6.280.1.1 decaf::security::GeneralSecurityException::GeneralSecurityException ()

Default Constructor.

6.280.1.2 decaf::security::GeneralSecurityException::GeneralSecurityException (const decaf::lang::Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.280.1.3 decaf::security::GeneralSecurityException::GeneralSecurityException (const GeneralSecurityException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.280.1.4 decaf::security::GeneralSecurityException::GeneralSecurityException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.280.1.5 decaf::security::GeneralSecurityException::GeneralSecurityException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.280.1.6 decaf::security::GeneralSecurityException::GeneralSecurityException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.280.1.7 virtual decaf::security::GeneralSecurityException::~GeneralSecurityException () throw () [virtual]

6.280.2 Member Function Documentation

6.280.2.1 virtual GeneralSecurityException* decaf::security::GeneralSecurityException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::lang::Exception** (p. 1460).

Reimplemented in **decaf::security::cert::CertificateEncodingException** (p. 901), **decaf::security::cert::CertificateException** (p. 904), **decaf::security::cert::CertificateExpiredException** (p. 907), **decaf::security::cert::CertificateNotYetValidException** (p. 910), **decaf::security::cert::CertificateParsingException** (p. 913), **decaf::security::DigestException** (p. 1400), **decaf::security::InvalidKeyException** (p. 1778), **decaf::security::KeyException** (p. 1845), **decaf::security::KeyManagementException** (p. 1848), **decaf::security::NoSuchAlgorithmException** (p. 2259), **decaf::security::NoSuchProviderException** (p. 2265), and **decaf::security::SignatureException** (p. 2758).

  *Protected convenience method to report an error to this Handler's **ErrorManager** (p. 1455).*

6.284.1 Detailed Description

A **Handler** (p. 1590) object takes log messages from a **Logger** (p. 1935) and exports them. It might for example, write them to a console or write them to a file, or send them to a network **logging** (p. 135) service, or forward them to an OS log, or whatever.

A **Handler** (p. 1590) can be disabled by doing a setLevel(**Level.OFF** (p. 1863)) and can be re-enabled by doing a setLevel with an appropriate level.

Handler (p. 1590) classes typically use **LogManager** (p. 1954) properties to set default values for the Handler's **Filter** (p. 1520), **Formatter** (p. 1569), and **Level** (p. 1859). See the specific documentation for each concrete **Handler** (p. 1590) class.

6.284.2 Constructor & Destructor Documentation

6.284.2.1 decaf::util::logging::Handler::Handler ()

6.284.2.2 virtual decaf::util::logging::Handler::~Handler () [virtual]

6.284.3 Member Function Documentation

6.284.3.1 virtual void decaf::util::logging::Handler::flush () [pure virtual]

Flush the Handler's output, clears any buffers.

Implemented in **decaf::util::logging::StreamHandler** (p. 2922).

6.284.3.2 virtual ErrorManager* decaf::util::logging::Handler::getErrorManager () [inline, virtual]

Gets the `ErrorManager` (p. 1455) used by this **Handler** (p. 1590).

Returns:

`ErrorManager` (p. 1455) derived pointer or NULL.

6.284.3.3 virtual Filter* decaf::util::logging::Handler::getFilter () [inline, virtual]

Gets the **Filter** (p. 1520) that this **Handler** (p. 1590) uses to filter Log Records.

Returns:

`Filter` (p. 1520) derived instance

6.284.3.4 virtual Formatter* decaf::util::logging::Handler::getFormatter () [inline, virtual]

Gets the `Formatter` (p. 1569) used by this **Handler** (p. 1590).

Returns:

`Filter` (p. 1520) derived instance

6.284.3.5 virtual Level decaf::util::logging::Handler::getLevel () [inline, virtual]

Get the log level specifying which message levels will be logged by this **Handler** (p. 1590).

Returns:

Level (p. 1859) enumeration value

6.284.3.6 virtual bool decaf::util::logging::Handler::isLoggable (const LogRecord & *record*) const [virtual]

Check if this **Handler** (p. 1590) would actually log a given **LogRecord** (p. 1960). This method checks if the **LogRecord** (p. 1960) has an appropriate **Level** (p. 1859) and whether it satisfies any **Filter** (p. 1520). It also may make other **Handler** (p. 1590) specific checks that might prevent a handler from **logging** (p. 135) the **LogRecord** (p. 1960).

Parameters:

record `LogRecord` (p. 1960) to check

Reimplemented in **decaf::util::logging::StreamHandler** (p. 2922).

6.284.3.7 virtual void decaf::util::logging::Handler::publish (const LogRecord & *record*) [pure virtual]

Publish the Log Record to this **Handler** (p. 1590).

Parameters:

record The Log Record to Publish

Implemented in **decaf::util::logging::ConsoleHandler** (p. 1154), and **decaf::util::logging::StreamHandler** (p. 2922).

6.284.3.8 void decaf::util::logging::Handler::reportError (const std::string & *message*, decaf::lang::Exception * *ex*, int *code*) [protected]

Protected convenience method to report an error to this Handler's **ErrorManager** (p. 1455).

Parameters:

message - a descriptive string (may be empty)

ex - an exception (may be NULL)

code (p. ***1005***) - an error **code** (p. 1005) defined in **ErrorManager** (p. 1455)

6.284.3.9 virtual void decaf::util::logging::Handler::setErrorManager (ErrorManager * *errorManager*) [virtual]

Sets the `Formatter (p. 1569)` used by this **Handler** (p. 1590). The ErrorManager's "error" method will be invoked if any errors occur while using this **Handler** (p. 1590).

Parameters:

errorManager `ErrorManager (p. 1455)` derived instance

6.284.3.10 virtual void decaf::util::logging::Handler::setFilter (Filter * *filter*) [inline, virtual]

Sets the **Filter** (p. 1520) that this **Handler** (p. 1590) uses to filter Log Records. For each call of publish the **Handler** (p. 1590) will call this **Filter** (p. 1520) (if it is non-null) to check if the **LogRecord** (p. 1960) should be published or discarded.

Parameters:

filter `Filter (p. 1520)` derived instance

6.284.3.11 virtual void decaf::util::logging::Handler::setFormatter (Formatter * *formatter*) [virtual]

Sets the `Formatter (p. 1569)` used by this **Handler** (p. 1590). Some Handlers may not use Formatters, in which case the **Formatter** (p. 1569) will be remembered, but not used.

Parameters:

formatter `Filter (p. 1520)` derived instance

6.284.3.12 virtual void decaf::util::logging::Handler::setLevel (const Level & *value*) [inline, virtual]

Set (p. 2715) the log level specifying which message levels will be logged by this **Handler** (p. 1590). The intention is to allow developers to turn on voluminous **logging** (p. 135), but to limit the messages that are sent to certain Handlers.

Parameters:

value **Level** (p. 1859) enumeration value

6.304.1 Detailed Description

template<typename K, typename V, typename HASHCODE = HashCode<K>> class decaf::util::HashMap< K, V, HASHCODE >

Hash table based implementation of the **Map** (p. 2008) interface. This implementation provides all of the optional map operations, and permits null values and the null key. This class makes no guarantees as to the order of the map; in particular, it does not guarantee that the order will remain constant over time.

This implementation provides constant-time performance for the basic operations (get and put), assuming the hash function disperses the elements properly among the buckets. Iteration over collection views requires time proportional to the "capacity" of the **HashMap** (p. 1613) instance (the number of buckets) plus its size (the number of key-value mappings). Thus, it's very important not to set the initial capacity too high (or the load factor too low) if iteration performance is important.

An instance of **HashMap** (p. 1613) has two parameters that affect its performance: initial capacity and load factor. The capacity is the number of buckets in the hash table, and the initial capacity is simply the capacity at the time the hash table is created. The load factor is a measure of how full the hash table is allowed to get before its capacity is automatically increased. When the number of entries in the hash table exceeds the product of the load factor and the current capacity, the hash table is rehashed (that is, **internal** (p. 97) data structures are rebuilt) so that the hash table has approximately twice the number of buckets.

As a general rule, the default load factor (.75) offers a good tradeoff between time and space costs. Higher values decrease the space overhead but increase the lookup cost (reflected in most

of the operations of the **HashMap** (p. 1613) class, including get and put). The expected number of entries in the map and its load factor should be taken into account when setting its initial capacity, so as to minimize the number of rehash operations. If the initial capacity is greater than the maximum number of entries divided by the load factor, no rehash operations will ever occur.

If many mappings are to be stored in a **HashMap** (p. 1613) instance, creating it with a sufficiently large capacity will allow the mappings to be stored more efficiently than letting it perform automatic rehashing as needed to grow the table.

Note that this implementation is not synchronized. If multiple threads access a hash map concurrently, and at least one of the threads modifies the map structurally, it must be synchronized externally. (A structural modification is any operation that adds or deletes one or more mappings; merely changing the value associated with a key that an instance already contains is not a structural modification.) This is typically accomplished by synchronizing on some object that naturally encapsulates the map. If no such object exists, the map should be "wrapped" using the Collections::synchronizedMap method. This is best done at creation time, to prevent accidental unsynchronized access to the map:

Map<K, V>* map = Collections::synchronizedMap(new **HashMap<K, V>()** (p. 1616));

The iterators returned by all of this class's "collection view methods" are fail-fast: if the map is structurally modified at any time after the iterator is created, in any way except through the iterator's own remove method, the iterator will throw a **ConcurrentModificationException** (p. 1056). Thus, in the face of **concurrent** (p. 130) modification, the iterator fails quickly and cleanly, rather than risking arbitrary, non-deterministic behavior at an undetermined time in the future.

Note that the fail-fast behavior of an iterator cannot be guaranteed as it is, generally speaking, impossible to make any hard guarantees in the presence of unsynchronized **concurrent** (p. 130) modification. Fail-fast iterators throw **ConcurrentModificationException** (p. 1056) on a best-effort basis. Therefore, it would be wrong to write a program that depended on this exception for its correctness: the fail-fast behavior of iterators should be used only to detect bugs.

Since:

1.0

6.304.2 Constructor & Destructor Documentation

6.304.2.1 template<typename K, typename V, typename HASHCODE = HashCode<K>> decaf::util::HashMap< K, V, HASHCODE >::HashMap () [inline]

Creates a new empty **HashMap** (p. 1613) with default configuration settings.

6.304.2.2 template<typename K, typename V, typename HASHCODE = HashCode<K>> decaf::util::HashMap< K, V, HASHCODE >::HashMap (int *capacity*) [inline]

Constructs a new **HashMap** (p. 1613) instance with the specified capacity.

Parameters:

capacity The initial capacity of this hash map.

Exceptions:

IllegalArgumentException when the capacity is less than zero.

6.304.2.3 template<typename K, typename V, typename HASHCODE = HashCode<K>> decaf::util::HashMap< K, V, HASHCODE >::HashMap (int *capacity*, float *loadFactor*) [inline]

Constructs a new **HashMap** (p. 1613) instance with the specified capacity.

Parameters:

capacity The initial capacity of this hash map.

loadFactor The load factor to use for this hash map.

Exceptions:

IllegalArgumentException when the capacity is less than zero.

6.304.2.4 template<typename K, typename V, typename HASHCODE = HashCode<K>> decaf::util::HashMap< K, V, HASHCODE >::HashMap (const HashMap< K, V > & *map*) [inline]

Creates a new **HashMap** (p. 1613) with default configuration settings and fills it with the contents of the given source **Map** (p. 2008) instance.

Parameters:

map The **Map** (p. 2008) instance whose elements are copied into this **HashMap** (p. 1613) instance.

6.304.2.5 template<typename K, typename V, typename HASHCODE = HashCode<K>> decaf::util::HashMap< K, V, HASHCODE >::HashMap (const Map< K, V > & *map*) [inline]

Creates a new **HashMap** (p. 1613) with default configuration settings and fills it with the contents of the given source **Map** (p. 2008) instance.

Parameters:

map The **Map** (p. 2008) instance whose elements are copied into this **HashMap** (p. 1613) instance.

6.304.2.6 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual decaf::util::HashMap< K, V, HASHCODE >::~HashMap () [inline, virtual]

6.304.3 Member Function Documentation

6.304.3.1 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual void decaf::util::HashMap< K, V, HASHCODE >::clear () [inline, virtual]

Removes all of the mappings from this map (optional operation). The map will be empty after this call returns.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this map.

Implements **decaf::util::Map< K, V >** (p. 2010).

Referenced by decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection::clear(), decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet::clear(), decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::clear(), and decaf::util::HashMap< E, Set< E > *, HASHCODE >::copy().

6.304.3.2 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::containsKey (const K & *key*) const [inline, virtual]

Returns true if this map contains a mapping for the specified key. More formally, returns true if and only if this map contains a mapping for a key k such that (key == k). (There can be at most one such mapping.)

Parameters:

key The key to look up.

Returns:

true if this map contains the key mapping, otherwise false.

Implements **decaf::util::Map< K, V >** (p. 2011).

Referenced by decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet::contains(), and decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet::contains().

6.304.3.3 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::containsValue (const V & *value*) const [inline, virtual]

Returns true if this map maps one or more keys to the specified value. More formally, returns true if and only if this map contains at least one mapping to a value v such that (value==v). This operation will probably require time linear in the map size for most implementations of the **Map** (p. 2008) interface.

Parameters:

value The Value to look up in this **Map** (p. 2008).

Returns:

true if this map contains at least one mapping for the value, otherwise false.

Implements **decaf::util::Map< K, V >** (p. 2011).

Referenced by decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection::contains(), and decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection::contains().

6.304.3.4 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual void decaf::util::HashMap< K, V, HASHCODE >::copy (const Map< K, V > & *source*) [inline, virtual]

6.304.3.5 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual HashMapEntry* decaf::util::HashMap< K, V, HASHCODE >::createEntry (const K & *key*, int *index*, const V & *value*) [inline, protected, virtual]

6.304.3.6 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual HashMapEntry* decaf::util::HashMap< K, V, HASHCODE >::createHashedEntry (const K & *key*, int *index*, int *hash*) [inline, protected, virtual]

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::putImpl().

6.304.3.7 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual const Set< MapEntry<K,V> >& decaf::util::HashMap< K, V, HASHCODE >::entrySet () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2012).

6.304.3.8 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Set< MapEntry<K,V> >& decaf::util::HashMap< K, V, HASHCODE >::entrySet () [inline, virtual]

Returns a **Set** (p. 2715) view of the mappings contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Set.remove** (p. 1013), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns:

a reference to a **Set** (p. 2715)<MapEntry<K,V>> that is backed by this **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2012).

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::equals().

6.304.3.9 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::equals (const Map< K, V > & *source*) const [inline, virtual]

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::operator!=(), and decaf::util::HashMap< E, Set< E > *, HASHCODE >::operator==().

6.304.3.10 template<typename K, typename V, typename HASHCODE = HashCode<K>> HashMapEntry* decaf::util::HashMap< K, V, HASHCODE >::findKeyEntry (const K & *key*, int *index*, int *keyHash*) const [inline, protected]

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::getEntry(), and decaf::util::HashMap< E, Set< E > *, HASHCODE >::putImpl().

6.304.3.11 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual const V& decaf::util::HashMap< K, V, HASHCODE >::get (const K & *key*) const [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 2008). If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.

Parameters:

key The search key whose value should be returned if present.

Returns:

A const reference to the value for the given key if present in the **Map** (p. 2008).

Exceptions:

NoSuchElementException *(p. 2260)* if the key requests doesn't exist in the **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2014).

6.304.3.12 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual V& decaf::util::HashMap< K, V, HASHCODE >::get (const K & *key*) [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 2008). If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.

Parameters:

key The search key whose value should be returned if present.

Returns:

A reference to the value for the given key if present in the **Map** (p. 2008).

Exceptions:

NoSuchElementException *(p. 2260)* if the key requests doesn't exist in the **Map** (p. 2008).

Implements **decaf::util::Map< K, V >** (p. 2014).

6.304.3.13 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual HashMapEntry* decaf::util::HashMap< K, V, HASHCODE >::getEntry (const K & *key*) const [inline, protected, virtual]

Referenced by decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapEntrySet::contains(), decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::contains(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::containsKey(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::get(), and decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::remove().

6.304.3.14 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::isEmpty () const [inline, virtual]

Returns:

if the **Map** (p. 2008) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V >** (p. 2015).

6.304.3.15 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual const Set<K>& decaf::util::HashMap< K, V, HASHCODE >::keySet () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2015).

6.304.3.16 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Set<K>& decaf::util::HashMap< K, V, HASHCODE >::keySet () [inline, virtual]

Returns a **Set** (p. 2715) view of the keys contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation), the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Set.remove** (p. 1013), removeAll, retainAll, and clear operations. It does not support the add or addAll operations.

Returns:

a set view of the keys contained in this map,

Implements **decaf::util::Map< K, V >** (p. 2016).

6.304.3.17 template<typename K, typename V, typename HASHCODE = HashCode<K>> bool decaf::util::HashMap< K, V, HASHCODE >::operator!= (const Map< K, V > & *other*) const [inline]

6.304.3.18 template<typename K, typename V, typename HASHCODE = HashCode<K>> bool decaf::util::HashMap< K, V, HASHCODE >::operator== (const Map< K, V > & *other*) const [inline]

6.304.3.19 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::put (const K & *key*, const V & *value*, V & *oldValue*) [inline, virtual]

Associates the specified value with the specified key in this map (optional operation). If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

This method accepts a reference to a value which will be assigned the previous value for the given key (if any). If there was no previous mapping for the given key the out value is not written to. A return of true indicates that a value was replaced by this put operation.

Parameters:

key The target key.

value The value to be set.

oldValue (out) The value previously held in the mapping for this key. .

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

IllegalArgumentException if some property of the specified key or value prevents it from being stored in this map

Implements **decaf::util::Map< K, V >** (p. 2017).

6.304.3.20 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::put (const K & *key*, const V & *value*) [inline, virtual]

Associates the specified value with the specified key in this map (optional operation). If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

Parameters:

key The target key.

value The value to be set.

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

IllegalArgumentException if some property of the specified key or value prevents it from being stored in this map

Implements **decaf::util::Map< K, V >** (p. 2017).

6.304.3.21 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual void decaf::util::HashMap< K, V, HASHCODE >::putAll (const Map< K, V > & *map*) [inline, virtual]

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::copy(), and decaf::util::HashMap< E, Set< E > *, HASHCODE >::HashMap().

6.304.3.22 template<typename K, typename V, typename HASHCODE = HashCode<K>> void decaf::util::HashMap< K, V, HASHCODE >::putAllImpl (const Map< K, V > & *map*) [inline, protected]

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::putAll().

6.304.3.23 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::putImpl (const K & *key*, const V & *value*, V & *oldValue*) [inline, protected, virtual]

6.304.3.24 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::putImpl (const K & *key*, const V & *value*) [inline, protected, virtual]

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::put(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::putAllImpl(), and decaf::util::HashMap< E, Set< E > *, HASHCODE >::putImpl().

6.304.3.25 template<typename K, typename V, typename HASHCODE = HashCode<K>> void decaf::util::HashMap< K, V, HASHCODE >::rehash () [inline, protected]

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::putAllImpl(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::putImpl(), and decaf::util::HashMap< E, Set< E > *, HASHCODE >::rehash().

6.304.3.26 template<typename K, typename V, typename HASHCODE = HashCode<K>> void decaf::util::HashMap< K, V, HASHCODE >::rehash (int *capacity*) [inline, protected]

6.304.3.27 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual V decaf::util::HashMap< K, V, HASHCODE >::remove (const K & *key*) [inline, virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key. Care must be taken when using this operation as it will throw an exception if there is no mapping for the given key.

Parameters:

key The search key whose mapping is to be removed.

Returns:

a copy of the element that was previously mapped to the given key.

Exceptions:

NoSuchElementException *(p. 2260)* if this key is not in the **Map** (p. 2008).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V >** (p. 2018).

6.304.3.28 template<typename K, typename V, typename HASHCODE = HashCode<K>> HashMapEntry* decaf::util::HashMap< K, V, HASHCODE >::removeEntry (const K & *key*) [inline, protected]

6.304.3.29 template<typename K, typename V, typename HASHCODE = HashCode<K>> void decaf::util::HashMap< K, V, HASHCODE >::removeEntry (HashMapEntry * *entry*) [inline, protected]

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::remove(), decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet::remove(), and decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::remove().

6.304.3.30 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual int decaf::util::HashMap< K, V, HASHCODE >::size () const [inline, virtual]

Returns:

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V >** (p. 2019).

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::equals(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::HashMap(), decaf::util::LRUCache< K, V, HASHCODE >::removeEldestEntry(), decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapValueCollection::size(), decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection::size(), decaf::util::HashMap< K, V, HASHCODE >::ConstHashMapKeySet::size(), and decaf::util::HashMap< K, V, HASHCODE >::HashMapKeySet::size().

6.304.3.31 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual std::string decaf::util::HashMap< K, V, HASHCODE >::toString () const [inline, virtual]

6.304.3.32 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual const Collection<V>& decaf::util::HashMap< K, V, HASHCODE >::values () const [inline, virtual]

Implements **decaf::util::Map< K, V >** (p. 2020).

6.304.3.33 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Collection<V>& decaf::util::HashMap< K, V, HASHCODE >::values () [inline, virtual]

Returns a **Collection** (p. 1006) view of the values contained in this map. The collection is backed by the map, so changes to the map are reflected in the collection, and vice-versa. If the map is modified while an iteration over the collection is in progress (except through the iterator's own remove operation), the results of the iteration are undefined. The collection supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Collection.remove** (p. 1013), removeAll, retainAll and clear operations. It does not support the add or addAll operations. For the const version of this method the **Collection** (p. 1006) can only be used as a view into the **Map** (p. 2008).

Returns:

a collection view of the values contained in this map.

Implements **decaf::util::Map< K, V >** (p. 2020).

6.304.4 Field Documentation

6.304.4.1 template<typename K, typename V, typename HASHCODE = HashCode<K>> decaf::lang::Pointer<ConstHashMapEntrySet> decaf::util::HashMap< K, V, HASHCODE >::cachedConstEntrySet [mutable, protected]

`#include <src/main/decaf/util/HashMap.h>`Inheritance diagram for decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet:

Public Member Functions

- **HashMapEntrySet** (**HashMap** *parent)
- virtual ~**HashMapEntrySet** ()
- virtual int **size** () const

  Returns the number of elements in this collection.

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).

- virtual bool **remove** (const **MapEntry**< K, V > &entry)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters:

  value *The reference to the element to remove from this Collection.*

  Returns:

  true if the collection was changed, false otherwise.

  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the Collection is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

6.306.2 Member Function Documentation

6.306.2.1 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual void decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 144).

References decaf::util::HashMap< K, V, HASHCODE >::clear().

6.306.2.2 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::contains (const MapEntry< K, V > & *entry*) [inline, virtual]

References decaf::util::HashMap< K, V, HASHCODE >::getEntry(), decaf::util::MapEntry< K, V >::getKey(), decaf::util::MapEntry< K, V >::getValue(), and NULL.

6.306.2.3 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Iterator< MapEntry<K, V> >* decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< MapEntry< K, V > >** (p. 1799).

6.306.2.4 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Iterator< MapEntry<K, V> >* decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< MapEntry< K, V > >** (p. 1800).

6.306.2.5 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::remove (const MapEntry< K, V > & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this Collection.

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the Collection is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object. This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< MapEntry< K, V > >** (p. 149).

References decaf::util::HashMap< K, V, HASHCODE >::getEntry(), decaf::util::MapEntry< K, V >::getValue(), NULL, and decaf::util::HashMap< K, V, HASHCODE >::removeEntry().

6.306.2.6 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual int decaf::util::HashMap< K, V, HASHCODE >::HashMapEntrySet::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< MapEntry< K, V > >** (p. 1015).

References decaf::util::HashMap< K, V, HASHCODE >::elementCount.

The documentation for this class was generated from the following file:

6.308.2.1 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual void decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< V >** (p. 144).

References decaf::util::HashMap< K, V, HASHCODE >::clear().

6.308.2.2 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual bool decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection::contains (const V & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the Collection contains pointers and the Collection does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element. This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< V >** (p. 145).

References decaf::util::HashMap< K, V, HASHCODE >::containsValue().

6.308.2.3 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Iterator<V>* decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< V >** (p. 1799).

6.308.2.4 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual Iterator<V>* decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< V >** (p. 1800).

6.308.2.5 template<typename K, typename V, typename HASHCODE = HashCode<K>> virtual int decaf::util::HashMap< K, V, HASHCODE >::HashMapValueCollection::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< V >** (p. 1015).

References decaf::util::HashMap< K, V, HASHCODE >::size().

6.309 decaf::util::HashSet< E, HASHCODE > Class Template Reference

This class implements the **Set** (p. 2715) interface, backed by a hash table (actually a **HashMap** (p. 1613) instance).

`#include <src/main/decaf/util/HashSet.h>`Inheritance diagram for decaf::util::HashSet< E, HASHCODE >:

Public Member Functions

- **HashSet** ()

  *Constructs a new, empty set; the backing **HashMap** (p. 1613) instance has default initial capacity (16) and load factor (0.75).*

- **HashSet** (int capacity)

  *Constructs a new, empty set; the backing **HashMap** (p. 1613) instance has the specified initial capacity and default load factor (0.75).*

Protected Attributes

- **HashMap**< E, **Set**< E > *, HASHCODE > * **backingMap**

6.309.1 Detailed Description

template<typename E, typename HASHCODE = HashCode<E>> class decaf::util::HashSet< E, HASHCODE >

This class implements the **Set** (p. 2715) interface, backed by a hash table (actually a **HashMap** (p. 1613) instance). It makes no guarantees as to the iteration order of the set; in particular, it does not guarantee that the order will remain constant over time.

This class offers constant time performance for the basic operations (add, remove, contains and size), assuming the hash function disperses the elements properly among the buckets. Iterating over this set requires time proportional to the sum of the **HashSet** (p. 1641) instance's size (the number of elements) plus the "capacity" of the backing **HashMap** (p. 1613) instance (the number of buckets). Thus, it's very important not to set the initial capacity too high (or the load factor too low) if iteration performance is important.

Note that this implementation is not synchronized. If multiple threads access a hash set concurrently, and at least one of the threads modifies the set, it must be synchronized externally. This is typically accomplished by synchronizing on some object that naturally encapsulates the set. If no such object exists, the set should be "wrapped" using the Collections::synchronizedSet method. This is best done at creation time, to prevent accidental unsynchronized access to the set:

Set<E>* s = Collections::synchronizedSet(new HashSet<E>(...));

The iterators returned by this class's iterator method are fail-fast: if the set is modified at any time after the iterator is created, in any way except through the iterator's own remove method, the **Iterator** (p. 1802) throws a **ConcurrentModificationException** (p. 1056). Thus, in the face

of **concurrent** (p. 130) modification, the iterator fails quickly and cleanly, rather than risking arbitrary, non-deterministic behavior at an undetermined time in the future.

Note that the fail-fast behavior of an iterator cannot be guaranteed as it is, generally speaking, impossible to make any hard guarantees in the presence of unsynchronized **concurrent** (p. 130) modification. Fail-fast iterators throw **ConcurrentModificationException** (p. 1056) on a best-effort basis. Therefore, it would be wrong to write a program that depended on this exception for its correctness: the fail-fast behavior of iterators should be used only to detect bugs.

Since:

1.0

6.309.2 Constructor & Destructor Documentation

6.309.2.1 template<typename E , typename HASHCODE = HashCode<E>> decaf::util::HashSet< E, HASHCODE >::HashSet () [inline]

Constructs a new, empty set; the backing **HashMap** (p. 1613) instance has default initial capacity (16) and load factor (0.75).

6.309.2.2 template<typename E , typename HASHCODE = HashCode<E>> decaf::util::HashSet< E, HASHCODE >::HashSet (int *capacity*) [inline]

Constructs a new, empty set; the backing **HashMap** (p. 1613) instance has the specified initial capacity and default load factor (0.75).

Parameters:

capacity The initial capacity of this **HashSet** (p. 1641).

6.309.3 Field Documentation

6.309.3.1 template<typename E , typename HASHCODE = HashCode<E>> HashMap<E, Set<E>*, HASHCODE>* decaf::util::HashSet< E, HASHCODE >::backingMap [protected]

6.310 decaf::internal::util::HexStringParser Class Reference

`#include <src/main/decaf/internal/util/HexStringParser.h>`

Public Member Functions

- **HexStringParser** (int exponentWidth, int mantissaWidth)

  Create a new HexParser.

- virtual ~**HexStringParser** ()
- long long **parse** (const std::string &hexString)

  Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or doulbe as needed.

Static Public Member Functions

- static double **parseDouble** (const std::string &hexString)
- static float **parseFloat** (const std::string &hexString)

6.310.1 Constructor & Destructor Documentation

6.310.1.1 decaf::internal::util::HexStringParser::HexStringParser (int *exponentWidth*, int *mantissaWidth*)

Create a new HexParser.

Parameters:

exponentWidth - Width of the exponent for the type to parse

mantissaWidth - Width of the mantissa for the type to parse

6.310.1.2 virtual decaf::internal::util::HexStringParser::~HexStringParser () `[inline, virtual]`

6.310.2 Member Function Documentation

6.310.2.1 long long decaf::internal::util::HexStringParser::parse (const std::string & *hexString*)

Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or doulbe as needed.

Parameters:

hexString - string to parse

Returns:

the bits parsed from the string

6.310.2.2 static double decaf::internal::util::HexStringParser::parseDouble (const std::string & *hexString*) [static]

6.310.2.3 static float decaf::internal::util::HexStringParser::parseFloat (const std::string & *hexString*) [static]

6.311 activemq::wireformat::openwire::utils::HexTable Class Reference

The **HexTable** (p. 1645) class maps hexidecimal strings to the value of an index into the table, i.e.

`#include <src/main/activemq/wireformat/openwire/utils/HexTable.h>`

Public Member Functions

- **HexTable** ()
- virtual ~**HexTable** ()
- virtual const std::string & **operator[]** (std::size_t index)

  Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

- virtual const std::string & **operator[]** (std::size_t index) const
- virtual std::size_t **size** () const

  Returns the max size of this Table.

6.311.1 Detailed Description

The **HexTable** (p. 1645) class maps hexidecimal strings to the value of an index into the table, i.e. the class will return "FF" for the index 255 in the table.

6.311.2 Constructor & Destructor Documentation

6.311.2.1 activemq::wireformat::openwire::utils::HexTable::HexTable ()

6.311.2.2 virtual activemq::wireformat::openwire::utils::HexTable::~HexTable () [inline, virtual]

6.311.3 Member Function Documentation

6.311.3.1 virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t *index*) const [virtual]

6.311.3.2 virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t *index*) [virtual]

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

Parameters:

index The index of the value in the table to fetch.

Returns:

string containing the hex value if the index

Exceptions:

IndexOutOfBoundsException if the index exceeds the table size.

6.311.3.3 virtual std::size_t activemq::wireformat::openwire::utils::HexTable::size () const [inline, virtual]

Returns the max size of this Table.

Returns:

an integer size value for the table.

6.312 decaf::net::HttpRetryException Class Reference

`#include <src/main/decaf/net/HttpRetryException.h>`Inheritance diagram for decaf::net::HttpRetryException:

Public Member Functions

- **HttpRetryException** ()

  Default Constructor.

- **HttpRetryException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **HttpRetryException** (const **HttpRetryException** &ex)

  Copy Constructor.

- **HttpRetryException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **HttpRetryException** (const std::exception *cause)

  Constructor.

- **HttpRetryException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **HttpRetryException** * **clone** () const

  Clones this exception.

- virtual ~**HttpRetryException** () throw ()

6.312.1 Constructor & Destructor Documentation

6.312.1.1 decaf::net::HttpRetryException::HttpRetryException ()

Default Constructor.

6.312.1.2 decaf::net::HttpRetryException::HttpRetryException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.312.1.3 decaf::net::HttpRetryException::HttpRetryException (const HttpRetryException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.312.1.4 decaf::net::HttpRetryException::HttpRetryException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.312.1.5 decaf::net::HttpRetryException::HttpRetryException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.312.1.6 decaf::net::HttpRetryException::HttpRetryException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.312.1.7 virtual decaf::net::HttpRetryException::~HttpRetryException () throw () [virtual]

6.312.2 Member Function Documentation

6.312.2.1 virtual HttpRetryException* decaf::net::HttpRetryException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1788).

The documentation for this class was generated from the following file:

6.313.2 Member Function Documentation

6.313.2.1 static int activemq::util::IdGenerator::compare (const std::string & *id1*, const std::string & *id2*) `[static]`

Compares two generated id values.

Parameters:

id1 The first id to compare, or left hand side.

id2 The second id to compare, or right hand side.

Returns:

zero if ids are equal or positove if id1 > id2...

6.313.2.2 std::string activemq::util::IdGenerator::generateId () const

Returns:

a newly generated unique id.

6.313.2.3 static std::string activemq::util::IdGenerator::getHostname () [static]

Since the initialization of this object results in the retrieval of the machine's host name we can quickly return it here.

Returns:

the previously retrieved host name.

6.313.2.4 static std::string activemq::util::IdGenerator::getSeedFromId (const std::string & *id*) [static]

Gets the seed value from a Generated Id, the count portion is removed.

Returns:

the seed portion of the Id, minus the count value.

6.313.2.5 static long long activemq::util::IdGenerator::getSequenceFromId (const std::string & *id*) [static]

Gets the count value from a Generated Id, the seed portion is removed.

Returns:

the sequence count portion of the id, minus the seed value.

6.317.1.1 decaf::lang::exceptions::IllegalStateException::IllegalStateException ()

Default Constructor.

6.317.1.2 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.317.1.3 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const IllegalStateException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.317.1.4 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.317.1.5 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.317.1.6 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.317.1.7 virtual decaf::lang::exceptions::IllegalStateException::~IllegalStateException () throw () [virtual]

6.317.2 Member Function Documentation

6.317.2.1 virtual IllegalStateException* decaf::lang::exceptions::IllegalStateException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

Reimplemented in **decaf::nio::InvalidMarkException** (p. 1781).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**IllegalStateException.h**

6.318 decaf::lang::exceptions::IllegalThreadStateException Class Reference

`#include <src/main/decaf/lang/exceptions/IllegalThreadStateException.h>`Inheritance diagram for decaf::lang::exceptions::IllegalThreadStateException:

Public Member Functions

- **IllegalThreadStateException** ()
  Default Constructor.
- **IllegalThreadStateException** (const **Exception** &ex)

  Constructor - Initializes the file name and line number where this message occurred.
- **IllegalThreadStateException** (const std::exception *cause)
  Constructor.
- virtual **IllegalThreadStateException** * **clone** () const
  Clones this exception.
- virtual ~**IllegalThreadStateException** () throw ()

6.318.1 Constructor & Destructor Documentation

6.318.1.1 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException ()

Default Constructor.

6.318.1.2 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.318.1.3 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const IllegalThreadStateException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.318.1.4 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.318.1.5 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.318.1.6 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.318.1.7 virtual decaf::lang::exceptions::IllegalThreadStateException::~IllegalThreadStateException () throw () [virtual]

6.318.2 Member Function Documentation

6.318.2.1 virtual IllegalThreadStateException* decaf::lang::exceptions::IllegalThreadStateException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

6.319.1 Constructor & Destructor Documentation

6.319.1.1 activemq::transport::inactivity::InactivityMonitor::InactivityMonitor (const Pointer< Transport > *next*, const Pointer< wireformat::WireFormat > *wireFormat*)

6.319.1.2 activemq::transport::inactivity::InactivityMonitor::InactivityMonitor (const Pointer< Transport > *next*, const decaf::util::Properties & *properties*, const Pointer< wireformat::WireFormat > *wireFormat*)

6.319.1.3 virtual activemq::transport::inactivity::InactivityMonitor::~InactivityMonitor () [virtual]

6.319.2 Member Function Documentation

6.319.2.1 virtual void activemq::transport::inactivity::InactivityMonitor::afterNextIsStarted () [protected, virtual]

Subclasses can override this method to do their own post startup work. This method will always be called after the doStart() method and the next transport's own **start()** (p. 3144) methods have been successfully run.

Reimplemented from **activemq::transport::TransportFilter** (p. 3137).

6.319.2.2 virtual void activemq::transport::inactivity::InactivityMonitor::beforeNextIsStopped () [protected, virtual]

Subclasses can override this method to do their own pre-stop work. This method will always be called before the next transport's own **stop()** (p. 3144) method or this filter's own doStop() method is called.

Reimplemented from **activemq::transport::TransportFilter** (p. 3138).

6.319.2.3 virtual void activemq::transport::inactivity::InactivityMonitor::doClose () [protected, virtual]

Subclasses can override this method to do their own close work. This method is always called after all the next transports have been closed to prevent this **transport** (p. 72) for destroying resources needed by the lower level transports.

Reimplemented from **activemq::transport::TransportFilter** (p. 3139).

6.319.2.4 long long activemq::transport::inactivity::InactivityMonitor::getInitialDelayTime () const

6.319.2.5 long long activemq::transport::inactivity::InactivityMonitor::getReadCheckTime () const

6.319.2.6 long long activemq::transport::inactivity::InactivityMonitor::getWriteCheckTime () const

6.319.2.7 bool activemq::transport::inactivity::InactivityMonitor::isKeepAliveResponseRequired () const

6.319.2.8 virtual void activemq::transport::inactivity::InactivityMonitor::onCommand (const Pointer< Command > *command*) [virtual]

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Reimplemented from **activemq::transport::TransportFilter** (p. 3141).

6.319.2.9 virtual void activemq::transport::inactivity::InactivityMonitor::oneway (const Pointer< Command > *command*) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3141).

6.319.2.10 virtual void activemq::transport::inactivity::InactivityMonitor::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 72).

Parameters:

ex The exception to handle.

Reimplemented from **activemq::transport::TransportFilter** (p. 3142).

6.319.2.11 void activemq::transport::inactivity::InactivityMonitor::setInitialDelayTime (long long *value*) const

6.319.2.12 void activemq::transport::inactivity::InactivityMonitor::setKeepAliveResponseRequired (bool *value*)

6.319.2.13 void activemq::transport::inactivity::InactivityMonitor::setReadCheckTime (long long *value*)

6.319.2.14 void activemq::transport::inactivity::InactivityMonitor::setWriteCheckTime (long long *value*)

6.320.1 Constructor & Destructor Documentation

6.320.1.1 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException ()

Default Constructor.

6.320.1.2 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.320.1.3 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const IndexOutOfBoundsException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.320.1.4 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.320.1.5 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.320.1.6 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.320.1.7 virtual decaf::lang::exceptions::IndexOutOfBoundsException::~IndexOutOfBoundsException () throw () [virtual]

6.320.2 Member Function Documentation

6.320.2.1 virtual IndexOutOfBoundsException* decaf::lang::exceptions::IndexOutOfBoundsException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

6.321.2 Member Function Documentation

6.321.2.1 virtual InetAddress* decaf::net::Inet4Address::clone () const [virtual]

Returns a newly allocated copy of this **InetAddress** (p. 1679). The caller owns the resulting copy and must delete it.

Returns:

a new **InetAddress** (p. 1679) instance that is a copy of this one, caller owns.

Reimplemented from **decaf::net::InetAddress** (p. 1681).

6.321.2.2 virtual bool decaf::net::Inet4Address::isAnyLocalAddress () const [virtual]

Check if this **InetAddress** (p. 1679) is a valid wildcard address.

Returns:

true if the address is a wildcard address.

Reimplemented from **decaf::net::InetAddress** (p. 1683).

6.321.2.3 virtual bool decaf::net::Inet4Address::isLinkLocalAddress () const [virtual]

Check if this **InetAddress** (p. 1679) is a valid link local address.

Returns:

true if the address is a link local address.

Reimplemented from **decaf::net::InetAddress** (p. 1683).

6.321.2.4 virtual bool decaf::net::Inet4Address::isLoopbackAddress () const [virtual]

Check if this **InetAddress** (p. 1679) is a valid loopback address.

Returns:

true if the address is a loopback address.

Reimplemented from **decaf::net::InetAddress** (p. 1684).

6.321.2.5 virtual bool decaf::net::Inet4Address::isMCGlobal () const [virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Global scope.

Returns:

true if the address is Multicast and has Global scope.

Reimplemented from **decaf::net::InetAddress** (p. 1684).

6.321.2.6 virtual bool decaf::net::Inet4Address::isMCLinkLocal () const [virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Link Local scope.

Returns:

true if the address is Multicast and has Link Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1684).

6.321.2.7 virtual bool decaf::net::Inet4Address::isMCNodeLocal () const [virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Node Local scope.

Returns:

true if the address is Multicast and has Node Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1684).

6.321.2.8 virtual bool decaf::net::Inet4Address::isMCOrgLocal () const [virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Organization scope.

Returns:

true if the address is Multicast and has Organization scope.

Reimplemented from **decaf::net::InetAddress** (p. 1684).

6.321.2.9 virtual bool decaf::net::Inet4Address::isMCSiteLocal () const [virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Site Local scope.

Returns:

true if the address is Multicast and has Site Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1685).

6.321.2.10 virtual bool decaf::net::Inet4Address::isMulticastAddress () const [virtual]

Check if this **InetAddress** (p. 1679) is a valid Multicast address.

Returns:

true if the address is a Multicast address.

Reimplemented from **decaf::net::InetAddress** (p. 1685).

6.321.2.11 virtual bool decaf::net::Inet4Address::isSiteLocalAddress () const [virtual]

Check if this **InetAddress** (p. 1679) is a valid site local address.

Returns:

true if the address is a site local address.

Reimplemented from **decaf::net::InetAddress** (p. 1685).

6.323.1 Detailed Description

Represents an IP address.

Since:

1.0

6.323.2 Constructor & Destructor Documentation

6.323.2.1 decaf::net::InetAddress::InetAddress () [protected]

6.323.2.2 decaf::net::InetAddress::InetAddress (const unsigned char * *ipAddress*, int *numBytes*) [protected]

6.323.2.3 decaf::net::InetAddress::InetAddress (const std::string & *hostname*, const unsigned char * *ipAddress*, int *numBytes*) [protected]

6.323.2.4 virtual decaf::net::InetAddress::~InetAddress () [virtual]

6.323.3 Member Function Documentation

6.323.3.1 static unsigned int decaf::net::InetAddress::bytesToInt (const unsigned char * *bytes*, int *start*) [static, protected]

Converts the bytes in an address array to an int starting from the value start treating the start value as the high order byte.

Parameters:

bytes The array of bytes to convert to an int.

start The index in the array to treat as the high order byte.

Returns:

an unsigned int that represents the address value.

6.323.3.2 virtual InetAddress* decaf::net::InetAddress::clone () const [virtual]

Returns a newly allocated copy of this **InetAddress** (p. 1679). The caller owns the resulting copy and must delete it.

Returns:

a new **InetAddress** (p. 1679) instance that is a copy of this one, caller owns.

Reimplemented in **decaf::net::Inet4Address** (p. 1674), and **decaf::net::Inet6Address** (p. 1677).

6.323.3.3 virtual decaf::lang::ArrayPointer<unsigned char> decaf::net::InetAddress::getAddress () const [virtual]

Returns the Raw IP address in Network byte order. The returned address is a copy of the bytes contained in this **InetAddress** (p. 1679).

Returns:

and ArrayPointer containing the raw bytes of the network address.

6.323.3.4 static InetAddress decaf::net::InetAddress::getAnyAddress () [static, protected]

6.323.3.5 static InetAddress decaf::net::InetAddress::getByAddress (const std::string & *hostname*, const unsigned char * *bytes*, int *numBytes*) [static]

Given a host name and IPAddress return a new **InetAddress** (p. 1679). There is no name service checking or address validation done on the provided host name. The host name can either be machine name or the text based representation of the IP Address.

An IPV4 address must be only four bytes in length and an IPV6 address must be 16 bytes in length.

Returns:

a copy of an **InetAddress** (p. 1679) that represents the given byte array address.

Exceptions:

UnknownHostException *(p. 3154)* if the address array length is invalid.

6.323.3.6 static InetAddress decaf::net::InetAddress::getByAddress (const unsigned char * *bytes*, int *numBytes*) [static]

Given a raw IP Address in byte array form, create and return a new **InetAddress** (p. 1679) instance. An IPV4 address must be only four bytes in length and an IPV6 address must be 16 bytes in length.

Returns:

a copy of an **InetAddress** (p. 1679) that represents the given byte array address.

Exceptions:

UnknownHostException *(p. 3154)* if the address array length is invalid.

6.323.3.7 virtual std::string decaf::net::InetAddress::getHostAddress () const [virtual]

Returns a textual representation of the IP Address.

Returns:

the string form of the IP Address.

6.323.3.8 virtual std::string decaf::net::InetAddress::getHostName () const [virtual]

Get the host name associated with this **InetAddress** (p. 1679) instance. If a host name was set upon construction then that value is returned, otherwise a reverse name lookup with be performed to attempt to get the host name associated with the set IP Address. If the host name cannot be resolved the textual representation of the IP Address is returned instead.

Returns:

the name of the host associated with this set IP Address.

6.323.3.9 static InetAddress decaf::net::InetAddress::getLocalHost () [static]

Gets an **InetAddress** (p. 1679) that is the local host address. If the localhost value cannot be resolved than the **InetAddress** (p. 1679) for Loopback is returned.

Returns:

a new **InetAddress** (p. 1679) object that contains the local host address.

Exceptions:

UnknownHostException (p. ***3154***) if the address for local host is not found.

6.323.3.10 static InetAddress decaf::net::InetAddress::getLoopbackAddress () [static, protected]

6.323.3.11 virtual bool decaf::net::InetAddress::isAnyLocalAddress () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is a valid wildcard address.

Returns:

true if the address is a wildcard address.

Reimplemented in **decaf::net::Inet4Address** (p. 1674).

6.323.3.12 virtual bool decaf::net::InetAddress::isLinkLocalAddress () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is a valid link local address.

Returns:

true if the address is a link local address.

Reimplemented in **decaf::net::Inet4Address** (p. 1674).

6.323.3.13 virtual bool decaf::net::InetAddress::isLoopbackAddress () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is a valid loopback address.

Returns:

true if the address is a loopback address.

Reimplemented in **decaf::net::Inet4Address** (p. 1675).

6.323.3.14 virtual bool decaf::net::InetAddress::isMCGlobal () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Global scope.

Returns:

true if the address is Multicast and has Global scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1675).

6.323.3.15 virtual bool decaf::net::InetAddress::isMCLinkLocal () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Link Local scope.

Returns:

true if the address is Multicast and has Link Local scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1675).

6.323.3.16 virtual bool decaf::net::InetAddress::isMCNodeLocal () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Node Local scope.

Returns:

true if the address is Multicast and has Node Local scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1675).

6.323.3.17 virtual bool decaf::net::InetAddress::isMCOrgLocal () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Organization scope.

Returns:

true if the address is Multicast and has Organization scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1675).

6.323.3.18 virtual bool decaf::net::InetAddress::isMCSiteLocal () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is Multicast and has Site Local scope.

Returns:

true if the address is Multicast and has Site Local scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1676).

6.323.3.19 virtual bool decaf::net::InetAddress::isMulticastAddress () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is a valid Multicast address.

Returns:

true if the address is a Multicast address.

Reimplemented in **decaf::net::Inet4Address** (p. 1676).

6.323.3.20 virtual bool decaf::net::InetAddress::isSiteLocalAddress () const [inline, virtual]

Check if this **InetAddress** (p. 1679) is a valid site local address.

Returns:

true if the address is a site local address.

Reimplemented in **decaf::net::Inet4Address** (p. 1676).

6.323.3.21 virtual std::string decaf::net::InetAddress::toString () const [virtual]

Returns a string representation of the **InetAddress** (p. 1679) in the form 'hostname / ipaddress'. If the hostname is not resolved than it appears as empty.

Returns:

string value of this **InetAddress** (p. 1679).

  Sets input data for decompression.

- void **setInput** (const std::vector< unsigned char > &buffer)

  Sets input data for decompression.

- int **getRemaining** () const

  Returns the total number of bytes remaining in the input buffer.

- void **setDictionary** (const unsigned char *buffer, int size, int offset, int length)

  Sets the preset dictionary to the given array of bytes.

- void **setDictionary** (const std::vector< unsigned char > &buffer, int offset, int length)

  Sets the preset dictionary to the given array of bytes.

- void **setDictionary** (const std::vector< unsigned char > &buffer)

  Sets the preset dictionary to the given array of bytes.

- bool **needsInput** () const
- bool **needsDictionary** () const
- void **finish** ()

  When called, indicates that decompression should end with the current contents of the input buffer.

- bool **finished** () const
- int **inflate** (unsigned char *buffer, int size, int offset, int length)

  Uncompresses bytes into specified buffer.

- int **inflate** (std::vector< unsigned char > &buffer, int offset, int length)

  Uncompresses bytes into specified buffer.

- int **inflate** (std::vector< unsigned char > &buffer)

  Uncompresses bytes into specified buffer.

- long long **getAdler** () const
- long long **getBytesRead** () const
- long long **getBytesWritten** () const
- void **reset** ()

  Resets deflater so that a new set of input data can be processed.

- void **end** ()

  Closes the decompressor and discards any unprocessed input.

6.326.1 Detailed Description

This class uncompresses data that was compressed using the *DEFLATE* algorithm (see `specification`). Basically this class is part of the API to the stream based ZLIB compression library and is used as such by **InflaterInputStream** (p. 1699) and its descendants.

The typical usage of a **Inflater** (p. 1691) outside this package consists of a specific call to one of its constructors before being passed to an instance of **InflaterInputStream** (p. 1699).

See also:

InflaterInputStream (p. 1699)
Deflater (p. 1350)

Since:

1.0

6.326.2 Constructor & Destructor Documentation

6.326.2.1 decaf::util::zip::Inflater::Inflater ()

Creates a new decompressor. This constructor defaults the inflater to use the ZLIB header and checksum fields.

6.326.2.2 decaf::util::zip::Inflater::Inflater (bool *nowrap*)

Creates a new decompressor. If the parameter 'nowrap' is true then the ZLIB header and checksum fields will not be used. This provides compatibility with the compression format used by both GZIP and PKZIP.

Note: When using the 'nowrap' option it is also necessary to provide an extra "dummy" byte as input. This is required by the ZLIB native library in order to support certain optimizations.

6.326.2.3 virtual decaf::util::zip::Inflater::~Inflater () [virtual]

6.326.3 Member Function Documentation

6.326.3.1 void decaf::util::zip::Inflater::end ()

Closes the decompressor and discards any unprocessed input. This method should be called when the decompressor is no longer being used, but will also be called automatically by the destructor. Once this method is called, the behavior of the **Inflater** (p. 1691) object is undefined.

6.326.3.2 void decaf::util::zip::Inflater::finish ()

When called, indicates that decompression should end with the current contents of the input buffer.

6.326.3.3 bool decaf::util::zip::Inflater::finished () const

Returns:

true if the end of the compressed data output stream has been reached.

6.326.3.4 long long decaf::util::zip::Inflater::getAdler () const

Returns:

the ADLER-32 value of the uncompressed data.

Exceptions:

IllegalStateException if in the end state.

6.326.3.5 long long decaf::util::zip::Inflater::getBytesRead () const

Returns:

the total number of compressed bytes input so far.

Exceptions:

IllegalStateException if in the end state.

6.326.3.6 long long decaf::util::zip::Inflater::getBytesWritten () const

Returns:

the total number of decompressed bytes output so far.

Exceptions:

IllegalStateException if in the end state.

6.326.3.7 int decaf::util::zip::Inflater::getRemaining () const

Returns the total number of bytes remaining in the input buffer. This can be used to find out what bytes still remain in the input buffer after decompression has finished.

Returns:

the total number of bytes remaining in the input buffer

6.326.3.8 int decaf::util::zip::Inflater::inflate (std::vector< unsigned char > & *buffer*)

Uncompresses bytes into specified buffer. Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p. 1695) or **needsDictionary()** (p. 1695) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p. 1693) can be used to get the Adler-32 value of the dictionary required.

Parameters:

buffer The Buffer to write the compressed data to.

Exceptions:

IllegalStateException if in the end state.

DataFormatException *(p. 1245)* if the compressed data format is invalid.

6.326.3.9 int decaf::util::zip::Inflater::inflate (std::vector< unsigned char > & *buffer*, int *offset*, int *length*)

Uncompresses bytes into specified buffer. Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p. 1695) or **needsDictionary()** (p. 1695) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p. 1693) can be used to get the Adler-32 value of the dictionary required.

Parameters:

buffer The Buffer to write the compressed data to.

offset The position in the Buffer to start writing at.

length The maximum number of byte of data to write.

Exceptions:

IllegalStateException if in the end state.

IndexOutOfBoundsException if the offset + length > size of the buffer.

DataFormatException *(p. 1245)* if the compressed data format is invalid.

6.326.3.10 int decaf::util::zip::Inflater::inflate (unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Uncompresses bytes into specified buffer. Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p. 1695) or **needsDictionary()** (p. 1695) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p. 1693) can be used to get the Adler-32 value of the dictionary required.

Parameters:

buffer The Buffer to write the compressed data to.

size The size of the buffer passed in.

offset The position in the Buffer to start writing at.

length The maximum number of byte of data to write.

Exceptions:

NullPointerException if buffer is NULL.

IllegalStateException if in the end state.

IndexOutOfBoundsException if the offset + length > size of the buffer.

DataFormatException *(p. 1245)* if the compressed data format is invalid.

6.326.3.11 bool decaf::util::zip::Inflater::needsDictionary () const

Returns:

true if a preset dictionary is needed for decompression.

6.326.3.12 bool decaf::util::zip::Inflater::needsInput () const

Returns:

true if the input data buffer is empty and **setInput()** (p. 1697) should be called in order to provide more input

6.326.3.13 void decaf::util::zip::Inflater::reset ()

Resets deflater so that a new set of input data can be processed. Keeps current decompression level and strategy settings.

Exceptions:

IllegalStateException if in the end state.

6.326.3.14 void decaf::util::zip::Inflater::setDictionary (const std::vector< unsigned char > & *buffer*)

Sets the preset dictionary to the given array of bytes. Should be called when **inflate()** (p. 1695) returns 0 and **needsDictionary()** (p. 1695) returns true indicating that a preset dictionary is required. The method **getAdler()** (p. 1693) can be used to get the Adler-32 value of the dictionary needed.

Parameters:

buffer The Buffer to read in for decompression.

Exceptions:

IllegalStateException if in the end state.

IllegalArgumentException if the given dictionary doesn't match the required dictionaries checksum value.

6.326.3.15 void decaf::util::zip::Inflater::setDictionary (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*)

Sets the preset dictionary to the given array of bytes. Should be called when **inflate()** (p. 1695) returns 0 and **needsDictionary()** (p. 1695) returns true indicating that a preset dictionary is required. The method **getAdler()** (p. 1693) can be used to get the Adler-32 value of the dictionary needed.

Parameters:

buffer The Buffer to read in for decompression.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions:

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

IllegalArgumentException if the given dictionary doesn't match thre required dictionaries checksum value.

6.326.3.16 void decaf::util::zip::Inflater::setDictionary (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Sets the preset dictionary to the given array of bytes. Should be called when **inflate()** (p. 1695) returns 0 and **needsDictionary()** (p. 1695) returns true indicating that a preset dictionary is required. The method **getAdler()** (p. 1693) can be used to get the Adler-32 value of the dictionary needed.

Parameters:

buffer The Buffer to read in for decompression.

size The size of the buffer passed in.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions:

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

IllegalArgumentException if the given dictionary doesn't match thre required dictionaries checksum value.

6.326.3.17 void decaf::util::zip::Inflater::setInput (const std::vector< unsigned char > & *buffer*)

Sets input data for decompression. This should be called whenever **needsInput()** (p. 1695) returns true indicating that more input data is required.

Parameters:

buffer The Buffer to read in for decompression.

Exceptions:

IllegalStateException if in the end state.

6.326.3.18 void decaf::util::zip::Inflater::setInput (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*)

Sets input data for decompression. This should be called whenever **needsInput()** (p. 1695) returns true indicating that more input data is required.

Parameters:

buffer The Buffer to read in for decompression.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions:

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

6.326.3.19 void decaf::util::zip::Inflater::setInput (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Sets input data for decompression. This should be called whenever **needsInput()** (p. 1695) returns true indicating that more input data is required.

Parameters:

buffer The Buffer to read in for decompression.

size The size of the buffer passed in.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions:

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**Inflater.h**

6.327 decaf::util::zip::InflaterInputStream Class Reference

A FilterInputStream that decompresses data read from the wrapped InputStream instance.

`#include <src/main/decaf/util/zip/InflaterInputStream.h>`Inheritance diagram for decaf::util::zip::InflaterInputStream:

Public Member Functions

- **InflaterInputStream** (**decaf::io::InputStream** ∗**inputStream**, bool **own**=false)

  Create an instance of this class with a default inflater and buffer size.

- **InflaterInputStream** (**decaf::io::InputStream** ∗**inputStream**, **Inflater** ∗**inflater**, bool **own**=false, bool **ownInflater**=false)

  *Creates a new **InflaterInputStream** (p. 1699) with a user supplied **Inflater** (p. 1691) and a default buffer size.*

- **InflaterInputStream** (**decaf::io::InputStream** ∗**inputStream**, **Inflater** ∗**inflater**, int bufferSize, bool **own**=false, bool **ownInflater**=false)

  *Creates a new DeflateOutputStream with a user supplied **Inflater** (p. 1691) and specified buffer size.*

- virtual ∼**InflaterInputStream** ()
- virtual int **available** () const

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.
  Returns:

  the number of bytes available on this input stream.
  Exceptions:

  ***IOException** (p. **1787**) if an I/O error occurs.*

- virtual void **close** ()

  *Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.*
  The default implementation of this method does nothing.
  Exceptions:

  ***IOException** (p. **1787**) if an I/O error occurs while closing the **InputStream** (p. 1707).*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  *The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters:

num *The number of bytes to skip.*

Returns:

total bytes skipped

Exceptions:

IOException *(p. **1787**) if an I/O error occurs.*
UnsupportedOperationException *if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
  If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.
  Calling mark on a closed stream instance should have no effect.
  The default implementation of this method does nothing.

  Parameters:

  readLimit *The max bytes read before marked position is invalid.*

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.
  *If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1787) might be thrown. * If such an **IOException** (p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*
  *If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1787). * If an **IOException** (p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*
  *The default implementation of this method throws an **IOException** (p. 1787).*

  Exceptions:

  IOException *(p. **1787**) if an I/O error occurs.*

- virtual bool **markSupported** () const

  Determines if this input stream supports the mark and reset methods.
  Whether or not mark and reset are supported is an invariant property of a particular input stream instance.
  The default implementation of this method returns false.

  Returns:

  true if this stream instance supports marks

Protected Member Functions

- virtual void **fill** ()

  Fills the input buffer with the next chunk of data.

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int **length**)

Protected Attributes

- **Inflater** * **inflater**

  *The **Inflater** (p. 1691) instance to use.*

- std::vector< unsigned char > **buff**

  The buffer to hold chunks of data read from the stream before inflation.

- int **length**

  The amount of data currently stored in the input buffer.

- bool **ownInflater**
- bool **atEOF**

Static Protected Attributes

- static const int **DEFAULT_BUFFER_SIZE**

6.327.1 Detailed Description

A FilterInputStream that decompresses data read from the wrapped InputStream instance.

Since:

1.0

6.327.2 Constructor & Destructor Documentation

6.327.2.1 decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * *inputStream*, bool *own* = `false`)

Create an instance of this class with a default inflater and buffer size.

Parameters:

inputStream The InputStream instance to wrap.

own Should this Filter take ownership of the InputStream pointer (defaults to false).

6.327.2.2 decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * *inputStream*, Inflater * *inflater*, bool *own* = `false`, bool *ownInflater* = `false`)

Creates a new **InflaterInputStream** (p. 1699) with a user supplied **Inflater** (p. 1691) and a default buffer size. When the user supplied a **Inflater** (p. 1691) instance the **InflaterInputStream** (p. 1699) does not take ownership of the **Inflater** (p. 1691) pointer unless the ownInflater parameter is set to true, otherwise the caller is still responsible for deleting the **Inflater** (p. 1691).

Parameters:

inputStream The InputStream instance to wrap.

inflater The user supplied **Inflater** (p. 1691) to use for decompression. (

own Should this filter take ownership of the InputStream pointer (default is false).

ownInflater Should the filter take ownership of the passed **Inflater** (p. 1691) object (default is false).

Exceptions:

NullPointerException if the **Inflater** (p. 1691) given is NULL.

6.327.2.3 decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * *inputStream*, Inflater * *inflater*, int *bufferSize*, bool *own* = `false`, bool *ownInflater* = `false`)

Creates a new DeflateOutputStream with a user supplied **Inflater** (p. 1691) and specified buffer size. When the user supplied a **Inflater** (p. 1691) instance the **InflaterInputStream** (p. 1699) does not take ownership of the **Inflater** (p. 1691) pointer unless the ownInflater parameter is set to true, otherwise the caller is still responsible for deleting the **Inflater** (p. 1691).

Parameters:

inputStream The InputStream instance to wrap.

inflater The user supplied **Inflater** (p. 1691) to use for decompression.

bufferSize The size of the input buffer.

own Should this filter take ownership of the InputStream pointer (default is false).

ownInflater Should the filter take ownership of the passed **Inflater** (p. 1691) object (default is false).

Exceptions:

NullPointerException if the **Inflater** (p. 1691) given is NULL.

IllegalArgumentException if the bufferSize value is zero.

6.327.2.4 virtual decaf::util::zip::InflaterInputStream::~InflaterInputStream () `[virtual]`

6.327.3 Member Function Documentation

6.327.3.1 virtual int decaf::util::zip::InflaterInputStream::available () const `[virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Until EOF this method always returns 1, thereafter it always returns 0.

Reimplemented from **decaf::io::FilterInputStream** (p. 1523).

6.327.3.2 virtual void decaf::util::zip::InflaterInputStream::close () [virtual]

Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs while closing the **InputStream** (p. 1707).

Closes any resources associated with this **InflaterInputStream** (p. 1699).

Reimplemented from **decaf::io::FilterInputStream** (p. 1523).

6.327.3.3 virtual int decaf::util::zip::InflaterInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.327.3.4 virtual int decaf::util::zip::InflaterInputStream::doReadByte () [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.327.3.5 virtual void decaf::util::zip::InflaterInputStream::fill () [protected, virtual]

Fills the input buffer with the next chunk of data.

Exceptions:

IOException if an I/O error occurs.

6.327.3.6 virtual void decaf::util::zip::InflaterInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters:

readLimit The max bytes read before marked position is invalid.

Does nothing.

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.327.3.7 virtual bool decaf::util::zip::InflaterInputStream::markSupported () const [virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns:

true if this stream instance supports marks

Always returns false.

Reimplemented from **decaf::io::FilterInputStream** (p. 1525).

6.327.3.8 virtual void decaf::util::zip::InflaterInputStream::reset () [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1787) might be thrown. ∗ If such an **IOException** (p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: ∗ The call to reset may throw an **IOException** (p. 1787). ∗ If an **IOException** (p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1787).

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Always throws an IOException when called.

Reimplemented from **decaf::io::FilterInputStream** (p. 1525).

6.327.3.9 virtual long long decaf::util::zip::InflaterInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Skips the specified amount of uncompressed input data.

Reimplemented from **decaf::io::FilterInputStream** (p. 1526).

6.327.4 Field Documentation

6.327.4.1 bool decaf::util::zip::InflaterInputStream::atEOF [protected]

6.327.4.2 std::vector<unsigned char> decaf::util::zip::InflaterInputStream::buff [protected]

The buffer to hold chunks of data read from the stream before inflation.

6.327.4.3 const int decaf::util::zip::InflaterInputStream::DEFAULT_BUFFER_SIZE [static, protected]

6.327.4.4 Inflater* decaf::util::zip::InflaterInputStream::inflater [protected]

The **Inflater** (p. 1691) instance to use.

6.327.4.5 int decaf::util::zip::InflaterInputStream::length [protected]

The amount of data currently stored in the input buffer.

6.327.4.6 bool decaf::util::zip::InflaterInputStream::ownInflater [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**InflaterInputStream.h**

6.328 decaf::io::InputStream Class Reference

6.328.1 Detailed Description

A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.

Since:

1.0

6.328.2 Constructor & Destructor Documentation

6.328.2.1 decaf::io::InputStream::InputStream ()

6.328.2.2 virtual decaf::io::InputStream::~InputStream () [virtual]

6.328.3 Member Function Documentation

6.328.3.1 virtual int decaf::io::InputStream::available () const [inline, virtual]

Indicates the number of bytes available. The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Reimplemented in **decaf::internal::io::StandardInputStream** (p. 2848), **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 2320), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 3001), **decaf::io::BlockingByteArrayInputStream** (p. 687), **decaf::io::BufferedInputStream** (p. 743), **decaf::io::ByteArrayInputStream** (p. 826), **decaf::io::FilterInputStream** (p. 1523), **decaf::io::PushbackInputStream** (p. 2510), and **decaf::util::zip::InflaterInputStream** (p. 1702).

6.328.3.2 virtual void decaf::io::InputStream::close () [virtual]

Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream. The default implementation of this method does nothing.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs while closing the **InputStream** (p. 1707).

Implements **decaf::io::Closeable** (p. 967).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 2320), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 3001), **decaf::io::BlockingByteArrayInputStream** (p. 688), **decaf::io::BufferedInputStream** (p. 744), **decaf::io::FilterInputStream** (p. 1523), and **decaf::util::zip::InflaterInputStream** (p. 1703).

6.328.3.3 virtual int decaf::io::InputStream::doReadArray (unsigned char * *buffer*, int *size*) [protected, virtual]

Reimplemented in **decaf::io::FilterInputStream** (p. 1524).

6.328.3.4 virtual int decaf::io::InputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented in **activemq::io::LoggingInputStream** (p. 1948), **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 2321), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 3002), **decaf::io::BlockingByteArrayInputStream** (p. 688), **decaf::io::BufferedInputStream** (p. 744), **decaf::io::ByteArrayInputStream** (p. 827), **decaf::io::FilterInputStream** (p. 1524), **decaf::io::PushbackInputStream** (p. 2510), **decaf::util::zip::CheckedInputStream** (p. 952), and **decaf::util::zip::InflaterInputStream** (p. 1703).

6.328.3.5 virtual int decaf::io::InputStream::doReadByte () [protected, pure virtual]

Implemented in **activemq::io::LoggingInputStream** (p. 1948), **decaf::internal::io::StandardInputStream** (p. 2849), **decaf::internal::net::ssl::openssl::OpenSSLSocketInput** (p. 2321), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 3002), **decaf::io::BlockingByteArrayInputStream** (p. 688), **decaf::io::BufferedInputStream** (p. 744), **decaf::io::ByteArrayInputStream** (p. 827), **decaf::io::FilterInputStream** (p. 1524), **decaf::io::PushbackInputStream** (p. 2510), **decaf::util::zip::CheckedInputStream** (p. 952), and **decaf::util::zip::InflaterInputStream** (p. 1703).

6.328.3.6 virtual void decaf::io::InputStream::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

6.328.3.7 virtual void decaf::io::InputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters:

readLimit The max bytes read before marked position is invalid.

Reimplemented in **decaf::io::BufferedInputStream** (p. 744), **decaf::io::ByteArrayInputStream** (p. 827), **decaf::io::FilterInputStream** (p. 1524), **decaf::io::PushbackInputStream** (p. 2511), and **decaf::util::zip::InflaterInputStream** (p. 1703).

6.328.3.8 virtual bool decaf::io::InputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns:

true if this stream instance supports marks

Reimplemented in **decaf::io::BufferedInputStream** (p. 744), **decaf::io::ByteArrayInputStream** (p. 827), **decaf::io::FilterInputStream** (p. 1525), **decaf::io::PushbackInputStream** (p. 2511), and **decaf::util::zip::InflaterInputStream** (p. 1704).

6.328.3.9 virtual void decaf::io::InputStream::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.328.3.10 virtual void decaf::io::InputStream::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.328.3.11 virtual int decaf::io::InputStream::read (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Reads up to length bytes of data from the input stream into an array of bytes. An attempt is made to read as many as length bytes, but a smaller number may be read. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If length is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into b.

The first byte read is stored into element b[off], the next one into b[off+1], and so on. The number of bytes read is, at most, equal to length. Let k be the number of bytes actually read; these bytes will be stored in elements b[off] through b[off+k-1], leaving elements b[offset+k] through b[offset+length-1] unaffected.

In every case, elements b[0] through b[offset] and elements b[offset+length] through b[b.length-1] are unaffected.

This method called the protected virtual method doReadArrayBounded which simply calls the method **doReadByte()** (p. 1710) repeatedly. If the first such call results in an **IOException**

(p. 1787), that exception is returned. If any subsequent call to **doReadByte()** (p. 1710) results in a **IOException** (p. 1787), the exception is caught and treated as if it were end of file; the bytes read up to that point are stored into the buffer and the number of bytes read before the exception occurred is returned. The default implementation of this method blocks until the requested amount of input data has been read, end of file is detected, or an exception is thrown. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

buffer The target buffer to write the read in data to.

size The size in bytes of the target buffer.

offset The position in the buffer to start inserting the read in data.

length The maximum number of bytes that should be read into buffer.

Returns:

The number of bytes read or -1 if EOF is detected

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

NullPointerException if buffer passed is NULL.

IndexOutOfBoundsException if length > size - offset.

6.328.3.12 virtual int decaf::io::InputStream::read (unsigned char * *buffer*, int *size*) [virtual]

Reads up to size bytes of data from the input stream into an array of bytes. An attempt is made to read as many as size bytes, but a smaller number may be read. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If size is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into b.

This method called the protected virtual method doReadArray which by default is the same as calling read(buffer, size, 0, size). Subclasses can customize the behavior of this method by overriding the doReadArray method to provide a better performing read operation.

Parameters:

buffer The target buffer to write the read in data to.

size The size in bytes of the target buffer.

Returns:

The number of bytes read or -1 if EOF is detected

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

NullPointerException if buffer passed is NULL.

6.328.3.13 virtual int decaf::io::InputStream::read () [virtual]

Reads a single byte from the buffer. The value byte is returned as an int in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown.

The default implementation of this method calls the **internal** (p. 97) virtual method doReadByte which is a pure virtual method and must be overridden by all subclasses.

Returns:

The next byte or -1 if the end of stream is reached.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error occurs.

6.328.3.14 virtual void decaf::io::InputStream::reset () [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1787) might be thrown. ∗ If such an **IOException** (p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: ∗ The call to reset may throw an **IOException** (p. 1787). ∗ If an **IOException** (p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1787).

Exceptions:

IOException *(*p. ***1787****)* if an I/O error occurs.

Reimplemented in **decaf::io::BufferedInputStream** (p. 745), **decaf::io::ByteArrayInputStream** (p. 827), **decaf::io::FilterInputStream** (p. 1525), **decaf::io::PushbackInputStream** (p. 2511), and **decaf::util::zip::InflaterInputStream** (p. 1704).

6.328.3.15 virtual long long decaf::io::InputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 2321), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 3002), **decaf::io::BlockingByteArrayInputStream** (p. 688), **decaf::io::BufferedInputStream** (p. 745), **decaf::io::ByteArrayInputStream** (p. 829), **decaf::io::FilterInputStream** (p. 1526), **decaf::io::PushbackInputStream** (p. 2512), **decaf::util::zip::CheckedInputStream** (p. 952), and **decaf::util::zip::InflaterInputStream** (p. 1705).

6.328.3.16 virtual std::string decaf::io::InputStream::toString () const [virtual]

Output a String representation of this object. The default version of this method just prints the Class Name.

Returns:

a string representation of the object.

6.328.3.17 virtual bool decaf::io::InputStream::tryLock () [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.328.3.18 virtual void decaf::io::InputStream::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.328.3.19 virtual void decaf::io::InputStream::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.328.3.20 virtual void decaf::io::InputStream::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.328.3.21 virtual void decaf::io::InputStream::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InputStream.h**

6.329 decaf::io::InputStreamReader Class Reference

An **InputStreamReader** (p. 1717) is a bridge from byte streams to character streams.

`#include <src/main/decaf/io/InputStreamReader.h>`Inheritance diagram for decaf::io::InputStreamReader:

Public Member Functions

- **InputStreamReader** (**InputStream** *stream, bool own=false)

  Override this method to customize the functionality of the method read(unsigned char buffer, int size, int offset, int length).*

- virtual void **checkClosed** () const

6.329.1 Detailed Description

An **InputStreamReader** (p. 1717) is a bridge from byte streams to character streams. For top efficiency, consider wrapping an **InputStreamReader** (p. 1717) within a BufferedReader. For example:

BufferedReader* in = new BufferedReader(new **InputStreamReader** (p. 1717)(System.in, false), true);

See also:

OutputStreamWriter (p. 2355)

Since:

1.0

6.329.2 Constructor & Destructor Documentation

6.329.2.1 decaf::io::InputStreamReader::InputStreamReader (InputStream * *stream*, bool *own* = `false`)

Create a new **InputStreamReader** (p. 1717) that wraps the given **InputStream** (p. 1707).

Parameters:

stream The **InputStream** (p. 1707) to read from. (cannot be null).

own Does this object own the passed **InputStream** (p. 1707) (defaults to false).

Exceptions:

NullPointerException if the passed **InputStream** (p. 1707) is NULL.

6.329.2.2 virtual decaf::io::InputStreamReader::~InputStreamReader () [virtual]

6.329.3 Member Function Documentation

6.329.3.1 virtual void decaf::io::InputStreamReader::checkClosed () const [protected, virtual]

6.329.3.2 virtual void decaf::io::InputStreamReader::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

IOException *(p. 1787)* if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 967).

6.329.3.3 virtual int decaf::io::InputStreamReader::doReadArrayBounded (char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Override this method to customize the functionality of the method read(unsigned char* buffer, int size, int offset, int length). All subclasses must override this method to provide the basic **Reader** (p. 2529) functionality.

Implements **decaf::io::Reader** (p. 2530).

6.329.3.4 virtual bool decaf::io::InputStreamReader::ready () const [virtual]

Tells whether this stream is ready to be read.

Returns:

True if the next **read()** (p. 2532) is guaranteed not to block for input, false otherwise. Note that returning false does not guarantee that the next read will block.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Reimplemented from **decaf::io::Reader** (p. 2533).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InputStreamReader.h**

6.330 decaf::internal::nio::IntArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/IntArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::IntArrayBuffer:

Public Member Functions

- **IntArrayBuffer** (int size, bool readOnly=false)

  *Creates a **IntArrayBuffer** (p. 1719) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **IntArrayBuffer** (int *array, int size, int offset, int length, bool readOnly=false)

  *Creates a **IntArrayBuffer** (p. 1719) object that wraps the given array.*

- **IntArrayBuffer** (const **decaf::lang::Pointer< ByteArrayAdapter >** &array, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **IntArrayBuffer** (const **IntArrayBuffer** &other)

  *Create a **IntArrayBuffer** (p. 1719) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**IntArrayBuffer** ()
- virtual int * **array** ()

  Returns the int array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  *the array that backs this **Buffer** (p. 735).*

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  The offset into the backing array where index zero starts.

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual IntBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only int buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
Returns:

The new, read-only int buffer which the caller then owns.

- virtual IntBuffer & **compact** ()

Compacts this buffer.
*The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.
Returns:

*a reference to this **IntBuffer** (p. 1728)*
Exceptions:

***ReadOnlyBufferException** (p. 2535) if this buffer is read-only.*

- virtual IntBuffer * **duplicate** ()

Creates a new int buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
The new buffer will be read-only if, and only if, this buffer is read-only.
Returns:

*a new int **Buffer** (p. 735) which the caller owns.*

- virtual int **get** ()

Relative get method.
Reads the value at this buffer's current position, and then increments the position.
Returns:

the int at the current position.
Exceptions:

***BufferUnderflowException** (p. 763) if there no more data to return.*

- virtual int **get** (int index) const

Absolute get method.
Reads the value at the given index.
Parameters:

***index** The index in the **Buffer** (p. 735) where the int is to be read.*
Returns:

the int that is located at the given index.

Exceptions:

IndexOutOfBoundsException *if index is not smaller than the buffer's limit, or index is negative.*

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible int array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.
  Returns:

  true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.
  Returns:

  true if, and only if, this buffer is read-only.

- virtual IntBuffer & **put** (int value)

  Writes the given integer into this buffer at the current position, and then increments the position.
  Parameters:

  value *The integer value to be written.*
  Returns:

  a reference to this buffer.
  Exceptions:

  BufferOverflowException *(p. **760**) if this buffer's current position is not smaller than its limit.*
  ReadOnlyBufferException *(p. **2535**) if this buffer is read-only.*

- virtual IntBuffer & **put** (int index, int value)

  Writes the given ints into this buffer at the given index.
  Parameters:

  index *The position in the* ***Buffer*** *(p. 735) to write the data.*
  value *The ints to write.*
  Returns:

  a reference to this buffer.
  Exceptions:

  IndexOutOfBoundsException *- If index greater than the buffer's limit minus the size of the type being written, or the index is negative.*
  ReadOnlyBufferException *(p. **2535**) - If this buffer is read-only.*

- virtual IntBuffer * **slice** () const

  Creates a new ***IntBuffer*** *(p. 1728) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.*
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the newly create ***IntBuffer*** *(p. 1728) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **IntArrayBuffer** (p. 1719) as Read-Only.*

6.330.1 Constructor & Destructor Documentation

6.330.1.1 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **IntArrayBuffer** (p. 1719) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

IllegalArguementException if the capacity value is negative.

6.330.1.2 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **IntArrayBuffer** (p. 1719) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.330.1.3 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset. The capacity and limit of the new **IntArrayBuffer** (p. 1719) will be that of the remaining capacity of the passed buffer.

Parameters:

array The ByteArrayAdapter to wrap.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if array is NULL

IndexOutOfBoundsException if offset + length is greater than array size.

6.330.1.4 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const IntArrayBuffer & *other*)

Create a **IntArrayBuffer** (p. 1719) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters:

other The **IntArrayBuffer** (p. 1719) this one is to mirror.

6.330.1.5 virtual decaf::internal::nio::IntArrayBuffer::~IntArrayBuffer () [virtual]

6.330.2 Member Function Documentation

6.330.2.1 virtual int* decaf::internal::nio::IntArrayBuffer::array () [virtual]

Returns the int array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1730).

6.330.2.2 virtual int decaf::internal::nio::IntArrayBuffer::arrayOffset () [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1731).

6.330.2.3 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only int buffer which the caller then owns.

Implements **decaf::nio::IntBuffer** (p. 1731).

6.330.2.4 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::compact () [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **IntBuffer** (p. 1728)

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1731).

6.330.2.5 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::duplicate () [virtual]

Creates a new int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new int **Buffer** (p. 735) which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1732).

6.330.2.6 virtual int decaf::internal::nio::IntArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the int is to be read.

Returns:

the int that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::IntBuffer** (p. 1733).

6.330.2.7 virtual int decaf::internal::nio::IntArrayBuffer::get () [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns:

the int at the current position.

Exceptions:

BufferUnderflowException *(p. 763)* if there no more data to return.

Implements **decaf::nio::IntBuffer** (p. 1733).

6.330.2.8 virtual bool decaf::internal::nio::IntArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible int array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::IntBuffer** (p. 1734).

6.330.2.9 virtual bool decaf::internal::nio::IntArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 738).

6.330.2.10 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (int *index*, int *value*) [virtual]

Writes the given ints into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The ints to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written, or the index is negative.

ReadOnlyBufferException (p. ***2535***) - If this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1734).

6.330.2.11 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (int *value*) [virtual]

Writes the given integer into this buffer at the current position, and then increments the position.

Parameters:

value The integer value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1734).

6.330.2.12 virtual void decaf::internal::nio::IntArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **IntArrayBuffer** (p. 1719) as Read-Only.

Parameters:

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.330.2.13 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::slice () const [virtual]

Creates a new **IntBuffer** (p. 1728) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **IntBuffer** (p. 1728) which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1736).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**IntArrayBuffer.h**

6.331 decaf::nio::IntBuffer Class Reference

This class defines four categories of operations upon int buffers:.

Protected Member Functions

- **IntBuffer** (int capacity)

  *Creates a **IntBuffer** (p. 1728) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.331.1 Detailed Description

This class defines four categories of operations upon int buffers:. o Absolute and relative get and put methods that read and write single ints; o Relative bulk get methods that transfer contiguous sequences of ints from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of ints from a int array or some other int buffer into this buffer o Methods for compacting, duplicating, and slicing a int buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing int array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.331.2 Constructor & Destructor Documentation

6.331.2.1 decaf::nio::IntBuffer::IntBuffer (int *capacity*) [protected]

Creates a **IntBuffer** (p. 1728) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity The size and limit of the **Buffer** (p. 735) in integers.

Exceptions:

IllegalArguementException if capacity is negative.

6.331.2.2 virtual decaf::nio::IntBuffer::~IntBuffer () [inline, virtual]

6.331.3 Member Function Documentation

6.331.3.1 static IntBuffer* decaf::nio::IntBuffer::allocate (int *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity The size of the Double buffer in integers.

Returns:

the **IntBuffer** (p. 1728) that was allocated, caller owns.

6.331.3.2 virtual int* decaf::nio::IntBuffer::array () [pure virtual]

Returns the int array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1723).

6.331.3.3 virtual int decaf::nio::IntBuffer::arrayOffset () [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1723).

6.331.3.4 virtual IntBuffer* decaf::nio::IntBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only int buffer which the caller then owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1724).

6.331.3.5 virtual IntBuffer& decaf::nio::IntBuffer::compact () [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **IntBuffer** (p. 1728)

Exceptions:

ReadOnlyBufferException *(*p. *2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1724).

6.331.3.6 virtual int decaf::nio::IntBuffer::compareTo (const IntBuffer & *value*) const [virtual]

6.331.3.7 virtual IntBuffer* decaf::nio::IntBuffer::duplicate () [pure virtual]

Creates a new int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new int **Buffer** (p. 735) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1725).

6.331.3.8 virtual bool decaf::nio::IntBuffer::equals (const IntBuffer & *value*) const [virtual]

6.331.3.9 IntBuffer& decaf::nio::IntBuffer::get (int * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method. This method transfers ints from this buffer into the given destination array. If there are fewer ints remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 740), then no bytes are transferred and a **BufferUnderflowException** (p. 763) is thrown.

Otherwise, this method copies length ints from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer The pointer to an allocated buffer to fill.

size The size of the buffer that was passed in.

offset The position in the buffer to start filling.

length The amount of data to put in the passed buffer.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. *763)* if there are fewer than length ints remaining in this buffer.

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.331.3.10 IntBuffer& decaf::nio::IntBuffer::get (std::vector< int > *buffer*)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are fewer than length ints remaining in this buffer.

6.331.3.11 virtual int decaf::nio::IntBuffer::get (int *index*) const [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the int is to be read.

Returns:

the int that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1725).

6.331.3.12 virtual int decaf::nio::IntBuffer::get () [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the int at the current position.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there no more data to return.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1725).

6.331.3.13 virtual bool decaf::nio::IntBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible int array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1726).

6.331.3.14 virtual bool decaf::nio::IntBuffer::operator< (const IntBuffer & *value*) const [virtual]

6.331.3.15 virtual bool decaf::nio::IntBuffer::operator== (const IntBuffer & *value*) const [virtual]

6.331.3.16 virtual IntBuffer& decaf::nio::IntBuffer::put (int *index*, int *value*) [pure virtual]

Writes the given ints into this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data.

value The ints to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written, or the index is negative.

ReadOnlyBufferException (p. ***2535***) - If this buffer is read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1726).

6.331.3.17 virtual IntBuffer& decaf::nio::IntBuffer::put (int *value*) [pure virtual]

Writes the given integer into this buffer at the current position, and then increments the position.

Parameters:

value The integer value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException (p. ***760***) if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1726).

6.331.3.18 IntBuffer& decaf::nio::IntBuffer::put (std::vector< int > & *buffer*)

This method transfers the entire content of the given source ints array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters:

buffer The buffer whose contents are copied to this **IntBuffer** (p. 1728).

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

6.331.3.19 IntBuffer& decaf::nio::IntBuffer::put (const int * *buffer*, int *size*, int *offset*, int *length*)

This method transfers ints into this buffer from the given source array. If there are more ints to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 740), then no ints are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer The array from which integers are to be read.

size The size of the buffer passed.

offset The offset within the array of the first char to be read.

length The number of integers to be read from the given array.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(p. 760)* if there is insufficient space in this buffer.

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

NullPointerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.331.3.20 IntBuffer& decaf::nio::IntBuffer::put (IntBuffer & *src*)

This method transfers the ints remaining in the given source buffer into this buffer. If there are more ints remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 740), then no ints are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies n = src.remaining() ints from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src The buffer to take ints from an place in this one.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if there is insufficient space in this buffer for the remaining ints in the source buffer.

IllegalArgumentException if the source buffer is this buffer.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

6.331.3.21 virtual IntBuffer* decaf::nio::IntBuffer::slice () const [pure virtual]

Creates a new **IntBuffer** (p. 1728) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **IntBuffer** (p. 1728) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1727).

6.331.3.22 virtual std::string decaf::nio::IntBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.331.3.23 static IntBuffer* decaf::nio::IntBuffer::wrap (std::vector< int > & *buffer*) [static]

Wraps the passed STL int Vector in a **IntBuffer** (p. 1728). The new buffer will be backed by the given int array; modifications to the buffer will cause the array to be modified and vice versa. The

new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **IntBuffer** (p. 1728) that is backed by buffer, caller owns.

6.331.3.24 static IntBuffer* decaf::nio::IntBuffer::wrap (int * *array*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new **IntBuffer** (p. 1728). The new buffer will be backed by the given int array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array The array that will back the new buffer.

size The size of the passed in array.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new **IntBuffer** (p. 1728) that is backed by buffer, caller owns.

Exceptions:

NullPointerException if the array pointer is NULL.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**IntBuffer.h**

6.332 decaf::lang::Integer Class Reference

`#include <src/main/decaf/lang/Integer.h>`Inheritance diagram for decaf::lang::Integer:

Public Member Functions

- **Integer** (int value)
- **Integer** (const std::string &value)

  *Constructs a new **Integer** (p. 1738) and attempts to convert the given string to an int value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted int.*

- virtual ~**Integer** ()
- virtual int **compareTo** (const **Integer** &i) const

  *Compares this **Integer** (p. 1738) instance with another.*

- bool **equals** (const **Integer** &i) const
- virtual bool **operator==** (const **Integer** &i) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Integer** &i) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const int &i) const

  *Compares this **Integer** (p. 1738) instance with another.*

- bool **equals** (const int &i) const
- virtual bool **operator==** (const int &i) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const int &i) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

Static Public Member Functions

- static **Integer decode** (const std::string &value)

  *Decodes a **String** (p. 2935) into a **Integer** (p. 1738).*

- static int **reverseBytes** (int value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.

- static int **reverse** (int value)

  Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.

- static int **parseInt** (const std::string &s, int radix)

  Parses the string argument as a signed int in the radix specified by the second argument.

- static int **parseInt** (const std::string &s)

  Parses the string argument as a signed decimal int.

- static **Integer valueOf** (int value)

  *Returns a **Integer** (p. 1738) instance representing the specified int value.*

- static **Integer valueOf** (const std::string &value)

  *Returns a **Integer** (p. 1738) object holding the value given by the specified std::string.*

- static **Integer valueOf** (const std::string &value, int radix)

  *Returns a **Integer** (p. 1738) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

- static int **bitCount** (int value)

  Returns the number of one-bits in the two's complement binary representation of the specified int value.

- static std::string **toString** (int value)

  *Converts the int to a **String** (p. 2935) representation.*

- static std::string **toString** (int value, int radix)

  Returns a string representation of the first argument in the radix specified by the second argument.

- static std::string **toHexString** (int value)

  Returns a string representation of the integer argument as an unsigned integer in base 16.

- static std::string **toOctalString** (int value)

Returns a string representation of the integer argument as an unsigned integer in base 8.

- static std::string **toBinaryString** (int value)

  Returns a string representation of the integer argument as an unsigned integer in base 2.

- static int **highestOneBit** (int value)

  Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

- static int **lowestOneBit** (int value)

  Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

- static int **numberOfLeadingZeros** (int value)

  Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.

- static int **numberOfTrailingZeros** (int value)

  Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.

- static int **rotateLeft** (int value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

- static int **rotateRight** (int value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

- static int **signum** (int value)

  Returns the signum function of the specified int value.

Static Public Attributes

- static const int **SIZE**

  The size in bits of the primitive int type.

- static const int **MAX_VALUE**

  The maximum value that the primitive type can hold.

- static const int **MIN_VALUE**

  The minimum value that the primitive type can hold.

6.332.1 Constructor & Destructor Documentation

6.332.1.1 decaf::lang::Integer::Integer (int *value*)

Parameters:

value The primitive value to wrap in an `Integer` (p. 1738) instance.

6.332.1.2 decaf::lang::Integer::Integer (const std::string & *value*)

Constructs a new **Integer** (p. 1738) and attempts to convert the given string to an int value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted int.

Parameters:

value The string to convert to a primitive type to wrap.

Exceptions:

NumberFormatException if the string is not a a valid integer.

6.332.1.3 virtual decaf::lang::Integer::~Integer () [inline, virtual]

6.332.2 Member Function Documentation

6.332.2.1 static int decaf::lang::Integer::bitCount (int *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value. This function is sometimes referred to as the population count.

Parameters:

value - the int to count

Returns:

the number of one-bits in the two's complement binary representation of the specified int value.

6.332.2.2 virtual unsigned char decaf::lang::Integer::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2269).

6.332.2.3 virtual int decaf::lang::Integer::compareTo (const int & *i*) const [virtual]

Compares this **Integer** (p. 1738) instance with another.

Parameters:

i - the **Integer** (p. 1738) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< int >** (p. 1037).

6.332.2.4 virtual int decaf::lang::Integer::compareTo (const Integer & *i*) const [virtual]

Compares this **Integer** (p. 1738) instance with another.

Parameters:

i - the **Integer** (p. 1738) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.332.2.5 static Integer decaf::lang::Integer::decode (const std::string & *value*) [static]

Decodes a **String** (p. 2935) into a **Integer** (p. 1738). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInteger method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 2935) is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Integer** (p. 1738) object containing the decoded value

Exceptions:

NumberFomatException if the string is not formatted correctly.

6.332.2.6 virtual double decaf::lang::Integer::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.332.2.7 bool decaf::lang::Integer::equals (const int & *i*) const [inline, virtual]

Parameters:

i - the **Integer** (p. 1738) object to compare against.

Returns:

true if the two **Integer** (p. 1738) Objects have the same value.

Implements **decaf::lang::Comparable< int >** (p. 1038).

6.332.2.8 bool decaf::lang::Integer::equals (const Integer & *i*) const [inline]

Parameters:

i - the **Integer** (p. 1738) object to compare against.

Returns:

true if the two **Integer** (p. 1738) Objects have the same value.

6.332.2.9 virtual float decaf::lang::Integer::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.332.2.10 static int decaf::lang::Integer::highestOneBit (int *value*) [static]

Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

an int value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.332.2.11 virtual int decaf::lang::Integer::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.332.2.12 virtual long long decaf::lang::Integer::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.332.2.13 static int decaf::lang::Integer::lowestOneBit (int *value*) [static]

Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

an int value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.332.2.14 static int decaf::lang::Integer::numberOfLeadingZeros (int *value*) [static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value. Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

∗ floor(log2(x)) = 31 - numberOfLeadingZeros(x) ∗ ceil(log2(x)) = 32 - numberOfLeadingZeros(x - 1)

Parameters:

value - the int to be inspected

Returns:

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.332.2.15 static int decaf::lang::Integer::numberOfTrailingZeros (int *value*) [static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value. Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.332.2.16 virtual bool decaf::lang::Integer::operator< (const int & *i*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< int >** (p. 1038).

6.332.2.17 virtual bool decaf::lang::Integer::operator< (const Integer & *i*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.332.2.18 virtual bool decaf::lang::Integer::operator== (const int & *i*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< int >** (p. 1038).

6.332.2.19 virtual bool decaf::lang::Integer::operator== (const Integer & *i*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.332.2.20 static int decaf::lang::Integer::parseInt (const std::string & *s*) [static]

Parses the string argument as a signed decimal int. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting int value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseInteger(const std::string, int) method.

Parameters:

s - **String** (p. 2935) to convert to a int

Returns:

the converted int value

Exceptions:

NumberFormatException if the string is not a int.

6.332.2.21 static int decaf::lang::Integer::parseInt (const std::string & *s*, int *radix*) [static]

Parses the string argument as a signed int in the radix specified by the second argument. The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 917) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type NumberFormatException is thrown if any of the following situations occurs: * The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p. 921) or larger than **Character.MAX_RADIX** (p. 921). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type int.

Parameters:

s - the **String** (p. 2935) containing the int representation to be parsed

radix - the radix to be used while parsing s

Returns:

the int represented by the string argument in the specified radix.

Exceptions:

NumberFormatException - If **String** (p. 2935) does not contain a parsable int.

6.332.2.22 static int decaf::lang::Integer::reverse (int *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.

Parameters:

value - the value whose bits are to be reversed

Returns:

the reversed bits int.

6.332.2.23 static int decaf::lang::Integer::reverseBytes (int *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.

Parameters:

value - the int whose bytes we are to reverse

Returns:

the reversed int.

6.332.2.24 static int decaf::lang::Integer::rotateLeft (int *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits. (Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters:

value - the int to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

6.332.2.25 static int decaf::lang::Integer::rotateRight (int *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits. (Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: rotateRight(val, -distance) == rotateLeft(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateRight(val, distance) == rotateRight(val, distance & 0x1F).

Parameters:

value - the int to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

6.332.2.26 virtual short decaf::lang::Integer::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2271).

6.332.2.27 static int decaf::lang::Integer::signum (int *value*) [static]

Returns the signum function of the specified int value. (The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters:

value - the int to be inspected

Returns:

the signum function of the specified int value.

6.332.2.28 static std::string decaf::lang::Integer::toBinaryString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 2. The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character.

The characters '0' and '1' are used as binary digits.

Parameters:

value - the int to be translated to a binary string

Returns:

the unsigned int value as a binary string

6.332.2.29 static std::string decaf::lang::Integer::toHexString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 16. The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters:

value - the int to be translated to an Octal string

Returns:

the unsigned int value as a Octal string

6.332.2.30 static std::string decaf::lang::Integer::toOctalString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 8. The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters:

value - the int to be translated to an Octal string

Returns:

the unsigned int value as a Octal string

6.332.2.31 static std::string decaf::lang::Integer::toString (int *value*, int *radix*) [static]

Returns a string representation of the first argument in the radix specified by the second argument. If the radix is smaller than **Character.MIN_RADIX** (p. 921) or larger than **Character.MAX_RADIX** (p. 921), then the radix 10 is used instead.

If the first argument is negative, the first element of the result is the ASCII minus character '-'. If the first argument is not negative, no sign character appears in the result.

The remaining characters of the result represent the magnitude of the first argument. If the magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the magnitude will not be the zero character. The following ASCII characters are used as digits:

0123456789abcdefghijklmnopqrstuvwxyz

Parameters:

value - the int to convert to a string

radix - the radix to format the string in

Returns:

an int formatted to the string value of the radix given.

6.332.2.32 static std::string decaf::lang::Integer::toString (int *value*) [static]

Converts the int to a **String** (p. 2935) representation.

Parameters:

value The int to convert to a `std::string` instance.

Returns:

string representation

6.332.2.33 std::string decaf::lang::Integer::toString () const

Returns:

this `Integer` (p. 1738) Object as a **String** (p. 2935) Representation

Referenced by decaf::util::ArrayList< Pointer< ActiveMQDestination > >::toString().

6.332.2.34 static Integer decaf::lang::Integer::valueOf (const std::string & *value*, int *radix*) [static]

Returns a **Integer** (p. 1738) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed int in the radix specified by the second argument, exactly as if the argument were given to the parseInt(std::string, int) method. The result is a **Integer** (p. 1738) object that represents the int value specified by the string.

Parameters:

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Integer** (p. 1738) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid int.

6.332.2.35 static Integer decaf::lang::Integer::valueOf (const std::string & *value*) [static]

Returns a **Integer** (p. 1738) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal int, exactly as if the argument were given to the parseInt(std::string) method. The result is a **Integer** (p. 1738) object that represents the int value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Integer** (p. 1738) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal int.

6.332.2.36 static Integer decaf::lang::Integer::valueOf (int *value*) [inline, static]

Returns a **Integer** (p. 1738) instance representing the specified int value.

Parameters:

value - the int to wrap

Returns:

the new **Integer** (p. 1738) object wrapping value.

6.332.3 Field Documentation

6.332.3.1 const int decaf::lang::Integer::MAX_VALUE [static]

The maximum value that the primitive type can hold.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::drainTo().

6.332.3.2 const int decaf::lang::Integer::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.332.3.3 const int decaf::lang::Integer::SIZE [static]

The size in bits of the primitive int type.

6.333.1 Constructor & Destructor Documentation

6.333.1.1 activemq::commands::IntegerResponse::IntegerResponse ()

6.333.1.2 virtual activemq::commands::IntegerResponse::~IntegerResponse () [virtual]

6.333.2 Member Function Documentation

6.333.2.1 virtual IntegerResponse* activemq::commands::IntegerResponse::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 2607).

6.333.2.2 virtual void activemq::commands::IntegerResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::Response** (p. 2607).

6.333.2.3 virtual bool activemq::commands::IntegerResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Response** (p. 2607).

6.333.2.4 virtual unsigned char activemq::commands::IntegerResponse::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::Response** (p. 2608).

6.333.2.5 virtual int activemq::commands::IntegerResponse::getResult () const [virtual]

6.333.2.6 virtual void activemq::commands::IntegerResponse::setResult (int *result*) [virtual]

6.333.2.7 virtual std::string activemq::commands::IntegerResponse::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2608).

6.334 activemq::wireformat::openwire::marshal::generated::IntegerRespo Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **IntegerResponseMarshaller** (p. 1756).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/IntegerResponseMarshaller.h>` In
diagram for activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller:

Public Member Functions

- **IntegerResponseMarshaller** ()
- virtual ~**IntegerResponseMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.334.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **IntegerResponseMarshaller** (p. 1756). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.334.2 Constructor & Destructor Documentation

6.334.2.1 activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::IntegerR () [inline]

6.334.2.2 virtual activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::~Integer () [inline, virtual]

6.334.3 Member Function Documentation

6.334.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::createObje () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.334.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::getDataStr () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.334.3.3 virtual void activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::looseMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2618).

6.334.3.4 virtual void activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::looseUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619).

6.334.3.5 virtual int activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2619).

6.334.3.6 virtual void activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2620).

6.334.3.7 virtual void activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::tightUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2620).

The documentation for this class was generated from the following file:

6.336 activemq::transport::mock::InternalCommandListener Class Reference

Listens for Commands sent from the **MockTransport** (p. 2221).

`#include <src/main/activemq/transport/mock/InternalCommandListener.h>`Inheritance diagram for activemq::transport::mock::InternalCommandListener:

Public Member Functions

- **InternalCommandListener** ()
- virtual ~**InternalCommandListener** ()
- void **setTransport** (**MockTransport** *transport)
- void **setResponseBuilder** (const **Pointer**< **ResponseBuilder** > responseBuilder)
- virtual void **onCommand** (const **Pointer**< **Command** > command)

  Event handler for the receipt of a command.

- void **run** ()

  Default implementation of the run method - does nothing.

6.336.1 Detailed Description

Listens for Commands sent from the **MockTransport** (p. 2221). This class processes all outbound **commands** (p. 61) and sends responses that are constructed by calling the Protocol provided **ResponseBuilder** (p. 2610) and getting a set of Commands to send back into the **MockTransport** (p. 2221) as incoming Commands and Responses.

6.336.2 Constructor & Destructor Documentation

6.336.2.1 activemq::transport::mock::InternalCommandListener::InternalCommandListener ()

6.336.2.2 virtual activemq::transport::mock::InternalCommandListener::~InternalCommandListener () `[virtual]`

6.336.3 Member Function Documentation

6.336.3.1 virtual void activemq::transport::mock::InternalCommandListener::onCommand (const Pointer< Command > command *AMQCPP_UNUSED*) `[virtual]`

Event handler for the receipt of a command. The **transport** (p. 72) passes off all received **commands** (p. 61) to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3125) deletes the command upon receipt.

Parameters:

command the received command object.

Reimplemented from **activemq::transport::DefaultTransportListener** (p. 1348).

6.336.3.2 void activemq::transport::mock::InternalCommandListener::run () [virtual]

Default implementation of the run method - does nothing.

Reimplemented from **decaf::lang::Thread** (p. 3023).

6.336.3.3 void activemq::transport::mock::InternalCommandListener::setResponseBuilder (const Pointer< ResponseBuilder > *responseBuilder*) [inline]

6.336.3.4 void activemq::transport::mock::InternalCommandListener::setTransport (MockTransport * *transport*) [inline]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**InternalCommandListener.h**

6.337 decaf::lang::exceptions::InterruptedException Class Reference

`#include <src/main/decaf/lang/exceptions/InterruptedException.h>`Inheritance diagram for decaf::lang::exceptions::InterruptedException:

Public Member Functions

- **InterruptedException** ()

  Default Constructor.

- **InterruptedException** (const **Exception** &ex)

  Conversion Constructor from some other ***Exception*** *(*p. *1458).*

- **InterruptedException** (const **InterruptedException** &ex)

  Copy Constructor.

- **InterruptedException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **InterruptedException** (const std::exception *cause)

  Constructor.

- **InterruptedException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **InterruptedException** * **clone** () const

  Clones this exception.

- virtual ~**InterruptedException** () throw ()

6.337.1 Constructor & Destructor Documentation

6.337.1.1 decaf::lang::exceptions::InterruptedException::InterruptedException ()

Default Constructor.

6.337.1.2 decaf::lang::exceptions::InterruptedException::InterruptedException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.337.1.3 decaf::lang::exceptions::InterruptedException::InterruptedException (const InterruptedException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.337.1.4 decaf::lang::exceptions::InterruptedException::InterruptedException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.337.1.5 decaf::lang::exceptions::InterruptedException::InterruptedException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.337.1.6 decaf::lang::exceptions::InterruptedException::InterruptedException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.337.1.7 virtual decaf::lang::exceptions::InterruptedException::~InterruptedException () throw () [virtual]

6.337.2 Member Function Documentation

6.337.2.1 virtual InterruptedException* decaf::lang::exceptions::InterruptedException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**InterruptedException.h**

  Copy Constructor.

- **InterruptedIOException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **InterruptedIOException** (const std::exception *cause)

  Constructor.

- **InterruptedIOException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor.

- virtual **InterruptedIOException** * **clone** () const

  Clones this exception.

- virtual ~**InterruptedIOException** () throw ()

6.338.1 Constructor & Destructor Documentation

6.338.1.1 decaf::io::InterruptedIOException::InterruptedIOException ()

Default Constructor.

6.338.1.2 decaf::io::InterruptedIOException::InterruptedIOException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.338.1.3 decaf::io::InterruptedIOException::InterruptedIOException (const InterruptedIOException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.338.1.4 decaf::io::InterruptedIOException::InterruptedIOException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.338.1.5 decaf::io::InterruptedIOException::InterruptedIOException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.338.1.6 decaf::io::InterruptedIOException::InterruptedIOException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.338.1.7 virtual decaf::io::InterruptedIOException::~InterruptedIOException () throw () [virtual]

6.338.2 Member Function Documentation

6.338.2.1 virtual InterruptedIOException* decaf::io::InterruptedIOException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1788).

Reimplemented in **decaf::net::SocketTimeoutException** (p. 2809).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InterruptedIOException.h**

6.339 cms::InvalidClientIdException Class Reference

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

`#include <src/main/cms/InvalidClientIdException.h>`Inheritance diagram for cms::InvalidClientIdException:

Public Member Functions

- **InvalidClientIdException** ()
- **InvalidClientIdException** (const **InvalidClientIdException** &ex)
- **InvalidClientIdException** (const std::string &message)
- **InvalidClientIdException** (const std::string &message, const std::exception *cause)
- **InvalidClientIdException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**InvalidClientIdException** () throw ()
- virtual **InvalidClientIdException** * **clone** ()

  *Creates a cloned version of this **CMSException** (p. 979) instance.*

6.339.1 Detailed Description

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

Since:

1.3

6.339.2 Constructor & Destructor Documentation

6.339.2.1 cms::InvalidClientIdException::InvalidClientIdException ()

6.339.2.2 cms::InvalidClientIdException::InvalidClientIdException (const InvalidClientIdException & *ex*)

6.339.2.3 cms::InvalidClientIdException::InvalidClientIdException (const std::string & *message*)

6.339.2.4 cms::InvalidClientIdException::InvalidClientIdException (const std::string & *message*, const std::exception * *cause*)

6.339.2.5 cms::InvalidClientIdException::InvalidClientIdException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.339.2.6 virtual cms::InvalidClientIdException::~InvalidClientIdException () throw () [virtual]

6.339.3 Member Function Documentation

6.339.3.1 virtual InvalidClientIdException* cms::InvalidClientIdException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

The documentation for this class was generated from the following file:

- src/main/cms/**InvalidClientIdException.h**

6.340 cms::InvalidDestinationException Class Reference

This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

`#include <src/main/cms/InvalidDestinationException.h>`Inheritance diagram for cms::InvalidDestinationException:

Public Member Functions

- **InvalidDestinationException** ()
- **InvalidDestinationException** (const **InvalidDestinationException** &ex)
- **InvalidDestinationException** (const std::string &message)
- **InvalidDestinationException** (const std::string &message, const std::exception *cause)
- **InvalidDestinationException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**InvalidDestinationException** () throw ()
- virtual **InvalidDestinationException** * **clone** ()

  *Creates a cloned version of this **CMSException** (p. 979) instance.*

6.340.1 Detailed Description

This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Since:

1.3

6.340.2 Constructor & Destructor Documentation

6.340.2.1 cms::InvalidDestinationException::InvalidDestinationException ()

6.340.2.2 cms::InvalidDestinationException::InvalidDestinationException (const InvalidDestinationException & *ex*)

6.340.2.3 cms::InvalidDestinationException::InvalidDestinationException (const std::string & *message*)

6.340.2.4 cms::InvalidDestinationException::InvalidDestinationException (const std::string & *message*, const std::exception * *cause*)

6.340.2.5 cms::InvalidDestinationException::InvalidDestinationException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.340.2.6 virtual cms::InvalidDestinationException::~InvalidDestinationException () throw () [virtual]

6.340.3 Member Function Documentation

6.340.3.1 virtual InvalidDestinationException* cms::InvalidDestinationException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

The documentation for this class was generated from the following file:

- src/main/cms/**InvalidDestinationException.h**

6.341 decaf::security::InvalidKeyException Class Reference

`#include <src/main/decaf/security/InvalidKeyException.h>`Inheritance diagram for decaf::security::InvalidKeyException:

Public Member Functions

- **InvalidKeyException** ()

  Default Constructor.

- **InvalidKeyException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **InvalidKeyException** (const **InvalidKeyException** &ex)

  Copy Constructor.

- **InvalidKeyException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **InvalidKeyException** (const std::exception *cause)

  Constructor.

- **InvalidKeyException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **InvalidKeyException** * **clone** () const

  Clones this exception.

- virtual ~**InvalidKeyException** () throw ()

6.341.1 Constructor & Destructor Documentation

6.341.1.1 decaf::security::InvalidKeyException::InvalidKeyException ()

Default Constructor.

6.341.1.2 decaf::security::InvalidKeyException::InvalidKeyException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.341.1.3 decaf::security::InvalidKeyException::InvalidKeyException (const InvalidKeyException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.341.1.4 decaf::security::InvalidKeyException::InvalidKeyException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.341.1.5 decaf::security::InvalidKeyException::InvalidKeyException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.341.1.6 decaf::security::InvalidKeyException::InvalidKeyException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.341.1.7 virtual decaf::security::InvalidKeyException::~InvalidKeyException () throw () [virtual]

6.341.2 Member Function Documentation

6.341.2.1 virtual InvalidKeyException* decaf::security::InvalidKeyException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::KeyException** (p. 1845).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**InvalidKeyException.h**

6.342 decaf::nio::InvalidMarkException Class Reference

`#include <src/main/decaf/nio/InvalidMarkException.h>`Inheritance diagram for decaf::nio::InvalidMarkException:

Public Member Functions

- **InvalidMarkException** ()

  Default Constructor.

- **InvalidMarkException** (const **lang::Exception** &ex)

  Conversion Constructor from some other Exception.

- **InvalidMarkException** (const **InvalidMarkException** &ex)

  Copy Constructor.

- **InvalidMarkException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **InvalidMarkException** (const std::exception *cause)

  Constructor.

- **InvalidMarkException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **InvalidMarkException** * **clone** () const

  Clones this exception.

- virtual ~**InvalidMarkException** () throw ()

6.342.1 Constructor & Destructor Documentation

6.342.1.1 decaf::nio::InvalidMarkException::InvalidMarkException ()

Default Constructor.

6.342.1.2 decaf::nio::InvalidMarkException::InvalidMarkException (const lang::Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex The Exception whose state data is to be copied into this Exception.

6.342.1.3 decaf::nio::InvalidMarkException::InvalidMarkException (const InvalidMarkException & *ex*)

Copy Constructor.

Parameters:

ex The Exception whose state data is to be copied into this Exception.

6.342.1.4 decaf::nio::InvalidMarkException::InvalidMarkException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.342.1.5 decaf::nio::InvalidMarkException::InvalidMarkException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.342.1.6 decaf::nio::InvalidMarkException::InvalidMarkException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.342.1.7 virtual decaf::nio::InvalidMarkException::~InvalidMarkException () throw () [virtual]

6.342.2 Member Function Documentation

6.342.2.1 virtual InvalidMarkException* decaf::nio::InvalidMarkException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new Exception instance that is a copy of this Exception.

Reimplemented from **decaf::lang::exceptions::IllegalStateException** (p. 1662).

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**InvalidMarkException.h**

6.343 cms::InvalidSelectorException Class Reference

This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

`#include <src/main/cms/InvalidSelectorException.h>`Inheritance diagram for cms::InvalidSelectorException:

Public Member Functions

- **InvalidSelectorException** ()
- **InvalidSelectorException** (const **InvalidSelectorException** &ex)
- **InvalidSelectorException** (const std::string &message)
- **InvalidSelectorException** (const std::string &message, const std::exception *cause)
- **InvalidSelectorException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**InvalidSelectorException** () throw ()
- virtual **InvalidSelectorException** * **clone** ()

  *Creates a cloned version of this **CMSException** (p. 979) instance.*

6.343.1 Detailed Description

This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

Since:

1.3

6.343.2 Constructor & Destructor Documentation

6.343.2.1 cms::InvalidSelectorException::InvalidSelectorException ()

6.343.2.2 cms::InvalidSelectorException::InvalidSelectorException (const InvalidSelectorException & *ex*)

6.343.2.3 cms::InvalidSelectorException::InvalidSelectorException (const std::string & *message*)

6.343.2.4 cms::InvalidSelectorException::InvalidSelectorException (const std::string & *message*, const std::exception * *cause*)

6.343.2.5 cms::InvalidSelectorException::InvalidSelectorException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.343.2.6 virtual cms::InvalidSelectorException::~InvalidSelectorException () throw () [virtual]

6.343.3 Member Function Documentation

6.343.3.1 virtual InvalidSelectorException* cms::InvalidSelectorException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

The documentation for this class was generated from the following file:

- src/main/cms/**InvalidSelectorException.h**

6.344 decaf::lang::exceptions::InvalidStateException Class Reference

`#include <src/main/decaf/lang/exceptions/InvalidStateException.h>`Inheritance diagram for decaf::lang::exceptions::InvalidStateException:

Public Member Functions

- **InvalidStateException** ()

  Default Constructor.

- **InvalidStateException** (const **Exception** &ex)

  Conversion Constructor from some other ***Exception*** *(*p. *1458).*

- **InvalidStateException** (const **InvalidStateException** &ex)

  Copy Constructor.

- **InvalidStateException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **InvalidStateException** (const std::exception *cause)

  Constructor.

- **InvalidStateException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **InvalidStateException** * **clone** () const

  Clones this exception.

- virtual ~**InvalidStateException** () throw ()

6.344.1 Constructor & Destructor Documentation

6.344.1.1 decaf::lang::exceptions::InvalidStateException::InvalidStateException ()

Default Constructor.

6.344.1.2 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.344.1.3 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const InvalidStateException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.344.1.4 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.344.1.5 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.344.1.6 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.344.1.7 virtual decaf::lang::exceptions::InvalidStateException::~InvalidStateException () throw () [virtual]

6.344.2 Member Function Documentation

6.344.2.1 virtual InvalidStateException* decaf::lang::exceptions::InvalidStateException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**InvalidStateException.h**

6.345 decaf::io::IOException Class Reference

`#include <src/main/decaf/io/IOException.h>`Inheritance diagram for decaf::io::IOException:

Public Member Functions

- **IOException** ()

  Default Constructor.

- **IOException** (const **lang::Exception** &ex)

  Copy Constructor.

- **IOException** (const **IOException** &ex)

  Copy Constructor.

- **IOException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **IOException** (const std::exception *cause)

  Constructor.

- **IOException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor.

- virtual **IOException** * **clone** () const

  Clones this exception.

- virtual ~**IOException** () throw ()

6.345.1 Constructor & Destructor Documentation

6.345.1.1 decaf::io::IOException::IOException ()

Default Constructor.

6.345.1.2 decaf::io::IOException::IOException (const lang::Exception & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy

6.345.1.3 decaf::io::IOException::IOException (const IOException & *ex*)

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.345.1.4 decaf::io::IOException::IOException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.345.1.5 decaf::io::IOException::IOException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.345.1.6 decaf::io::IOException::IOException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.345.1.7 virtual decaf::io::IOException::~IOException () throw () [virtual]

6.345.2 Member Function Documentation

6.345.2.1 virtual IOException* decaf::io::IOException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an Exception that is a copy of this instance.

Reimplemented from **decaf::lang::Exception** (p. 1460).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2310), **decaf::io::EOFException** (p. 1453), **decaf::io::InterruptedIOException** (p. 1771), **decaf::io::UnsupportedEncodingException** (p. 3162), **decaf::io::UTFDataFormatException** (p. 3218), **decaf::net::BindException** (p. 675), **decaf::net::ConnectException** (p. 1088), **decaf::net::HttpRetryException** (p. 1649), **decaf::net::MalformedURLException** (p. 2007), **decaf::net::NoRouteToHostException** (p. 2256), **decaf::net::PortUnreachableException** (p. 2396), **decaf::net::ProtocolException** (p. 2499), **decaf::net::SocketException** (p. 2788), **decaf::net::SocketTimeoutException** (p. 2809), **decaf::net::UnknownHostException** (p. 3156), **decaf::net::UnknownServiceException** (p. 3159), and **decaf::util::zip::ZipException** (p. 3299).

- src/main/decaf/io/**IOException.h**

6.346 activemq::transport::IOTransport Class Reference

Implementation of the **Transport** (p. 3125) interface that performs marshaling of **commands** (p. 61) to IO streams.

`#include <src/main/activemq/transport/IOTransport.h>`Inheritance diagram for activemq::transport::IOTransport:

Public Member Functions

- **IOTransport** ()

  Default Constructor.

- **IOTransport** (const **Pointer**< **wireformat::WireFormat** > wireFormat)

  *Create an instance of this **Transport** (p. 3125) and assign its WireFormat instance at creation time.*

- virtual ~**IOTransport** ()
- virtual void **setInputStream** (**decaf::io::DataInputStream** *is)

  *Sets the stream from which this **Transport** (p. 3125) implementation will read its data.*

- virtual void **setOutputStream** (**decaf::io::DataOutputStream** *os)

  *Sets the stream to which this **Transport** (p. 3125) implementation will write its data.*

- virtual void **oneway** (const **Pointer**< **Command** > command)

  Sends a one-way command.

- virtual **Pointer**< **FutureResponse** > **asyncRequest** (const **Pointer**< **Command** > command, const **Pointer**< **ResponseCallback** > responseCallback)

  *Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.*

  Parameters:

  command *The Command object that is to sent out.*
  responseCallback *A callback object that will be notified once a response to the command is received.*

  Returns:

  *A **FutureResponse** (p. 1573) instance that can be queried for the Response to the Command.*

  Exceptions:

  IOException *if an exception occurs during the read of the command.*
  UnsupportedOperationException *if this method is not implemented by this **transport** (p. 72).*

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > command)

  Sends the given command to the broker and then waits for the response.

  Parameters:

  command *the command to be sent.*

  Returns:

  the response from the broker.

Exceptions:

IOException *if an exception occurs during the read of the command.*
UnsupportedOperationException *if this method is not implemented by this* ***transport*** *(p. 72).*

- virtual **Pointer< Response > request** (const **Pointer< Command >** command, unsigned int timeout)

  Sends the given command to the broker and then waits for the response.

  Parameters:

  command *The command to be sent.*
  timeout *The time to wait for this response.*

  Returns:

  the response from the broker.

  Exceptions:

  IOException *if an exception occurs during the read of the command.*
  UnsupportedOperationException *if this method is not implemented by this* ***transport*** *(p. 72).*

- virtual **Pointer< wireformat::WireFormat > getWireFormat** () const

  Gets the WireFormat instance that is in use by this ***transport*** *(p. 72).*

- virtual void **setWireFormat** (const **Pointer< wireformat::WireFormat >** wireFormat)

  Sets the WireFormat instance to use.

- virtual void **setTransportListener** (**TransportListener** *listener)

  Sets the observer of asynchronous events from this ***transport*** *(p. 72).*

- virtual **TransportListener** * **getTransportListener** () const

  Gets the observer of asynchronous events from this ***transport*** *(p. 72).*

- virtual void **start** ()

  Starts the ***Transport*** *(p. 3125), the send methods of a* ***Transport*** *(p. 3125) will throw an exception if used before the* ***Transport*** *(p. 3125) is started.*

- virtual void **stop** ()

  Stops the ***Transport*** *(p. 3125).*

- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual **Transport** * **narrow** (const std::type_info &typeId)

  Narrows down a Chain of Transports to a specific ***Transport*** *(p. 3125) to allow a higher level* ***transport*** *(p. 72) to skip intermediate Transports in certain circumstances.*

- virtual bool **isFaultTolerant** () const

  Is this ***Transport*** *(p. 3125) fault tolerant, meaning that it will reconnect to a broker on disconnect.*

- virtual bool **isConnected** () const

  Is the ***Transport*** *(p. 3125) Connected to its Broker.*

- virtual bool **isClosed** () const

  *Has the **Transport** (p. 3125) been shutdown and no longer usable.*

- virtual std::string **getRemoteAddress** () const
- virtual bool **isReconnectSupported** () const
- virtual bool **isUpdateURIsSupported** () const
- virtual void **updateURIs** (bool rebalance AMQCPP_UNUSED, const **decaf::util::List**< **decaf::net::URI** > &uris AMQCPP_UNUSED)
- virtual void **reconnect** (const **decaf::net::URI** &uri AMQCPP_UNUSED)

- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.

6.346.1 Detailed Description

Implementation of the **Transport** (p. 3125) interface that performs marshaling of **commands** (p. 61) to IO streams. This class does not implement the **Transport::request** (p. 3130) method, it only handles oneway messages. A thread polls on the input stream for in-coming **commands** (p. 61). When a command is received, the command listener is notified. The polling thread is not started until the start method is called. Polling can be suspending by calling stop; however, because the read operation is blocking the **transport** (p. 72) my still pull one command off the wire even after the stop method has been called.

The close method will close the associated streams. Close can be called explicitly by the user, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

6.346.2 Constructor & Destructor Documentation

6.346.2.1 activemq::transport::IOTransport::IOTransport ()

Default Constructor.

6.346.2.2 activemq::transport::IOTransport::IOTransport (const Pointer< wireformat::WireFormat > *wireFormat*)

Create an instance of this **Transport** (p. 3125) and assign its WireFormat instance at creation time.

Parameters:

wireFormat Data encoder / decoder to use when reading and writing.

6.346.2.3 virtual activemq::transport::IOTransport::~IOTransport () [virtual]

6.346.3 Member Function Documentation

6.346.3.1 virtual Pointer<FutureResponse> activemq::transport::IOTransport::asyncRequest (const Pointer< Command > *command*, const Pointer< ResponseCallback > *responseCallback*) [virtual]

Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.

Parameters:

command The Command object that is to sent out.

responseCallback A callback object that will be notified once a response to the command is received.

Returns:

A **FutureResponse** (p. 1573) instance that can be queried for the Response to the Command.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

This method always thrown an UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 3126).

6.346.3.2 virtual void activemq::transport::IOTransport::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

IOException if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 967).

6.346.3.3 virtual std::string activemq::transport::IOTransport::getRemoteAddress () const [inline, virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3127).

6.346.3.4 virtual TransportListener* activemq::transport::IOTransport::getTransportListener () const [virtual]

Gets the observer of asynchronous events from this **transport** (p. 72).

Returns:

the listener of **transport** (p. 72) events.

Implements **activemq::transport::Transport** (p. 3127).

6.346.3.5 virtual Pointer<wireformat::WireFormat> activemq::transport::IOTransport::getWireFormat () const [virtual]

Gets the WireFormat instance that is in use by this **transport** (p. 72). In the case of nested **transport** (p. 72) this method delegates down to the lowest level **transport** (p. 72) that actually maintains a WireFormat info instance.

Returns:

The WireFormat the object used to encode / decode **commands** (p. 61).

Implements **activemq::transport::Transport** (p. 3127).

6.346.3.6 virtual bool activemq::transport::IOTransport::isClosed () const [virtual]

Has the **Transport** (p. 3125) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3125)

Implements **activemq::transport::Transport** (p. 3128).

6.346.3.7 virtual bool activemq::transport::IOTransport::isConnected () const [virtual]

Is the **Transport** (p. 3125) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3128).

6.346.3.8 virtual bool activemq::transport::IOTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3125) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3125) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3128).

6.346.3.9 virtual bool activemq::transport::IOTransport::isReconnectSupported () const [inline, virtual]

Returns:

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 3128).

6.346.3.10 virtual bool activemq::transport::IOTransport::isUpdateURIsSupported () const [inline, virtual]

Returns:

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 3129).

6.346.3.11 virtual Transport* activemq::transport::IOTransport::narrow (const std::type_info & *typeId*) [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3125) to allow a higher level **transport** (p. 72) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3129).

References NULL.

6.346.3.12 virtual void activemq::transport::IOTransport::oneway (const Pointer< Command > *command*) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3129).

6.346.3.13 virtual void activemq::transport::IOTransport::reconnect (const decaf::net::URI &uri *AMQCPP_UNUSED*) [inline, virtual]

This method does nothing in this subclass.

6.346.3.14 virtual Pointer<Response> activemq::transport::IOTransport::request (const Pointer< Command > *command*, unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command The command to be sent.

timeout The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

This method always thrown an UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 3130).

6.346.3.15 virtual Pointer<Response> activemq::transport::IOTransport::request (const Pointer< Command > *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

This method always thrown an UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 3130).

6.346.3.16 virtual void activemq::transport::IOTransport::run () [virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2622).

6.346.3.17 virtual void activemq::transport::IOTransport::setInputStream (decaf::io::DataInputStream * *is*) [virtual]

Sets the stream from which this **Transport** (p. 3125) implementation will read its data.

Parameters:

is The InputStream that will be read from by this object.

6.346.3.18 virtual void activemq::transport::IOTransport::setOutputStream (decaf::io::DataOutputStream * *os*) [virtual]

Sets the stream to which this **Transport** (p. 3125) implementation will write its data.

Parameters:

os The OuputStream that will be written to by this object.

6.346.3.19 virtual void activemq::transport::IOTransport::setTransportListener (TransportListener * *listener*) [virtual]

Sets the observer of asynchronous events from this **transport** (p. 72).

Parameters:

listener the listener of **transport** (p. 72) events.

Implements **activemq::transport::Transport** (p. 3131).

6.346.3.20 virtual void activemq::transport::IOTransport::setWireFormat (const Pointer< wireformat::WireFormat > *wireFormat*) [virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 61).

Implements **activemq::transport::Transport** (p. 3131).

6.346.3.21 virtual void activemq::transport::IOTransport::start () [virtual]

Starts the **Transport** (p. 3125), the send methods of a **Transport** (p. 3125) will throw an exception if used before the **Transport** (p. 3125) is started.

Exceptions:

IOException if and error occurs while starting the **Transport** (p. 3125).

Implements **activemq::transport::Transport** (p. 3131).

6.346.3.22 virtual void activemq::transport::IOTransport::stop () [virtual]

Stops the **Transport** (p. 3125).

Exceptions:

IOException if an error occurs while stopping the **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3132).

6.346.3.23 virtual void activemq::transport::IOTransport::updateURIs (bool rebalance *AMQCPP_UNUSED*, const decaf::util::List< decaf::net::URI > &uris *AMQCPP_UNUSED*) [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Iterable.h**

6.348 decaf::util::Iterator< E > Class Template Reference

Defines an object that can be used to iterate over the elements of a collection.

`#include <src/main/decaf/util/Iterator.h>`Inheritance diagram for decaf::util::Iterator< E >:

Public Member Functions

- virtual ~**Iterator** ()
- virtual E **next** ()=0

  Returns the next element in the iteration.

- virtual bool **hasNext** () const =0

  Returns true if the iteration has more elements.

- virtual void **remove** ()=0

  Removes from the underlying collection the last element returned by the iterator (optional operation).

6.348.1 Detailed Description

template<typename E> class decaf::util::Iterator< E >

Defines an object that can be used to iterate over the elements of a collection. The iterator provides a way to access and remove elements with well defined semantics.

6.348.2 Constructor & Destructor Documentation

6.348.2.1 template<typename E> virtual decaf::util::Iterator< E >::~Iterator () [inline, virtual]

6.348.3 Member Function Documentation

6.348.3.1 template<typename E> virtual bool decaf::util::Iterator< E >::hasNext () const [pure virtual]

Returns true if the iteration has more elements. Returns false if the next call to next would result in an **NoSuchElementException** (p. 2260) to be thrown.

Returns:

true if there are more elements available for iteration.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 596).

6.348.3.2 template<typename E> virtual E decaf::util::Iterator< E >::next () [pure virtual]

Returns the next element in the iteration. Calling this method repeatedly until the **hasNext()** (p. 1802) method returns false will return each element in the underlying collection exactly once.

Returns:

the next element in the iteration of elements.

Exceptions:

NoSuchElementException *(p. 2260)* if the iteration has no more elements.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 596).

6.348.3.3 template<typename E> virtual void decaf::util::Iterator< E >::remove () [pure virtual]

Removes from the underlying collection the last element returned by the iterator (optional operation). This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this **Iterator** (p. 1802).

IllegalStateException if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 597).

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.350.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **JournalQueueAckMarshaller** (p. 1807). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.350.2 Constructor & Destructor Documentation

6.350.2.1 activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::Journa
() [inline]

6.350.2.2 virtual activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::~Journ
() [inline, virtual]

6.350.3 Member Function Documentation

6.350.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::createOb
() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.350.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::getDataS
() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.350.3.3 virtual void activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::looseMar
(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.350.3.4 virtual void activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::looseUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.350.3.5 virtual int activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.350.3.6 virtual void activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.350.3.7 virtual void activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::tightUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

6.352.3 Member Function Documentation

6.352.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::createObj() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.352.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::getDataSt() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.352.3.3 virtual void activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::looseMars(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.352.3.4 virtual void activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::looseUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.352.3.5 virtual int activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.352.3.6 virtual void activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::tightMarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.352.3.7 virtual void activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::tightUnma (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

6.354.3 Member Function Documentation

6.354.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.354.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::getDataStruct () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.354.3.3 virtual void activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.354.3.4 virtual void activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::looseUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.354.3.5 virtual int activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.354.3.6 virtual void activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.354.3.7 virtual void activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::tightUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.355.2.2 virtual void activemq::commands::JournalTransaction::copyDataStructure (const DataStructure * *src*) [virtual]

6.355.2.3 virtual bool activemq::commands::JournalTransaction::equals (const DataStructure * *value*) const [virtual]

6.355.2.4 virtual unsigned char activemq::commands::JournalTransaction::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.355.2.5 virtual Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () [virtual]

6.355.2.6 virtual const Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () const [virtual]

6.355.2.7 virtual unsigned char activemq::commands::JournalTransaction::getType () const [virtual]

6.355.2.8 virtual bool activemq::commands::JournalTransaction::getWasPrepared () const [virtual]

6.355.2.9 virtual void activemq::commands::JournalTransaction::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.355.2.10 virtual void activemq::commands::JournalTransaction::setType (unsigned char *type*) [virtual]

6.355.2.11 virtual void activemq::commands::JournalTransaction::setWasPrepared (bool *wasPrepared*) [virtual]

6.355.2.12 virtual std::string activemq::commands::JournalTransaction::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

6.355.3 Field Documentation

6.355.3.1 const unsigned char activemq::commands::JournalTransaction::ID_JOURNALTRANSACTION = 54 [static]

6.355.3.2 Pointer<TransactionId> activemq::commands::JournalTransaction::transactionId [protected]

6.355.3.3 unsigned char activemq::commands::JournalTransaction::type [protected]

6.355.3.4 bool activemq::commands::JournalTransaction::wasPrepared [protected]

The documentation for this class was generated from the following file:

6.356.3 Member Function Documentation

6.356.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::createO () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.356.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::getData () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.356.3.3 virtual void activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::looseMa (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.356.3.4 virtual void activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::looseUn (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.356.3.5 virtual int activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::tightMa (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.356.3.6 virtual void activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::tightMa (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.356.3.7 virtual void activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::tightUn (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

The documentation for this class was generated from the following file:

6.357.1.2 virtual activemq::commands::KeepAliveInfo::~KeepAliveInfo () [virtual]

6.357.2 Member Function Documentation

6.357.2.1 virtual KeepAliveInfo* activemq::commands::KeepAliveInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.357.2.2 virtual void activemq::commands::KeepAliveInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.357.2.3 virtual bool activemq::commands::KeepAliveInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.357.2.4 virtual unsigned char activemq::commands::KeepAliveInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.357.2.5 virtual bool activemq::commands::KeepAliveInfo::isKeepAliveInfo () const [inline, virtual]

Returns:

an answer of true to the **isKeepAliveInfo()** (p. 1835) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 638).

6.357.2.6 virtual std::string activemq::commands::KeepAliveInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.357.2.7 virtual Pointer<Command> activemq::commands::KeepAliveInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.358.3 Member Function Documentation

6.358.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::createObject() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.358.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::getDataStruc() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.358.3.3 virtual void activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::looseMarsha(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.358.3.4 virtual void activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::looseUnmars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.358.3.5 virtual int activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.358.3.6 virtual void activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::tightMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.358.3.7 virtual void activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::tightUnmars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**KeepAliveInfoMarshaller.h**

6.359 decaf::security::Key Class Reference

The **Key** (p. 1841) interface is the top-level interface for all keys.

`#include <src/main/decaf/security/Key.h>`Inheritance diagram for decaf::security::Key:

Public Member Functions

- virtual ~**Key** ()
- virtual std::string **getAlgorithm** () const =0

  Returns the standard algorithm name for this key.

- virtual void **getEncoded** (std::vector< unsigned char > &output) const =0

  Provides the key in its primary encoding format, or nothing if this key does not support encoding.

- virtual std::string **getFormat** () const =0

  Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

6.359.1 Detailed Description

The **Key** (p. 1841) interface is the top-level interface for all keys. It defines the functionality shared by all key objects. All keys have three characteristics:

An Algorithm

This is the key algorithm for that key. The key algorithm is usually an encryption or asymmetric operation algorithm (such as DSA or RSA), which will work with those algorithms and with related algorithms (such as MD5 with RSA, SHA-1 with RSA, Raw DSA, etc.) The name of the algorithm of a key is obtained using the getAlgorithm method.

An Encoded Form

This is an external encoded form for the key used when a standard representation of the key is needed outside the application, as when transmitting the key to some other party. The key is encoded according to a standard format (such as X.509 SubjectPublicKeyInfo or PKCS#8), and is returned using the getEncoded method. Note: The syntax of the ASN.1 type SubjectPublicKeyInfo is defined as follows:

SubjectPublicKeyInfo ::= SEQUENCE {

algorithm AlgorithmIdentifier,

subjectPublicKey BIT STRING }

AlgorithmIdentifier ::= SEQUENCE {

algorithm OBJECT IDENTIFIER,

parameters ANY DEFINED BY algorithm OPTIONAL }

For more information, see RFC 2459: Internet X.509 Public **Key** (p. 1841) Infrastructure Certificate and CRL Profile.

A Format

This is the name of the format of the encoded key. It is returned by the getFormat method.

6.359.2 Constructor & Destructor Documentation

6.359.2.1 virtual decaf::security::Key::~Key () [virtual]

6.359.3 Member Function Documentation

6.359.3.1 virtual std::string decaf::security::Key::getAlgorithm () const [pure virtual]

Returns the standard algorithm name for this key. For example, "DSA" would indicate that this key is a DSA key.

Returns:

the name of the algorithm associated with this key.

6.359.3.2 virtual void decaf::security::Key::getEncoded (std::vector< unsigned char > & *output*) const [pure virtual]

Provides the key in its primary encoding format, or nothing if this key does not support encoding.

Parameters:

output Receives the encoded key, or nothing if the key does not support encoding.

6.359.3.3 virtual std::string decaf::security::Key::getFormat () const [pure virtual]

Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding. The primary encoding format is named in terms of the appropriate ASN.1 data format, if an ASN.1 specification for this key exists. For example, the name of the ASN.1 data format for public keys is SubjectPublicKeyInfo, as defined by the X.509 standard; in this case, the returned format is "X.509". Similarly, the name of the ASN.1 data format for private keys is PrivateKeyInfo, as defined by the PKCS #8 standard; in this case, the returned format is "PKCS#8".

Returns:

the primary encoding format of the key.

The documentation for this class was generated from the following file:

- src/main/decaf/security/**Key.h**

6.360 decaf::security::KeyException Class Reference

`#include <src/main/decaf/security/KeyException.h>`Inheritance diagram for decaf::security::KeyException:

Public Member Functions

- **KeyException** ()

  Default Constructor.

- **KeyException** (const **decaf::lang::Exception** &ex)

  Conversion Constructor from some other Exception.

- **KeyException** (const **KeyException** &ex)

  Copy Constructor.

- **KeyException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **KeyException** (const std::exception *cause)

  Constructor.

- **KeyException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **KeyException** * **clone** () const

  Clones this exception.

- virtual ~**KeyException** () throw ()

6.360.1 Constructor & Destructor Documentation

6.360.1.1 decaf::security::KeyException::KeyException ()

Default Constructor.

6.360.1.2 decaf::security::KeyException::KeyException (const decaf::lang::Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.360.1.3 decaf::security::KeyException::KeyException (const KeyException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.360.1.4 decaf::security::KeyException::KeyException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.360.1.5 decaf::security::KeyException::KeyException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.360.1.6 decaf::security::KeyException::KeyException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.360.1.7 virtual decaf::security::KeyException::~KeyException () throw () [virtual]

6.360.2 Member Function Documentation

6.360.2.1 virtual KeyException* decaf::security::KeyException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1585).

Reimplemented in **decaf::security::InvalidKeyException** (p. 1778), and **decaf::security::KeyManagementException** (p. 1848).

The documentation for this class was generated from the following file:

6.361.1 Constructor & Destructor Documentation

6.361.1.1 decaf::security::KeyManagementException::KeyManagementException ()

Default Constructor.

6.361.1.2 decaf::security::KeyManagementException::KeyManagementException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.361.1.3 decaf::security::KeyManagementException::KeyManagementException (const KeyManagementException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.361.1.4 decaf::security::KeyManagementException::KeyManagementException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.361.1.5 decaf::security::KeyManagementException::KeyManagementException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.361.1.6 decaf::security::KeyManagementException::KeyManagementException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.361.1.7 virtual decaf::security::KeyManagementException::~KeyManagementException () throw () [virtual]

6.361.2 Member Function Documentation

6.361.2.1 virtual KeyManagementException* decaf::security::KeyManagementException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::KeyException** (p. 1845).

6.362 activemq::commands::LastPartialCommand Class Reference

`#include <src/main/activemq/commands/LastPartialCommand.h>`Inheritance diagram for activemq::commands::LastPartialCommand:

Public Member Functions

- **LastPartialCommand** ()
- virtual ~**LastPartialCommand** ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **LastPartialCommand** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

Static Public Attributes

- static const unsigned char **ID_LASTPARTIALCOMMAND** = 61

6.362.1 Constructor & Destructor Documentation

6.362.1.1 activemq::commands::LastPartialCommand::LastPartialCommand ()

6.362.1.2 virtual activemq::commands::LastPartialCommand::~LastPartialCommand () [virtual]

6.362.2 Member Function Documentation

6.362.2.1 virtual LastPartialCommand* activemq::commands::LastPartialCommand::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::PartialCommand** (p. 2358).

6.362.2.2 virtual void activemq::commands::LastPartialCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::PartialCommand** (p. 2358).

6.362.2.3 virtual bool activemq::commands::LastPartialCommand::equals (const DataStructure * *value*) const [virtual]

Reimplemented from **activemq::commands::PartialCommand** (p. 2358).

6.362.2.4 virtual unsigned char activemq::commands::LastPartialCommand::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::PartialCommand** (p. 2358).

6.362.2.5 virtual std::string activemq::commands::LastPartialCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::PartialCommand** (p. 2359).

6.362.3 Field Documentation

6.362.3.1 const unsigned char activemq::commands::LastPartialCommand::ID_LASTPARTIALCOMMAND = 61 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**LastPartialCommand.h**

6.363 activemq::wireformat::openwire::marshal::generated::LastPartialC Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **LastPartialCommandMarshaller** (p. 1851).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/LastPartialCommandMarshaller.h`
diagram for activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller:

Public Member Functions

- **LastPartialCommandMarshaller** ()
- virtual ~**LastPartialCommandMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.363.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **LastPartialCommandMarshaller** (p. 1851). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.363.2 Constructor & Destructor Documentation

6.363.2.1 activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::Las () [inline]

6.363.2.2 virtual activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::~La () [inline, virtual]

6.363.3 Member Function Documentation

6.363.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::create () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2361).

6.363.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::getDa () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2361).

6.363.3.3 virtual void activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::looseM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2361).

6.363.3.4 virtual void activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::looseU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2362).

6.363.3.5 virtual int activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2362).

6.363.3.6 virtual void activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2363).

6.363.3.7 virtual void activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::tightU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 2363).

The documentation for this class was generated from the following file:

6.364 decaf::util::comparators::Less< E > Class Template Reference

Simple **Less** (p. 1855) **Comparator** (p. 1040) that compares to elements to determine if the first is less than the second.

`#include <src/main/decaf/util/comparators/Less.h>`Inheritance diagram for decaf::util::comparators::Less< E >:

Public Member Functions

- **Less** ()
- virtual ~**Less** ()
- virtual bool **operator()** (const E &left, const E &right) const

  *Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1040) to be passed to an STL **Map** (p. 2008) for use as the sorting criteria.*

- virtual int **compare** (const E &o1, const E &o2) const

  Compares its two arguments for order.

6.364.1 Detailed Description

template<typename E> class decaf::util::comparators::Less< E >

Simple **Less** (p. 1855) **Comparator** (p. 1040) that compares to elements to determine if the first is less than the second. This can be used in **Collection** (p. 1006) classes to sort elements according to their natural ordering. By design the Comparator's compare function return more information about comparison than the STL binary function's boolean compare operator. In this case the compare method will return

Since:

1.0

6.364.2 Constructor & Destructor Documentation

6.364.2.1 template<typename E > decaf::util::comparators::Less< E >::Less () [inline]

6.364.2.2 template<typename E > virtual decaf::util::comparators::Less< E >::~Less () [inline, virtual]

6.364.3 Member Function Documentation

6.364.3.1 template<typename E > virtual int decaf::util::comparators::Less< E >::compare (const E & *o1*, const E & *o2*) const [inline, virtual]

Compares its two arguments for order. Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that sgn(compare(x, y)) == -sgn(compare(y, x)) for all x and y. (This implies that compare(x, y) must throw an exception if and only if compare(y, x) throws an exception.)

The implementor must also ensure that the relation is transitive: ((compare(x, y)>0) && (compare(y, z)>0)) implies compare(x, z)>0.

Finally, the implementer must ensure that compare(x, y)==0 implies that sgn(compare(x, z))==sgn(compare(y, z)) for all z.

It is generally the case, but not strictly required that (compare(x, y)==0) == (x == y)). Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters:

o1 The first object to be compared

o2 The second object to be compared

Returns:

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implements **decaf::util::Comparator< E >** (p. 1040).

6.364.3.2 template<typename E > virtual bool decaf::util::comparators::Less< E >::operator() (const E & *left*, const E & *right*) const [inline, virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1040) to be passed to an STL **Map** (p. 2008) for use as the sorting criteria.

Parameters:

left The Left hand side operand.

right The Right hand side operand.

Returns:

true if the vale of left is less than the value of right.

Implements **decaf::util::Comparator< E >** (p. 1041).

The documentation for this class was generated from the following file:

- virtual bool **operator==** (const **Level** &value) const
- virtual bool **operator<** (const **Level** &value) const

Static Public Member Functions

- static **Level parse** (const std::string &name)

  *Parse a level name string into a **Level** (p. 1859).*

Static Public Attributes

- static const **Level INHERIT**

  *NULL is a special level that indicates that the **Logger** (p. 1935) should get its **Level** (p. 1859) from its parent **Logger** (p. 1935), the value is initialized as zero.*

- static const **Level OFF**

  *OFF is a special level that can be used to turn off **logging** (p. 135).*

- static const **Level SEVERE**

  SEVERE is a message level indicating a serious failure.

- static const **Level WARNING**

  WARNING is a message level indicating a potential problem.

- static const **Level INFO**

  INFO is a message level for informational messages.

- static const **Level DEBUG**

  DEBUG is a level for more verbose informative messages.

- static const **Level CONFIG**

  CONFIG is a message level for static configuration messages.

- static const **Level FINE**

  FINE is a message level providing tracing information.

- static const **Level FINER**

  FINER indicates a fairly detailed tracing message.

- static const **Level FINEST**

  FINEST indicates a highly detailed tracing message.

- static const **Level ALL**

  ALL indicates that all messages should be logged.

Protected Member Functions

- **Level** (const std::string &name, int value)

  *Create a named **Level** (p. 1859) with a given integer value.*

6.367.1 Detailed Description

The **Level** (p. 1859) class defines a set of standard **logging** (p. 135) levels that can be used to control **logging** (p. 135) output. The **logging** (p. 135) **Level** (p. 1859) objects are ordered and are specified by ordered integers. Enabling **logging** (p. 135) at a given level also enables **logging** (p. 135) at all higher levels.

Clients should normally use the predefined **Level** (p. 1859) constants such as **Level.SEVERE** (p. 1863).

The levels in descending order are:

* SEVERE (highest value) * WARNING * INFO * DEBUG * CONFIG * FINE * FINER * FINEST (lowest value)

In addition there is a level OFF that can be used to turn off **logging** (p. 135), and a level ALL that can be used to enable **logging** (p. 135) of all messages.

It is possible for third parties to define additional **logging** (p. 135) levels by subclassing **Level** (p. 1859). In such cases subclasses should take care to chose unique integer level values.

Since:

1.0

6.367.2 Constructor & Destructor Documentation

6.367.2.1 decaf::util::logging::Level::Level (const std::string & *name*, int *value*) [protected]

Create a named **Level** (p. 1859) with a given integer value.

Parameters:

name Name of the level, e.g. SEVERE

value Unique integer value of this level, e.g. 100

6.367.2.2 virtual decaf::util::logging::Level::~Level () [virtual]

6.367.3 Member Function Documentation

6.367.3.1 virtual int decaf::util::logging::Level::compareTo (const Level & *value*) const [virtual]

6.367.3.2 virtual bool decaf::util::logging::Level::equals (const Level & *value*) const [virtual]

6.367.3.3 std::string decaf::util::logging::Level::getName () const [inline]

Returns:

the name of this **Level** (p. 1859) instance.

6.367.3.4 int decaf::util::logging::Level::intValue () const [inline]

Returns:

the integer value of this level instance.

6.367.3.5 virtual bool decaf::util::logging::Level::operator< (const Level & *value*) const [virtual]

6.367.3.6 virtual bool decaf::util::logging::Level::operator== (const Level & *value*) const [virtual]

6.367.3.7 static Level decaf::util::logging::Level::parse (const std::string & *name*) [static]

Parse a level name string into a **Level** (p. 1859). The argument string may consist of either a level name or an integer value.

For example:

∗ "SEVERE" ∗ "1000"

Parameters:

name - The name or int value of the desired **Level** (p. 1859)

Returns:

the parsed **Level** (p. 1859) value, passing in a level name that is an int value that is not one of the known **Level** (p. 1859) values will result in a new **Level** (p. 1859) that has been initialized with that int value and name as the string form of the int.

Exceptions:

IllegalArgumentException if the value is not valid, validity means that the string is either a valid int (between Integer::MIN_VALUE and Integer::MAX_VALUE or is one of the known level names.

6.367.3.8 std::string decaf::util::logging::Level::toString () const [inline]

Returns:

the string value of this **Level** (p. 1859), e.g. "SEVERE".

6.367.4 Field Documentation

6.367.4.1 const Level decaf::util::logging::Level::ALL [static]

ALL indicates that all messages should be logged. This level is initialized to Integer::MIN_-VALUE.

6.367.4.2 const Level decaf::util::logging::Level::CONFIG [static]

CONFIG is a message level for static configuration messages. CONFIG messages are intended to provide a variety of static configuration information, to assist in debugging problems that may be associated with particular configurations. For example, CONFIG message might include the CPU type, the System properties, etc. This level is initialized to 600.

6.367.4.3 const Level decaf::util::logging::Level::DEBUG [static]

DEBUG is a level for more verbose informative messages. DEBUG messages are intended to provide a more detailed message intended for use by developers in tracking the behavior of a client. DEBUG messages typically contain more implementation specific information that might not be significant to end users or system admins. This level is initialized to 700.

6.367.4.4 const Level decaf::util::logging::Level::FINE [static]

FINE is a message level providing tracing information. All of FINE, FINER, and FINEST are intended for relatively detailed tracing. The exact meaning of the three levels will vary between subsystems, but in general, FINEST should be used for the most detailed output, FINER for somewhat less detailed output, and FINE for the lowest volume (and most important) messages.

In general the FINE level should be used for information that will be broadly interesting to developers who do not have a specialized interest in the specific subsystem.

FINE messages might include things like minor (recoverable) failures. Issues indicating potential performance problems are also worth **logging** (p. 135) as FINE. This level is initialized to 500.

6.367.4.5 const Level decaf::util::logging::Level::FINER [static]

FINER indicates a fairly detailed tracing message. By default **logging** (p. 135) calls for entering, returning, or throwing an exception are traced at this level. This level is initialized to 400.

6.367.4.6 const Level decaf::util::logging::Level::FINEST [static]

FINEST indicates a highly detailed tracing message. This level is initialized to 300.

6.367.4.7 const Level decaf::util::logging::Level::INFO [static]

INFO is a message level for informational messages. Typically INFO messages will be written to the console or its equivalent. So the INFO level should only be used for reasonably significant messages that will make sense to end users and system admins. This level is initialized to 800.

6.367.4.8 const Level decaf::util::logging::Level::INHERIT [static]

NULL is a special level that indicates that the **Logger** (p. 1935) should get its **Level** (p. 1859) from its parent **Logger** (p. 1935), the value is initialized as zero.

6.367.4.9 const Level decaf::util::logging::Level::OFF [static]

OFF is a special level that can be used to turn off **logging** (p. 135). This level is initialized to Integer::MAX_VALUE

6.367.4.10 const Level decaf::util::logging::Level::SEVERE [static]

SEVERE is a message level indicating a serious failure. In general SEVERE messages should describe events that are of considerable importance and which will prevent normal program execution. They should be reasonably intelligible to end users and to system administrators. This level is initialized to 1000.

6.367.4.11 const Level decaf::util::logging::Level::WARNING [static]

WARNING is a message level indicating a potential problem. In general WARNING messages should describe events that will be of interest to end users or system managers, or which indicate potential problems. This level is initialized to 900.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Level.h**

6.368 decaf::util::concurrent::LinkedBlockingQueue< E > Class Template Reference

A **BlockingQueue** (p. 690) derivative that allows for a bound to be placed on the number of elements that can be enqueued at any one time.

`#include <src/main/decaf/util/concurrent/LinkedBlockingQueue.h>`Inheritance diagram for decaf::util::concurrent::LinkedBlockingQueue< E >:

Data Structures

- class **ConstLinkedIterator**
- class **LinkedIterator**
- class **QueueNode**
- class **TotalLock**

Public Member Functions

- **LinkedBlockingQueue** ()

  Create a new instance with a Capacity of Integer::MAX_ VALUE.

- **LinkedBlockingQueue** (int capacity)

  Create a new instance with the given initial capacity value.

- **LinkedBlockingQueue** (const **Collection**< E > &collection)

  *Create a new instance with a Capacity of Integer::MAX_ VALUE and adds all the values contained in the specified collection to this **Queue** (p. 2515).*

- **LinkedBlockingQueue** (const **LinkedBlockingQueue** &queue)

  *Create a new instance with a Capacity of Integer::MAX_ VALUE and adds all the values contained in the specified **LinkedBlockingQueue** (p. 1864) to this **Queue** (p. 2515).*

- virtual ~**LinkedBlockingQueue** ()
- **LinkedBlockingQueue**< E > & **operator**= (const **LinkedBlockingQueue**< E > &queue)

  Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

- **LinkedBlockingQueue**< E > & **operator**= (const **Collection**< E > &collection)
- virtual int **size** () const

  Returns the number of elements in this collection.

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  *This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.*

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException *if the clear operation is not supported by this collection*

This implementation repeatedly invokes poll until it returns false.

- virtual int **remainingCapacity** () const

  Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` *if there is no intrinsic limit.*

- virtual void **put** (const E &value)

  Inserts the specified element into this queue, waiting if necessary for space to become available.

- virtual bool **offer** (const E &value, long long timeout, const **TimeUnit** &unit)

  Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

- virtual bool **offer** (const E &value)

  Inserts the specified element into the queue provided that the condition allows such an operation.

- virtual E **take** ()

  Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

- virtual bool **poll** (E &result, long long timeout, const **TimeUnit** &unit)

  Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

- virtual bool **poll** (E &result)

  Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) const

  Gets but not removes the element in the head of the queue.

- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters:

  value *The reference to the element to remove from this* ***Collection*** *(*p. *1006).*

  Returns:

  true if the collection was changed, false otherwise.

  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(*p. *1006) is a container of pointers and does not allow NULL values.*

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual std::vector< E > **toArray** () const

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(*p. 1006*).*

- virtual std::string **toString** () const
- virtual int **drainTo** (**Collection**< E > &c)

  Removes all available elements from this queue and adds them to the given collection.

- virtual int **drainTo** (**Collection**< E > &sink, int maxElements)

  Removes at most the given number of available elements from this queue and adds them to the given collection.

- virtual **decaf::util::Iterator**< E > * **iterator** ()
- virtual **decaf::util::Iterator**< E > * **iterator** () const

6.368.1 Detailed Description

template<typename E> class decaf::util::concurrent::LinkedBlockingQueue< E >

A **BlockingQueue** (p. 690) derivative that allows for a bound to be placed on the number of elements that can be enqueued at any one time. Elements are inserted and removed in FIFO order. The **internal** (p. 97) structure of the queue is based on a linked nodes which provides for better performance over their array based versions but the performance is less predictable.

The capacity bound of this class default to Integer::MAX_VALUE.

Since:

1.0

6.368.2 Constructor & Destructor Documentation

6.368.2.1 template<typename E> decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue () [inline]

Create a new instance with a Capacity of Integer::MAX_VALUE.

6.368.2.2 template<typename E> decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue (int *capacity*) [inline]

Create a new instance with the given initial capacity value.

Parameters:

capacity The initial capacity value to assign to this **Queue** (p. 2515).

Exceptions:

IllegalArgumentException if the specified capacity is not greater than zero.

6.368.2.3 template<typename E> decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue (const Collection< E > & *collection*) [inline]

Create a new instance with a Capacity of Integer::MAX_VALUE and adds all the values contained in the specified collection to this **Queue** (p. 2515).

Parameters:

collection The **Collection** (p. 1006) whose elements are to be copied to this **Queue** (p. 2515).

Exceptions:

IllegalStateException if the number of elements in the collection exceeds this Queue's capacity.

6.368.2.4 template<typename E> decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue (const LinkedBlockingQueue< E > & *queue*) [inline]

Create a new instance with a Capacity of Integer::MAX_VALUE and adds all the values contained in the specified **LinkedBlockingQueue** (p. 1864) to this **Queue** (p. 2515).

Parameters:

queue The **LinkedBlockingQueue** (p. 1864) whose elements are to be copied to this **Queue** (p. 2515).

Exceptions:

IllegalStateException if the number of elements in the collection exceeds this Queue's capacity.

6.368.2.5 template<typename E> virtual decaf::util::concurrent::LinkedBlockingQueue< E >::~LinkedBlockingQueue () [inline, virtual]

6.368.3 Member Function Documentation

6.368.3.1 template<typename E> virtual void decaf::util::concurrent::LinkedBlockingQueue< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

This implementation repeatedly invokes poll until it returns false. This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 177).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::operator=().

6.368.3.2 template<typename E> virtual int decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo (Collection< E > & *c*, int *maxElements*) [inline, virtual]

Removes at most the given number of available elements from this queue and adds them to the given collection. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters:

c the collection to transfer elements into

maxElements the maximum number of elements to transfer

Returns:

the number of elements transferred

Exceptions:

UnsupportedOperationException if addition of elements is not supported by the specified collection

IllegalArgumentException if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 692).

6.368.3.3 template<typename E> virtual int decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo (Collection< E > & *c*) [inline, virtual]

Removes all available elements from this queue and adds them to the given collection. This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters:

c the collection to transfer elements into

Returns:

the number of elements transferred

Exceptions:

UnsupportedOperationException if addition of elements is not supported by the specified collection

IllegalArgumentException if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 693).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::drainTo().

6.368.3.4 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::concurrent::LinkedBlockingQueue< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1799).

6.368.3.5 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::concurrent::LinkedBlockingQueue< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1800).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::LinkedBlockingQueue().

6.368.3.6 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::offer (const E & *value*) [inline, virtual]

Inserts the specified element into the queue provided that the condition allows such an operation. The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters:

value the specified element to insert into the queue.

Returns:

true if the operation succeeds and false if it fails.

Exceptions:

NullPointerException if the **Queue** (p. 2515) implementation does not allow Null values to be inserted into the **Queue** (p. 2515).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2516).

6.368.3.7 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::offer (const E & *e*, long long *timeout*, const TimeUnit & *unit*) [inline, virtual]

Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Parameters:

e the element to add

timeout how long to wait before giving up, in units of `unit`

unit a `TimeUnit` (p. 3088) determining how to interpret the `timeout` parameter

Returns:

`true` if successful, or `false` if the specified waiting time elapses before space is available

Exceptions:

InterruptedException if interrupted while waiting

NullPointerException if the specified element is null

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 693).

6.368.3.8 template<typename E> LinkedBlockingQueue<E>& decaf::util::concurrent::LinkedBlockingQueue< E >::operator= (const Collection< E > & *collection*) [inline]

6.368.3.9 template<typename E> LinkedBlockingQueue<E>& decaf::util::concurrent::LinkedBlockingQueue< E >::operator= (const LinkedBlockingQueue< E > & *collection*) [inline]

Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

Parameters:

collection - the collection to copy

Returns:

a reference to this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 148).

6.368.3.10 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::peek (E & *result*) const [inline, virtual]

Gets but not removes the element in the head of the queue. The result if successful is assigned to the result parameter.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2517).

6.368.3.11 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::poll (E & *result*) [inline, virtual]

Gets and removes the element in the head of the queue. If the operation succeeds the value of the element at the head of the **Queue** (p. 2515) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2517).

6.368.3.12 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::poll (E & *result*, long long *timeout*, const TimeUnit & *unit*) [inline, virtual]

Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

Parameters:

result the referenced value that will be assigned the value retrieved from the **Queue** (p. 2515). Undefined if this methods returned false.

timeout how long to wait before giving up, in units of `unit`

unit a `TimeUnit` (p. 3088) determining how to interpret the `timeout` parameter.

Returns:

`true` if successful or `false` if the specified waiting time elapses before an element is available.

Exceptions:

InterruptedException if interrupted while waiting

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 694).

6.368.3.13 template<typename E> virtual void decaf::util::concurrent::LinkedBlockingQueue< E >::put (const E & *value*) [inline, virtual]

Inserts the specified element into this queue, waiting if necessary for space to become available.

Parameters:

value the element to add

Exceptions:

InterruptedException if interrupted while waiting

NullPointerException if the specified element is null

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 694).

6.368.3.14 template<typename E> virtual int decaf::util::concurrent::LinkedBlockingQueue< E >::remainingCapacity () const [inline, virtual]

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit. Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns:

the remaining capacity

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 695).

6.368.3.15 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object. This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 149).

6.368.3.16 template<typename E> virtual int decaf::util::concurrent::LinkedBlockingQueue< E >::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1015).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::toArray().

6.368.3.17 template<typename E> virtual E decaf::util::concurrent::LinkedBlockingQueue< E >::take () [inline, virtual]

Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Returns:

the head of this queue

Exceptions:

InterruptedException if interrupted while waiting

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 695).

6.368.3.18 template<typename E> virtual std::vector<E> decaf::util::concurrent::LinkedBlockingQueue< E >::toArray () const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1006). All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns:

an vector of copies of all the elements from this **Collection** (p. 1006)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 150).

6.368.3.19 template<typename E> virtual std::string decaf::util::concurrent::LinkedBlockingQueue< E >::toString () const [inline, virtual]

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::toString().

6.369.1 Detailed Description

template<typename K, typename V, typename HASHCODE = HashCode<K>> class decaf::util::LinkedHashMap< K, V, HASHCODE >

Hashed and linked list implementation of the **Map** (p. 2008) interface, with predictable iteration order. This implementation differs from **HashMap** (p. 1613) in that it maintains a doubly-linked list running through all of its entries. This linked list defines the iteration ordering, which is normally the order in which keys were inserted into the map (insertion-order). Note that insertion order is not affected if a key is re-inserted into the map. (A key k is reinserted into a map

m if m.put(k, v) is invoked when m.containsKey(k) would return true immediately prior to the invocation.)

This implementation spares its clients from the unspecified, generally chaotic ordering provided by **HashMap** (p. 1613), without incurring the increased cost associated with TreeMap. It can be used to produce a copy of a map that has the same order as the original, regardless of the original map's implementation:

void foo(Map m) { **Map** (p. 2008) copy = new LinkedHashMap(m); ... }

This technique is particularly useful if a module takes a map on input, copies it, and later returns results whose order is determined by that of the copy. (Clients generally appreciate having things returned in the same order they were presented.)

A special constructor is provided to create a linked hash map whose order of iteration is the order in which its entries were last accessed, from least-recently accessed to most-recently (access-order). This kind of map is well-suited to building LRU caches. Invoking the put or get method results in an access to the corresponding entry (assuming it exists after the invocation completes). The putAll method generates one entry access for each mapping in the specified map, in the order that key-value mappings are provided by the specified map's entry set iterator. No other methods generate entry accesses. In particular, operations on collection-views do not affect the order of iteration of the backing map.

The removeEldestEntry(MapEntry) method may be overridden to impose a policy for removing stale mappings automatically when new mappings are added to the map. When the entries are about to be removed from the map the onEviction method is called giving subclasses a chance to delete pointer values or perform other cleanup prior to the mapping being removed.

This class provides all of the optional **Map** (p. 2008) operations. Like **HashMap** (p. 1613), it provides constant-time performance for the basic operations (add, contains and remove), assuming the hash function disperses elements properly among the buckets. Performance is likely to be just slightly below that of **HashMap** (p. 1613), due to the added expense of maintaining the linked list, with one exception: Iteration over the collection-views of a **LinkedHashMap** (p. 1875) requires time proportional to the size of the map, regardless of its capacity. Iteration over a **HashMap** (p. 1613) is likely to be more expensive, requiring time proportional to its capacity.

A linked hash map has two parameters that affect its performance: initial capacity and load factor. They are defined precisely as for **HashMap** (p. 1613). Note, however, that the penalty for choosing an excessively high value for initial capacity is less severe for this class than for **HashMap** (p. 1613), as iteration times for this class are unaffected by capacity.

Note that this implementation is not synchronized. If multiple threads access a linked hash map concurrently, and at least one of the threads modifies the map structurally, it must be synchronized externally. This is typically accomplished by synchronizing on some object that naturally encapsulates the map. If no such object exists, the map should be "wrapped" using the Collections.synchronizedMap method. This is best done at creation time, to prevent accidental unsynchronized access to the map:

Map<K,V>* m = Collections::synchronizedMap(new **LinkedHashMap** (p. 1875)(...));

A structural modification is any operation that adds or deletes one or more mappings or, in the case of access-ordered linked hash maps, affects iteration order. In insertion-ordered linked hash maps, merely changing the value associated with a key that is already contained in the map is not a structural modification. In access-ordered linked hash maps, merely querying the map with get is a structural modification.)

The iterators returned by the iterator method of the collections returned by all of this class's collection view methods are fail-fast: if the map is structurally modified at any time after the iterator is created, in any way except through the iterator's own remove method, the iterator

will throw a **ConcurrentModificationException** (p. 1056). Thus, in the face of **concurrent** (p. 130) modification, the iterator fails quickly and cleanly, rather than risking arbitrary, non-deterministic behavior at an undetermined time in the future.

Note that the fail-fast behavior of an iterator cannot be guaranteed as it is, generally speaking, impossible to make any hard guarantees in the presence of unsynchronized **concurrent** (p. 130) modification. Fail-fast iterators throw **ConcurrentModificationException** (p. 1056) on a best-effort basis. Therefore, it would be wrong to write a program that depended on this exception for its correctness: the fail-fast behavior of iterators should be used only to detect bugs.

6.370.1 Detailed Description

template<typename E, typename HASHCODE = HashCode<E>> class decaf::util::LinkedHashSet< E, HASHCODE >

Hash table and linked list implementation of the **Set** (p. 2715) interface, with predictable iteration order. This implementation differs from **HashSet** (p. 1641) in that it maintains a doubly-linked list running through all of its entries. This linked list defines the iteration ordering, which is the order in which elements were inserted into the set (insertion-order). Note that insertion order is not affected if an element is re-inserted into the set. (An element e is reinserted into a set s if s.add(e) is invoked when s.contains(e) would return true immediately prior to the invocation.)

This implementation spares its clients from the unspecified, generally chaotic ordering provided by **HashSet** (p. 1641), without incurring the increased cost associated with TreeSet. It can be used to produce a copy of a set that has the same order as the original, regardless of the original set's implementation:

void foo(const Set<E& s) { Set<E>* copy = new LinkedHashSet<E>(s); ... }

This technique is particularly useful if a module takes a set on input, copies it, and later returns results whose order is determined by that of the copy. (Clients generally appreciate having things returned in the same order they were presented.)

This class provides all of the optional **Set** (p. 2715) operations, and permits null elements. Like **HashSet** (p. 1641), it provides constant-time performance for the basic operations (add, contains and remove), assuming the hash function disperses elements properly among the buckets. Performance is likely to be just slightly below that of **HashSet** (p. 1641), due to the added expense of maintaining the linked list, with one exception: Iteration over a **LinkedHashSet** (p. 1878) requires time proportional to the size of the set, regardless of its capacity. Iteration over a **HashSet** (p. 1641) is likely to be more expensive, requiring time proportional to its capacity.

A linked hash set has two parameters that affect its performance: initial capacity and load factor. They are defined precisely as for **HashSet** (p. 1641). Note, however, that the penalty for choosing

an excessively high value for initial capacity is less severe for this class than for **HashSet** (p. 1641), as iteration times for this class are unaffected by capacity.

Note that this implementation is not synchronized. If multiple threads access a linked hash set concurrently, and at least one of the threads modifies the set, it must be synchronized externally. This is typically accomplished by synchronizing on some object that naturally encapsulates the set. If no such object exists, the set should be "wrapped" using the Collections.synchronizedSet method. This is best done at creation time, to prevent accidental unsynchronized access to the set:

Set<E>* s = Collections::synchronizedSet(new LinkedHashSet<E>(...));

The iterators returned by this class's iterator method are fail-fast: if the set is modified at any time after the iterator is created, in any way except through the iterator's own remove method, the iterator will throw a **ConcurrentModificationException** (p. 1056). Thus, in the face of **concurrent** (p. 130) modification, the iterator fails quickly and cleanly, rather than risking arbitrary, non-deterministic behavior at an undetermined time in the future.

Note that the fail-fast behavior of an iterator cannot be guaranteed as it is, generally speaking, impossible to make any hard guarantees in the presence of unsynchronized **concurrent** (p. 130) modification. Fail-fast iterators throw **ConcurrentModificationException** (p. 1056) on a best-effort basis. Therefore, it would be wrong to write a program that depended on this exception for its correctness: the fail-fast behavior of iterators should be used only to detect bugs.

- **LinkedList** (const **Collection**< E > &collection)
- virtual ~**LinkedList** ()
- **LinkedList**< E > & **operator**= (const **LinkedList**< E > &list)

  Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

- **LinkedList**< E > & **operator**= (const **Collection**< E > &collection)
- bool **operator**== (const **LinkedList**< E > &other) const
- bool **operator!**= (const **LinkedList**< E > &other) const
- virtual E **get** (int index) const

  Gets the element contained at position passed.
  Parameters:

  index *The position to get.*
  Returns:

  value at index specified.
  Exceptions:

  IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*

  This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the element using ***ListIterator.next*** *(p. 1803) and returns it.*

- virtual E **set** (int index, const E &element)

  Replaces the element at the specified position in this list with the specified element.
  Parameters:

  index *The index of the element to replace.*
  element *The element to be stored at the specified position.*
  Returns:

  the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*
UnsupportedOperationExceptio *if this is an unmodifiable collection.*
NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
IllegalArgumentException *if some property of the element prevents it from being added to this collection*
IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the current element using ***ListIterator.next*** *(p. 1803) and replaces it with* ***ListIterator.set*** *(p. 1915).*

- virtual bool **add** (const E &value)

  Returns true if this collection changed as a result of the call.

- virtual void **add** (int index, const E &value)

  Inserts the specified element at the specified position in this list.
  Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

  Parameters:

  index *The index at which the specified element is to be inserted.*
  element *The element to be inserted in this* ***List*** *(p. 1902).*

  Exceptions:

  IndexOutOfBoundsException *if the index is greater than size of the* ***List*** *(p. 1902).*
  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
  IllegalArgumentException *if some property of the element prevents it from being added to this collection*
  IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

  This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it inserts the specified element with ***ListIterator.add*** *(p. 1914).*

- virtual bool **addAll** (const **Collection**< E > &collection)

  This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
  Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual bool **addAll** (int index, const **Collection**< E > &collection)

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
  Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

  Parameters:

  index *The index at which to insert the first element from the specified collection*
  source *The* ***Collection*** *(p. 1006) containing elements to be added to this list*

  Returns:

  true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException *if the index given is less than zero or greater than the* ***List*** *(p. 1902) size.*
UnsupportedOperationExceptio *if this is an unmodifiable collection.*
NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
IllegalArgumentException *if some property of the element prevents it from being added to this collection.*
IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with listIterator(index)). Then, it iterates over the specified collection, inserting the elements obtained from the iterator into this list, one at a time, using ***ListIterator.add*** *(p. 1914) (to skip over the added element).*

- virtual void **copy** (const **Collection**< E > &collection)

  Renders this ***Collection*** *(p. 1006) as a Copy of the given* ***Collection*** *(p. 1006).*

- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).
  Parameters:

  value *The reference to the element to remove from this* ***Collection*** *(p. 1006).*
  Returns:

  true if the collection was changed, false otherwise.
  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual bool **isEmpty** () const

  Returns true if this collection contains no elements.

- virtual int **size** () const

  Returns the number of elements in this collection.

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).

- virtual bool **contains** (const E &value) const

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).
  Parameters:

  value *The value to check for presence in the collection.*
  Returns:

  true if there is at least one of the elements in the collection

Exceptions:

NullPointerException *if the* ***Collection*** *(p. 1006) contains pointers and the* ***Collection*** *(p. 1006) does not allow for NULL elements (optional check).*

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual int **indexOf** (const E &value) const

  Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual int **lastIndexOf** (const E &value) const

  Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual std::vector< E > **toArray** () const

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(p. 1006).*

- virtual bool **offer** (const E &value)

  Inserts the specified element into the queue provided that the condition allows such an operation.

- virtual bool **poll** (E &result)

  Gets and removes the element in the head of the queue.

- virtual E **remove** ()

  Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) const

  Gets but not removes the element in the head of the queue.

- virtual E **element** () const

  Gets but not removes the element in the head of the queue.

- virtual void **addFirst** (const E &value)

  Inserts an element onto the front of the ***Deque*** *(p. 1366) if possible without violating the implementations capacity restrictions.*

- virtual void **addLast** (const E &value)

  Inserts an element onto the end of the ***Deque*** *(p. 1366) if possible without violating the implementations capacity restrictions.*

- virtual E & **getFirst** ()

  Attempts to fetch a reference to the first element in the ***Deque*** *(p. 1366).*

- virtual const E & **getFirst** () const
- virtual E & **getLast** ()

  Attempts to fetch a reference to the last element in the ***Deque*** *(p. 1366).*

- virtual const E & **getLast** () const
- virtual bool **offerFirst** (const E &element)

  This method attempts to insert the given element into the ***Deque*** *(p. 1366) at the front end.*

- virtual bool **offerLast** (const E &element)

  This method attempts to insert the given element into the ***Deque*** *(p. 1366) at the end.*

- virtual E **removeFirst** ()

  Removes the topmost element from the ***Deque*** *(p. 1366) and returns it.*

- virtual E **removeLast** ()

  Removes the last element from the ***Deque*** *(p. 1366) and returns it.*

- virtual bool **pollFirst** (E &result)

  Removes the first element from the ***Deque*** *(p. 1366) assigns it to the element reference passed.*

- virtual bool **pollLast** (E &result)

  Removes the last element from the ***Deque*** *(p. 1366) assigns it to the element reference passed.*

- virtual bool **peekFirst** (E &result) const

  Retrieves the first element contained in this ***Deque*** *(p. 1366) and assigns its value to the reference value passed the value however is not removed from the* ***Deque*** *(p. 1366).*

- virtual bool **peekLast** (E &result) const

  Retrieves the last element contained in this ***Deque*** *(p. 1366) and assigns its value to the reference value passed the value however is not removed from the* ***Deque*** *(p. 1366).*

- virtual E **pop** ()

  Treats this ***Deque*** *(p. 1366) as a stack and attempts to pop an element off the top.*

- virtual void **push** (const E &element)

  Pushes an element onto the stack represented by this deque (in other words, at the head of this deque) if it is possible to do so immediately without violating capacity restrictions, otherwise it throwing an IllegalStateException if no space is currently available.

- virtual bool **removeFirstOccurrence** (const E &value)

  Removes the first occurrence of the specified element from this ***Deque*** *(p. 1366).*

- virtual bool **removeLastOccurrence** (const E &value)

  Removes the last occurrence of the specified element from this ***Deque*** *(p. 1366).*

- virtual **ListIterator**< E > * **listIterator** (int index)
- virtual **ListIterator**< E > * **listIterator** (int index) const
- virtual **Iterator**< E > * **descendingIterator** ()

  Provides an ***Iterator*** *(p. 1802) over this* ***Collection*** *(p. 1006) that traverses the element in reverse order.*

- virtual **Iterator**< E > * **descendingIterator** () const

6.371.1 Detailed Description

template<typename E> class decaf::util::LinkedList< E >

A complete implementation of the **List** (p. 1902) interface using a doubly linked list data structure. This class also implements the **Deque** (p. 1366) interface providing a common interface for

additions into the list at the front and end as well as allowing insertions anywhere in between. This class can be used then to implement other data structures such as Stacks, Queue's or double ended Queue's.

The operations on this **List** (p. 1902) object that index a particular element involve iterating over the links of the list from beginning to end, starting from whichever end is closer to the location the operation is to be performed on.

Since:

1.0

6.371.2.4 template<typename E> virtual decaf::util::LinkedList< E >::~LinkedList () [inline, virtual]

6.371.3 Member Function Documentation

6.371.3.1 template<typename E> virtual void decaf::util::LinkedList< E >::add (int index, const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index The index at which the specified element is to be inserted.

element The element to be inserted in this **List** (p. 1902).

Exceptions:

IndexOutOfBoundsException if the index is greater than size of the **List** (p. 1902).

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it inserts the specified element with **ListIterator.add** (p. 1914). This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it inserts the specified element with **ListIterator.add** (p. 1914).

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 193).

6.371.3.2 template<typename E> virtual bool decaf::util::LinkedList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 158).

6.371.3.3 template<typename E> virtual bool decaf::util::LinkedList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are

returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1006) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with listIterator(index)). Then, it iterates over the specified collection, inserting the elements obtained from the iterator into this list, one at a time, using **ListIterator.add** (p. 1914) (to skip over the added element). This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with listIterator(index)). Then, it iterates over the specified collection, inserting the elements obtained from the iterator into this list, one at a time, using **ListIterator.add** (p. 1914) (to skip over the added element).

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 194).

6.371.3.4 template<typename E> virtual bool decaf::util::LinkedList< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty). This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 143).

6.371.3.5 template<typename E> virtual void decaf::util::LinkedList< E >::addFirst (const E & *element*) [inline, virtual]

Inserts an element onto the front of the **Deque** (p. 1366) if possible without violating the implementations capacity restrictions. For a capacity restricted **Deque** (p. 1366) it is preferable to call

offerFirst instead.

Parameters:

element The element to be placed at the front of the **Deque** (p. 1366).

Exceptions:

IllegalStateException if the element cannot be added at this time due to capacity restrictions

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 1367).

6.371.3.6 template<typename E> virtual void decaf::util::LinkedList< E >::addLast (const E & *element*) [inline, virtual]

Inserts an element onto the end of the **Deque** (p. 1366) if possible without violating the implementations capacity restrictions. For a capacity restricted **Deque** (p. 1366) it is preferable to call offerLast instead.

Parameters:

element The element to be placed at the end of the **Deque** (p. 1366).

Exceptions:

IllegalStateException if the element cannot be added at this time due to capacity restrictions

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 1368).

Referenced by decaf::util::LinkedList< cms::Connection * >::offer().

6.371.3.7 template<typename E> virtual void decaf::util::LinkedList< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractList< E >** (p. 160).

Referenced by decaf::util::LinkedList< cms::Connection * >::copy(), and decaf::util::LinkedList< cms::Connection * >::operator=().

6.371.3.8 template<typename E> virtual bool decaf::util::LinkedList< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters:

value The value to check for presence in the collection.

Returns:

true if there is at least one of the elements in the collection

Exceptions:

NullPointerException if the **Collection** (p. 1006) contains pointers and the **Collection** (p. 1006) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element. This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 145).

6.371.3.9 template<typename E> virtual void decaf::util::LinkedList< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 1006) as a Copy of the given **Collection** (p. 1006). The default implementation iterates over the contents of the given collection adding each to this collection after first calling this Collection's clear method.

Parameters:

collection The collection to mirror.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

IllegalStateException if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 146).

6.371.3.10 template<typename E> virtual Iterator<E>* decaf::util::LinkedList< E >::descendingIterator () const [inline, virtual]

Implements **decaf::util::Deque< E >** (p. 1369).

6.371.3.11 template<typename E> virtual Iterator<E>* decaf::util::LinkedList< E >::descendingIterator () [inline, virtual]

Provides an **Iterator** (p. 1802) over this **Collection** (p. 1006) that traverses the element in reverse order.

Returns:

a new **Iterator** (p. 1802) instance that moves from last to first.

Implements **decaf::util::Deque< E >** (p. 1369).

Referenced by decaf::util::LinkedList< cms::Connection * >::removeLastOccurrence().

6.371.3.12 template<typename E> virtual E decaf::util::LinkedList< E >::element () const [inline, virtual]

Gets but not removes the element in the head of the queue. Throws a **NoSuchElementException** (p. 2260) if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260)* if there is no element in the queue.

Implements **decaf::util::Queue< E >** (p. 2516).

Referenced by decaf::util::LinkedList< cms::Connection * >::set().

6.371.3.13 template<typename E> virtual E decaf::util::LinkedList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters:

index The position to get.

Returns:

value at index specified.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the element using **ListIterator.next** (p. 1803) and returns it. This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the element using **ListIterator.next** (p. 1803) and returns it.

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 195).

6.371.3.14 template<typename E> virtual const E& decaf::util::LinkedList< E >::getFirst () const [inline, virtual]

Implements **decaf::util::Deque< E >** (p. 1369).

6.371.3.15 template<typename E> virtual E& decaf::util::LinkedList< E >::getFirst () [inline, virtual]

Attempts to fetch a reference to the first element in the **Deque** (p. 1366). This method does not remove the element from the **Deque** (p. 1366) but simply returns a reference to it.

Returns:

reference to the first element in the **Deque** (p. 1366).

Exceptions:

NoSuchElementException *(p. 2260)* if the **Deque** (p. 1366) is empty.

Implements **decaf::util::Deque< E >** (p. 1369).

6.371.3.16 template<typename E> virtual const E& decaf::util::LinkedList< E >::getLast () const [inline, virtual]

Implements **decaf::util::Deque< E >** (p. 1370).

6.371.3.17 template<typename E> virtual E& decaf::util::LinkedList< E >::getLast () [inline, virtual]

Attempts to fetch a reference to the last element in the **Deque** (p. 1366). This method does not remove the element from the **Deque** (p. 1366) but simply returns a reference to it.

Returns:

reference to the last element in the **Deque** (p. 1366).

Exceptions:

NoSuchElementException *(p. 2260)* if the **Deque** (p. 1366) is empty.

Implements **decaf::util::Deque< E >** (p. 1370).

6.371.3.18 template<typename E> virtual int decaf::util::LinkedList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 160).

Referenced by decaf::util::LinkedList< cms::Connection * >::contains().

6.371.3.19 template<typename E> virtual bool decaf::util::LinkedList< E >::isEmpty () const [inline, virtual]

Returns true if this collection contains no elements. This implementation returns **size()** (p. 1900) == 0.

Returns:

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 147).

6.371.3.20 template<typename E> virtual int decaf::util::LinkedList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 162).

6.371.3.21 template<typename E> virtual ListIterator<E>* decaf::util::LinkedList< E >::listIterator (int index) const [inline, virtual]

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 196).

6.371.3.22 template<typename E> virtual ListIterator<E>* decaf::util::LinkedList< E >::listIterator (int *index*) [inline, virtual]

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (index < 0 || index > **size()** (p. 1900))

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 196).

6.371.3.23 template<typename E> virtual bool decaf::util::LinkedList< E >::offer (const E & *value*) [inline, virtual]

Inserts the specified element into the queue provided that the condition allows such an operation. The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters:

value the specified element to insert into the queue.

Returns:

true if the operation succeeds and false if it fails.

Exceptions:

NullPointerException if the **Queue** (p. 2515) implementation does not allow Null values to be inserted into the **Queue** (p. 2515).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2516).

6.371.3.24 template<typename E> virtual bool decaf::util::LinkedList< E >::offerFirst (const E & *element*) [inline, virtual]

This method attempts to insert the given element into the **Deque** (p. 1366) at the front end. Unlike the addFirst method that throws an exception if it cannot insert the element due to capacity restrictions etc this method returns false if it cannot insert the element.

Parameters:

element The element to add to this **Deque** (p. 1366).

Returns:

true if the element was added, false otherwise.

Exceptions:

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 1371).

6.371.3.25 template<typename E> virtual bool decaf::util::LinkedList< E >::offerLast (const E & *element*) [inline, virtual]

This method attempts to insert the given element into the **Deque** (p. 1366) at the end. Unlike the addLast method that throws an exception if it cannot insert the element due to capacity restrictions etc this method returns false if it cannot insert the element.

Parameters:

element The element to add to this **Deque** (p. 1366).

Returns:

true if the element was added, false otherwise.

Exceptions:

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 1371).

6.371.3.26 template<typename E> bool decaf::util::LinkedList< E >::operator!= (const LinkedList< E > & *other*) const [inline]

6.371.3.27 template<typename E> LinkedList<E>& decaf::util::LinkedList< E >::operator= (const Collection< E > & *collection*) [inline]

6.371.3.28 template<typename E> LinkedList<E>& decaf::util::LinkedList< E >::operator= (const LinkedList< E > & *collection*) [inline]

Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

Parameters:

collection - the collection to copy

Returns:

a reference to this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 148).

6.371.3.29 template<typename E> bool decaf::util::LinkedList< E >::operator== (const LinkedList< E > & *other*) const [inline]

6.371.3.30 template<typename E> virtual bool decaf::util::LinkedList< E >::peek (E & *result*) const [inline, virtual]

Gets but not removes the element in the head of the queue. The result if successful is assigned to the result parameter.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2517).

6.371.3.31 template<typename E> virtual bool decaf::util::LinkedList< E >::peekFirst (E & *value*) const [inline, virtual]

Retrieves the first element contained in this **Deque** (p. 1366) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 1366). If this call is successful it returns true. Unlike getFirst this method does not throw an exception if the **Deque** (p. 1366) is empty.

Returns:

true if an element was assigned to the reference passed, false otherwise.

Implements **decaf::util::Deque< E >** (p. 1372).

6.371.3.32 template<typename E> virtual bool decaf::util::LinkedList< E >::peekLast (E & *value*) const [inline, virtual]

Retrieves the last element contained in this **Deque** (p. 1366) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 1366). If this call is successful it returns true. Unlike getLast this method does not throw an exception if the **Deque** (p. 1366) is empty.

Returns:

true if an element was assigned to the reference passed, false otherwise.

Implements **decaf::util::Deque< E >** (p. 1372).

6.371.3.33 template<typename E> virtual bool decaf::util::LinkedList< E >::poll (E & *result*) [inline, virtual]

Gets and removes the element in the head of the queue. If the operation succeeds the value of the element at the head of the **Queue** (p. 2515) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2517).

6.371.3.34 template<typename E> virtual bool decaf::util::LinkedList< E >::pollFirst (E & *element*) [inline, virtual]

Removes the first element from the **Deque** (p. 1366) assigns it to the element reference passed.

Parameters:

element Reference to an variable that can be assigned the value of the head of this **Deque** (p. 1366).

Returns:

true if an element was available to remove, false otherwise.

Implements **decaf::util::Deque< E >** (p. 1373).

6.371.3.35 template<typename E> virtual bool decaf::util::LinkedList< E >::pollLast (E & *element*) [inline, virtual]

Removes the last element from the **Deque** (p. 1366) assigns it to the element reference passed.

Parameters:

element Reference to an variable that can be assigned the value of the tail of this **Deque** (p. 1366).

Returns:

true if an element was available to remove, false otherwise.

Implements **decaf::util::Deque< E >** (p. 1373).

6.371.3.36 template<typename E> virtual E decaf::util::LinkedList< E >::pop () [inline, virtual]

Treats this **Deque** (p. 1366) as a stack and attempts to pop an element off the top. If there's no element to pop then a NuSuchElementException is thrown, otherwise the top element is removed and assigned to the reference passed.

This operation performs the same basic function as the removeFirst method.

Returns:

the element at the front of this deque which would be the top of a stack.

Exceptions:

NoSuchElementException *(p. 2260)* if there is nothing on the top of the stack.

Implements **decaf::util::Deque< E >** (p. 1373).

6.371.3.37 template<typename E> virtual void decaf::util::LinkedList< E >::push (const E & *element*) [inline, virtual]

Pushes an element onto the stack represented by this deque (in other words, at the head of this deque) if it is possible to do so immediately without violating capacity restrictions, otherwise it throwing an IllegalStateException if no space is currently available. This method performs the same basic operation as the addFirst method.

Parameters:

element The element to be pushed onto the **Deque** (p. 1366).

Exceptions:

IllegalStateException if the element cannot be added at this time due to capacity restrictions

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

IllegalArgumentException if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 1374).

6.371.3.38 template<typename E> virtual E decaf::util::LinkedList< E >::remove () [inline, virtual]

Gets and removes the element in the head of the queue. Throws a **NoSuchElementException** (p. 2260) if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260)* if there is no element in the queue.

Implements **decaf::util::Queue< E >** (p. 2518).

6.371.3.39 template<typename E> virtual bool decaf::util::LinkedList< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object. This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 149).

6.371.3.40 template<typename E> virtual E decaf::util::LinkedList< E >::removeFirst () [inline, virtual]

Removes the topmost element from the **Deque** (p. 1366) and returns it. Unlike the pollFirst method this method throws a NuSuchElementException if the **Deque** (p. 1366) is empty.

Returns:

the element at the Head of the **Deque** (p. 1366).

Exceptions:

NoSuchElementException *(p. 2260)* if the **Deque** (p. 1366) is empty.

Implements **decaf::util::Deque< E >** (p. 1374).

6.371.3.41 template<typename E> virtual bool decaf::util::LinkedList< E >::removeFirstOccurrence (const E & *value*) [inline, virtual]

Removes the first occurrence of the specified element from this **Deque** (p. 1366). If there is no matching element then the **Deque** (p. 1366) is left unchanged.

Parameters:

value The value to be removed from this **Deque** (p. 1366).

Returns:

true if the **Deque** (p. 1366) was modified as a result of this operation.

Exceptions:

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

Implements **decaf::util::Deque< E >** (p. 1375).

Referenced by decaf::util::LinkedList< cms::Connection * >::remove().

6.371.3.42 template<typename E> virtual E decaf::util::LinkedList< E >::removeLast () [inline, virtual]

Removes the last element from the **Deque** (p. 1366) and returns it. Unlike the pollLast method this method throws a NuSuchElementException if the **Deque** (p. 1366) is empty.

Returns:

the element at the Tail of the **Deque** (p. 1366).

Exceptions:

NoSuchElementException *(p. 2260)* if the **Deque** (p. 1366) is empty.

Implements **decaf::util::Deque< E >** (p. 1375).

6.371.3.43 template<typename E> virtual bool decaf::util::LinkedList< E >::removeLastOccurrence (const E & *value*) [inline, virtual]

Removes the last occurrence of the specified element from this **Deque** (p. 1366). If there is no matching element then the **Deque** (p. 1366) is left unchanged.

Parameters:

value The value to be removed from this **Deque** (p. 1366).

Returns:

true if the **Deque** (p. 1366) was modified as a result of this operation.

Exceptions:

NullPointerException if the specified element is NULL and this deque is a **Collection** (p. 1006) of pointers and does not permit null elements.

Implements **decaf::util::Deque< E >** (p. 1376).

6.371.3.44 template<typename E> virtual E decaf::util::LinkedList< E >::set (int index, const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters:

index The index of the element to replace.

element The element to be stored at the specified position.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the current element using **ListIterator.next** (p. 1803) and replaces it with **ListIterator.set** (p. 1915). This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the current element using **ListIterator.next** (p. 1803) and replaces it with **ListIterator.set** (p. 1915).

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 198).

6.371.3.45 template<typename E> virtual int decaf::util::LinkedList< E >::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1015).

6.371.3.46 template<typename E> virtual std::vector<E> decaf::util::LinkedList< E >::toArray () const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1006). All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns:

an vector of copies of all the elements from this **Collection** (p. 1006)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 150).

  Inserts the specified element at the specified position in this list.

- virtual bool **addAll** (int index, const **Collection**< E > &source)=0

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

- virtual E **removeAt** (int index)=0

  Removes the element at the specified position in this list.

6.372.1 Detailed Description

template<typename E> class decaf::util::List< E >

An ordered collection (also known as a sequence). The user of this interface has precise control over where in the list each element is inserted. The user can access elements by their integer index (position in the list), and search for elements in the list.

Unlike sets, lists typically allow duplicate elements. More formally, lists typically allow pairs of elements e1 and e2 such that e1.equals(e2), and they typically allow multiple null elements if they

allow null elements at all. It is not inconceivable that someone might wish to implement a list that prohibits duplicates, by throwing runtime exceptions when the user attempts to insert them, but we expect this usage to be rare.

6.372.2 Constructor & Destructor Documentation

6.372.2.1 template<typename E> decaf::util::List< E >::List () [inline]

6.372.2.2 template<typename E> virtual decaf::util::List< E >::~List () [inline, virtual]

6.372.3 Member Function Documentation

6.372.3.1 template<typename E> virtual void decaf::util::List< E >::add (int *index*, const E & *element*) [pure virtual]

Inserts the specified element at the specified position in this list. Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index The index at which the specified element is to be inserted.

element The element to be inserted in this **List** (p. 1902).

Exceptions:

IndexOutOfBoundsException if the index is greater than size of the **List** (p. 1902).

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::AbstractSequentialList< E >** (p. 193), **decaf::util::ArrayList< E >** (p. 587), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1206), **decaf::util::LinkedList< E >** (p. 1885), **decaf::util::StlList< E >** (p. 2860), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 193), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 193), **decaf::util::AbstractSequentialList< URI >** (p. 193), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 193), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 193), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 193), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 193), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 193), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 193), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 193), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 193), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 193), **decaf::util::ArrayList< ServiceListener * >** (p. 587), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 587), **decaf::util::LinkedList<**

cms::MessageConsumer * > (p. 1885), **decaf::util::LinkedList< CompositeTask** * > (p. 1885), **decaf::util::LinkedList< URI** > (p. 1885), **decaf::util::LinkedList< Pointer< MessageDispatch** > > (p. 1885), **decaf::util::LinkedList< Pointer< DestinationInfo** > > (p. 1885), **decaf::util::LinkedList< PrimitiveValueNode** > (p. 1885), **decaf::util::LinkedList< decaf::net::URI** > (p. 1885), **decaf::util::LinkedList< Pointer< Command** > > (p. 1885), **decaf::util::LinkedList< cms::MessageProducer** * > (p. 1885), **decaf::util::LinkedList< cms::Destination** * > (p. 1885), **decaf::util::LinkedList< cms::Session** * > (p. 1885), and **decaf::util::LinkedList< cms::Connection** * > (p. 1885).

6.372.3.2 template<typename E> virtual bool decaf::util::List< E >::addAll (int *index*, const Collection< E > & *source*) [pure virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation). Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1006) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::AbstractList< E >** (p. 159), **decaf::util::AbstractSequentialList< E >** (p. 194), **decaf::util::ArrayList< E >** (p. 588), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1207), **decaf::util::LinkedList< E >** (p. 1886), **decaf::util::StlList< E >** (p. 2861), **decaf::util::AbstractList< ServiceListener** * > (p. 159), **decaf::util::AbstractList< cms::MessageConsumer** * > (p. 159), **decaf::util::AbstractList< CompositeTask** * > (p. 159), **decaf::util::AbstractList< URI** > (p. 159), **decaf::util::AbstractList< Pointer< MessageDispatch** > > (p. 159), **decaf::util::AbstractList< Pointer< DestinationInfo** > > (p. 159), **decaf::util::AbstractList< PrimitiveValueNode** > (p. 159), **decaf::util::AbstractList< decaf::net::URI** > (p. 159), **decaf::util::AbstractList< Pointer< Command** > > (p. 159), **decaf::util::AbstractList< cms::MessageProducer** * > (p. 159), **decaf::util::AbstractList< cms::Destination** * > (p. 159),

decaf::util::AbstractList< cms::Session * > (p. 159), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 159), **decaf::util::AbstractList< cms::Connection * >** (p. 159), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 194), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 194), **decaf::util::AbstractSequentialList< URI >** (p. 194), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 194), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 194), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 194), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 194), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 194), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 194), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 194), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 194), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 194), **decaf::util::ArrayList< ServiceListener * >** (p. 588), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 588), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1886), **decaf::util::LinkedList< CompositeTask * >** (p. 1886), **decaf::util::LinkedList< URI >** (p. 1886), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1886), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1886), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1886), **decaf::util::LinkedList< decaf::net::URI >** (p. 1886), **decaf::util::LinkedList< Pointer< Command > >** (p. 1886), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1886), **decaf::util::LinkedList< cms::Destination * >** (p. 1886), **decaf::util::LinkedList< cms::Session * >** (p. 1886), and **decaf::util::LinkedList< cms::Connection * >** (p. 1886).

6.372.3.3 template<typename E> virtual E decaf::util::List< E >::get (int *index*) const [pure virtual]

Gets the element contained at position passed.

Parameters:

index The position to get.

Returns:

value at index specified.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

Implemented in **decaf::util::AbstractSequentialList< E >** (p. 195), **decaf::util::ArrayList< E >** (p. 590), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1210), **decaf::util::LinkedList< E >** (p. 1890), **decaf::util::StlList< E >** (p. 2863), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 195), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 195), **decaf::util::AbstractSequentialList< URI >** (p. 195), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 195), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 195), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 195), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 195), **decaf::util::AbstractSequentialList< Pointer< Command >**

> (p. 195), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 195), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 195), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 195), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 195), **decaf::util::ArrayList< ServiceListener * >** (p. 590), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 590), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1890), **decaf::util::LinkedList< CompositeTask * >** (p. 1890), **decaf::util::LinkedList< URI >** (p. 1890), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1890), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1890), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1890), **decaf::util::LinkedList< decaf::net::URI >** (p. 1890), **decaf::util::LinkedList< Pointer< Command > >** (p. 1890), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1890), **decaf::util::LinkedList< cms::Destination * >** (p. 1890), **decaf::util::LinkedList< cms::Session * >** (p. 1890), and **decaf::util::LinkedList< cms::Connection * >** (p. 1890).

6.372.3.4 template<typename E> virtual int decaf::util::List< E >::indexOf (const E & *value*) const [pure virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

6.372.3.5 template<typename E> virtual int decaf::util::List< E >::lastIndexOf (const E & *value*) const [pure virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value The element to search for in this **List** (p. 1902).

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::AbstractList< E >** (p. 162), **decaf::util::ArrayList< E >** (p. 591), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1213), **decaf::util::LinkedList< E >** (p. 1892), **decaf::util::StlList< E >** (p. 2864), **decaf::util::AbstractList< ServiceListener * >** (p. 162), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 162), **decaf::util::AbstractList< CompositeTask * >** (p. 162), **decaf::util::AbstractList< URI >** (p. 162), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 162), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 162), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 162), **decaf::util::AbstractList< decaf::net::URI >** (p. 162), **decaf::util::AbstractList< Pointer< Command > >** (p. 162), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 162), **decaf::util::AbstractList< cms::Destination * >** (p. 162), **decaf::util::AbstractList< cms::Session * >** (p. 162), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 162), **decaf::util::AbstractList< cms::Connection * >** (p. 162), **decaf::util::ArrayList< ServiceListener * >** (p. 591), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 591), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1892), **decaf::util::LinkedList< CompositeTask * >** (p. 1892), **decaf::util::LinkedList< URI >** (p. 1892), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1892), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1892), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1892), **decaf::util::LinkedList< decaf::net::URI >** (p. 1892), **decaf::util::LinkedList< Pointer< Command > >** (p. 1892), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1892), **decaf::util::LinkedList< cms::Destination * >** (p. 1892), **decaf::util::LinkedList< cms::Session * >** (p. 1892), and **decaf::util::LinkedList< cms::Connection * >** (p. 1892).

6.372.3.6 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (int *index*) const [pure virtual]

Implemented in **decaf::util::AbstractList< E >** (p. 162), **decaf::util::AbstractSequentialList< E >** (p. 196), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1213), **decaf::util::LinkedList< E >** (p. 1892), **decaf::util::StlList< E >** (p. 2865), **decaf::util::AbstractList< ServiceListener * >** (p. 162), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 162), **decaf::util::AbstractList< CompositeTask * >** (p. 162), **decaf::util::AbstractList< URI >** (p. 162), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 162), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 162), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 162), **decaf::util::AbstractList< decaf::net::URI >** (p. 162), **decaf::util::AbstractList< Pointer< Command > >** (p. 162), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 162), **decaf::util::AbstractList< cms::Destination * >** (p. 162), **decaf::util::AbstractList< cms::Session * >** (p. 162), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 162), **decaf::util::AbstractList< cms::Connection * >** (p. 162), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 196), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 196), **decaf::util::AbstractSequentialList< URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 196), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 196), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 196), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 196), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1892), **decaf::util::LinkedList< CompositeTask * >** (p. 1892), **decaf::util::LinkedList< URI >** (p. 1892), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1892), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1892), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1892), **decaf::util::LinkedList< decaf::net::URI >** (p. 1892), **decaf::util::LinkedList< Pointer< Command > >** (p. 1892), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1892), **decaf::util::LinkedList< cms::Destination * >** (p. 1892), **decaf::util::LinkedList< cms::Session * >** (p. 1892), and **decaf::util::LinkedList< cms::Connection * >** (p. 1892).

6.372.3.7 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (int *index*) [pure virtual]

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (index < 0 || index > **size()** (p. 1015))

Implemented in **decaf::util::AbstractList< E >** (p. 163), **decaf::util::AbstractSequentialList< E >** (p. 196), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1213), **decaf::util::LinkedList< E >** (p. 1893), **decaf::util::StlList< E >** (p. 2865), **decaf::util::AbstractList< ServiceListener * >** (p. 163), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 163), **decaf::util::AbstractList< CompositeTask * >** (p. 163), **decaf::util::AbstractList< URI >** (p. 163), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 163), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 163), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 163), **decaf::util::AbstractList< decaf::net::URI >** (p. 163), **decaf::util::AbstractList< Pointer< Command > >** (p. 163), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 163), **decaf::util::AbstractList< cms::Destination * >** (p. 163), **decaf::util::AbstractList< cms::Session * >** (p. 163), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 163), **decaf::util::AbstractList< cms::Connection * >** (p. 163), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 196), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 196), **decaf::util::AbstractSequentialList< URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 196), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 196), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 196), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 196), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 196), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 196), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1893), **decaf::util::LinkedList< CompositeTask * >** (p. 1893), **decaf::util::LinkedList< URI >** (p. 1893), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1893), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1893), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1893), **decaf::util::LinkedList< decaf::net::URI >** (p. 1893), **decaf::util::LinkedList< Pointer< Command > >** (p. 1893), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1893), **decaf::util::LinkedList< cms::Destination * >** (p. 1893), **decaf::util::LinkedList< cms::Session * >** (p. 1893), and **decaf::util::LinkedList< cms::Connection * >** (p. 1893).

6.372.3.8 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator () const [pure virtual]

Implemented in **decaf::util::AbstractList< E >** (p. 164), **decaf::util::AbstractSequentialList< E >** (p. 197), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1214), **decaf::util::StlList< E >** (p. 2865), **decaf::util::AbstractList< ServiceListener * >** (p. 164), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 164), **decaf::util::AbstractList< CompositeTask * >** (p. 164), **decaf::util::AbstractList< URI >** (p. 164), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 164), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 164), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 164), **decaf::util::AbstractList< decaf::net::URI >** (p. 164), **decaf::util::AbstractList< Pointer< Command > >** (p. 164), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 164), **decaf::util::AbstractList< cms::Destination * >** (p. 164),

6.372.3.9 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator () [pure virtual]

Returns:

a list iterator over the elements in this list (in proper sequence).

Implemented in **decaf::util::AbstractList< E >** (p. 164), **decaf::util::AbstractSequentialList< E >** (p. 197), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1214), **decaf::util::StlList< E >** (p. 2866), **decaf::util::AbstractList< ServiceListener * >** (p. 164), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 164), **decaf::util::AbstractList< CompositeTask * >** (p. 164), **decaf::util::AbstractList< URI >** (p. 164), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 164), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 164), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 164), **decaf::util::AbstractList< decaf::net::URI >** (p. 164), **decaf::util::AbstractList< Pointer< Command > >** (p. 164), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 164), **decaf::util::AbstractList< cms::Destination * >** (p. 164), **decaf::util::AbstractList< cms::Session * >** (p. 164), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 164), **decaf::util::AbstractList< cms::Connection * >** (p. 164), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 197), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 197), **decaf::util::AbstractSequentialList< URI >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 197), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 197), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 197), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 197), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 197).

Referenced by decaf::util::Collections::reverse().

6.372.3.10 template<typename E> virtual E decaf::util::List< E >::removeAt (int *index*) [pure virtual]

Removes the element at the specified position in this list. Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

Implemented in **decaf::util::AbstractList< E >** (p. 165), **decaf::util::AbstractSequentialList< E >** (p. 197), **decaf::util::ArrayList< E >** (p. 593), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1216), **decaf::util::StlList< E >** (p. 2866), **decaf::util::AbstractList< ServiceListener * >** (p. 165), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 165), **decaf::util::AbstractList< CompositeTask * >** (p. 165), **decaf::util::AbstractList< URI >** (p. 165), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 165), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 165), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 165), **decaf::util::AbstractList< decaf::net::URI >** (p. 165), **decaf::util::AbstractList< Pointer< Command > >** (p. 165), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 165), **decaf::util::AbstractList< cms::Destination * >** (p. 165), **decaf::util::AbstractList< cms::Session * >** (p. 165), **decaf::util::AbstractList< Pointer< ActiveMQDestination > >** (p. 165), **decaf::util::AbstractList< cms::Connection * >** (p. 165), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 197), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 197), **decaf::util::AbstractSequentialList< URI >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 197), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 197), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 197), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 197), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 197), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 197), **decaf::util::ArrayList< ServiceListener * >** (p. 593), and **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 593).

6.372.3.11 template<typename E> virtual E decaf::util::List< E >::set (int *index*, const E & *element*) [pure virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters:

index The index of the element to replace.

element The element to be stored at the specified position.

Returns:

the element previously at the specified position.

Exceptions:

IndexOutOfBoundsException if the index given is less than zero or greater than the **List** (p. 1902) size.

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::AbstractSequentialList< E >** (p. 198), **decaf::util::ArrayList< E >** (p. 593), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1217), **decaf::util::LinkedList< E >** (p. 1899), **decaf::util::StlList< E >** (p. 2867), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 198), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 198), **decaf::util::AbstractSequentialList< URI >** (p. 198), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 198), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 198), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 198), **decaf::util::AbstractSequentialList< decaf::net::URI >** (p. 198), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 198), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 198), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 198), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 198), **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 198), **decaf::util::ArrayList< ServiceListener * >** (p. 593), **decaf::util::ArrayList< Pointer< ActiveMQDestination > >** (p. 593), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1899), **decaf::util::LinkedList< CompositeTask * >** (p. 1899), **decaf::util::LinkedList< URI >** (p. 1899), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1899), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1899), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1899), **decaf::util::LinkedList< decaf::net::URI >** (p. 1899), **decaf::util::LinkedList< Pointer< Command > >** (p. 1899), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1899), **decaf::util::LinkedList< cms::Destination * >** (p. 1899), **decaf::util::LinkedList< cms::Session * >** (p. 1899), and **decaf::util::LinkedList< cms::Connection * >** (p. 1899).

6.373 decaf::util::ListIterator< E > Class Template Reference

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.

`#include <src/main/decaf/util/ListIterator.h>`Inheritance diagram for decaf::util::ListIterator< E >:

Public Member Functions

- virtual ~**ListIterator** ()
- virtual void **add** (const E &e)=0

  Inserts the specified element into the list (optional operation).

- virtual void **set** (const E &e)=0

  Replaces the last element returned by next or previous with the specified element (optional operation).

- virtual bool **hasPrevious** () const =0

  Returns true if this list iterator has more elements when traversing the list in the reverse direction.

- virtual E **previous** ()=0

  Returns the previous element in the list.

- virtual int **nextIndex** () const =0

  Returns the index of the element that would be returned by a subsequent call to next.

- virtual int **previousIndex** () const =0

  Returns the index of the element that would be returned by a subsequent call to previous.

6.373.1 Detailed Description

template<typename E> class decaf::util::ListIterator< E >

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list. Note that the **remove()** (p. 1803) and set(Object) methods are not defined in terms of the cursor position; they are defined to operate on the last element returned by a call to **next()** (p. 1803) or **previous()** (p. 1915).

6.373.2 Constructor & Destructor Documentation

6.373.2.1 template<typename E > virtual decaf::util::ListIterator< E >::~ListIterator () [inline, virtual]

6.373.3 Member Function Documentation

6.373.3.1 template<typename E > virtual void decaf::util::ListIterator< E >::add (const E & e) [pure virtual]

Inserts the specified element into the list (optional operation). The element is inserted immediately before the next element that would be returned by next, if any, and after the next element that would be returned by previous, if any. (If the list contains no elements, the new element becomes the sole element on the list.) The new element is inserted before the implicit cursor: a subsequent call to next would be unaffected, and a subsequent call to previous would return the new element. (This call increases by one the value that would be returned by a call to nextIndex or previousIndex.)

Parameters:

e The element to insert into the **List** (p. 1902).

Exceptions:

UnsupportedOperationException if the add method is not supported by this list iterator.

IllegalArgumentException if some aspect of this element prevents it from being added to this list.

6.373.3.2 template<typename E > virtual bool decaf::util::ListIterator< E >::hasPrevious () const [pure virtual]

Returns true if this list iterator has more elements when traversing the list in the reverse direction. (In other words, returns true if previous would return an element rather than throwing an exception.)

Returns:

true if the list iterator has more elements when traversing the list in the reverse direction.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 596).

6.373.3.3 template<typename E > virtual int decaf::util::ListIterator< E >::nextIndex () const [pure virtual]

Returns the index of the element that would be returned by a subsequent call to next. (Returns list size if the list iterator is at the end of the list.)

Returns:

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 597).

6.373.3.4 template<typename E > virtual E decaf::util::ListIterator< E >::previous () [pure virtual]

Returns the previous element in the list. This method may be called repeatedly to iterate through the list backwards, or intermixed with calls to next to go back and forth. (Note that alternating calls to next and previous will return the same element repeatedly.)

Returns:

the previous element in the list.

Exceptions:

NoSuchElementException *(*p. *2260)* if the iteration has no previous element.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 597).

6.373.3.5 template<typename E > virtual int decaf::util::ListIterator< E >::previousIndex () const [pure virtual]

Returns the index of the element that would be returned by a subsequent call to previous. (Returns -1 if the list iterator is at the beginning of the list.)

Returns:

the index of the element that would be returned by a subsequent call to previous, or -1 if list iterator is at beginning of list.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 597).

6.373.3.6 template<typename E > virtual void decaf::util::ListIterator< E >::set (const E & *e*) [pure virtual]

Replaces the last element returned by next or previous with the specified element (optional operation). This call can be made only if neither **ListIterator.remove** (p. 1803) nor **ListIterator.add** (p. 1914) have been called after the last call to next or previous.

Parameters:

e The element with which to replace the last element returned by next or previous.

Exceptions:

UnsupportedOperationException if the add method is not supported by this list iterator.

IllegalArgumentException if some aspect of this element prevents it from being added to this list.

IllegalStateException if neither next nor previous have been called, or remove or add have been called after the last call to next or previous.

() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.375.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::getData

() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.375.3.3 virtual void activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::looseMa

(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3103).

6.375.3.4 virtual void activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::looseUn (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3103).

6.375.3.5 virtual int activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::tightMa (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3104).

6.375.3.6 virtual void activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::tightMa (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3104).

6.375.3.7 virtual void activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::tightUn (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 3104).

6.376 decaf::util::concurrent::Lock Class Reference

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

`#include <src/main/decaf/util/concurrent/Lock.h>`

Public Member Functions

- **Lock** (**Synchronizable** *object, const bool intiallyLocked=true)

  Constructor - initializes the object member and ***locks*** *(p. 134) the object if desired.*

- virtual ~**Lock** ()

  Destructor - Unlocks the object if it is locked.

- void **lock** ()

  Locks the object.

- void **unlock** ()

  Unlocks the object if it is already locked, otherwise a call to this method has no effect.

- bool **isLocked** () const

  Indicates whether or not the object is locked.

6.376.1 Detailed Description

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

Since:

1.0

6.376.2 Constructor & Destructor Documentation

6.376.2.1 decaf::util::concurrent::Lock::Lock (Synchronizable * *object*, const bool *intiallyLocked* = `true`)

Constructor - initializes the object member and **locks** (p. 134) the object if desired.

Parameters:

object The sync object to control

intiallyLocked If true, the object will automatically be locked.

6.376.2.2 virtual decaf::util::concurrent::Lock::~Lock () `[virtual]`

Destructor - Unlocks the object if it is locked.

6.376.3 Member Function Documentation

6.376.3.1 bool decaf::util::concurrent::Lock::isLocked () const [inline]

Indicates whether or not the object is locked.

Returns:

true if the object is locked, otherwise false.

6.376.3.2 void decaf::util::concurrent::Lock::lock ()

Locks the object.

6.376.3.3 void decaf::util::concurrent::Lock::unlock ()

Unlocks the object if it is already locked, otherwise a call to this method has no effect.

The documentation for this class was generated from the following file:

6.377 decaf::util::concurrent::locks::Lock Class Reference

Lock (p. 1926) implementations provide more extensive locking operations than can be obtained using synchronized statements.

`#include <src/main/decaf/util/concurrent/locks/Lock.h>`Inheritance diagram for decaf::util::concurrent::locks::Lock:

Public Member Functions

- virtual ~**Lock** ()
- virtual void **lock** ()=0

  Acquires the lock.

- virtual void **lockInterruptibly** ()=0

  Acquires the lock unless the current thread is interrupted.

- virtual bool **tryLock** ()=0

  Acquires the lock only if it is free at the time of invocation.

- virtual bool **tryLock** (long long time, const **TimeUnit** &unit)=0

  Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.

- virtual void **unlock** ()=0

  Releases the lock.

- virtual **Condition** * **newCondition** ()=0

  *Returns a new **Condition** (p. 1077) instance that is bound to this **Lock** (p. 1926) instance.*

- virtual std::string **toString** () const =0

6.377.1 Detailed Description

Lock (p. 1926) implementations provide more extensive locking operations than can be obtained using synchronized statements. They allow more flexible structuring, may have quite different properties, and may support multiple associated **Condition** (p. 1077) objects.

A lock is a tool for controlling access to a shared resource by multiple threads. Commonly, a lock provides exclusive access to a shared resource: only one thread at a time can acquire the lock and all access to the shared resource requires that the lock be acquired first. However, some **locks** (p. 134) may allow **concurrent** (p. 130) access to a shared resource, such as the read lock of a **ReadWriteLock** (p. 2538).

While the scoping mechanism for synchronized statements makes it much easier easier to program with monitor **locks** (p. 134), and helps avoid many common programming errors involving **locks** (p. 134), there are occasions where you need to work with **locks** (p. 134) in a more flexible way. For example, some algorithms for traversing concurrently accessed data structures require the use of "hand-over-hand" or "chain locking": you acquire the lock of node A, then node B, then release A and acquire C, then release B and acquire D and so on. Implementations of the **Lock**

(p. 1926) interface enable the use of such techniques by allowing a lock to be acquired and released in different scopes, and allowing multiple **locks** (p. 134) to be acquired and released in any order.

With this increased flexibility comes additional responsibility. The absence of block-structured locking removes the automatic release of **locks** (p. 134) that occurs with synchronized statements. In most cases, the following idiom should be used:

Lock (p. 1926) l = ...; l.lock(); try { // access the resource protected by this lock } catch(...) { l.unlock(); }

When locking and unlocking occur in different scopes, care must be taken to ensure that all **code** (p. 1005) that is executed while the lock is held is protected by try-catch ensure that the lock is released when necessary.

Lock (p. 1926) implementations provide additional functionality over the use of synchronized methods and statements by providing a non-blocking attempt to acquire a lock (**tryLock()** (p. 1930)), an attempt to acquire the lock that can be interrupted (**lockInterruptibly()** (p. 1928), and an attempt to acquire the lock that can timeout (tryLock(long, TimeUnit)).

Note that **Lock** (p. 1926) instances are just normal objects and can themselves be used as the target in a synchronized statement.

The three forms of lock acquisition (interruptible, non-interruptible, and timed) may differ in their performance characteristics, ordering guarantees, or other implementation qualities. Further, the ability to interrupt the ongoing acquisition of a lock may not be available in a given **Lock** (p. 1926) class. Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of lock acquisition, nor is it required to support interruption of an ongoing lock acquisition. An implementation is required to clearly document the semantics and guarantees provided by each of the locking methods. It must also obey the interruption semantics as defined in this interface, to the extent that interruption of lock acquisition is supported: which is either totally, or only on method entry.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since:

1.0

6.377.2 Constructor & Destructor Documentation

6.377.2.1 virtual decaf::util::concurrent::locks::Lock::~Lock () [virtual]

6.377.3 Member Function Documentation

6.377.3.1 virtual void decaf::util::concurrent::locks::Lock::lock () [pure virtual]

Acquires the lock. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired.

Implementation Considerations

A **Lock** (p. 1926) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1926) implementation.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2554).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::add(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addIfAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::clear(), decaf::util::concurrent::CopyOnWriteArrayList< E >::contains(), decaf::util::concurrent::CopyOnWriteArrayList< E >::copy(), decaf::util::concurrent::CopyOnWriteArrayList< E >::get(), decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf(), decaf::util::concurrent::CopyOnWriteArrayList< E >::isEmpty(), decaf::util::concurrent::CopyOnWriteArrayList< E >::iterator(), decaf::util::concurrent::CopyOnWriteArrayList< E >::lastIndexOf(), decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator(), decaf::util::concurrent::CopyOnWriteArrayList< E >::lock(), decaf::util::concurrent::CopyOnWriteArrayList< E >::operator=(), decaf::util::concurrent::CopyOnWriteArrayList< E >::remove(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::set(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::util::concurrent::CopyOnWriteArrayList< E >::toArray(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::toString().

6.377.3.2 virtual void decaf::util::concurrent::locks::Lock::lockInterruptibly () [pure virtual]

Acquires the lock unless the current thread is interrupted. Acquires the lock if it is available and returns immediately.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

∗ The lock is acquired by the current thread; or ∗ Some other thread interrupts the current thread, and interruption of lock acquisition is supported.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return.

A **Lock** (p. 1926) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1926) implementation.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2554).

6.377.3.3 virtual Condition* decaf::util::concurrent::locks::Lock::newCondition () [pure virtual]

Returns a new **Condition** (p. 1077) instance that is bound to this **Lock** (p. 1926) instance. Before waiting on the condition the lock must be held by the current thread. A call to **Condition.await()** (p. 1079) will atomically release the lock before waiting and re-acquire the lock before the wait returns.

Implementation Considerations

The exact operation of the **Condition** (p. 1077) instance depends on the **Lock** (p. 1926) implementation and must be documented by that implementation.

Returns:

A new **Condition** (p. 1077) instance for this **Lock** (p. 1926) instance the caller must delete the returned **Condition** (p. 1077) object when done with it.

Exceptions:

RuntimeException if an error occurs while creating the **Condition** (p. 1077).

UnsupportedOperationException if this **Lock** (p. 1926) implementation does not support conditions

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2555).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList().

6.377.3.4 virtual std::string decaf::util::concurrent::locks::Lock::toString () const [pure virtual]

Returns:

a string representation of the **Lock** (p. 1926) useful for debugging purposes.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2555).

6.377.3.5 virtual bool decaf::util::concurrent::locks::Lock::tryLock (long long *time*, const TimeUnit & *unit*) [pure virtual]

Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted. If the lock is available this method returns immediately with the value true. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread, and interruption of lock acquisition is supported; or * The specified waiting time elapses

If the lock is acquired then the value true is returned.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return, or reporting a timeout.

A **Lock** (p. 1926) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an (unchecked) exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1926) implementation.

Parameters:

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns:

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2555).

6.377.3.6 virtual bool decaf::util::concurrent::locks::Lock::tryLock () [pure virtual]

Acquires the lock only if it is free at the time of invocation. Acquires the lock if it is available and returns immediately with the value true. If the lock is not available then this method will return immediately with the value false.

A typical usage idiom for this method would be:

Lock (p. 1926) lock = ...; if (lock.tryLock()) { try { // manipulate protected state } catch(...) { lock.unlock(); } } else { // perform alternative actions }

This usage ensures that the lock is unlocked if it was acquired, and doesn't try to unlock if the lock was not acquired.

Returns:

true if the lock was acquired and false otherwise

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2556).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::tryLock().

6.377.3.7 virtual void decaf::util::concurrent::locks::Lock::unlock () [pure virtual]

Releases the lock. Implementation Considerations

A **Lock** (p. 1926) implementation will usually impose restrictions on which thread can release a lock (typically only the holder of the lock can release it) and may throw an exception if the restriction is violated. Any restrictions and the exception type must be documented by that **Lock** (p. 1926) implementation.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

IllegalMonitorStateException if the current thread is not the owner of the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2557).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::add(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addIfAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::clear(), decaf::util::concurrent::CopyOnWriteArrayList< E >::contains(), decaf::util::concurrent::CopyOnWriteArrayList< E >::copy(), decaf::util::concurrent::CopyOnWriteArrayList< E >::get(), decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf(), decaf::util::concurrent::CopyOnWriteArrayList< E >::isEmpty(), decaf::util::concurrent::CopyOnWriteArrayList< E >::iterator(), decaf::util::concurrent::CopyOnWriteArrayList< E >::lastIndexOf(), decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator(), decaf::util::concurrent::CopyOnWriteArrayList< E >::operator=(), decaf::util::concurrent::CopyOnWriteArrayList< E >::remove(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::set(), decaf::util::concurrent::CopyOnWriteArrayList< E >::size(), decaf::util::concurrent::CopyOnWriteArrayList< E >::toArray(), decaf::util::concurrent::CopyOnWriteArrayList< E >::toString(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::unlock().

6.378 decaf::util::concurrent::locks::LockSupport Class Reference

Basic thread blocking primitives for creating **locks** (p. 134) and other synchronization classes.

`#include <src/main/decaf/util/concurrent/locks/LockSupport.h>`

Public Member Functions

- ~**LockSupport** ()

Static Public Member Functions

- static void **unpark** (**decaf::lang::Thread** *thread)

  Makes available the permit for the given thread, if it was not already available.

- static void **park** ()

  Disables the current thread for thread scheduling purposes unless the permit is available.

- static void **parkNanos** (long long nanos)

  Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available.

- static void **parkUntil** (long long deadline)

  Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available.

6.378.1 Detailed Description

Basic thread blocking primitives for creating **locks** (p. 134) and other synchronization classes. This class associates, with each thread that uses it, a permit (in the sense of the **Semaphore** (p. 2648) class). A call to park will return immediately if the permit is available, consuming it in the process; otherwise it may block. A call to unpark makes the permit available, if it was not already available. (Unlike with Semaphores though, permits do not accumulate. There is at most one.)

Methods park and unpark provide efficient means of blocking and unblocking threads Races between one thread invoking park and another thread trying to unpark it will preserve liveness, due to the permit. Additionally, park will return if the caller's thread was interrupted, and timeout versions are supported. The park method may also return at any other time, for "no reason", so in general must be invoked within a loop that rechecks conditions upon return. In this sense park serves as an optimization of a "busy wait" that does not waste as much time spinning, but must be paired with an unpark to be effective.

These methods are designed to be used as tools for creating higher-level synchronization utilities, and are not in themselves useful for most concurrency control applications. The park method is designed for use only in constructions of the form:

while (!canProceed()) { ... LockSupport.park(this); }

where neither canProceed nor any other actions prior to the call to park entail locking or blocking. Because only one permit is associated with each thread, any intermediary uses of park could interfere with its intended effects.

Sample Usage. Here is a sketch of a first-in-first-out non-reentrant lock class:

class FIFOMutex { private:

AtomicBoolean locked; ConcurrentLinkedQueue<Thread*> waiters;

public:

void lock() {

bool wasInterrupted = false; Thread* current = Thread::currentThread(); waiters.add(current);

// Block while not first in queue or cannot acquire lock while(waiters.peek() != current || !locked.compareAndSet(false, true)) {

LockSupport.park(this); if(Thread::interrupted()) // ignore interrupts while waiting wasInterrupted = true; }

waiters.remove(); if(wasInterrupted) // reassert interrupt status on exit current.interrupt(); }

void unlock() { locked.set(false); **LockSupport.unpark** (p. 1934)(waiters.peek()); } };

6.378.2 Constructor & Destructor Documentation

6.378.2.1 decaf::util::concurrent::locks::LockSupport::~LockSupport ()

6.378.3 Member Function Documentation

6.378.3.1 static void decaf::util::concurrent::locks::LockSupport::park () [static]

Disables the current thread for thread scheduling purposes unless the permit is available. If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* Some other thread invokes unpark with the current thread as the target; or * Some other thread interrupts the current thread; or * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread upon return.

6.378.3.2 static void decaf::util::concurrent::locks::LockSupport::parkNanos (long long *nanos*) [static]

Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available. If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

* Some other thread invokes unpark with the current thread as the target; or * Some other thread

interrupts the current thread; or * The specified waiting time elapses; or * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the elapsed time upon return.

Parameters:

nanos the maximum number of nanoseconds to wait

6.378.3.3 static void decaf::util::concurrent::locks::LockSupport::parkUntil (long long *deadline*) [static]

Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available. If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

* Some other thread invokes unpark with the current thread as the target; or * Some other thread interrupts the current thread; or * The specified deadline passes; or * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the current time upon return.

Parameters:

deadline the absolute time, in milliseconds from the Epoch, to wait until

6.378.3.4 static void decaf::util::concurrent::locks::LockSupport::unpark (decaf::lang::Thread * *thread*) [static]

Makes available the permit for the given thread, if it was not already available. If the thread was blocked on park then it will unblock. Otherwise, its next call to park is guaranteed not to block. This operation is not guaranteed to have any effect at all if the given thread has not been started.

Parameters:

thread the thread to unport, or NULL in which case the method has no effect.

The documentation for this class was generated from the following file:

Public Member Functions

- virtual ~**Logger** ()
- const std::string & **getName** () const

  *Gets the name of this **Logger** (p. 1935).*

- **Logger** * **getParent** () const

  *Gets the parent of this **Logger** (p. 1935) which will be the nearest existing **Logger** (p. 1935) in this Loggers namespace.*

- void **setParent** (**Logger** *parent)

  ***Set** (p. 2715) the parent for this **Logger** (p. 1935).*

- void **addHandler** (**Handler** *handler)

  *Add a log **Handler** (p. 1590) to receive **logging** (p. 135) messages.*

- void **removeHandler** (**Handler** *handler)

  *Removes the specified **Handler** (p. 1590) from this logger, ownership of the **Handler** (p. 1590) pointer is returned to the caller.*

- const std::list< **Handler** * > & **getHandlers** () const

  Gets a vector containing all the handlers that this class has been assigned to use.

- void **setFilter** (**Filter** *filter)

  ***Set** (p. 2715) a filter to control output on this **Logger** (p. 1935).*

- const **Filter** * **getFilter** () const

  *Gets the **Filter** (p. 1520) object that this class is using.*

- **Level** **getLevel** () const

  *Get the log **Level** (p. 1859) that has been specified for this **Logger** (p. 1935).*

- void **setLevel** (const **Level** &level)

  ***Set** (p. 2715) the log level specifying which message levels will be logged by this logger.*

- bool **getUseParentHandlers** () const

  Discover whether or not this logger is sending its output to its parent logger.

- void **setUseParentHandlers** (bool value)

  *Specify whether or not this logger should send its output to it's parent **Logger** (p. 1935).*

- virtual void **entering** (const std::string &blockName, const std::string &file, const int line)

  Logs an Block Enter message.

- virtual void **exiting** (const std::string &blockName, const std::string &file, const int line)

  Logs an Block Exit message.

- virtual void **severe** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a SEVERE ***Level*** *(*p. *1859)* *Log.*

- virtual void **warning** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a WARN ***Level*** *(*p. *1859)* *Log.*

- virtual void **info** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a INFO ***Level*** *(*p. *1859)* *Log.*

- virtual void **debug** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a DEBUG ***Level*** *(*p. *1859)* *Log.*

- virtual void **config** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a CONFIG ***Level*** *(*p. *1859)* *Log.*

- virtual void **fine** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a FINE ***Level*** *(*p. *1859)* *Log.*

- virtual void **finer** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a FINER ***Level*** *(*p. *1859)* *Log.*

- virtual void **finest** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a FINEST ***Level*** *(*p. *1859)* *Log.*

- virtual void **throwing** (const std::string &file, const int line, const std::string functionName, const **decaf::lang::Throwable** &thrown)

  Log throwing an exception.

- virtual bool **isLoggable** (const **Level** &level) const

  Check if a message of the given level would actually be logged by this logger.

- virtual void **log** (**LogRecord** &record)

  Log a ***LogRecord*** *(*p. *1960)**.*

- virtual void **log** (const **Level** &level, const std::string &message)

  Log a message, with no arguments.

- virtual void **log** (const **Level** &levels, const std::string &file, const int line, const std::string &message,...)

  Log a message, with the list of params that is formatted into the message string.

- virtual void **log** (const **Level** &level, const std::string &file, const int line, const std::string &message, **lang::Exception** &ex)

  Log a message, with associated Throwable information.

Static Public Member Functions

  *Creates a new instance of the **Logger** (p. 1935) with the given name.*

6.379.1 Detailed Description

A **Logger** (p. 1935) object is used to log messages for a specific system or application component. Loggers are normally named, using a hierarchical dot-separated namespace. **Logger** (p. 1935) names can be arbitrary strings, but they should normally be based on the namespace or class name of the logged component, such as **decaf.net** (p. 117) or org.apache.decaf. In addition it is possible to create "anonymous" Loggers that are not stored in the **Logger** (p. 1935) namespace.

Logger (p. 1935) objects may be obtained by calls on one of the getLogger factory methods. These will either create a new **Logger** (p. 1935) or return a suitable existing **Logger** (p. 1935).

Logging messages will be forwarded to registered **Handler** (p. 1590) objects, which can forward the messages to a variety of destinations, including consoles, files, OS logs, etc.

Each **Logger** (p. 1935) keeps track of a "parent" **Logger** (p. 1935), which is its nearest existing ancestor in the **Logger** (p. 1935) namespace.

Each **Logger** (p. 1935) has a "Level" associated with it. This reflects a minimum **Level** (p. 1859) that this logger cares about. If a Logger's level is set to **Level::INHERIT** (p. 1863), then its effective level is inherited from its parent, which may in turn obtain it recursively from its parent, and so on up the tree.

The log level can be configured based on the properties from the **logging** (p. 135) configuration file, as described in the description of the **LogManager** (p. 1954) class. However it may also be dynamically changed by calls on the **Logger.setLevel** (p. 1944) method. If a logger's level is changed the change may also affect child loggers, since any child logger that has 'inherit' as its level will inherit its effective level from its parent.

On each **logging** (p. 135) call the **Logger** (p. 1935) initially performs a cheap check of the request level (e.g. SEVERE or FINE) against the effective log level of the logger. If the request level is lower than the log level, the **logging** (p. 135) call returns immediately.

After passing this initial (cheap) test, the **Logger** (p. 1935) will allocate a **LogRecord** (p. 1960) to describe the **logging** (p. 135) message. It will then call a **Filter** (p. 1520) (if present) to do a

more detailed check on whether the record should be published. If that passes it will then publish the **LogRecord** (p. 1960) to its output Handlers. By default, loggers also publish to their parent's Handlers, recursively up the tree.

Formatting is the responsibility of the output **Handler** (p. 1590), which will typically call a **Formatter** (p. 1569).

Note that formatting need not occur synchronously. It may be delayed until a **LogRecord** (p. 1960) is actually written to an external sink.

All methods on **Logger** (p. 1935) are thread safe.

Since:

1.0

6.379.2 Constructor & Destructor Documentation

6.379.2.1 decaf::util::logging::Logger::Logger (const std::string & *name*) [protected]

Creates a new instance of the **Logger** (p. 1935) with the given name. The logger will be initially configured with a null **Level** (p. 1859) and with useParentHandlers true.

Parameters:

name A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as **decaf.net** (p. 117) or org.apache.decaf. It may be empty for anonymous Loggers.

6.379.2.2 virtual decaf::util::logging::Logger::~Logger () [virtual]

6.379.3 Member Function Documentation

6.379.3.1 void decaf::util::logging::Logger::addHandler (Handler * *handler*)

Add a log **Handler** (p. 1590) to receive **logging** (p. 135) messages. By default, Loggers also send their output to their parent logger. Typically the root **Logger** (p. 1935) is configured with a set of Handlers that essentially act as default handlers for all loggers.

The ownership of the given **Handler** (p. 1590) is passed to the **Logger** (p. 1935) and the **Handler** (p. 1590) will be deleted when this **Logger** (p. 1935) is destroyed unless the caller first calls removeHandler with the same pointer value as was originally given.

Parameters:

handler A Logging **Handler** (p. 1590)

Exceptions:

NullPointerException if the **Handler** (p. 1590) given is NULL.

6.379.3.2 virtual void decaf::util::logging::Logger::config (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a CONFIG **Level** (p. 1859) Log. If the logger is currently enabled for the CONFIG message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects.

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 1859).

6.379.3.3 virtual void decaf::util::logging::Logger::debug (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a DEBUG **Level** (p. 1859) Log. If the logger is currently enabled for the DEBUG message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects.

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 1859).

6.379.3.4 virtual void decaf::util::logging::Logger::entering (const std::string & *blockName*, const std::string & *file*, const int *line*) [virtual]

Logs an Block Enter message. This is a convenience method that is used to tag a block enter, a log record with the given information is logged at the **Level::FINER** (p. 1862) log level.

Parameters:

blockName The source block name, (usually ClassName::MethodName, or MethodName).

file The source file name where this method was called from.

line The source line number where this method was called from.

6.379.3.5 virtual void decaf::util::logging::Logger::exiting (const std::string & *blockName*, const std::string & *file*, const int *line*) [virtual]

Logs an Block Exit message. This is a convenience method that is used to tag a block enter, a log record with the given information is logged at the **Level::FINER** (p. 1862) log level.

Parameters:

blockName The source block name, (usually ClassName::MethodName, or MethodName).

file The source file name where this method was called from.

line The source line number where this method was called from.

6.379.3.6 virtual void decaf::util::logging::Logger::fine (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a FINE **Level** (p. 1859) Log. If the logger is currently enabled for the FINE message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects.

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 1859).

6.379.3.7 virtual void decaf::util::logging::Logger::finer (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a FINER **Level** (p. 1859) Log. If the logger is currently enabled for the FINER message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects.

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 1859).

6.379.3.8 virtual void decaf::util::logging::Logger::finest (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a FINEST **Level** (p. 1859) Log. If the logger is currently enabled for the FINEST message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects.

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 1859).

6.379.3.9 static Logger* decaf::util::logging::Logger::getAnonymousLogger () [static]

Creates an anonymous logger. The newly created **Logger** (p. 1935) is not registered in the **LogManager** (p. 1954) namespace. There will be no access checks on updates to the logger. Even although the new logger is anonymous, it is configured to have the root logger ("") as its parent. This means that by default it inherits its effective level and handlers from the root logger.

The caller is responsible for destroying the returned logger.

Returns:

Newly created anonymous logger

6.379.3.10 const Filter* decaf::util::logging::Logger::getFilter () const [inline]

Gets the **Filter** (p. 1520) object that this class is using.

Returns:

the **Filter** (p. 1520) in use, (can be NULL).

6.379.3.11 const std::list<Handler*>& decaf::util::logging::Logger::getHandlers () const

Gets a vector containing all the handlers that this class has been assigned to use.

Returns:

a list of handlers that are used by this logger

6.379.3.12 Level decaf::util::logging::Logger::getLevel () const [inline]

Get the log **Level** (p. 1859) that has been specified for this **Logger** (p. 1935). The result may be the INHERIT level, which means that this logger's effective level will be inherited from its parent.

Returns:

the level that is currently set

6.379.3.13 static Logger* decaf::util::logging::Logger::getLogger (const std::string & *name*) [static]

Find or create a logger for a named subsystem. If a logger has already been created with the given name it is returned. Otherwise a new logger is created.

If a new logger is created its log level will be configured based on the **LogManager** (p. 1954) and it will configured to also send **logging** (p. 135) output to its parent loggers Handlers. It will be registered in the **LogManager** (p. 1954) global namespace.

Parameters:

name - A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as **cms** (p. 91) or **activemq.core.ActiveMQConnection** (p. 232)

Returns:

a suitable logger.

6.379.3.14 const std::string& decaf::util::logging::Logger::getName () const [inline]

Gets the name of this **Logger** (p. 1935).

Returns:

logger name

6.379.3.15 Logger* decaf::util::logging::Logger::getParent () const [inline]

Gets the parent of this **Logger** (p. 1935) which will be the nearest existing **Logger** (p. 1935) in this Loggers namespace. If this is the Root **Logger** (p. 1935) than this method returns NULL.

Returns:

Pointer to this Loggers nearest parent **Logger** (p. 1935).

6.379.3.16 bool decaf::util::logging::Logger::getUseParentHandlers () const [inline]

Discover whether or not this logger is sending its output to its parent logger.

Returns:

true if using Parent Handlers

6.379.3.17 virtual void decaf::util::logging::Logger::info (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a INFO **Level** (p. 1859) Log. If the logger is currently enabled for the INFO message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects.

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 1859).

6.379.3.18 virtual bool decaf::util::logging::Logger::isLoggable (const Level & *level*) const [virtual]

Check if a message of the given level would actually be logged by this logger. This check is based on the Loggers effective level, which may be inherited from its parent.

Parameters:

level - a message **logging** (p. 135) level

Returns:

true if the given message level is currently being logged.

6.379.3.19 virtual void decaf::util::logging::Logger::log (const Level & *level*, const std::string & *file*, const int *line*, const std::string & *message*, lang::Exception & *ex*) [virtual]

Log a message, with associated Throwable information. If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p. 1960) which is forwarded to all registered output handlers. Note that the thrown argument is stored in the **LogRecord** (p. 1960) thrown property, rather than the **LogRecord** (p. 1960) parameters property. Thus is it processed specially by output Formatters and is not treated as a formatting parameter to the **LogRecord** (p. 1960) message property.

Parameters:

level the **Level** (p. 1859) to log at.

file File that the message was logged in.

line the line number where the message was logged at.

message the message to log.

ex the Exception to log

6.379.3.20 virtual void decaf::util::logging::Logger::log (const Level & *levels*, const std::string & *file*, const int *line*, const std::string & *message*, ...) [virtual]

Log a message, with the list of params that is formatted into the message string. If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects

Parameters:

level the **Level** (p. 1859) to log at

file the message to log

line the line in the file

... variable length argument to format the message string.

6.379.3.21 virtual void decaf::util::logging::Logger::log (const Level & *level*, const std::string & *message*) [virtual]

Log a message, with no arguments. If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects

Parameters:

level the **Level** (p. 1859) to log at

message the message to log

6.379.3.22 virtual void decaf::util::logging::Logger::log (LogRecord & *record*) [virtual]

Log a **LogRecord** (p. 1960). All the other **logging** (p. 135) methods in this class call through this method to actually perform any **logging** (p. 135). Subclasses can override this single method to capture all log activity.

Parameters:

record - the **LogRecord** (p. 1960) to be published

6.379.3.23 void decaf::util::logging::Logger::removeHandler (Handler * *handler*)

Removes the specified **Handler** (p. 1590) from this logger, ownership of the **Handler** (p. 1590) pointer is returned to the caller. Returns silently if the given **Handler** (p. 1590) is not found.

Parameters:

handler The **Handler** (p. 1590) to remove

6.379.3.24 void decaf::util::logging::Logger::setFilter (Filter * *filter*)

Set (p. 2715) a filter to control output on this **Logger** (p. 1935). After passing the initial "level" check, the **Logger** (p. 1935) will call this **Filter** (p. 1520) to check if a log record should really be published.

The caller releases ownership of this filter to this logger

Parameters:

filter The **Filter** (p. 1520) to use, (can be NULL).

6.379.3.25 void decaf::util::logging::Logger::setLevel (const Level & *level*) [inline]

Set (p. 2715) the log level specifying which message levels will be logged by this logger. Message levels lower than this value will be discarded. The level value **Level::OFF** (p. 1863) can be used to turn off **logging** (p. 135).

If the new level is the INHERIT **Level** (p. 1859), it means that this node should inherit its level from its nearest ancestor with a specific (non-INHERIT) level value.

Parameters:

level The new **Level** (p. 1859) value to use when **logging** (p. 135).

6.379.3.26 void decaf::util::logging::Logger::setParent (Logger * *parent*) [inline]

Set (p. 2715) the parent for this **Logger** (p. 1935). This method is used by the **LogManager** (p. 1954) to update a **Logger** (p. 1935) when the namespace changes.

It should not be called from application **code** (p. 1005).

6.379.3.27 void decaf::util::logging::Logger::setUseParentHandlers (bool *value*) [inline]

Specify whether or not this logger should send its output to it's parent **Logger** (p. 1935). This means that any LogRecords will also be written to the parent's Handlers, and potentially to its parent, recursively up the namespace.

Parameters:

value True is output is to be written to the parent

6.379.3.28 virtual void decaf::util::logging::Logger::severe (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a SEVERE **Level** (p. 1859) Log. If the logger is currently enabled for the SEVERE message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects.

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 1859).

6.379.3.29 virtual void decaf::util::logging::Logger::throwing (const std::string & *file*, const int *line*, const std::string *functionName*, const decaf::lang::Throwable & *thrown*) [virtual]

Log throwing an exception. This is a convenience method to log that a method is terminating by throwing an exception. The **logging** (p. 135) is done using the FINER level.

If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p. 1960) which is forwarded to all registered output handlers. The LogRecord's message is set to "THROW".

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

thrown The Throwable that will be thrown, will be cloned.

6.379.3.30 virtual void decaf::util::logging::Logger::warning (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a WARN **Level** (p. 1859) Log. If the logger is currently enabled for the WARN message level then the given message is forwarded to all the registered output **Handler** (p. 1590) objects.

Parameters:

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 1859).

A **transport** (p. 72) filter that logs **commands** (p. 61) as they are sent/received.

`#include <src/main/activemq/transport/logging/LoggingTransport.h>`Inheritance diagram for activemq::transport::logging::LoggingTransport:

Public Member Functions

- **LoggingTransport** (const **Pointer**< **Transport** > **next**)
  Constructor.
- virtual ~**LoggingTransport** ()
- virtual void **onCommand** (const **Pointer**< **Command** > command)
  Event handler for the receipt of a command.
- virtual void **oneway** (const **Pointer**< **Command** > command)
  Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > command)
  Sends the given command to the broker and then waits for the response.
  Parameters:
  command *the command to be sent.*
  Returns:
  the response from the broker.
  Exceptions:
  IOException *if an exception occurs during the read of the command.*
  UnsupportedOperationException *if this method is not implemented by this* ***transport*** *(p. 72).*
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > command, unsigned int timeout)
  Sends the given command to the broker and then waits for the response.
  Parameters:
  command *The command to be sent.*
  timeout *The time to wait for this response.*
  Returns:
  the response from the broker.
  Exceptions:
  IOException *if an exception occurs during the read of the command.*
  UnsupportedOperationException *if this method is not implemented by this* ***transport*** *(p. 72).*

6.383.1 Detailed Description

A **transport** (p. 72) filter that logs **commands** (p. 61) as they are sent/received.

6.383.2 Constructor & Destructor Documentation

6.383.2.1 activemq::transport::logging::LoggingTransport::LoggingTransport (const Pointer< Transport > *next*)

Constructor.

Parameters:

next - the next **Transport** (p. 3125) in the chain

6.383.2.2 virtual activemq::transport::logging::LoggingTransport::~LoggingTransport () [inline, virtual]

6.383.3 Member Function Documentation

6.383.3.1 virtual void activemq::transport::logging::LoggingTransport::onCommand (const Pointer< Command > *command*) [virtual]

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Reimplemented from **activemq::transport::TransportFilter** (p. 3141).

6.383.3.2 virtual void activemq::transport::logging::LoggingTransport::oneway (const Pointer< Command > *command*) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3141).

6.383.3.3 virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > *command*, unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command The command to be sent.

timeout The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Not supported by this class - throws an exception.

Reimplemented from **activemq::transport::TransportFilter** (p. 3142).

6.383.3.4 virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Not supported by this class - throws an exception.

Reimplemented from **activemq::transport::TransportFilter** (p. 3143).

The documentation for this class was generated from the following file:

6.384.1 Detailed Description

There is a single global **LogManager** (p. 1954) object that is used to maintain a set of shared state about Loggers and log services. This **LogManager** (p. 1954) object:

* Manages a hierarchical namespace of **Logger** (p. 1935) objects. All named Loggers are stored in this namespace. * Manages a set of **logging** (p. 135) control properties. These are simple key-value pairs that can be used by Handlers and other **logging** (p. 135) objects to configure themselves.

The global **LogManager** (p. 1954) object can be retrieved using **LogManager::getLogManager()** (p. 1958). The **LogManager** (p. 1954) object is created during class initialization and cannot subsequently be changed.

TODO* By default, the **LogManager** (p. 1954) reads its initial configuration from a properties file "lib/logging.properties" in the JRE directory. If you edit that property file you can change the default **logging** (p. 135) configuration for all uses of that JRE.

In addition, the **LogManager** (p. 1954) uses two optional system properties that allow more control over reading the initial configuration:

* "decaf.logger.config.class" * "decaf.logger.config.file"

These two properties may be set via the Preferences API, or as command line property definitions to the "java" command, or as system property definitions passed to JNI_CreateJavaVM.

If the "java.util.logging.config.class" property is set, then the property value is treated as a class name. The given class will be loaded, an object will be instantiated, and that object's constructor is responsible for reading in the initial configuration. (That object may use other system properties to control its configuration.) The alternate configuration class can use readConfiguration(InputStream) to define properties in the **LogManager** (p. 1954).

If "decaf.util.logging.config.class" property is not set, then the "decaf.util.logging.config.file" system property can be used to specify a properties file (in **decaf.util.Properties** (p. 2486) format). The initial **logging** (p. 135) configuration will be read from this file.

If neither of these properties is defined then, as described above, the **LogManager** (p. 1954) will read its initial configuration from a properties file "lib/logging.properties" in the working directory.

The properties for loggers and Handlers will have names starting with the dot-separated name for the handler or logger. ***TODO****

The global **logging** (p. 135) properties may include:

* A property "handlers". This defines a whitespace separated list of class names for handler classes to load and register as handlers on the root **Logger** (p. 1935) (the **Logger** (p. 1935) named ""). Each class name must be for a **Handler** (p. 1590) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.handlers". This defines a whitespace or comma separated list of class names for handlers classes to load and register as handlers to the specified logger. Each class name must be for a **Handler** (p. 1590) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.useParentHandlers". This defines a boolean value. By default every logger calls its parent in addition to handling the **logging** (p. 135) message itself, this often result in messages being handled by the root logger as well. When setting this property to false a **Handler** (p. 1590) needs to be configured for this logger otherwise no **logging** (p. 135) messages are delivered. * A property "config". This property is intended to allow arbitrary configuration **code** (p. 1005) to be run. The property defines a whitespace separated list of class names. A new instance will be created for each named class. The default constructor of each class may execute arbitrary **code** (p. 1005) to update the **logging** (p. 135) configuration, such as setting logger levels, adding handlers, adding filters, etc.

Loggers are organized into a naming hierarchy based on their dot separated names. Thus "a.b.c" is a child of "a.b", but "a.b1" and a.b2 are peers.

All properties whose names end with ".level" are assumed to define log levels for Loggers. Thus "foo.level" defines a log level for the logger called "foo" and (recursively) for any of its children in the naming hierarchy. Log Levels are applied in the order they are defined in the properties file. Thus level settings for child nodes in the tree should come after settings for their parents. The property name ".level" can be used to set the level for the root of the tree.

All methods on the **LogManager** (p. 1954) object are multi-thread safe.

Since:

1.0

6.384.2 Constructor & Destructor Documentation

6.384.2.1 virtual decaf::util::logging::LogManager::~LogManager () [virtual]

6.384.2.2 decaf::util::logging::LogManager::LogManager () [protected]

Constructor, hidden to protect against direct instantiation.

6.384.2.3 decaf::util::logging::LogManager::LogManager (const LogManager & *manager*) [protected]

Copy Constructor.

Parameters:

manager the Manager to copy

6.384.3 Member Function Documentation

6.384.3.1 bool decaf::util::logging::LogManager::addLogger (Logger * *logger*)

Add a named logger. This does nothing and returns false if a logger with the same name is already registered.

The **Logger** (p. 1935) factory methods call this method to register each newly created **Logger** (p. 1935).

Parameters:

logger The new **Logger** (p. 1935) instance to add to this **LogManager** (p. 1954).

Exceptions:

NullPointerException if logger is NULL.

IllegalArgumentException if the logger has no name.

6.384.3.2 void decaf::util::logging::LogManager::addPropertyChangeListener (PropertyChangeListener * *listener*)

Adds a change listener for **LogManager** (p. 1954) **Properties** (p. 2486), adding the same instance of a change event listener does nothing.

Parameters:

listener The PropertyChangeListener to add (can be NULL).

6.384.3.3 Logger* decaf::util::logging::LogManager::getLogger (const std::string & *name*)

Retrieves or creates a new **Logger** (p. 1935) using the name specified a new logger inherits the configuration of the logger's parent if there is no configuration data for the logger.

Parameters:

name The name of the **Logger** (p. 1935).

6.384.3.4 int decaf::util::logging::LogManager::getLoggerNames (const std::vector< std::string > & *names*)

Gets a list of known **Logger** (p. 1935) Names from this Manager, new loggers added while this method is in progress are not garunteed to be in the list.

Parameters:

names STL Vector to hold string logger names.

Returns:

names count of how many loggers were inserted.

6.384.3.5 static LogManager& decaf::util::logging::LogManager::getLogManager () [static]

Get the global **LogManager** (p. 1954) instance.

Returns:

A reference to the global **LogManager** (p. 1954) instance.

6.384.3.6 const util::Properties& decaf::util::logging::LogManager::getProperties () const [inline]

Gets a reference to the Logging **Properties** (p. 2486) used by this logger.

Returns:

The **Logger** (p. 1935) **Properties** (p. 2486) Pointer

6.384.3.7 std::string decaf::util::logging::LogManager::getProperty (const std::string & *name*)

Gets the value of a named property of this **LogManager** (p. 1954).

Parameters:

name The name of the Property to retrieve.

Returns:

the value of the property

6.384.3.8 void decaf::util::logging::LogManager::operator= (const LogManager & *manager*) [protected]

Assignment operator.

Parameters:

manager the manager to assign from

6.384.3.9 void decaf::util::logging::LogManager::readConfiguration (decaf::io::InputStream * *stream*)

Reinitialize the **logging** (p. 135) properties and reread the **logging** (p. 135) configuration from the given stream, which should be in **decaf.util.Properties** (p. 2486) format. A PropertyChangeEvent will be fired after the properties are read.

Any log level definitions in the new configuration file will be applied using **Logger.setLevel()** (p. 1944), if the target **Logger** (p. 1935) exists.

Parameters:

stream The InputStream to read the **Properties** (p. 2486) from.

Exceptions:

NullPointerException if stream is NULL.

IOException if an I/O error occurs.

6.384.3.10 void decaf::util::logging::LogManager::readConfiguration ()

Reinitialize the **logging** (p. 135) properties and reread the **logging** (p. 135) configuration. The same rules are used for locating the configuration properties as are used at startup. So normally the **logging** (p. 135) properties will be re-read from the same file that was used at startup.

Any log level definitions in the new configuration file will be applied using **Logger.setLevel()** (p. 1944), if the target **Logger** (p. 1935) exists.

A PropertyChangeEvent will be fired after the properties are read.

Exceptions:

IOException if an I/O error occurs.

6.384.3.11 void decaf::util::logging::LogManager::removePropertyChangeListener (PropertyChangeListener * *listener*)

Removes a properties change listener from the **LogManager** (p. 1954), if the listener is not found of the param is NULL this method returns silently.

Parameters:

listener The PropertyChangeListener to remove from the listeners set.

6.384.3.12 void decaf::util::logging::LogManager::reset ()

Reset the **logging** (p. 135) configuration. For all named loggers, the reset operation removes and closes all Handlers and (except for the root logger) sets the level to INHERIT. The root logger's level is set to **Level::INFO** (p. 1863).

6.384.3.13 void decaf::util::logging::LogManager::setProperties (const util::Properties & *properties*)

Sets the **Properties** (p. 2486) this **LogManager** (p. 1954) should use to configure its loggers. Once set a properties change event is fired.

Parameters:

properties Pointer to read the configuration from

6.384.4 Friends And Related Function Documentation

6.384.4.1 friend class decaf::lang::Runtime [friend]

  Gets any Throwable associated with this ***LogRecord*** *(p. 1960).*
- void **setThrown** (**decaf::lang::Throwable** *thrown)
  Sets the Throwable associated with this ***LogRecord*** *(p. 1960), the pointer becomes the property of this instance of the* ***LogRecord*** *(p. 1960) and will be deleted when the record is destroyed.*

6.385.1 Detailed Description

LogRecord (p. 1960) objects are used to pass **logging** (p. 135) requests between the **logging** (p. 135) framework and individual log Handlers. When a **LogRecord** (p. 1960) is passed into the **logging** (p. 135) framework it logically belongs to the framework and should no longer be used or updated by the client application.

Since:

1.0

6.385.2 Constructor & Destructor Documentation

6.385.2.1 decaf::util::logging::LogRecord::LogRecord ()

6.385.2.2 virtual decaf::util::logging::LogRecord::~LogRecord () [virtual]

6.385.3 Member Function Documentation

6.385.3.1 Level decaf::util::logging::LogRecord::getLevel () const [inline]

Get **Level** (p. 1859) of this log record.

Returns:

Level (p. 1859) enumeration value.

6.385.3.2 const std::string& decaf::util::logging::LogRecord::getLoggerName () const [inline]

Gets the Source Logger's Name.

Returns:

the source loggers name

6.385.3.3 const std::string& decaf::util::logging::LogRecord::getMessage () const [inline]

Gets the Message to be Logged.

Returns:

the source logger's message

6.385.3.4 const std::string& decaf::util::logging::LogRecord::getSourceFile () const [inline]

Gets the Source Log File name.

Returns:

the source loggers name

6.385.3.5 const std::string& decaf::util::logging::LogRecord::getSourceFunction () const [inline]

Gets the name of the function where this log was logged.

Returns:

the source logger's message

6.385.3.6 unsigned int decaf::util::logging::LogRecord::getSourceLine () const [inline]

Gets the Source Log line number.

Returns:

the source loggers line number

6.385.3.7 decaf::lang::Throwable* decaf::util::logging::LogRecord::getThrown () const [inline]

Gets any Throwable associated with this **LogRecord** (p. 1960).

Returns:

point to a Throwable instance or Null.

6.385.3.8 long long decaf::util::logging::LogRecord::getTimestamp () const [inline]

Gets the time in mills that this message was logged.

Returns:

UTC time in milliseconds

6.385.3.9 long long decaf::util::logging::LogRecord::getTreadId () const [inline]

Gets the Thread Id where this Log was created.

Returns:

the source loggers line number

6.385.3.10 void decaf::util::logging::LogRecord::setLevel (Level *value*) [inline]

Set (p. 2715) the **Level** (p. 1859) of this Log Record.

Parameters:

value **Level** (p. 1859) Enumeration Value

6.385.3.11 void decaf::util::logging::LogRecord::setLoggerName (const std::string & *loggerName*) [inline]

Sets the Source Logger's Name.

Parameters:

loggerName the source loggers name

6.385.3.12 void decaf::util::logging::LogRecord::setMessage (const std::string & *message*) [inline]

Sets the Message to be Logged.

Parameters:

message the source loggers message

6.385.3.13 void decaf::util::logging::LogRecord::setSourceFile (const std::string & *sourceFile*) [inline]

Sets the Source Log File Name.

Parameters:

sourceFile the source loggers name

6.385.3.14 void decaf::util::logging::LogRecord::setSourceFunction (const std::string & *functionName*) [inline]

Sets the name of the function where this log was logged.

Parameters:

functionName the source of the log

6.385.3.15 void decaf::util::logging::LogRecord::setSourceLine (unsigned int *sourceLine*) [inline]

Sets the Source Log line number.

Parameters:

sourceLine the source logger's line number

6.385.3.16 void decaf::util::logging::LogRecord::setThrown (decaf::lang::Throwable * *thrown*) [inline]

Sets the Throwable associated with this **LogRecord** (p. 1960), the pointer becomes the property of this instance of the **LogRecord** (p. 1960) and will be deleted when the record is destroyed.

Parameters:

thrown A pointer to a Throwable that will be associated with this record.

6.385.3.17 void decaf::util::logging::LogRecord::setTimestamp (long long *timeStamp*) [inline]

Sets the time in mills that this message was logged.

Parameters:

timeStamp UTC Time in Milliseconds.

6.385.3.18 void decaf::util::logging::LogRecord::setTreadId (long long *threadId*) [inline]

Sets the Thread Id where this Log was created.

Parameters:

threadId the source logger's line number

The documentation for this class was generated from the following file:

6.386 decaf::util::logging::LogWriter Class Reference

`#include <src/main/decaf/util/logging/LogWriter.h>`

Public Member Functions

- **LogWriter** ()
- virtual ~**LogWriter** ()
- virtual void **log** (const std::string &file, const int line, const std::string &prefix, const std::string &message)

  Writes a message to the output destination.

- virtual void **log** (const std::string &message)

  Writes a message to the output destination.

Static Public Member Functions

- static **LogWriter** & **getInstance** ()

  Get the singleton instance.

- static void **returnInstance** ()

  Returns a Checked out instance of this Writer.

- static void **destroy** ()

  *Forcefully Delete the Instance of this **LogWriter** (p. 1965) even if there are outstanding references.*

6.386.1 Constructor & Destructor Documentation

6.386.1.1 decaf::util::logging::LogWriter::LogWriter ()

6.386.1.2 virtual decaf::util::logging::LogWriter::~LogWriter () [virtual]

6.386.2 Member Function Documentation

6.386.2.1 static void decaf::util::logging::LogWriter::destroy () [static]

Forcefully Delete the Instance of this **LogWriter** (p. 1965) even if there are outstanding references.

6.386.2.2 static LogWriter& decaf::util::logging::LogWriter::getInstance () [static]

Get the singleton instance.

6.386.2.3 virtual void decaf::util::logging::LogWriter::log (const std::string & *message*) [virtual]

Writes a message to the output destination.

Parameters:

message

6.386.2.4 virtual void decaf::util::logging::LogWriter::log (const std::string & *file*, const int *line*, const std::string & *prefix*, const std::string & *message*) [virtual]

Writes a message to the output destination.

Parameters:

file

line

prefix

message

6.386.2.5 static void decaf::util::logging::LogWriter::returnInstance () [static]

Returns a Checked out instance of this Writer.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**LogWriter.h**

6.387 decaf::lang::Long Class Reference

`#include <src/main/decaf/lang/Long.h>`Inheritance diagram for decaf::lang::Long:

Public Member Functions

- **Long** (long long value)
- **Long** (const std::string &value)

  *Constructs a new **Long** (p. 1967) and attempts to convert the given string to an long long value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted long long.*

- virtual ~**Long** ()
- virtual int **compareTo** (const **Long** &l) const

  *Compares this **Long** (p. 1967) instance with another.*

- bool **equals** (const **Long** &l) const
- virtual bool **operator==** (const **Long** &l) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Long** &l) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const long long &l) const

  *Compares this **Long** (p. 1967) instance with another.*

- bool **equals** (const long long &l) const
- virtual bool **operator==** (const long long &l) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const long long &l) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

Static Public Member Functions

- static int **bitCount** (long long value)

  Returns the number of one-bits in the two's complement binary representation of the specified int value.

- static **Long decode** (const std::string &value)

  *Decodes a **String** (p. 2935) into a **Long** (p. 1967).*

- static long long **highestOneBit** (long long value)

  Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

- static long long **lowestOneBit** (long long value)

  Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

- static int **numberOfLeadingZeros** (long long value)

  Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.

- static int **numberOfTrailingZeros** (long long value)

  Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.

- static long long **parseLong** (const std::string &value)

  Parses the string argument as a signed decimal long.

- static long long **parseLong** (const std::string &value, int radix)

  *Returns a **Long** (p. 1967) object holding the value extracted from the specified string when parsed with the radix given by the second argument.*

- static long long **reverseBytes** (long long value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.

- static long long **reverse** (long long value)

  Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.

- static long long **rotateLeft** (long long value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

- static long long **rotateRight** (long long value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

- static int **signum** (long long value)

  Returns the signum function of the specified value.

- static std::string **toString** (long long value)

  *Converts the long to a **String** (p. 2935) representation.*

- static std::string **toString** (long long value, int radix)
- static std::string **toHexString** (long long value)

  Returns a string representation of the integer argument as an unsigned integer in base 16.

- static std::string **toOctalString** (long long value)

  Returns a string representation of the long long argument as an unsigned long long in base 8.

- static std::string **toBinaryString** (long long value)

  Returns a string representation of the long long argument as an unsigned long long in base 2.

- static **Long valueOf** (long long value)

  *Returns a **Long** (p. 1967) instance representing the specified int value.*

- static **Long valueOf** (const std::string &value)

  *Returns a **Long** (p. 1967) object holding the value given by the specified std::string.*

- static **Long valueOf** (const std::string &value, int radix)

  *Returns a **Long** (p. 1967) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE**

  The size in bits of the primitive long long type.

- static const long long **MAX_VALUE**

  The maximum value that the primitive type can hold.

- static const long long **MIN_VALUE**

  The minimum value that the primitive type can hold.

6.387.1 Constructor & Destructor Documentation

6.387.1.1 decaf::lang::Long::Long (long long *value*)

Parameters:

value - the primitive long long to wrap

6.387.1.2 decaf::lang::Long::Long (const std::string & *value*)

Constructs a new **Long** (p. 1967) and attempts to convert the given string to an long long value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted long long.

Parameters:

value The string to convert to a primitive type to wrap.

Exceptions:

NumberFormatException if the string is not a a valid 64bit long.

6.387.1.3 virtual decaf::lang::Long::~Long () [inline, virtual]

6.387.2 Member Function Documentation

6.387.2.1 static int decaf::lang::Long::bitCount (long long *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value. This function is sometimes referred to as the population count.

Parameters:

value - the long long to count

Returns:

the number of one-bits in the two's complement binary representation of the specified long long value.

6.387.2.2 virtual unsigned char decaf::lang::Long::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2269).

6.387.2.3 virtual int decaf::lang::Long::compareTo (const long long & *l*) const [virtual]

Compares this **Long** (p. 1967) instance with another.

Parameters:

l - the **Integer** (p. 1738) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< long long >** (p. 1037).

6.387.2.4 virtual int decaf::lang::Long::compareTo (const Long & *l*) const [virtual]

Compares this **Long** (p. 1967) instance with another.

Parameters:

l - the **Long** (p. 1967) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.387.2.5 static Long decaf::lang::Long::decode (const std::string & *value*) [static]

Decodes a **String** (p. 2935) into a **Long** (p. 1967). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInteger method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 2935) is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Long** (p. 1967) object containing the decoded value

Exceptions:

NumberFomatException if the string is not formatted correctly.

6.387.2.6 virtual double decaf::lang::Long::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.387.2.7 bool decaf::lang::Long::equals (const long long & *l*) const [inline, virtual]

Parameters:

l - the **Long** (p. 1967) object to compare against.

Returns:

true if the two **Integer** (p. 1738) Objects have the same value.

Implements **decaf::lang::Comparable< long long >** (p. 1038).

6.387.2.8 bool decaf::lang::Long::equals (const Long & *l*) const [inline]

Parameters:

l - the **Long** (p. 1967) object to compare against.

Returns:

true if the two **Integer** (p. 1738) Objects have the same value.

6.387.2.9 virtual float decaf::lang::Long::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.387.2.10 static long long decaf::lang::Long::highestOneBit (long long *value*) [static]

Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the long long to be inspected

Returns:

an long long value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.387.2.11 virtual int decaf::lang::Long::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.387.2.12 virtual long long decaf::lang::Long::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2270).

6.387.2.13 static long long decaf::lang::Long::lowestOneBit (long long *value*) [static]

Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the long long to be inspected

Returns:

an long long value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.387.2.14 static int decaf::lang::Long::numberOfLeadingZeros (long long *value*) [static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value. Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

∗ floor(log2(x)) = 63 - numberOfLeadingZeros(x) ∗ ceil(log2(x)) = 64 - numberOfLeadingZeros(x - 1)

Parameters:

value - the long long to be inspected

Returns:

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.387.2.15 static int decaf::lang::Long::numberOfTrailingZeros (long long *value*) [static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value. Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.387.2.16 virtual bool decaf::lang::Long::operator< (const long long & *l*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< long long >** (p. 1038).

6.387.2.17 virtual bool decaf::lang::Long::operator< (const Long & *l*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.387.2.18 virtual bool decaf::lang::Long::operator== (const long long & *l*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< long long >** (p. 1038).

6.387.2.19 virtual bool decaf::lang::Long::operator== (const Long & *l*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.387.2.20 static long long decaf::lang::Long::parseLong (const std::string & *value*, int *radix*) [static]

Returns a **Long** (p. 1967) object holding the value extracted from the specified string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed long in the radix specified by the second argument, exactly as if the arguments were given to the parseLong(std::string, int) method. The result is a **Long** (p. 1967) object that represents the long long value specified by the string.

Parameters:

value - **String** (p. 2935) to parse

radix - the base encoding of the string

Returns:

long long value

Exceptions:

NumberFormatException on invalid string value

6.387.2.21 static long long decaf::lang::Long::parseLong (const std::string & *value*) [static]

Parses the string argument as a signed decimal long. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting long value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseLong(java.lang.String, int) method.

Note that the characters LL or ULL are not permitted to appear at the end of this string as would normally be permitted in a C++ program.

Parameters:

value - **String** (p. 2935) to parse

Returns:

long long value

Exceptions:

NumberFormatException on invalid string value

6.387.2.22 static long long decaf::lang::Long::reverse (long long *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.

Parameters:

value - the value whose bits are to be reversed

Returns:

the reversed bits long long.

6.387.2.23 static long long decaf::lang::Long::reverseBytes (long long *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.

Parameters:

value - the long long whose bytes we are to reverse

Returns:

the reversed long long.

6.387.2.24 static long long decaf::lang::Long::rotateLeft (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits. (Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters:

value - the long long to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

6.387.2.25 static long long decaf::lang::Long::rotateRight (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits. (Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: rotateRight(val, -distance) == rotateLeft(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateRight(val, distance) == rotateRight(val, distance & 0x1F).

Parameters:

value - the long long to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

6.387.2.26 virtual short decaf::lang::Long::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2271).

6.387.2.27 static int decaf::lang::Long::signum (long long *value*) [static]

Returns the signum function of the specified value. (The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters:

value - the long long to be inspected

Returns:

the signum function of the specified long long value.

6.387.2.28 static std::string decaf::lang::Long::toBinaryString (long long *value*) [static]

Returns a string representation of the long long argument as an unsigned long long in base 2. The unsigned long long value is the argument plus 2^32 if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The characters '0' and '1' are used as binary digits.

Parameters:

value - the long long to be translated to a binary string

Returns:

the unsigned long long value as a binary string

6.387.2.29 static std::string decaf::lang::Long::toHexString (long long *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 16. The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters:

value - the long long to be translated to an Octal string

Returns:

the unsigned long long value as a Octal string

6.387.2.30 static std::string decaf::lang::Long::toOctalString (long long *value*) [static]

Returns a string representation of the long long argument as an unsigned long long in base 8. The unsigned long long value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters:

value - the long long to be translated to an Octal string

Returns:

the unsigned long long value as a Octal string

6.387.2.31 static std::string decaf::lang::Long::toString (long long *value*, int *radix*) [static]

6.387.2.32 static std::string decaf::lang::Long::toString (long long *value*) [static]

Converts the long to a **String** (p. 2935) representation.

Parameters:

value The long to convert to a std::string.

Returns:

string representation

6.387.2.33 std::string decaf::lang::Long::toString () const

Returns:

this **Long** (p. 1967) Object as a **String** (p. 2935) Representation

6.387.2.34 static Long decaf::lang::Long::valueOf (const std::string & *value*, int *radix*) [static]

Returns a **Long** (p. 1967) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed long long in the radix specified by the second argument, exactly as if the argument were given to the parseLong(std::string, int) method. The result is a **Long** (p. 1967) object that represents the long long value specified by the string.

Parameters:

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Long** (p. 1967) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid long long.

6.387.2.35 static Long decaf::lang::Long::valueOf (const std::string & *value*) [static]

Returns a **Long** (p. 1967) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal long long, exactly as if the argument were given to the parseLong(std::string) method. The result is a **Integer** (p. 1738) object that represents the long long value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Long** (p. 1967) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal long long.

6.387.2.36 static Long decaf::lang::Long::valueOf (long long *value*) [inline, static]

Returns a **Long** (p. 1967) instance representing the specified int value.

Parameters:

value - the long long to wrap

Returns:

the new **Integer** (p. 1738) object wrapping value.

6.387.3 Field Documentation

6.387.3.1 const long long decaf::lang::Long::MAX_VALUE [static]

The maximum value that the primitive type can hold.

6.387.3.2 const long long decaf::lang::Long::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.387.3.3 const int decaf::lang::Long::SIZE [static]

The size in bits of the primitive long long type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Long.h**

6.388 decaf::internal::nio::LongArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/LongArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::LongArrayBuffer:

Public Member Functions

- **LongArrayBuffer** (int size, bool readOnly=false)

  *Creates a **IntArrayBuffer** (p. 1719) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **LongArrayBuffer** (long long *array, int size, int offset, int length, bool readOnly=false)

  *Creates a **LongArrayBuffer** (p. 1981) object that wraps the given array.*

- **LongArrayBuffer** (const **decaf::lang::Pointer< ByteArrayAdapter >** &array, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **LongArrayBuffer** (const **LongArrayBuffer** &other)

  *Create a **LongArrayBuffer** (p. 1981) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**LongArrayBuffer** ()
- virtual long long * **array** ()

  Returns the long long array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  *the array that backs this **Buffer** (p. 735).*

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns:

  The offset long longo the backing array where index zero starts.

  Exceptions:

  ***ReadOnlyBufferException** (p. 2535) if this **Buffer** (p. 735) is read only.*
  ***UnsupportedOperationException** if the underlying store has no array.*

- virtual LongBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only long long buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
Returns:

The new, read-only long long buffer which the caller then owns.

- virtual LongBuffer & **compact** ()

Compacts this buffer.
*The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.
Returns:

*a reference to this **LongBuffer** (p. 1990).*
Exceptions:

***ReadOnlyBufferException** (p. 2535) if this buffer is read-only.*

- virtual LongBuffer * **duplicate** ()

Creates a new long long buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
The new buffer will be read-only if, and only if, this buffer is read-only.
Returns:

*a new long long **Buffer** (p. 735) which the caller owns.*

- virtual long long **get** ()

Relative get method.
Reads the value at this buffer's current position, and then increments the position.
Returns:

the long long at the current position.
Exceptions:

***BufferUnderflowException** (p. 763) if there no more data to return.*

- virtual long long **get** (int index) const

Absolute get method.
Reads the value at the given index.
Parameters:

***index** The index in the **Buffer** (p. 735) where the long long is to be read.*
Returns:

the long long that is located at the given index.

Exceptions:

IndexOutOfBoundsException *if index is not smaller than the buffer's limit, or index is negative.*

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible long long array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.
  Returns:

  true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.
  Returns:

  true if, and only if, this buffer is read-only.

- virtual LongBuffer & **put** (long long value)

  Writes the given long longs long longo this buffer at the current position, and then increments the position.
  Parameters:

  value *The long longs value to be written.*
  Returns:

  a reference to this buffer.
  Exceptions:

  BufferOverflowException *(*p. 760*)* *if this buffer's current position is not smaller than its limit*
  ReadOnlyBufferException *(*p. 2535*)* *if this buffer is read-only*

- virtual LongBuffer & **put** (int index, long long value)

  Writes the given long longs long longo this buffer at the given index.
  Parameters:

  index *The position in the* ***Buffer*** *(*p. 735*) to write the data*
  value *The long longs to write.*
  Returns:

  a reference to this buffer.
  Exceptions:

  IndexOutOfBoundsException *if index greater than the buffer's limit minus the size of the type being written.*
  ReadOnlyBufferException *(*p. 2535*)* *if this buffer is read-only*

- virtual LongBuffer * **slice** () const

  Creates a new ***LongBuffer*** *(*p. 1990*) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns:

  the newly create ***LongBuffer*** *(*p. 1990*) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **LongArrayBuffer** (p. 1981) as Read-Only.*

6.388.1 Constructor & Destructor Documentation

6.388.1.1 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **IntArrayBuffer** (p. 1719) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

IllegalArguementException if the capacity value is negative.

6.388.1.2 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (long long * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **LongArrayBuffer** (p. 1981) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.388.1.3 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset. The capacity and limit of the new **LongArrayBuffer** (p. 1981) will be that of the remaining capacity of the passed buffer.

Parameters:

array The ByteArrayAdapter to wrap.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions:

NullPointerException if array is NULL

IndexOutOfBoundsException if offset + length is greater than array size.

6.388.1.4 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (const LongArrayBuffer & *other*)

Create a **LongArrayBuffer** (p. 1981) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters:

other The **LongArrayBuffer** (p. 1981) this one is to mirror.

6.388.1.5 virtual decaf::internal::nio::LongArrayBuffer::~LongArrayBuffer () [virtual]

6.388.2 Member Function Documentation

6.388.2.1 virtual long long* decaf::internal::nio::LongArrayBuffer::array () [virtual]

Returns the long long array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 1992).

6.388.2.2 virtual int decaf::internal::nio::LongArrayBuffer::arrayOffset () [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset long longo the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 1993).

6.388.2.3 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only long long buffer which the caller then owns.

Implements **decaf::nio::LongBuffer** (p. 1993).

6.388.2.4 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::compact () [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **LongBuffer** (p. 1990).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implements **decaf::nio::LongBuffer** (p. 1993).

6.388.2.5 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::duplicate () [virtual]

Creates a new long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new long long **Buffer** (p. 735) which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 1994).

6.388.2.6 virtual long long decaf::internal::nio::LongArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the long long is to be read.

Returns:

the long long that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::LongBuffer** (p. 1995).

6.388.2.7 virtual long long decaf::internal::nio::LongArrayBuffer::get () [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns:

the long long at the current position.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there no more data to return.

Implements **decaf::nio::LongBuffer** (p. 1996).

6.388.2.8 virtual bool decaf::internal::nio::LongArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible long long array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::LongBuffer** (p. 1996).

6.388.2.9 virtual bool decaf::internal::nio::LongArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 738).

6.388.2.10 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (int *index*, long long *value*) [virtual]

Writes the given long longs long longo this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data

value The long longs to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 1996).

6.388.2.11 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (long long *value*) [virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters:

value The long longs value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 1997).

6.388.2.12 virtual void decaf::internal::nio::LongArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **LongArrayBuffer** (p. 1981) as Read-Only.

Parameters:

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.388.2.13 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::slice () const [virtual]

Creates a new **LongBuffer** (p. 1990) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **LongBuffer** (p. 1990) which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 1998).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**LongArrayBuffer.h**

6.389 decaf::nio::LongBuffer Class Reference

This class defines four categories of operations upon long long buffers:.

`#include <src/main/decaf/nio/LongBuffer.h>`Inheritance diagram for decaf::nio::LongBuffer:

Public Member Functions

- virtual ~**LongBuffer** ()
- virtual std::string **toString** () const
- virtual long long * **array** ()=0

  Returns the long long array that backs this buffer (optional operation).

  *Wraps the passed STL long long Vector in a **LongBuffer** (p. 1990).*

Protected Member Functions

- **LongBuffer** (int capacity)

  *Creates a **LongBuffer** (p. 1990) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.*

6.389.1 Detailed Description

This class defines four categories of operations upon long long buffers:. o Absolute and relative get and put methods that read and write single long longs; o Relative bulk get methods that transfer contiguous sequences of long longs from this buffer long longo an array; and o Relative bulk put methods that transfer contiguous sequences of long longs from a long long array or some other long long buffer long longo this buffer o Methods for compacting, duplicating, and slicing a long long buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing long long array long longo a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.389.2 Constructor & Destructor Documentation

6.389.2.1 decaf::nio::LongBuffer::LongBuffer (int *capacity*) [protected]

Creates a **LongBuffer** (p. 1990) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity The size and limit of the **Buffer** (p. 735) in long longs.

Exceptions:

IllegalArguementException if capacity is negative.

6.389.2.2 virtual decaf::nio::LongBuffer::~LongBuffer () [inline, virtual]

6.389.3 Member Function Documentation

6.389.3.1 static LongBuffer* decaf::nio::LongBuffer::allocate (int *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity The size of the Double buffer in long longs.

Returns:

the **LongBuffer** (p. 1990) that was allocated, caller owns.

6.389.3.2 virtual long long* decaf::nio::LongBuffer::array () [pure virtual]

Returns the long long array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 735).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1985).

6.389.3.3 virtual int decaf::nio::LongBuffer::arrayOffset () [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset long longo the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this **Buffer** (p. 735) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1986).

6.389.3.4 virtual LongBuffer* decaf::nio::LongBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only long long buffer which the caller then owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1986).

6.389.3.5 virtual LongBuffer& decaf::nio::LongBuffer::compact () [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 739) is copied

to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 739) - 1 is copied to index n = **limit()** (p. 739) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **LongBuffer** (p. 1990).

Exceptions:

ReadOnlyBufferException *(p. 2535)* if this buffer is read-only.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1986).

6.389.3.6 virtual int decaf::nio::LongBuffer::compareTo (const LongBuffer & *value*) const [virtual]

6.389.3.7 virtual LongBuffer* decaf::nio::LongBuffer::duplicate () [pure virtual]

Creates a new long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new long long **Buffer** (p. 735) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1987).

6.389.3.8 virtual bool decaf::nio::LongBuffer::equals (const LongBuffer & *value*) const [virtual]

6.389.3.9 LongBuffer& decaf::nio::LongBuffer::get (long long * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method. This method transfers long longs from this buffer long longo the given destination array. If there are fewer long longs remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 740), then no bytes are transferred and a **BufferUnderflowException** (p. 763) is thrown.

Otherwise, this method copies length long longs from this buffer long longo the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer The pointer to an allocated long long buffer to fill.

size The size of the passed in buffer.

offset The position in the buffer to start filling.

length The amount of data to put in the passed buffer.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are fewer than length long longs remaining in this buffer

NullPolong longerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.389.3.10 LongBuffer& decaf::nio::LongBuffer::get (std::vector< long long > *buffer*)

Relative bulk get method. This method transfers values from this buffer long longo the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 735).

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there are fewer than length long longs remaining in this buffer.

6.389.3.11 virtual long long decaf::nio::LongBuffer::get (int *index*) const [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index The index in the **Buffer** (p. 735) where the long long is to be read.

Returns:

the long long that is located at the given index.

Exceptions:

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1987).

6.389.3.12 virtual long long decaf::nio::LongBuffer::get () [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the long long at the current position.

Exceptions:

BufferUnderflowException *(*p. ***763)*** if there no more data to return.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1987).

6.389.3.13 virtual bool decaf::nio::LongBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible long long array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1988).

6.389.3.14 virtual bool decaf::nio::LongBuffer::operator< (const LongBuffer & *value*) const [virtual]

6.389.3.15 virtual bool decaf::nio::LongBuffer::operator== (const LongBuffer & *value*) const [virtual]

6.389.3.16 virtual LongBuffer& decaf::nio::LongBuffer::put (int *index*, long long *value*) [pure virtual]

Writes the given long longs long longo this buffer at the given index.

Parameters:

index The position in the **Buffer** (p. 735) to write the data

value The long longs to write.

Returns:

a reference to this buffer.

Exceptions:

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1988).

6.389.3.17 virtual LongBuffer& decaf::nio::LongBuffer::put (long long *value*) [pure virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters:

value The long longs value to be written.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1989).

6.389.3.18 LongBuffer& decaf::nio::LongBuffer::put (std::vector< long long > & *buffer*)

This method transfers the entire content of the given source long longs array long longo this buffer. This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters:

buffer The buffer whose contents are copied to this **LongBuffer** (p. 1990).

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760****)* if there is insufficient space in this buffer.

ReadOnlyBufferException *(*p. ***2535****)* if this buffer is read-only.

6.389.3.19 LongBuffer& decaf::nio::LongBuffer::put (const long long * *buffer*, int *size*, int *offset*, int *length*)

This method transfers long longs long longo this buffer from the given source array. If there are more long longs to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 740), then no long longs are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies length bytes from the given array long longo this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer The array from which long longs are to be read.

size The size of the buffer passed.

offset The offset within the array of the first char to be read.

length The number of long longs to be read from the given array.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if there is insufficient space in this buffer

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only

NullPolong longerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.389.3.20 LongBuffer& decaf::nio::LongBuffer::put (LongBuffer & *src*)

This method transfers the long longs remaining in the given source buffer long longo this buffer. If there are more long longs remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 740), then no long longs are transferred and a **BufferOverflowException** (p. 760) is thrown.

Otherwise, this method copies n = src.remaining() long longs from the given buffer long longo this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src The buffer to take long longs from an place in this one.

Returns:

a reference to this buffer.

Exceptions:

BufferOverflowException *(*p. ***760)*** if there is insufficient space in this buffer for the remaining long longs in the source buffer

IllegalArgumentException if the source buffer is this buffer

ReadOnlyBufferException *(*p. ***2535)*** if this buffer is read-only

6.389.3.21 virtual LongBuffer* decaf::nio::LongBuffer::slice () const [pure virtual]

Creates a new **LongBuffer** (p. 1990) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **LongBuffer** (p. 1990) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1989).

6.389.3.22 virtual std::string decaf::nio::LongBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.389.3.23 static LongBuffer* decaf::nio::LongBuffer::wrap (std::vector< long long > & *buffer*) [static]

Wraps the passed STL long long Vector in a **LongBuffer** (p. 1990). The new buffer will be backed by the given long long array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **LongBuffer** (p. 1990) that is backed by buffer, caller owns.

6.389.3.24 static LongBuffer* decaf::nio::LongBuffer::wrap (long long * *array*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new **LongBuffer** (p. 1990). The new buffer will be backed by the given long long array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array The array that will back the new buffer.

size The size of the passed in array.

offset The offset of the subarray to be used.

length The length of the subarray to be used.

Returns:

a new **LongBuffer** (p. 1990) that is backed by buffer, caller owns.

Exceptions:

NullPointerException if the array pointer is NULL.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.391.1 Detailed Description

template<typename K, typename V, typename HASHCODE = HashCode<K>> class decaf::util::LRUCache< K, V, HASHCODE >

A Basic Least Recently Used (LRU) Cache **Map** (p. 2008). This **LRUCache** (p. 2002) implements the **LinkedHashMap** (p. 1875) class so all the standard **Map** (p. 2008) operations are provided. When the sive of this **LRUCache** (p. 2002) map exceeds the specified maxCacheSize value then by default the oldest entry is evicted from the Cache.

Subclasses can override the LinkedHashMap::onEviction method to perform custom cache eviction processing.

Since:

1.0

6.391.2 Constructor & Destructor Documentation

6.391.2.1 template<typename K , typename V , typename HASHCODE = HashCode<K>> decaf::util::LRUCache< K, V, HASHCODE >::LRUCache () [inline]

Default constructor for an LRU Cache The default capacity is 10000.

6.391.2.2 template<typename K , typename V , typename HASHCODE = HashCode<K>> decaf::util::LRUCache< K, V, HASHCODE >::LRUCache (int *maximumCacheSize*) [inline]

Constructs a **LRUCache** (p. 2002) with a maximum capacity.

Parameters:

maximumCacheSize The maximum number of cached entries before eviction begins.

6.391.2.3 template<typename K , typename V , typename HASHCODE = HashCode<K>> decaf::util::LRUCache< K, V, HASHCODE >::LRUCache (int *initialCapacity*, int *maximumCacheSize*, float *loadFactor*, bool *accessOrder*) [inline]

Constructs an empty **LRUCache** (p. 2002) instance with the specified initial capacity, maximumCacheSize, load factor and ordering mode.

Parameters:

initialCapacity The initial capacity of the **LRUCache** (p. 2002).

maximumCacheSize The maximum number of cached entries before eviction begins.

loadFactor the load factor. The initial load factor for this **LRUCache** (p. 2002).

accessOrder The ordering mode - true for access-order, false for insertion-order.

Exceptions:

IllegalArgumentException if the initial capacity is negative or the load factor is non-positive.

6.391.2.4 template<typename K , typename V , typename HASHCODE = HashCode<K>> virtual decaf::util::LRUCache< K, V, HASHCODE >::~LRUCache () [inline, virtual]

6.391.3 Member Function Documentation

6.391.3.1 template<typename K , typename V , typename HASHCODE = HashCode<K>> int decaf::util::LRUCache< K, V, HASHCODE >::getMaxCacheSize () const [inline]

Gets the currently configured Max Cache Size setting.

Returns:

the current max cache size value.

References decaf::util::LRUCache< K, V, HASHCODE >::maxCacheSize.

6.391.3.2 template<typename K , typename V , typename HASHCODE = HashCode<K>> virtual bool decaf::util::LRUCache< K, V, HASHCODE >::removeEldestEntry (const MapEntry< K, V > &eldest *DECAF_UNUSED*) [inline, protected, virtual]

References decaf::util::LRUCache< K, V, HASHCODE >::maxCacheSize, and decaf::util::HashMap< K, V, HASHCODE >::size().

6.391.3.3 template<typename K , typename V , typename HASHCODE = HashCode<K>> void decaf::util::LRUCache< K, V, HASHCODE >::setMaxCacheSize (int *size*) [inline]

Sets the maximum size allowed for this LRU Cache.

Parameters:

size The new maximum cache size setting.

Exceptions:

IllegalArgumentException is size is less than or equal to zero.

References decaf::util::LRUCache< K, V, HASHCODE >::maxCacheSize.

6.391.4 Field Documentation

6.391.4.1 template<typename K , typename V , typename HASHCODE = HashCode<K>> int decaf::util::LRUCache< K, V, HASHCODE >::maxCacheSize [protected]

  Constructor - Initializes the file name and line number where this message occurred.

- **MalformedURLException** (const std::exception *cause)

  Constructor.

- **MalformedURLException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **MalformedURLException** * **clone** () const

  Clones this exception.

- virtual ~**MalformedURLException** () throw ()

6.392.1 Constructor & Destructor Documentation

6.392.1.1 decaf::net::MalformedURLException::MalformedURLException ()

Default Constructor.

6.392.1.2 decaf::net::MalformedURLException::MalformedURLException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.392.1.3 decaf::net::MalformedURLException::MalformedURLException (const MalformedURLException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.392.1.4 decaf::net::MalformedURLException::MalformedURLException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.392.1.5 decaf::net::MalformedURLException::MalformedURLException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.392.1.6 decaf::net::MalformedURLException::MalformedURLException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.392.1.7 virtual decaf::net::MalformedURLException::~MalformedURLException () throw () [virtual]

6.392.2 Member Function Documentation

6.392.2.1 virtual MalformedURLException* decaf::net::MalformedURLException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1788).

  *Returns a **Set** (p. 2715) view of the keys contained in this map.*

- virtual const **Set**< K > & **keySet** () const =0
- virtual **Collection**< V > & **values** ()=0

  *Returns a **Collection** (p. 1006) view of the values contained in this map.*

- virtual const **Collection**< V > & **values** () const =0

6.393.1 Detailed Description

template<typename K, typename V> class decaf::util::Map< K, V >

An object that maps keys to values. A map cannot contain duplicate keys; each key can map to at most one value.

The **Map** (p. 2008) interface provides three collection views, which allow a map's contents to be viewed as a set of keys, collection of values, or set of key-value mappings. The order of a map is defined as the order in which the iterators on the map's collection views return their elements. Some map implementations, like the TreeMap class, make specific guarantees as to their order; others, like the **HashMap** (p. 1613) class, do not.

Note: great care must be exercised if mutable objects are used as map keys. The behavior of a map is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is a key in the map. A special case of this prohibition is that it is not permissible for a map to contain itself as a key. While it is permissible for a map to contain itself as a value, extreme caution is advised: the equals and hashCode methods are no longer well defined on such a map.

All general-purpose map implementation classes should provide two "standard" constructors: a void (no arguments) constructor which creates an empty map, and a constructor with a single argument of type **Map** (p. 2008), which creates a new map with the same key-value mappings as its argument. In effect, the latter constructor allows the user to copy any map, producing an equivalent map of the desired class.

The "destructive" methods contained in this interface, that is, the methods that modify the map on which they operate, are specified to throw UnsupportedOperationException if this map does not support the operation. If this is the case, these methods may, but are not required to, throw an UnsupportedOperationException if the invocation would have no effect on the map. For example, invoking the putAll(Map) method on an unmodifiable map may, but is not required to, throw the exception if the map whose mappings are to be "superimposed" is empty.

Some map implementations have restrictions on the keys and values they may contain. For example, some implementations prohibit NULL keys and values, and some have restrictions on the types of their keys. Attempting to insert an ineligible key or value throws an exception, typically NullPointerException or ClassCastException. Attempting to query the presence of an ineligible key or value may throw an exception, or it may simply return false; some implementations will exhibit the former behavior and some will exhibit the latter. More generally, attempting an operation on an ineligible key or value whose completion would not result in the insertion of an ineligible element into the map may throw an exception or it may succeed, at the option of the implementation. Such exceptions are marked as "optional" in the specification for this interface.

Many methods in **Collections** (p. 1018) Framework interfaces are defined in terms of the equals method. For example, the specification for the containsKey(Object key) method says: "returns true if and only if this map contains a mapping for a key k such that (key == k)." This specification should not be construed to imply that invoking **Map.containsKey** (p. 2011) with a non-null argument key will cause (key == k) to be invoked for any key k. Implementations are free to implement optimizations whereby the equals invocation is avoided, for example, by first comparing the hash codes of the two keys. (The Object.hashCode() specification guarantees that two objects with unequal hash codes cannot be equal.) More generally, implementations of the various **Collections** (p. 1018) Framework interfaces are free to take advantage of the specified behavior of underlying Object methods wherever the implementor deems it appropriate.

Since:

1.0

6.393.2 Constructor & Destructor Documentation

6.393.2.1 template<typename K, typename V> decaf::util::Map< K, V >::Map () [inline]

Default constructor - does nothing.

6.393.2.2 template<typename K, typename V> virtual decaf::util::Map< K, V >::~Map () [inline, virtual]

6.393.3 Member Function Documentation

6.393.3.1 template<typename K, typename V> virtual void decaf::util::Map< K, V >::clear () [pure virtual]

Removes all of the mappings from this map (optional operation). The map will be empty after this call returns.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this map.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1064), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1617), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2874), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1064), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1064), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1064), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1064), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1617), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2874), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2874), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2874), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2874), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2874), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2874), **decaf::util::StlMap< std::string, TransportFactory * >**

(p. 2874), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2874), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2874), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2874).

6.393.3.2 template<typename K, typename V> virtual bool decaf::util::Map< K, V >::containsKey (const K & *key*) const [pure virtual]

Returns true if this map contains a mapping for the specified key. More formally, returns true if and only if this map contains a mapping for a key k such that (key == k). (There can be at most one such mapping.)

Parameters:

key The key to look up.

Returns:

true if this map contains the key mapping, otherwise false.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1064), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1618), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2874), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1618), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2874), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2874), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2874), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2874), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2874), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2874), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2874), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2874), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2874), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2874).

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::equals().

6.393.3.3 template<typename K, typename V> virtual bool decaf::util::Map< K, V >::containsValue (const V & *value*) const [pure virtual]

Returns true if this map maps one or more keys to the specified value. More formally, returns true if and only if this map contains at least one mapping to a value v such that (value==v). This operation will probably require time linear in the map size for most implementations of the **Map** (p. 2008) interface.

Parameters:

value The Value to look up in this **Map** (p. 2008).

Returns:

true if this map contains at least one mapping for the value, otherwise false.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1065), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1618), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2875), **decaf::util::HashMap< E, Set< E > *,**

HASHCODE > (p. 1618), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2875), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2875), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2875), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2875), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2875), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2875), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2875), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2875), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2875), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2875).

6.393.3.4 template<typename K, typename V> virtual void decaf::util::Map< K, V >::copy (const Map< K, V > & *source*) [pure virtual]

Copies the content of the source map into this map. Erases all existing mappings in this map. The copy is performed by using the entrySet of the source **Map** (p. 2008) and iterating over those entries, inserting each into the target.

Parameters:

source The source object to copy from.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1065), and **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2875).

6.393.3.5 template<typename K, typename V> virtual const Set< MapEntry<K,V> >& decaf::util::Map< K, V >::entrySet () const [pure virtual]

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1066), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1619), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2875), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1066), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1066), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1066), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1066), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1619), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2875), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2875), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2875), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2875), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2875), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2875), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2875), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2875), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2875), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2875).

6.393.3.6 template<typename K, typename V> virtual Set< MapEntry<K,V> >& decaf::util::Map< K, V >::entrySet () [pure virtual]

Returns a **Set** (p. 2715) view of the mappings contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Set.remove** (p. 1013), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns:

a reference to a **Set** (p. 2715)<MapEntry<K,V>> that is backed by this **Map** (p. 2008).

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1066), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1619), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2875), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1066), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1066), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1066), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1066), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1619), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2875), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2875), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2875), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2875), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2875), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2875), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2875), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2875), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2875), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2875).

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::putAllImpl().

6.393.3.7 template<typename K, typename V> virtual bool decaf::util::Map< K, V >::equals (const Map< K, V > & *source*) const [pure virtual]

Compares the specified object with this map for equality. Returns true if the two maps represent the same mappings. More formally, two maps m1 and m2 represent the same mappings if m1.entrySet().equals(m2.entrySet()). This ensures that the equals method works properly across different implementations of the **Map** (p. 2008) interface.

Parameters:

source **Map** (p. 2008) to compare to this one.

Returns:

true if the **Map** (p. 2008) passed is equal in value to this one.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1066), and **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2876).

6.393.3.8 template<typename K, typename V> virtual const V& decaf::util::Map< K, V >::get (const K & *key*) const [pure virtual]

Gets the value mapped to the specified key in the **Map** (p. 2008). If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.

Parameters:

key The search key whose value should be returned if present.

Returns:

A const reference to the value for the given key if present in the **Map** (p. 2008).

Exceptions:

NoSuchElementException *(p. 2260)* if the key requests doesn't exist in the **Map** (p. 2008).

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1067), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1620), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2876), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1620), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2876), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2876), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2876), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2876), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2876), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2876), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2876), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2876), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2876), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2876).

6.393.3.9 template<typename K, typename V> virtual V& decaf::util::Map< K, V >::get (const K & *key*) [pure virtual]

Gets the value mapped to the specified key in the **Map** (p. 2008). If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 2260) is thrown.

Parameters:

key The search key whose value should be returned if present.

Returns:

A reference to the value for the given key if present in the **Map** (p. 2008).

Exceptions:

NoSuchElementException *(p. 2260)* if the key requests doesn't exist in the **Map** (p. 2008).

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1067), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1620), **decaf::util::StlMap<**

K, V, COMPARATOR > (p. 2877), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1620), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2877), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2877), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2877), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2877), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2877), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2877), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2877), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2877), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2877), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2877).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::equals(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals(), decaf::util::StlMap< std::string, cms::Topic * >::putAll(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll().

6.393.3.10 template<typename K, typename V> virtual bool decaf::util::Map< K, V >::isEmpty () const [pure virtual]

Returns:

if the **Map** (p. 2008) contains any element or not, TRUE or FALSE

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1068), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1621), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2877), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1068), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1621), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2877), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2877), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2877), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2877), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2877), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2877), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2877), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2877), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2877), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2877).

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::putAll().

6.393.3.11 template<typename K, typename V> virtual const Set<K>& decaf::util::Map< K, V >::keySet () const [pure virtual]

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1068), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1621), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2877), **decaf::util::concurrent::ConcurrentStlMap<**

Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1068), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1621), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2877), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2877), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2877), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2877), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2877), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2877), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2877), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2877), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2877), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2877).

6.393.3.12 template<typename K, typename V> virtual Set<K>& decaf::util::Map< K, V >::keySet () [pure virtual]

Returns a **Set** (p. 2715) view of the keys contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation), the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Set.remove** (p. 1013), removeAll, retainAll, and clear operations. It does not support the add or addAll operations.

Returns:

a set view of the keys contained in this map,

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1068), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1621), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2877), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1068), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1068), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1621), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2877), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2877), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2877), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2877), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2877), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2877), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2877), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2877), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2877), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2877).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::putAll(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll().

6.393.3.13 template<typename K, typename V> virtual bool decaf::util::Map< K, V >::put (const K & *key*, const V & *value*, V & *oldValue*) [pure virtual]

Associates the specified value with the specified key in this map (optional operation). If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

This method accepts a reference to a value which will be assigned the previous value for the given key (if any). If there was no previous mapping for the given key the out value is not written to. A return of true indicates that a value was replaced by this put operation.

Parameters:

key The target key.

value The value to be set.

oldValue (out) The value previously held in the mapping for this key. .

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

IllegalArgumentException if some property of the specified key or value prevents it from being stored in this map

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1069), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1622), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2879), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1622), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2879), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2879), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2879), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2879), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2879), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2879), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2879), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2879), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2879), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2879).

6.393.3.14 template<typename K, typename V> virtual bool decaf::util::Map< K, V >::put (const K & *key*, const V & *value*) [pure virtual]

Associates the specified value with the specified key in this map (optional operation). If the map previously contained a mapping for the key, the old value is replaced by the specified value. (A map m is said to contain a mapping for a key k if and only if m.containsKey(k) would return true.)

Parameters:

key The target key.

value The value to be set.

Returns:

true if the put operation replaced a value that was associated with an existing mapping to the given key or false otherwise.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

IllegalArgumentException if some property of the specified key or value prevents it from being stored in this map

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1070), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1622), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2879), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1622), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2879), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2879), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2879), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2879), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2879), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2879), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2879), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2879), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2879), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2879).

6.393.3.15 template<typename K, typename V> virtual void decaf::util::Map< K, V >::putAll (const Map< K, V > & *other*) [pure virtual]

Copies all of the mappings from the specified map to this map (optional operation). The effect of this call is equivalent to that of calling put(k, v) on this map once for each mapping from key k to value v in the specified map. The behavior of this operation is undefined if the specified map is modified while the operation is in progress.

Parameters:

other A **Map** (p. 2008) instance whose elements are to all be inserted in this **Map** (p. 2008).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1070), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2880), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1623), and **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2880).

6.393.3.16 template<typename K, typename V> virtual V decaf::util::Map< K, V >::remove (const K & *key*) [pure virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key. Care must be taken when using this operation as it will throw an exception if there is no mapping for the given key.

Parameters:

key The search key whose mapping is to be removed.

Returns:

a copy of the element that was previously mapped to the given key.

Exceptions:

NoSuchElementException *(*p. *2260)* if this key is not in the **Map** (p. 2008).

UnsupportedOperationException if this map is unmodifiable.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1072), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1624), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2880), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1624), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2880), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2880), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2880), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2880), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2880), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2880), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2880), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2880), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2880), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2880).

6.393.3.17 template<typename K, typename V> virtual int decaf::util::Map< K, V >::size () const [pure virtual]

Returns:

The number of elements (key/value pairs) in this map.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1074), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1624), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2881), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1074), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1624), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2881), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2881), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2881), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2881),

decaf::util::StlMap< std::string, cms::Queue * > (p. 2881), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2881), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2881), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2881), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2881), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2881).

Referenced by decaf::util::HashMap< E, Set< E > *, HASHCODE >::copy(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::equals(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::HashMap(), and decaf::util::HashMap< E, Set< E > *, HASHCODE >::putAllImpl().

6.393.3.18 template<typename K, typename V> virtual const Collection<V>& decaf::util::Map< K, V >::values () const [pure virtual]

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1074), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1625), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2881), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1074), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1074), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1625), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2881), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2881), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2881), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2881), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2881), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2881), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2881), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2881), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2881), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2881).

6.393.3.19 template<typename K, typename V> virtual Collection<V>& decaf::util::Map< K, V >::values () [pure virtual]

Returns a **Collection** (p. 1006) view of the values contained in this map. The collection is backed by the map, so changes to the map are reflected in the collection, and vice-versa. If the map is modified while an iteration over the collection is in progress (except through the iterator's own remove operation), the results of the iteration are undefined. The collection supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1803), **Collection.remove** (p. 1013), removeAll, retainAll and clear operations. It does not support the add or addAll operations. For the const version of this method the **Collection** (p. 1006) can only be used as a view into the **Map** (p. 2008).

Returns:

a collection view of the values contained in this map.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1075), **decaf::util::HashMap< K, V, HASHCODE >** (p. 1625), **decaf::util::StlMap<**

K, V, COMPARATOR > (p. 2882), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1075), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1075), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1075), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1075), **decaf::util::HashMap< E, Set< E > *, HASHCODE >** (p. 1625), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2882), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2882), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2882), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2882), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2882), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2882), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2882), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2882), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2882), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2882).

  Sets a Char value with the specified name into the Map.

- virtual double **getDouble** (const std::string &name) const =0

  Returns the Double value of the Specified name.

- virtual void **setDouble** (const std::string &name, double value)=0
  Sets a Double value with the specified name into the Map.
- virtual float **getFloat** (const std::string &name) const =0
  Returns the Float value of the Specified name.
- virtual void **setFloat** (const std::string &name, float value)=0
  Sets a Float value with the specified name into the Map.
- virtual int **getInt** (const std::string &name) const =0
  Returns the Int value of the Specified name.
- virtual void **setInt** (const std::string &name, int value)=0
  Sets a Int value with the specified name into the Map.
- virtual long long **getLong** (const std::string &name) const =0
  Returns the Long value of the Specified name.
- virtual void **setLong** (const std::string &name, long long value)=0
  Sets a Long value with the specified name into the Map.
- virtual short **getShort** (const std::string &name) const =0
  Returns the Short value of the Specified name.
- virtual void **setShort** (const std::string &name, short value)=0
  Sets a Short value with the specified name into the Map.
- virtual std::string **getString** (const std::string &name) const =0
  Returns the String value of the Specified name.
- virtual void **setString** (const std::string &name, const std::string &value)=0
  Sets a String value with the specified name into the Map.

6.395.1 Detailed Description

A **MapMessage** (p. 2024) object is used to send a set of name-value pairs. The names are String objects, and the values are primitive data types in the Java programming language. The names must have a value that is not null, and not an empty string. The entries can be accessed sequentially or randomly by name. The order of the entries is undefined. **MapMessage** (p. 2024) inherits from the **Message** (p. 2090) interface and adds a message body that contains a Map.

When a client receives a **MapMessage** (p. 2024), it is in read-only mode. If a client attempts to write to the message at this point, a **MessageNotWriteableException** (p. 2190) is thrown. To place the **MapMessage** (p. 2024) back into a state where it can be read from and written to, call the `clearBody` method.

MapMessage (p. 2024) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 979). The String-to-primitive conversions may throw a **MessageFormatException** (p. 2172) if the primitive's valueOf() method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X								X	
byte		X	X		X	X			X	
short			X		X	X			X	
char				X					X	
int					X	X			X	
long						X			X	
float							X	X	X	
double								X	X	
String	X	X	X		X	X	X	X	X	
byte[]										X

6.395.2 Constructor & Destructor Documentation

6.395.2.1 virtual cms::MapMessage::~MapMessage () [virtual]

6.395.3 Member Function Documentation

6.395.3.1 virtual bool cms::MapMessage::getBoolean (const std::string & *name*) const [pure virtual]

Returns the Boolean value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 351).

6.395.3.2 virtual unsigned char cms::MapMessage::getByte (const std::string & *name*) const [pure virtual]

Returns the Byte value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException *(*p. ***2172)*** - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 351).

6.395.3.3 virtual std::vector<unsigned char> cms::MapMessage::getBytes (const std::string & *name*) const [pure virtual]

Returns the Bytes value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException *(*p. ***979)*** - if the operation fails due to an internal error.

MessageFormatException *(*p. ***2172)*** - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 351).

6.395.3.4 virtual char cms::MapMessage::getChar (const std::string & *name*) const [pure virtual]

Returns the Char value of the Specified name.

Parameters:

name name of the value to fetch from the map

Exceptions:

CMSException *(*p. ***979)*** - if the operation fails due to an internal error.

MessageFormatException *(*p. ***2172)*** - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 352).

6.395.3.5 virtual double cms::MapMessage::getDouble (const std::string & *name*) const [pure virtual]

Returns the Double value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException *(*p. ***979)*** - if the operation fails due to an internal error.

MessageFormatException *(*p. ***2172)*** - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 352).

6.395.3.6 virtual float cms::MapMessage::getFloat (const std::string & *name*) const [pure virtual]

Returns the Float value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 353).

6.395.3.7 virtual int cms::MapMessage::getInt (const std::string & *name*) const [pure virtual]

Returns the Int value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 353).

6.395.3.8 virtual long long cms::MapMessage::getLong (const std::string & *name*) const [pure virtual]

Returns the Long value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 353).

6.395.3.9 virtual std::vector<std::string> cms::MapMessage::getMapNames () const [pure virtual]

Returns an Enumeration of all the names in the **MapMessage** (p. 2024) object.

Returns:

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 2024)

Exceptions:

CMSException *(p. 979)* - if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 354).

6.395.3.10 virtual short cms::MapMessage::getShort (const std::string & *name*) const [pure virtual]

Returns the Short value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException *(p. 979)* - if the operation fails due to an internal error.

MessageFormatException *(p. 2172)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 354).

6.395.3.11 virtual std::string cms::MapMessage::getString (const std::string & *name*) const [pure virtual]

Returns the String value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException *(p. 979)* - if the operation fails due to an internal error.

MessageFormatException *(p. 2172)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 355).

6.395.3.12 virtual ValueType cms::MapMessage::getValueType (const std::string & *key*) const [pure virtual]

Returns the value type for the given key mapping. The CMS provider should translate all internal type identifiers into the CMS Value types returning UNKNOWN_TYPE for any specialized types not directly supported in the CMS API.

Parameters:

key The string key used to look up the value type mapping.

Returns:

The ValueType contained in the given mapping.

Exceptions:

CMSException *(*p. ***979***) if no mapping exists that matches the requested key.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 355).

6.395.3.13 virtual bool cms::MapMessage::isEmpty () const [pure virtual]

Returns true if there are no values stored in the **MapMessage** (p. 2024) body.

Returns:

true if the body of the **MapMessage** (p. 2024) contains no elements.

Exceptions:

CMSException *(*p. ***979***) if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 355).

6.395.3.14 virtual bool cms::MapMessage::itemExists (const std::string & *name*) const [pure virtual]

Indicates whether an item exists in this **MapMessage** (p. 2024) object.

Parameters:

name String name of the Object in question

Returns:

boolean value indicating if the name is in the map

Exceptions:

CMSException *(*p. ***979***) - if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 356).

6.395.3.15 virtual void cms::MapMessage::setBoolean (const std::string & *name*, bool *value*) [pure virtual]

Sets a boolean value with the specified name into the Map.

Parameters:

name the name of the boolean

value the boolean value to set in the Map

Exceptions:

CMSException *(*p. ***979***) - if the operation fails due to an internal error.

MessageNotWritableException - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 356).

6.395.3.16 virtual void cms::MapMessage::setByte (const std::string & *name*, unsigned char *value*) [pure virtual]

Sets a Byte value with the specified name into the Map.

Parameters:

name the name of the Byte

value the Byte value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 356).

6.395.3.17 virtual void cms::MapMessage::setBytes (const std::string & *name*, const std::vector< unsigned char > & *value*) [pure virtual]

Sets a Bytes value with the specified name into the Map.

Parameters:

name The name of the Bytes

value The Bytes value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 357).

6.395.3.18 virtual void cms::MapMessage::setChar (const std::string & *name*, char *value*) [pure virtual]

Sets a Char value with the specified name into the Map.

Parameters:

name the name of the Char

value the Char value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException *(*p. ***2190)*** - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 357).

6.395.3.19 virtual void cms::MapMessage::setDouble (const std::string & *name*, double *value*) [pure virtual]

Sets a Double value with the specified name into the Map.

Parameters:

name The name of the Double

value The Double value to set in the Map

Exceptions:

CMSException *(*p. ***979)*** - if the operation fails due to an internal error.

MessageNotWriteableException *(*p. ***2190)*** - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 357).

6.395.3.20 virtual void cms::MapMessage::setFloat (const std::string & *name*, float *value*) [pure virtual]

Sets a Float value with the specified name into the Map.

Parameters:

name The name of the Float

value The Float value to set in the Map

Exceptions:

CMSException *(*p. ***979)*** - if the operation fails due to an internal error.

MessageNotWriteableException *(*p. ***2190)*** - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 358).

6.395.3.21 virtual void cms::MapMessage::setInt (const std::string & *name*, int *value*) [pure virtual]

Sets a Int value with the specified name into the Map.

Parameters:

name The name of the Int

value The Int value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 358).

6.395.3.22 virtual void cms::MapMessage::setLong (const std::string & *name*, long long *value*) [pure virtual]

Sets a Long value with the specified name into the Map.

Parameters:

name The name of the Long

value The Long value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 358).

6.395.3.23 virtual void cms::MapMessage::setShort (const std::string & *name*, short *value*) [pure virtual]

Sets a Short value with the specified name into the Map.

Parameters:

name The name of the Short

value The Short value to set in the Map

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 359).

6.395.3.24 virtual void cms::MapMessage::setString (const std::string & *name*, const std::string & *value*) [pure virtual]

Sets a String value with the specified name into the Map.

Parameters:

name The name of the String

value The String value to set in the Map

Exceptions:

CMSException *(*p. ***979****)* - if the operation fails due to an internal error.

MessageNotWriteableException *(*p. ***2190****)* - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 359).

6.396 decaf::util::logging::MarkBlockLogger Class Reference

Defines a class that can be used to mark the entry and exit from scoped blocks.

`#include <src/main/decaf/util/logging/MarkBlockLogger.h>`

Public Member Functions

- **MarkBlockLogger** (**Logger** *logger, const std::string &blockName)
  Constructor - Marks Block entry.
- virtual ~**MarkBlockLogger** ()

6.396.1 Detailed Description

Defines a class that can be used to mark the entry and exit from scoped blocks. Create an instance of this class at the start of a scoped block, passing it the logger to use and the name of the block. The block entry and exit will be marked using the scope name, logger to the logger at the MARKBLOCK log level.

6.396.2 Constructor & Destructor Documentation

6.396.2.1 decaf::util::logging::MarkBlockLogger::MarkBlockLogger (Logger * *logger*, const std::string & *blockName*) [inline]

Constructor - Marks Block entry.

Parameters:

logger **Logger** (p. 1935) to use

blockName Block name

6.396.2.2 virtual decaf::util::logging::MarkBlockLogger::~MarkBlockLogger () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**MarkBlockLogger.h**

6.397 activemq::wireformat::MarshalAware Class Reference

`#include <src/main/activemq/wireformat/MarshalAware.h>`Inheritance diagram for activemq::wireformat::MarshalAware:

Public Member Functions

- virtual ~**MarshalAware** ()
- virtual bool **isMarshalAware** () const =0

  Determine if the class implementing this interface is really wanting to be told about marshaling.

- virtual void **beforeMarshal** (**WireFormat** *wireFormat)=0

  Called before marshaling is started to prepare the object to be marshaled.

- virtual void **afterMarshal** (**WireFormat** *wireFormat)=0

  Called after marshaling is started to cleanup the object being marshaled.

- virtual void **beforeUnmarshal** (**WireFormat** *wireFormat)=0

  Called before unmarshaling is started to prepare the object to be unmarshaled.

- virtual void **afterUnmarshal** (**WireFormat** *wireFormat)=0

  Called after unmarshaling is started to cleanup the object being unmarshaled.

- virtual void **setMarshaledForm** (**WireFormat** *wireFormat, const std::vector< char > &data)=0

  Called to set the data to this object that will contain the objects marshaled form.

- virtual std::vector< unsigned char > **getMarshaledForm** (**WireFormat** *wireFormat)=0

  Called to get the data to this object that will contain the objects marshaled form.

6.397.1 Constructor & Destructor Documentation

6.397.1.1 virtual activemq::wireformat::MarshalAware::~MarshalAware () [virtual]

6.397.2 Member Function Documentation

6.397.2.1 virtual void activemq::wireformat::MarshalAware::afterMarshal (WireFormat * *wireFormat*) [pure virtual]

Called after marshaling is started to cleanup the object being marshaled.

Parameters:

wireFormat The **wireformat** (p. 81) object to control marshaling

Exceptions:

IOException if an I/O error occurs.

6.397.2.2 virtual void activemq::wireformat::MarshalAware::afterUnmarshal (WireFormat * *wireFormat*) [pure virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters:

wireFormat The **wireformat** (p. 81) object to control marshaling

Exceptions:

IOException if an I/O error occurs.

6.397.2.3 virtual void activemq::wireformat::MarshalAware::beforeMarshal (WireFormat * *wireFormat*) [pure virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters:

wireFormat The **wireformat** (p. 81) object to control marshaling

Exceptions:

IOException if an I/O error occurs.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 349), and **activemq::commands::ActiveMQTextMessage** (p. 519).

6.397.2.4 virtual void activemq::wireformat::MarshalAware::beforeUnmarshal (WireFormat * *wireFormat*) [pure virtual]

Called before unmarshaling is started to prepare the object to be unmarshaled.

Parameters:

wireFormat The **wireformat** (p. 81) object to control marshaling

Exceptions:

IOException if an I/O error occurs.

6.397.2.5 virtual std::vector<unsigned char> activemq::wireformat::MarshalAware::getMarshaledForm (WireFormat * *wireFormat*) [pure virtual]

Called to get the data to this object that will contain the objects marshaled form.

Parameters:

wireFormat The **wireformat** (p. 81) object to control unmarshaling

Returns:

buffer that holds the objects data.

6.397.2.6 virtual bool activemq::wireformat::MarshalAware::isMarshalAware () const [pure virtual]

Determine if the class implementing this interface is really wanting to be told about marshaling. Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns:

true if this class cares about marshaling.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 356), **activemq::commands::BaseDataStructure** (p. 670), **activemq::commands::Message** (p. 2082), and **activemq::commands::WireFormatInfo** (p. 3238).

6.397.2.7 virtual void activemq::wireformat::MarshalAware::setMarshaledForm (WireFormat * *wireFormat*, const std::vector< char > & *data*) [pure virtual]

Called to set the data to this object that will contain the objects marshaled form.

Parameters:

wireFormat - the **wireformat** (p. 81) object to control unmarshaling

data - vector of object binary data

wireFormat The **wireformat** (p. 81) object to control marshaling

data A vector of bytes that contains the object in marshaled form.

Exceptions:

IOException if an I/O error occurs.

Public Member Functions

- **MarshallingSupport** ()
- virtual ~**MarshallingSupport** ()

Static Public Member Functions

- static void **writeString** (**decaf::io::DataOutputStream** &dataOut, const std::string &value)

  Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

- static void **writeString16** (**decaf::io::DataOutputStream** &dataOut, const std::string &value)

  Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

- static void **writeString32** (**decaf::io::DataOutputStream** &dataOut, const std::string &value)

  Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

- static std::string **readString16** (**decaf::io::DataInputStream** &dataIn)

  Reads an Openwire encoded string from the provided DataInputStream.

- static std::string **readString32** (**decaf::io::DataInputStream** &dataIn)

  Reads an Openwire encoded string from the provided DataInputStream.

- static std::string **asciiToModifiedUtf8** (const std::string &asciiString)

  Given an ASCII String with byte values [0..255] convert the string to a string containing the modified UTF-8 form of that same string.

- static std::string **modifiedUtf8ToAscii** (const std::string modifiedUtf8String)

  Given a string that contains bytes in the Java Modified UTF-8 format convert that string back into ASCII values from [0..255].

6.399.1 Constructor & Destructor Documentation

6.399.1.1 activemq::util::MarshallingSupport::MarshallingSupport ()

6.399.1.2 virtual activemq::util::MarshallingSupport::~MarshallingSupport () [virtual]

6.399.2 Member Function Documentation

6.399.2.1 static std::string activemq::util::MarshallingSupport::asciiToModifiedUtf8 (const std::string & *asciiString*) [static]

Given an ASCII String with byte values [0..255] convert the string to a string containing the modified UTF-8 form of that same string. This allows an ASCII string containing values greater than 127 as well as embedded NULLs to be sent to a Java client.

Parameters:

asciiString The ASCII string to encode as Modified UTF-8

Returns:

a string containing the Modified UTF-8 encoded form of the provided string.

Exceptions:

UTFDataFormatException if the length of the encoded string would exceed the size of an signed integer.

6.399.2.2 static std::string activemq::util::MarshallingSupport::modifiedUtf8ToAscii (const std::string *modifiedUtf8String*) [static]

Given a string that contains bytes in the Java Modified UTF-8 format convert that string back into ASCII values from [0..255]. This will handle any string sent from a Java client which contains values within the [0..255] range or has embedded Nulls. Strings that have encoded values greater than 255 will cause an exception to be thrown.

Parameters:

modifiedUtf8String The string to convert from Modified UTF-8 to ASCII.

Returns:

the ASCII encoded version of the provided string.

Exceptions:

UTFDataFormatException if the provided string contains invalid data or the character values encoded in the string exceed ASCII value 255.

6.399.2.3 static std::string activemq::util::MarshallingSupport::readString16 (decaf::io::DataInputStream & *dataIn*) [static]

Reads an Openwire encoded string from the provided DataInputStream. No string processing is performed by this method, clients that know the data contains UTF-8 encoded content must use one of the utility methods of this class to decode the UTF-8 data.

This version assumes a size prefix of 16bits.

Parameters:

dataIn The DataInputStream to read the String data from.

Returns:

the String value.

Exceptions:

IOException if an I/O error occurs while writing the string.

6.399.2.4 static std::string activemq::util::MarshallingSupport::readString32 (decaf::io::DataInputStream & *dataIn*) [static]

Reads an Openwire encoded string from the provided DataInputStream. No string processing is performed by this method, clients that know the data contains UTF-8 encoded content must use one of the utility methods of this class to decode the UTF-8 data.

This version assumes a size prefix of 32bits.

Parameters:

dataIn The DataInputStream to read the String data from.

Returns:

the String value.

Exceptions:

IOException if an I/O error occurs while writing the string.

6.399.2.5 static void activemq::util::MarshallingSupport::writeString (decaf::io::DataOutputStream & *dataOut*, const std::string & *value*) [static]

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string. User must encode to Modified UTF-8 as needed.

Parameters:

dataOut The DataOutputStream to write the String data to.

value Thre String value to write in Openwire form.

Exceptions:

IOException if an I/O error occurs while writing the string.

6.399.2.6 static void activemq::util::MarshallingSupport::writeString16 (decaf::io::DataOutputStream & *dataOut*, const std::string & *value*) [static]

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string. User must encode to Modified UTF-8 as needed. This method write out only the size as a short and the string data no Openwire Type tag is appended.

Parameters:

dataOut The DataOutputStream to write the String data to.

value Thre String value to write in Openwire form.

Exceptions:

IOException if an I/O error occurs while writing the string.

6.399.2.7 static void activemq::util::MarshallingSupport::writeString32 (decaf::io::DataOutputStream & *dataOut*, const std::string & *value*) [static]

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string. User must encode to Modified UTF-8 as needed. This method write out only the size as a int and the string data no Openwire Type tag is appended.

Parameters:

dataOut The DataOutputStream to write the String data to.

value Thre String value to write in Openwire form.

Exceptions:

IOException if an I/O error occurs while writing the string.

The documentation for this class was generated from the following file:

6.400 decaf::lang::Math Class Reference

The class `Math` (p. 2043) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

`#include <src/main/decaf/lang/Math.h>`

Public Member Functions

- **Math** ()
- virtual ~**Math** ()

Static Public Member Functions

- static int **abs** (int value)

  Returns the absolute value of an int value.

- static long long **abs** (long long value)

  Returns the absolute value of an long long value.

- static float **abs** (float value)

  Returns the absolute value of a float value.

- static double **abs** (double value)

  Returns the absolute value of a double value.

- static double **sqrt** (double value)

  Returns the arc cosine of an angle, in the range of 0.0 through pi.

- static double **pow** (double base, double exp)

  Returns the value of the first argument raised to the power of the second argument.

- static short **min** (short a, short b)

  Returns the double value that is closest in value to the argument and is equal to a mathematical integer.

- static int **min** (int a, int b)

  Returns the smaller of two `int` values.

- static unsigned int **min** (unsigned int a, unsigned int b)

  Returns the smaller of two `unsigned int` values.

- static long long **min** (long long a, long long b)

  Returns the smaller of two `long long` values.

- static float **min** (float a, float b)

  Returns the smaller of two float values.

- static double **min** (double a, double b)

  Returns the smaller of two double values.

- static short **max** (short a, short b)

  Returns the larger of two `short` *values.*

- static int **max** (int a, int b)

  Returns the larger of two `int` *values.*

- static long long **max** (long long a, long long b)

  Returns the larger of two `long long` *values.*

- static float **max** (float a, float b)

  Returns the greater of two float values.

- static double **max** (double a, double b)

  Returns the greater of two double values.

- static double **ceil** (double value)

  Returns the natural logarithm (base e) of a double value.

- static double **floor** (double value)

  Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.

- static int **round** (float value)

  Returns the closest int to the argument.

- static long long **round** (double value)

  Returns the closest long long to the argument.

- static double **random** ()

  Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.

- static float **signum** (float value)

  Returns Euler's number e raised to the power of a double value.

- static double **signum** (double value)

  Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.

- static double **toRadians** (double angdeg)

  Returns the measure in radians of the supplied degree angle.

- static double **toDegrees** (double angrad)

  Returns the measure in degrees of the supplied radian angle.

Static Public Attributes

- static const double **E**
- static const double **PI**

6.400.1 Detailed Description

The class `Math` (p. 2043) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

6.400.2 Constructor & Destructor Documentation

6.400.2.1 decaf::lang::Math::Math () [inline]

6.400.2.2 virtual decaf::lang::Math::~Math () [inline, virtual]

6.400.3 Member Function Documentation

6.400.3.1 static double decaf::lang::Math::abs (double *value*) [static]

Returns the absolute value of a double value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

o If the argument is positive zero or negative zero, the result is positive zero. o If the argument is infinite, the result is positive infinity. o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: **Double::longBitsToDouble** (p. 1420)(0x7fffffffffffffffULL & Double::doubleToLongBits(value))

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.400.3.2 static float decaf::lang::Math::abs (float *value*) [static]

Returns the absolute value of a float value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

o If the argument is positive zero or negative zero, the result is positive zero. o If the argument is infinite, the result is positive infinity. o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: **Float::intBitsToFloat** (p. 1536)(0x7fffffff & Float::floatToIntBits(value))

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.400.3.3 static long long decaf::lang::Math::abs (long long *value*) [inline, static]

Returns the absolute value of an long long value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.400.3.4 static int decaf::lang::Math::abs (int *value*) [inline, static]

Returns the absolute value of an int value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.400.3.5 static double decaf::lang::Math::ceil (double *value*) [static]

Returns the natural logarithm (base e) of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity.

Parameters:

value the value to compute the natural log of.

Returns:

the natural log of value. Returns the base 10 logarithm of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity. o If the argument is equal to 10n for integer n, then the result is n.

Parameters:

value - the value to operate on

Returns:

the long base 10 of value Returns the natural logarithm of the sum of the argument and 1. Note that for small values x, the result of log1p(x) is much closer to the true result of ln(1 + x) than the floating-point evaluation of log(1.0+x).

Special cases:

o If the argument is NaN or less than -1, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative one, then the result is negative infinity. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to operate on

Returns:

the the value ln(x + 1), the natural log of x + 1 Returns the smallest (closest to negative infinity) double value that is greater than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument. o If the argument value is less than zero but greater than -1.0, then the result is negative zero.

Note that the value of Math.ceil(x) is exactly the value of -Math.floor(-x).

Parameters:

value - the value to find the ceiling of

Returns:

the smallest (closest to negative infinity) floating-point value that is greater than or equal to the argument and is equal to a mathematical integer.

6.400.3.6 static double decaf::lang::Math::floor (double *value*) [static]

Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the value to find the floor of

Returns:

the largest (closest to positive infinity) floating-point value that less than or equal to the argument and is equal to a mathematical integer.

6.400.3.7 static double decaf::lang::Math::max (double *a*, double *b*) [static]

Returns the greater of two double values. That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.400.3.8 static float decaf::lang::Math::max (float *a*, float *b*) [static]

Returns the greater of two float values. That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.400.3.9 static long long decaf::lang::Math::max (long long *a*, long long *b*) [inline, static]

Returns the larger of two `long long` values. That is, the result the argument closer to the value of `Long::MAX_VALUE` (p. 1980). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.400.3.10 static int decaf::lang::Math::max (int *a*, int *b*) [inline, static]

Returns the larger of two `int` values. That is, the result the argument closer to the value of `Integer::MAX_VALUE` (p. 1751). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.400.3.11 static short decaf::lang::Math::max (short *a*, short *b*) [inline, static]

Returns the larger of two `short` values. That is, the result the argument closer to the value of `Short::MAX_VALUE` (p. 2729). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.400.3.12 static double decaf::lang::Math::min (double *a*, double *b*) [static]

Returns the smaller of two double values. That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.400.3.13 static float decaf::lang::Math::min (float *a*, float *b*) [static]

Returns the smaller of two float values. That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.400.3.14 static long long decaf::lang::Math::min (long long *a*, long long *b*) [inline, static]

Returns the smaller of two `long long` values. That is, the result the argument closer to the value of `Long::MIN_VALUE` (p. 1980). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.400.3.15 static unsigned int decaf::lang::Math::min (unsigned int *a*, unsigned int *b*) [inline, static]

Returns the smaller of two `unsigned int` values. That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p. 1751). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.400.3.16 static int decaf::lang::Math::min (int *a*, int *b*) [inline, static]

Returns the smaller of two `int` values. That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p. 1751). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.400.3.17 static short decaf::lang::Math::min (short *a*, short *b*) [inline, static]

Returns the double value that is closest in value to the argument and is equal to a mathematical integer. If two double values that are mathematical integers are equally close, the result is the integer value that is even. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the value to round to the nearest integer

Returns:

the rounded value Returns the smaller of two short values. That is, the result is the argument closer to the value of `decaf.lang.Short::MIN_VALUE` (p. 2729). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::drainTo().

6.400.3.18 static double decaf::lang::Math::pow (double *base*, double *exp*) [static]

Returns the value of the first argument raised to the power of the second argument. Special cases:

o If the second argument is positive or negative zero, then the result is 1.0. o If the second argument is 1.0, then the result is the same as the first argument. o If the second argument is NaN, then the result is NaN. o If the first argument is NaN and the second argument is nonzero, then the result is NaN.

Parameters:

base - the base

exp - the exponent

Returns:

the base raised to the power of exp.

6.400.3.19 static double decaf::lang::Math::random () [static]

Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard. The remainder value is mathematically equal to f1 - f2 × n, where n is the mathematical integer closest to the exact mathematical value of the quotient f1/f2, and if two mathematical integers are equally close to f1/f2, then n is the integer that is even. If the remainder is zero, its sign is the same as the sign of the first argument. Special cases:

o If either argument is NaN, or the first argument is infinite, or the second argument is positive zero or negative zero, then the result is NaN. o If the first argument is finite and the second argument is infinite, then the result is the same as the first argument.

Parameters:

f1 - the dividend.

f2 - the divisor

Returns:

the IEEE remainder of value Returns a double value with a positive sign, greater than or equal to 0.0 and less than 1.0. Returned values are chosen pseudorandomly with (approximately) uniform distribution from that range.

When this method is first called, it creates a single new pseudorandom-number generator; This new pseudorandom-number generator is used thereafter for all calls to this method and is used nowhere else.

This method is properly synchronized to allow correct use by more than one thread. However, if many threads need to generate pseudorandom numbers at a great rate, it may reduce contention for each thread to have its own pseudorandom-number generator.

Returns:

a pseudorandom double greater than or equal to 0.0 and less than 1.0.

6.400.3.20 static long long decaf::lang::Math::round (double *value*) [static]

Returns the closest long long to the argument. The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type long long. In other words, the result is equal to the value of the expression: (long long)**Math.floor** (p. 2047)(a + 0.5d)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Long::MIN_VALUE** (p. 1980), the result is equal to the value of **Long::MIN_VALUE** (p. 1980). o If the argument is positive infinity or any value greater than or equal to the value of **Long::MAX_VALUE** (p. 1980), the result is equal to the value of **Long::MAX_VALUE** (p. 1980).

Parameters:

value - the value to round

Returns:

the value of the argument rounded to the nearest integral value.

6.400.3.21 static int decaf::lang::Math::round (float *value*) [static]

Returns the closest int to the argument. The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type int. In other words, the result is equal to the value of the expression: (int)**Math.floor** (p. 2047)(a + 0.5f)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Integer::MIN_VALUE** (p. 1751), the result is equal to the value of **Integer::MIN_VALUE** (p. 1751). o If the argument is positive infinity or any value greater than or equal to the value of **Integer::MAX_VALUE** (p. 1751), the result is equal to the value of **Integer::MAX_VALUE** (p. 1751).

Parameters:

value - the value to round

Returns:

the value of the argument rounded to the nearest integral value.

6.400.3.22 static double decaf::lang::Math::signum (double *value*) [static]

Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero. Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the floating-point value whose signum is to be returned

Returns:

the signum function of the argument

6.400.3.23 static float decaf::lang::Math::signum (float *value*) [static]

Returns Euler's number e raised to the power of a double value. Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is positive zero.

Parameters:

value - the exponent to raise e to

Returns:

the value e^a, where e is the base of the natural logarithms. Returns e^x - 1. Note that for values of x near 0, the exact sum of expm1(x) + 1 is much closer to the true result of ex than exp(x). Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is -1.0. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to raise e^x - 1

Returns:

the value ex - 1. Returns sqrt(x^2 + y^2) without intermediate overflow or underflow. Special cases:

If either argument is infinite, then the result is positive infinity. If either argument is NaN and neither argument is infinite, then the result is NaN.

Parameters:

x - an argument

y - another argument

Returns:

the sqrt(x^2 + y^2) without intermediate overflow or underflow Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero. Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the floating-point value whose signum is to be returned

Returns:

the signum function of the argument

6.400.3.24 static double decaf::lang::Math::sqrt (double *value*) [static]

Returns the arc cosine of an angle, in the range of 0.0 through pi. Special case:

o If the argument is NaN or its absolute value is greater than 1, then the result is NaN.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc cosine of value in radians. Returns the arc sine of an angle, in the range of -pi/2 through pi/2. Special cases:

o If the argument is NaN or its absolute value is greater than 1, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc cosine of value in radians. Returns the arc tangent of an angle, in the range of -pi/2 through pi/2. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc tangent of value in radians. Converts rectangular coordinates (x, y) to polar (r, theta). This method computes the phase theta by computing an arc tangent of y/x in the range of -pi to pi. Special cases:

o If either argument is NaN, then the result is NaN. o If the first argument is positive zero and the second argument is positive, or the first argument is positive and finite and the second argument is positive infinity, then the result is positive zero. o If the first argument is negative zero and the second argument is positive, or the first argument is negative and finite and the second argument is positive infinity, then the result is negative zero. o If the first argument is positive zero and the second argument is negative, or the first argument is positive and finite and the second argument is negative infinity, then the result is the double value closest to pi. o If the first argument is negative zero and the second argument is negative, or the first argument is negative and finite and the second argument is negative infinity, then the result is the double value closest to -pi. o If the first argument is positive and the second argument is positive zero or negative zero, or the first argument is positive infinity and the second argument is finite, then the result is the double value closest to pi/2. o If the first argument is negative and the second argument is positive zero or negative zero, or the first argument is negative infinity and the second argument is finite, then the result is the double value closest to -pi/2. o If both arguments are positive infinity, then the result is the double value closest to pi/4. o If the first argument is positive infinity and the second argument is negative infinity, then the result is the double value closest to 3∗pi/4. o If the first argument is negative infinity and the second argument is positive infinity, then the result is the double value closest to -pi/4. o If both arguments are negative infinity, then the result is the double value closest to -3∗pi/4.

Parameters:

y - the ordinate coordinate

x - the abscissa coordinate

Returns:

the theta component of the point (r, theta) in polar coordinates that corresponds to the point (x, y) in Cartesian coordinates. Returns the cube root of a double value. For positive finite x, cbrt(-x) == -cbrt(x); that is, the cube root of a negative value is the negative of the cube root of that value's magnitude. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the double to compute the cube root of

Returns:

the cube root of value Returns the trigonometric cosine of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN.

Parameters:

value - an value in radians

Returns:

the cosine of the argument. Returns the hyperbolic cosine of a double value. The hyperbolic cosine of x is defined to be (ex + e-x)/2 where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is positive infinity. o If the argument is zero, then the result is 1.0.

Parameters:

value - the number whose hyperbolic cosine is to be found

Returns:

the hyperbolic cosine of value Returns the trigonometric sine of an angle. Special case:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose sin is to be found

Returns:

the sine of value Returns the hyperbolic sine of a double value. The hyperbolic sine of x is defined to be (ex - e-x)/2 where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose hyperbolic sin is to be found

Returns:

the hyperbolic sine of value Returns the trigonometric tangent of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose tangent is to be found

Returns:

the tangent of value Returns the hyperbolic tangent of a double value. The hyperbolic tangent of x is defined to be (ex - e-x)/(ex + e-x), in other words, sinh(x)/cosh(x). Note that the absolute value of the exact tanh is always less than 1. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument. o If the argument is positive infinity, then the result is +1.0. o If the argument is negative infinity, then the result is -1.0.

Parameters:

value - the number whose hyperbolic tangent is to be found

Returns:

the hyperbolic cosine of value Returns the correctly rounded positive square root of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Otherwise, the result is the double value closest to the true mathematical square root of the argument value.

Parameters:

value - the value to find the square root of

the square root of the argument.

6.400.3.25 static double decaf::lang::Math::toDegrees (double *angrad*) [inline, static]

Returns the measure in degrees of the supplied radian angle.

Parameters:

angrad - an angle in radians

Returns:

the degree measure of the angle.

6.400.3.26 static double decaf::lang::Math::toRadians (double *angdeg*) [inline, static]

Returns the measure in radians of the supplied degree angle.

Parameters:

angdeg - an angle in degrees

Returns:

the radian measure of the angle.

MD4 MessageDigestSpi.

`#include <src/main/decaf/internal/security/provider/crypto/MD4MessageDigestSpi.h>`Inheritance diagram for decaf::internal::security::provider::crypto::MD4MessageDigestSpi:

Public Member Functions

- **MD4MessageDigestSpi** ()
- virtual ~**MD4MessageDigestSpi** ()
- virtual bool **isCloneable** () const

  Queries the SPI implementation and returns true if the SPI can be cloned.

- virtual MessageDigestSpi * **clone** ()

  Returns a clone if the implementation supports being cloned.

- virtual int **engineGetDigestLength** ()

  Returns the digest length in bytes.

- virtual void **engineUpdate** (unsigned char input)

  Updates the digest using the specified byte.

- virtual void **engineUpdate** (const unsigned char *input, int size, int offset, int length)

  Updates the digest using the specified array of bytes, starting at the specified offset.

- virtual void **engineReset** ()

  Resets the digest for further use.

- virtual void **engineUpdate** (const std::vector< unsigned char > &input)

  Update the digest using the specified Vector of Bytes.

- virtual void **engineUpdate** (**decaf::nio::ByteBuffer** &input)

  Update the digest using the specified ByteBuffer.

- virtual std::vector< unsigned char > **engineDigest** ()

  Completes the hash computation by performing final operations such as padding.

- virtual int **engineDigest** (unsigned char *buffer, int size, int offset, int length)

  Completes the hash computation by performing final operations such as padding.

6.401.2 Constructor & Destructor Documentation

6.401.2.1 decaf::internal::security::provider::crypto::MD4MessageDigestSpi::MD4MessageDigestSpi ()

6.401.2.2 virtual decaf::internal::security::provider::crypto::MD4MessageDigestSpi::~MD4MessageDigestSp () [virtual]

6.401.3 Member Function Documentation

6.401.3.1 virtual MessageDigestSpi* decaf::internal::security::provider::crypto::MD4MessageDigestSpi::clone () [virtual]

Returns a clone if the implementation supports being cloned.

Returns:

a new pointer that is a copy of this object.

Exceptions:

CloneNotSupportedException if this is called on an implementation that does not support cloning.

Reimplemented from **decaf::security::MessageDigestSpi** (p. 2141).

6.401.3.2 virtual int decaf::internal::security::provider::crypto::MD4MessageDigestSpi::engineDigest (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Completes the hash computation by performing final operations such as padding. Once engineDigest has been called, the engine should be reset (see engineReset). Resetting is the responsibility of the engine implementor.

Parameters:

buffer The output buffer in which to store the digest

size The size of the given input buffer

offset The offset to start from in the output buffer

length The number of bytes within buffer allotted for the digest. Both this default implementation and the SUN **provider** (p. 105) do not return partial digests. The presence of this parameter is solely for consistency in our API's. If the value of this parameter is less than the actual digest length, the method will throw a DigestException. This parameter is ignored if its value is greater than or equal to the actual digest length.

Returns:

the length of the digest stored in the output buffer.

Exceptions:

DigestException if an error occurs.

NullPointerException if the buffer pointer is NULL.

Implements **decaf::security::MessageDigestSpi** (p. 2141).

6.401.3.3 virtual std::vector<unsigned char> decaf::internal::security::provider::crypto::MD4MessageDigestSpi::engineDigest () [virtual]

Completes the hash computation by performing final operations such as padding. Once engineDigest has been called, the engine should be reset (see engineReset). Resetting is the responsibility of the engine implementor.

Returns:

an STL vector of bytes containing the resulting hash value.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.401.3.4 virtual int decaf::internal::security::provider::crypto::MD4MessageDigestSpi::engineGetDigestLength () [virtual]

Returns the digest length in bytes.

Returns:

The digest length in bytes.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.401.3.5 virtual void decaf::internal::security::provider::crypto::MD4MessageDigestSpi::engineReset () [virtual]

Resets the digest for further use.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.401.3.6 virtual void decaf::internal::security::provider::crypto::MD4MessageDigestSpi::engineUpdate (decaf::nio::ByteBuffer & *input*) [virtual]

Update the digest using the specified ByteBuffer. The digest is updated using the input.remaining() bytes starting at input.position(). Upon return, the buffer's position will be equal to its limit; its limit will not have changed.

Parameters:

input The ByteBuffer instance that will be used to update the digest.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.401.3.7 virtual void decaf::internal::security::provider::crypto::MD4MessageDigestSpi::engineUpdate (const std::vector< unsigned char > & *input*) [virtual]

Update the digest using the specified Vector of Bytes.

Parameters:

input The vector of bytes that will be used to update the digest.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.401.3.8 virtual void decaf::internal::security::provider::crypto::MD4MessageDigestSpi::engineUpdate (const unsigned char * *input*, int *size*, int *offset*, int *length*) [virtual]

Updates the digest using the specified array of bytes, starting at the specified offset.

Parameters:

input The array of bytes to use for the update.

size The size of the given input buffer..

offset The offset to start from in the array of bytes.

length The number of bytes to use, starting at offset.

Exceptions:

NullPointerException if the input array pointer is NULL.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.401.3.9 virtual void decaf::internal::security::provider::crypto::MD4MessageDigestSpi::engineUpdate (unsigned char *input*) [virtual]

Updates the digest using the specified byte.

Parameters:

input The byte to use for the update.

Implements **decaf::security::MessageDigestSpi** (p. 2144).

6.401.3.10 virtual bool decaf::internal::security::provider::crypto::MD4MessageDigestSpi::isCloneable () const [inline, virtual]

Queries the SPI implementation and returns true if the SPI can be cloned.

Returns:

true if the SPI is clonable.

Reimplemented from **decaf::security::MessageDigestSpi** (p. 2144).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/security/provider/crypto/**MD4MessageDigestSpi.h**

6.402 decaf::internal::security::provider::crypto::MD5MessageDigestSpi Class Reference

6.402.3 Member Function Documentation

6.402.3.1 virtual MessageDigestSpi* decaf::internal::security::provider::crypto::MD5MessageDigestSpi::clone () [virtual]

Returns a clone if the implementation supports being cloned.

Returns:

a new pointer that is a copy of this object.

Exceptions:

CloneNotSupportedException if this is called on an implementation that does not support cloning.

Reimplemented from **decaf::security::MessageDigestSpi** (p. 2141).

6.402.3.2 virtual int decaf::internal::security::provider::crypto::MD5MessageDigestSpi::engineDigest (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Completes the hash computation by performing final operations such as padding. Once engineDigest has been called, the engine should be reset (see engineReset). Resetting is the responsibility of the engine implementor.

Parameters:

buffer The output buffer in which to store the digest

size The size of the given input buffer

offset The offset to start from in the output buffer

length The number of bytes within buffer allotted for the digest. Both this default implementation and the SUN **provider** (p. 105) do not return partial digests. The presence of this parameter is solely for consistency in our API's. If the value of this parameter is less than the actual digest length, the method will throw a DigestException. This parameter is ignored if its value is greater than or equal to the actual digest length.

Returns:

the length of the digest stored in the output buffer.

Exceptions:

DigestException if an error occurs.

NullPointerException if the buffer pointer is NULL.

Implements **decaf::security::MessageDigestSpi** (p. 2141).

6.402.3.3 virtual std::vector<unsigned char> decaf::internal::security::provider::crypto::MD5MessageDigestSpi::engineDigest () [virtual]

Completes the hash computation by performing final operations such as padding. Once engineDigest has been called, the engine should be reset (see engineReset). Resetting is the responsibility of the engine implementor.

Returns:

an STL vector of bytes containing the resulting hash value.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.402.3.4 virtual int decaf::internal::security::provider::crypto::MD5MessageDigestSpi::engineGetDigestLength () [virtual]

Returns the digest length in bytes.

Returns:

The digest length in bytes.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.402.3.5 virtual void decaf::internal::security::provider::crypto::MD5MessageDigestSpi::engineReset () [virtual]

Resets the digest for further use.

Implements **decaf::security::MessageDigestSpi** (p. 2142).

6.402.3.6 virtual void decaf::internal::security::provider::crypto::MD5MessageDigestSpi::engineUpdate (decaf::nio::ByteBuffer & *input*) [virtual]

Update the digest using the specified ByteBuffer. The digest is updated using the input.remaining() bytes starting at input.position(). Upon return, the buffer's position will be equal to its limit; its limit will not have changed.

Parameters:

input The ByteBuffer instance that will be used to update the digest.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.402.3.7 virtual void decaf::internal::security::provider::crypto::MD5MessageDigestSpi::engineUpdate (const std::vector< unsigned char > & *input*) [virtual]

Update the digest using the specified Vector of Bytes.

Parameters:

input The vector of bytes that will be used to update the digest.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.402.3.8 virtual void decaf::internal::security::provider::crypto::MD5MessageDigestSpi::engineUpdate (const unsigned char * *input*, int *size*, int *offset*, int *length*) [virtual]

Updates the digest using the specified array of bytes, starting at the specified offset.

Parameters:

input The array of bytes to use for the update.

size The size of the given input buffer..

offset The offset to start from in the array of bytes.

length The number of bytes to use, starting at offset.

Exceptions:

NullPointerException if the input array pointer is NULL.

Implements **decaf::security::MessageDigestSpi** (p. 2143).

6.402.3.9 virtual void decaf::internal::security::provider::crypto::MD5MessageDigestSpi::engineUpdate (unsigned char *input*) [virtual]

Updates the digest using the specified byte.

Parameters:

input The byte to use for the update.

Implements **decaf::security::MessageDigestSpi** (p. 2144).

6.402.3.10 virtual bool decaf::internal::security::provider::crypto::MD5MessageDigestSpi::isCloneable () const [inline, virtual]

Queries the SPI implementation and returns true if the SPI can be cloned.

Returns:

true if the SPI is clonable.

Reimplemented from **decaf::security::MessageDigestSpi** (p. 2144).

The documentation for this class was generated from the following file:

6.403 activemq::util::MemoryUsage Class Reference

`#include <src/main/activemq/util/MemoryUsage.h>`Inheritance diagram for activemq::util::MemoryUsage:

Public Member Functions

- **MemoryUsage** ()

  Default Constructor.

- **MemoryUsage** (unsigned long long limit)

  *Creates an instance of an **Usage** (p. 3214) monitor with a set limit.*

- virtual ~**MemoryUsage** ()
- virtual void **waitForSpace** ()

  *Waits forever for more space to be returned to this **Usage** (p. 3214) Manager.*

- virtual void **waitForSpace** (unsigned int timeout)

  *Waits for more space to be returned to this **Usage** (p. 3214) Manager, times out when the given time span in milliseconds elapses.*

- virtual void **enqueueUsage** (unsigned long long value)

  Tries to increase the usage by value amount but blocks if this object is currently full.

- virtual void **increaseUsage** (unsigned long long value)

  Increases the usage by the value amount.

- virtual void **decreaseUsage** (unsigned long long value)

  Decreases the usage by the value amount.

- virtual bool **isFull** () const

  *Returns true if this **Usage** (p. 3214) instance is full, i.e.*

- unsigned long long **getUsage** () const

  Gets the current usage amount.

- void **setUsage** (unsigned long long usage)

  Sets the current usage amount.

- unsigned long long **getLimit** () const

  Gets the current limit amount.

- void **setLimit** (unsigned long long limit)

  Sets the current limit amount.

6.403.1 Constructor & Destructor Documentation

6.403.1.1 activemq::util::MemoryUsage::MemoryUsage ()

Default Constructor.

6.403.1.2 activemq::util::MemoryUsage::MemoryUsage (unsigned long long *limit*)

Creates an instance of an **Usage** (p. 3214) monitor with a set limit.

Parameters:

limit - amount of memory this manager allows.

6.403.1.3 virtual activemq::util::MemoryUsage::~MemoryUsage () [virtual]

6.403.2 Member Function Documentation

6.403.2.1 virtual void activemq::util::MemoryUsage::decreaseUsage (unsigned long long *value*) [virtual]

Decreases the usage by the value amount.

Parameters:

value Amount of space to return to the pool

Implements **activemq::util::Usage** (p. 3214).

6.403.2.2 virtual void activemq::util::MemoryUsage::enqueueUsage (unsigned long long *value*) [inline, virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters:

value Amount of usage in bytes to add.

Implements **activemq::util::Usage** (p. 3214).

6.403.2.3 unsigned long long activemq::util::MemoryUsage::getLimit () const [inline]

Gets the current limit amount.

Returns:

the amount that can be used before full.

6.403.2.4 unsigned long long activemq::util::MemoryUsage::getUsage () const [inline]

Gets the current usage amount.

Returns:

the amount of bytes currently used.

6.403.2.5 virtual void activemq::util::MemoryUsage::increaseUsage (unsigned long long *value*) [virtual]

Increases the usage by the value amount.

Parameters:

value Amount of usage to add.

Implements **activemq::util::Usage** (p. 3215).

6.403.2.6 virtual bool activemq::util::MemoryUsage::isFull () const [virtual]

Returns true if this **Usage** (p. 3214) instance is full, i.e. **Usage** (p. 3214) >= 100%

Implements **activemq::util::Usage** (p. 3215).

6.403.2.7 void activemq::util::MemoryUsage::setLimit (unsigned long long *limit*) [inline]

Sets the current limit amount.

Parameters:

limit - The amount that can be used before full.

6.403.2.8 void activemq::util::MemoryUsage::setUsage (unsigned long long *usage*) [inline]

Sets the current usage amount.

Parameters:

usage - The amount to tag as used.

6.403.2.9 virtual void activemq::util::MemoryUsage::waitForSpace (unsigned int *timeout*) [virtual]

Waits for more space to be returned to this **Usage** (p. 3214) Manager, times out when the given time span in milliseconds elapses.

Parameters:

timeout The time to wait for more space.

Implements **activemq::util::Usage** (p. 3215).

6.403.2.10 virtual void activemq::util::MemoryUsage::waitForSpace () [virtual]

Waits forever for more space to be returned to this **Usage** (p. 3214) Manager.

Implements **activemq::util::Usage** (p. 3215).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**MemoryUsage.h**

6.404 activemq::commands::Message Class Reference

`#include <src/main/activemq/commands/Message.h>`Inheritance diagram for activemq::commands::Message:

Public Member Functions

- **Message** ()
- virtual ~**Message** ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **Message** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent.*

- **Pointer**< **Message** > **copy** () const

  Create a Pointer based copy of this message.

- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED)

  Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.

- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED)

  Called after unmarshaling is started to cleanup the object being unmarshaled.

- virtual bool **isMarshalAware** () const

  Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

- virtual void **setAckHandler** (const **Pointer**< **core::ActiveMQAckHandler** > &handler)

  *Sets the Acknowledgment Handler that this **Message** (p. 2072) will use when the Acknowledge method is called.*

- virtual **Pointer**< **core::ActiveMQAckHandler** > **getAckHandler** () const

  *Gets the Acknowledgment Handler that this **Message** (p. 2072) will use when the Acknowledge method is called.*

- void **setConnection** (**core::ActiveMQConnection** *__connection__)

  Sets the ActiveMQConnection instance that this ***Command*** (p. *1019*) *was created from when the session create methods are called to create a* ***Message*** (p. *2072*).

- **core::ActiveMQConnection** * **getConnection** () const

  Gets the ActiveMQConnection instance that this ***Command*** (p. *1019*) *was created from when the session create methods are called to create a* ***Message*** (p. *2072*).

- virtual unsigned int **getSize** () const

  Returns the Size of this message in Bytes.

- virtual bool **isExpired** () const

  Returns if this message has expired, meaning that its Expiration time has elapsed.

- virtual void **onSend** ()

  Allows derived ***Message*** (p. *2072*) *classes to perform tasks before a message is sent.*

- **util::PrimitiveMap** & **getMessageProperties** ()

  Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.

- const **util::PrimitiveMap** & **getMessageProperties** () const
- bool **isReadOnlyProperties** () const

  Returns if the ***Message*** (p. *2072*) *Properties Are Read Only.*

- void **setReadOnlyProperties** (bool value)

  Set the Read Only State of the ***Message*** (p. *2072*) *Properties.*

- bool **isReadOnlyBody** () const

  Returns if the ***Message*** (p. *2072*) *Body is Read Only.*

- void **setReadOnlyBody** (bool value)

  Set the Read Only State of the ***Message*** (p. *2072*) *Content.*

- virtual const **Pointer< ProducerId >** & **getProducerId** () const
- virtual **Pointer< ProducerId >** & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer< ProducerId >** &**producerId**)
- virtual const **Pointer< ActiveMQDestination >** & **getDestination** () const
- virtual **Pointer< ActiveMQDestination >** & **getDestination** ()
- virtual void **setDestination** (const **Pointer< ActiveMQDestination >** &**destination**)
- virtual const **Pointer< TransactionId >** & **getTransactionId** () const
- virtual **Pointer< TransactionId >** & **getTransactionId** ()
- virtual void **setTransactionId** (const **Pointer< TransactionId >** &**transactionId**)

6.404.1 Constructor & Destructor Documentation

6.404.1.1 activemq::commands::Message::Message ()

6.404.1.2 virtual activemq::commands::Message::~Message () [virtual]

6.404.2 Member Function Documentation

6.404.2.1 virtual void activemq::commands::Message::afterUnmarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters:

wireFormat - the **wireformat** (p. 81) object to control unmarshaling

Reimplemented from **activemq::commands::BaseDataStructure** (p. 669).

6.404.2.2 virtual void activemq::commands::Message::beforeMarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.

Parameters:

wireFormat - the **wireformat** (p. 81) controller

Reimplemented from **activemq::commands::BaseDataStructure** (p. 670).

6.404.2.3 virtual Message* activemq::commands::Message::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 205), **activemq::commands::ActiveMQBytesMessage** (p. 216), **activemq::commands::ActiveMQMapMessage** (p. 350), **activemq::commands::ActiveMQMessage** (p. 366), **activemq::commands::ActiveMQObjectMessage** (p. 386), **activemq::commands::ActiveMQStreamMessage** (p. 478), and **activemq::commands::ActiveMQTextMessage** (p. 520).

6.404.2.4 Pointer<Message> activemq::commands::Message::copy () const [inline]

Create a Pointer based copy of this message. Useful for chaining a clone operation with other operation such as casting to a **cms** (p. 91) **Message** (p. 2072) type.

Pointer<cms::Message> cmsMsg = message->**copy()** (p. 2077).dynamic_cast<cms::Message>();

Returns:

a **Pointer<Message>** (p. 2370) which is a duplicate of this object.

6.404.2.5 virtual void activemq::commands::Message::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 205), **activemq::commands::ActiveMQBytesMessage** (p. 216), **activemq::commands::ActiveMQMapMessage** (p. 350), **activemq::commands::ActiveMQMessage** (p. 366), **activemq::commands::ActiveMQObjectMessage** (p. 386), **activemq::commands::ActiveMQStreamMessage** (p. 478), and **activemq::commands::ActiveMQTextMessage** (p. 520).

6.404.2.6 virtual bool activemq::commands::Message::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 206), **activemq::commands::ActiveMQBytesMessage** (p. 216), **activemq::commands::ActiveMQMapMessage** (p. 351), **activemq::commands::ActiveMQMessage** (p. 366), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 378), **activemq::commands::ActiveMQObjectMessage** (p. 386), **activemq::commands::ActiveMQStreamMessage** (p. 478), **activemq::commands::ActiveMQTextMessage** (p. 520), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 378), **activemq::commands::ActiveMQMessageTemplate<**

cms::MapMessage > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 378), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 378).

6.404.2.7 virtual Pointer<core::ActiveMQAckHandler> activemq::commands::Message::getAckHandler () const [inline, virtual]

Gets the Acknowledgment Handler that this **Message** (p. 2072) will use when the Acknowledge method is called.

Returns:

handler ActiveMQAckHandler to call or NULL if not set

6.404.2.8 virtual long long activemq::commands::Message::getArrival () const [virtual]

6.404.2.9 virtual long long activemq::commands::Message::getBrokerInTime () const [virtual]

6.404.2.10 virtual long long activemq::commands::Message::getBrokerOutTime () const [virtual]

6.404.2.11 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath () [virtual]

6.404.2.12 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath () const [virtual]

6.404.2.13 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster () [virtual]

6.404.2.14 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster () const [virtual]

6.404.2.15 core::ActiveMQConnection* activemq::commands::Message::getConnection () const [inline]

Gets the ActiveMQConnection instance that this **Command** (p. 1019) was created from when the session create methods are called to create a **Message** (p. 2072).

Returns:

the ActiveMQConnection parent for this **Message** (p. 2072) or NULL if not set.

6.404.2.16 virtual std::vector<unsigned char>& activemq::commands::Message::getContent () [virtual]

6.404.2.17 virtual const std::vector<unsigned char>& activemq::commands::Message::getContent () const [virtual]

6.404.2.18 virtual std::string& activemq::commands::Message::getCorrelationId () [virtual]

6.404.2.19 virtual const std::string& activemq::commands::Message::getCorrelationId () const [virtual]

6.404.2.20 virtual Pointer<DataStructure>& activemq::commands::Message::getDataStructure () [virtual]

6.404.2.21 virtual const Pointer<DataStructure>& activemq::commands::Message::getDataStructure () const [virtual]

6.404.2.22 virtual unsigned char activemq::commands::Message::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 206), **activemq::commands::ActiveMQBytesMessage** (p. 217), **activemq::commands::ActiveMQMapMessage** (p. 352), **activemq::commands::ActiveMQMessage** (p. 366), **activemq::commands::ActiveMQObjectMessage** (p. 387), **activemq::commands::ActiveMQStreamMessage** (p. 478), and **activemq::commands::ActiveMQTextMessage** (p. 520).

6.404.2.23 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () [virtual]

6.404.2.24 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () const [virtual]

6.404.2.25 virtual long long activemq::commands::Message::getExpiration () const [virtual]

6.404.2.26 virtual std::string& activemq::commands::Message::getGroupID () [virtual]

6.404.2.27 virtual const std::string& activemq::commands::Message::getGroupID () const [virtual]

6.404.2.28 virtual int activemq::commands::Message::getGroupSequence () const [virtual]

6.404.2.29 virtual std::vector<unsigned char>& activemq::commands::Message::getMarshalledProperties () [virtual]

6.404.2.30 virtual const std::vector<unsigned char>& activemq::commands::Message::getMarshalledProperties () const [virtual]

6.404.2.31 virtual Pointer<MessageId>& activemq::commands::Message::getMessageId () [virtual]

6.404.2.32 virtual const Pointer<MessageId>& activemq::commands::Message::getMessageId () const [virtual]

6.404.2.33 const util::PrimitiveMap& activemq::commands::Message::getMessageProperties () const [inline]

6.404.2.34 util::PrimitiveMap& activemq::commands::Message::getMessageProperties () [inline]

Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.

Returns:

a reference to the Primitive Map that holds message properties.

6.404.2.35 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination () [virtual]

6.404.2.36 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination () const [virtual]

6.404.2.37 virtual Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId () [virtual]

6.404.2.38 virtual const Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId () const [virtual]

6.404.2.39 virtual unsigned char activemq::commands::Message::getPriority () const [virtual]

6.404.2.40 virtual Pointer<ProducerId>& activemq::commands::Message::getProducerId () [virtual]

6.404.2.41 virtual const Pointer<ProducerId>& activemq::commands::Message::getProducerId () const [virtual]

6.404.2.42 virtual int activemq::commands::Message::getRedeliveryCounter () const [virtual]

6.404.2.43 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo () [virtual]

6.404.2.44 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo () const [virtual]

6.404.2.45 virtual unsigned int activemq::commands::Message::getSize () const [virtual]

Returns the Size of this message in Bytes.

Returns:

number of bytes this message equates to.

Reimplemented in **activemq::commands::ActiveMQTextMessage** (p. 521).

6.404.2.46 virtual Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId () [virtual]

6.404.2.47 virtual const Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId () const [virtual]

6.404.2.48 virtual long long activemq::commands::Message::getTimestamp () const [virtual]

6.404.2.49 virtual Pointer<TransactionId>& activemq::commands::Message::getTransactionId () [virtual]

6.404.2.50 virtual const Pointer<TransactionId>& activemq::commands::Message::getTransactionId () const [virtual]

6.404.2.51 virtual std::string& activemq::commands::Message::getType () [virtual]

6.404.2.52 virtual const std::string& activemq::commands::Message::getType () const [virtual]

6.404.2.53 virtual std::string& activemq::commands::Message::getUserID () [virtual]

6.404.2.54 virtual const std::string& activemq::commands::Message::getUserID () const [virtual]

6.404.2.55 virtual bool activemq::commands::Message::isCompressed () const [virtual]

6.404.2.56 virtual bool activemq::commands::Message::isDroppable () const [virtual]

6.404.2.57 virtual bool activemq::commands::Message::isExpired () const [virtual]

Returns if this message has expired, meaning that its Expiration time has elapsed.

Returns:

true if message is expired.

6.404.2.58 virtual bool activemq::commands::Message::isMarshalAware () const [inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns:

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 670).

Reimplemented in **activemq::commands::ActiveMQMapMessage** (p. 356).

6.404.2.59 virtual bool activemq::commands::Message::isMessage () const [inline, virtual]

Returns:

an answer of true to the **isMessage()** (p. 2083) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 638).

6.404.2.60 virtual bool activemq::commands::Message::isPersistent () const [virtual]

6.404.2.61 bool activemq::commands::Message::isReadOnlyBody () const [inline]

Returns if the **Message** (p. 2072) Body is Read Only.

Returns:

true if **Message** (p. 2072) Content is Read Only.

6.404.2.62 bool activemq::commands::Message::isReadOnlyProperties () const [inline]

Returns if the **Message** (p. 2072) Properties Are Read Only.

Returns:

true if **Message** (p. 2072) Properties are Read Only.

6.404.2.63 virtual bool activemq::commands::Message::isRecievedByDFBridge () const [virtual]

6.404.2.64 virtual void activemq::commands::Message::onSend () [inline, virtual]

Allows derived **Message** (p. 2072) classes to perform tasks before a message is sent.

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 217), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 379), **activemq::commands::ActiveMQStreamMessage** (p. 479), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 379).

6.404.2.65 virtual void activemq::commands::Message::setAckHandler (const Pointer< core::ActiveMQAckHandler > & *handler*) [inline, virtual]

Sets the Acknowledgment Handler that this **Message** (p. 2072) will use when the Acknowledge method is called.

Parameters:

handler ActiveMQAckHandler to call

6.404.2.66 virtual void activemq::commands::Message::setArrival (long long *arrival*) [virtual]

6.404.2.67 virtual void activemq::commands::Message::setBrokerInTime (long long *brokerInTime*) [virtual]

6.404.2.68 virtual void activemq::commands::Message::setBrokerOutTime (long long *brokerOutTime*) [virtual]

6.404.2.69 virtual void activemq::commands::Message::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.404.2.70 virtual void activemq::commands::Message::setCluster (const std::vector< decaf::lang::Pointer< BrokerId > > & *cluster*) [virtual]

6.404.2.71 virtual void activemq::commands::Message::setCompressed (bool *compressed*) [virtual]

6.404.2.72 void activemq::commands::Message::setConnection (core::ActiveMQConnection * *connection*) [inline]

Sets the ActiveMQConnection instance that this **Command** (p. 1019) was created from when the session create methods are called to create a **Message** (p. 2072).

Parameters:

handler ActiveMQConnection parent for this message

6.404.2.73 **virtual void activemq::commands::Message::setContent (const std::vector< unsigned char > & *content*)** [virtual]

6.404.2.74 **virtual void activemq::commands::Message::setCorrelationId (const std::string & *correlationId*)** [virtual]

6.404.2.75 **virtual void activemq::commands::Message::setDataStructure (const Pointer< DataStructure > & *dataStructure*)** [virtual]

6.404.2.76 **virtual void activemq::commands::Message::setDestination (const Pointer< ActiveMQDestination > & *destination*)** [virtual]

6.404.2.77 **virtual void activemq::commands::Message::setDroppable (bool *droppable*)** [virtual]

6.404.2.78 **virtual void activemq::commands::Message::setExpiration (long long *expiration*)** [virtual]

6.404.2.79 **virtual void activemq::commands::Message::setGroupID (const std::string & *groupID*)** [virtual]

6.404.2.80 **virtual void activemq::commands::Message::setGroupSequence (int *groupSequence*)** [virtual]

6.404.2.81 **virtual void activemq::commands::Message::setMarshalledProperties (const std::vector< unsigned char > & *marshalledProperties*)** [virtual]

6.404.2.82 **virtual void activemq::commands::Message::setMessageId (const Pointer< MessageId > & *messageId*)** [virtual]

6.404.2.83 **virtual void activemq::commands::Message::setOriginalDestination (const Pointer< ActiveMQDestination > & *originalDestination*)** [virtual]

6.404.2.84 **virtual void activemq::commands::Message::setOriginalTransactionId (const Pointer< TransactionId > & *originalTransactionId*)** [virtual]

6.404.2.85 **virtual void activemq::commands::Message::setPersistent (bool *persistent*)** [virtual]

6.404.2.86 **virtual void activemq::commands::Message::setPriority (unsigned char *priority*)** [virtual]

6.404.2.87 **virtual void activemq::commands::Message::setProducerId (const Pointer< ProducerId > & *producerId*)** [virtual]

6.404.2.88 **void activemq::commands::Message::setReadOnlyBody (bool *value*)** [inline]

Set the Read Only State of the **Message** (p. 2072) Content.

Parameters:

value - true if Content should be read only.

Referenced by activemq::commands::ActiveMQTextMessage::clone(), activemq::commands::ActiveMQStreamMessage::clone(), activemq::commands::ActiveMQObjectMessage::clone(), activemq::commands::ActiveMQMessage::clone(), activemq::commands::ActiveMQMapMessage::clone(), activemq::commands::ActiveMQBytesMessage::clone(), and activemq::commands::ActiveMQBlobMessage::clone().

6.404.2.89 void activemq::commands::Message::setReadOnlyProperties (bool *value*) [inline]

Set the Read Only State of the **Message** (p. 2072) Properties.

Parameters:

value - true if Properties should be read only.

Referenced by activemq::commands::ActiveMQTextMessage::clone(), activemq::commands::ActiveMQStreamMessage::clone(), activemq::commands::ActiveMQObjectMessage::clone(), activemq::commands::ActiveMQMessage::clone(), activemq::commands::ActiveMQMapMessage::clone(), activemq::commands::ActiveMQBytesMessage::clone(), and activemq::commands::ActiveMQBlobMessage::clone().

6.404.2.90 virtual void activemq::commands::Message::setRecievedByDFBridge (bool *recievedByDFBridge*) [virtual]

6.404.2.91 virtual void activemq::commands::Message::setRedeliveryCounter (int *redeliveryCounter*) [virtual]

6.404.2.92 virtual void activemq::commands::Message::setReplyTo (const Pointer< ActiveMQDestination > & *replyTo*) [virtual]

6.404.2.93 virtual void activemq::commands::Message::setTargetConsumerId (const Pointer< ConsumerId > & *targetConsumerId*) [virtual]

6.404.2.94 virtual void activemq::commands::Message::setTimestamp (long long *timestamp*) [virtual]

6.404.2.95 virtual void activemq::commands::Message::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.404.2.96 virtual void activemq::commands::Message::setType (const std::string & *type*) [virtual]

6.404.2.97 virtual void activemq::commands::Message::setUserID (const std::string & *userID*) [virtual]

6.404.2.98 virtual std::string activemq::commands::Message::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 207), **activemq::commands::ActiveMQBytesMessage** (p. 223), **activemq::commands::ActiveMQMapMessage** (p. 359), **activemq::commands::ActiveMQMessage** (p. 367), **activemq::commands::ActiveMQObjectMessage** (p. 388), **activemq::commands::ActiveMQStreamMessage** (p. 484), and **activemq::commands::ActiveMQTextMessage** (p. 522).

6.404.2.99 virtual Pointer<Command> activemq::commands::Message::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

Public Types

- enum **ValueType** {

  NULL_TYPE = 0, **BOOLEAN_TYPE** = 1, **BYTE_TYPE** = 2, **CHAR_TYPE** = 3,

  SHORT_TYPE = 4, **INTEGER_TYPE** = 5, **LONG_TYPE** = 6, **DOUBLE_TYPE** = 7,

  FLOAT_TYPE = 8, **STRING_TYPE** = 9, **BYTE_ARRAY_TYPE** = 10, **UNKNOWN_TYPE** = 11 }

  *Defines the Type Identifiers used to identify the type contained within a specific **Message** (p. 2090) property or **MapMessage** (p. 2024) keyed value.*

Public Member Functions

- virtual ~**Message** ()
- virtual **Message** * **clone** () const =0

  Clone this message exactly, returns a new instance that the caller is required to delete.

- virtual void **acknowledge** () const =0

  Acknowledges all consumed messages of the session of this consumed message.

- virtual void **clearBody** ()=0

  Clears out the body of the message.

- virtual void **clearProperties** ()=0

  Clears out the message body.

- virtual std::vector< std::string > **getPropertyNames** () const =0

  Retrieves the property names.

- virtual bool **propertyExists** (const std::string &name) const =0

  Indicates whether or not a given property exists.

- virtual **ValueType** **getPropertyValueType** (const std::string &name) const =0

  Returns the value type for the given property key.

- virtual bool **getBooleanProperty** (const std::string &name) const =0

  Gets a boolean property.

- virtual unsigned char **getByteProperty** (const std::string &name) const =0

Gets a byte property.

- virtual double **getDoubleProperty** (const std::string &name) const =0
  Gets a double property.
- virtual float **getFloatProperty** (const std::string &name) const =0
  Gets a float property.
- virtual int **getIntProperty** (const std::string &name) const =0
  Gets a int property.
- virtual long long **getLongProperty** (const std::string &name) const =0
  Gets a long property.
- virtual short **getShortProperty** (const std::string &name) const =0
  Gets a short property.
- virtual std::string **getStringProperty** (const std::string &name) const =0
  Gets a string property.
- virtual void **setBooleanProperty** (const std::string &name, bool value)=0
  Sets a boolean property.
- virtual void **setByteProperty** (const std::string &name, unsigned char value)=0
  Sets a byte property.
- virtual void **setDoubleProperty** (const std::string &name, double value)=0
  Sets a double property.
- virtual void **setFloatProperty** (const std::string &name, float value)=0
  Sets a float property.
- virtual void **setIntProperty** (const std::string &name, int value)=0
  Sets a int property.
- virtual void **setLongProperty** (const std::string &name, long long value)=0
  Sets a long property.
- virtual void **setShortProperty** (const std::string &name, short value)=0
  Sets a short property.
- virtual void **setStringProperty** (const std::string &name, const std::string &value)=0
  Sets a string property.
- virtual std::string **getCMSCorrelationID** () const =0
  Gets the correlation ID for the message.
- virtual void **setCMSCorrelationID** (const std::string &correlationId)=0
  Sets the correlation ID for the message.

- virtual int **getCMSDeliveryMode** () const =0

  *Gets the **DeliveryMode** (p. 1364) for this message.*

- virtual void **setCMSDeliveryMode** (int mode)=0

  *Sets the **DeliveryMode** (p. 1364) for this message.*

- virtual const **Destination** * **getCMSDestination** () const =0

  *Gets the **Destination** (p. 1377) object for this message.*

- virtual void **setCMSDestination** (const **Destination** *destination)=0

  *Sets the **Destination** (p. 1377) object for this message.*

- virtual long long **getCMSExpiration** () const =0

  Gets the message's expiration value.

- virtual void **setCMSExpiration** (long long expireTime)=0

  Sets the message's expiration value.

- virtual std::string **getCMSMessageID** () const =0

  The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.

- virtual void **setCMSMessageID** (const std::string &id)=0

  Sets the message ID.

- virtual int **getCMSPriority** () const =0

  Gets the message priority level.

- virtual void **setCMSPriority** (int priority)=0

  Sets the Priority Value for this message.

- virtual bool **getCMSRedelivered** () const =0

  Gets an indication of whether this message is being redelivered.

- virtual void **setCMSRedelivered** (bool redelivered)=0

  Specifies whether this message is being redelivered.

- virtual const **cms::Destination** * **getCMSReplyTo** () const =0

  *Gets the **Destination** (p. 1377) object to which a reply to this message should be sent.*

- virtual void **setCMSReplyTo** (const **cms::Destination** *destination)=0

  *Sets the **Destination** (p. 1377) object to which a reply to this message should be sent.*

- virtual long long **getCMSTimestamp** () const =0

  Gets the message timestamp.

- virtual void **setCMSTimestamp** (long long timeStamp)=0

  Sets the message timestamp.

- virtual std::string **getCMSType** () const =0

Gets the message type identifier supplied by the client when the message was sent.

- virtual void **setCMSType** (const std::string &type)=0

  Sets the message type.

Static Public Attributes

- static const int **DEFAULT_DELIVERY_MODE**

  The Default delivery mode for ***Message*** *(p. 2090) Producers is PERSISTENT.*

- static const int **DEFAULT_MSG_PRIORITY**

  The Default priority assigned to a ***Message*** *(p. 2090) is 4.*

- static const long long **DEFAULT_TIME_TO_LIVE**

  The Default Time to Live for a ***Message*** *(p. 2090) Producer is unlimited, the message will never expire.*

6.405.1 Detailed Description

Root of all messages. As in JMS, a message is comprised of 3 parts: CMS-specific headers, user-defined properties, and the body.

Message (p. 2090) Bodies

The CMS API defines four types of message bodies, each type is contained within its own **Message** (p. 2090) Interface definition.

- Stream - A **StreamMessage** (p. 2923) object's message body contains a stream of primitive values in the C++ language. It is filled and read sequentially. Unlike the **BytesMessage** (p. 857) type the values written to a **StreamMessage** (p. 2923) retain information on their type and rules for type conversion are enforced when reading back the values from the **Message** (p. 2090) Body.
- Map - A **MapMessage** (p. 2024) object's message body contains a set of name-value pairs, where names are std::string objects, and values are C++ primitives. The entries can be accessed sequentially or randomly by name. The **MapMessage** (p. 2024) makes no garuntee on the order of the elements within the **Message** (p. 2090) body.
- Text - A **TextMessage** (p. 3014) object's message body contains a std::string object. This message type can be used to transport plain-text messages, and XML messages.
- Bytes - A **BytesMessage** (p. 857) object's message body contains a stream of uninterpreted bytes. This message type is for literally encoding a body to match an existing message format. In many cases, it is possible to use one of the other body types, which are easier to use.

Message (p. 2090) Properties

Message (p. 2090) properties support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 979). The String-to-primitive conversions may throw a runtime exception if the primitive's valueOf method does not accept the String as a valid representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	int	long	float	double	String
boolean	X							X
byte		X	X	X	X			X
short			X	X	X			X
int				X	X			X
long					X			X
float						X	X	X
double							X	X
String	X	X	X	X	X	X	X	X

When a **Message** (p. 2090) is delivered its properties are considered to be in a read-only mode and cannot be changed. Attempting to change the value of a delivered Message's properties will result in a **CMSException** (p. 979) being thrown.

JMS API

Since:

1.0

6.405.2 Member Enumeration Documentation

6.405.2.1 enum cms::Message::ValueType

Defines the Type Identifiers used to identify the type contained within a specific **Message** (p. 2090) property or **MapMessage** (p. 2024) keyed value. CMS Providers can store other types in their internal representations, which should map to the UNKNOWN_TYPE from the CMS API.

Enumerator:

NULL_TYPE

BOOLEAN_TYPE

BYTE_TYPE

CHAR_TYPE

SHORT_TYPE

INTEGER_TYPE

LONG_TYPE

DOUBLE_TYPE

FLOAT_TYPE

STRING_TYPE

BYTE_ARRAY_TYPE

UNKNOWN_TYPE

6.405.3 Constructor & Destructor Documentation

6.405.3.1 virtual cms::Message::~Message () [virtual]

6.405.4 Member Function Documentation

6.405.4.1 virtual void cms::Message::acknowledge () const [pure virtual]

Acknowledges all consumed messages of the session of this consumed message. All consumed CMS messages support the acknowledge method for use when a client has specified that its CMS session's consumed messages are to be explicitly acknowledged. By invoking acknowledge on a consumed message, a client acknowledges all messages consumed by the session that the message was delivered to.

Calls to acknowledge are ignored for both transacted sessions and sessions specified to use implicit acknowledgment modes.

A client may individually acknowledge each message as it is consumed, or it may choose to acknowledge messages as an application-defined group (which is done by calling acknowledge on the last received message of the group, thereby acknowledging all messages consumed by the session.)

Messages that have been received but not acknowledged may be redelivered.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

IllegalStateException (p. ***1658***) - if this method is called on a closed session.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 377), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 377).

6.405.4.2 virtual void cms::Message::clearBody () [pure virtual]

Clears out the body of the message. This does not clear the headers or properties.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 215), **activemq::commands::ActiveMQMapMessage** (p. 350), **activemq::commands::ActiveMQStreamMessage** (p. 477), **activemq::commands::ActiveMQTextMessage** (p. 519), **activemq::commands::ActiveMQMessageTemplate** **cms::BytesMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 377), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 377).

6.405.4.3 virtual void cms::Message::clearProperties () [pure virtual]

Clears out the message body. Clearing a message's body does not clear its header values or property entries.

If this message body was read-only, calling this method leaves the message body in the same state as an empty body in a newly created message.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 378), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 378), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 378), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 378), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 378), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 378).

6.405.4.4 virtual Message* cms::Message::clone () const [pure virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 205), **activemq::commands::ActiveMQBytesMessage** (p. 216), **activemq::commands::ActiveMQMapMessage** (p. 350), **activemq::commands::ActiveMQMessage** (p. 365), **activemq::commands::ActiveMQObjectMessage** (p. 386), **activemq::commands::ActiveMQStreamMessage** (p. 477), **activemq::commands::ActiveMQTextMessage** (p. 519), and **cms::BytesMessage** (p. 859).

6.405.4.5 virtual bool cms::Message::getBooleanProperty (const std::string & *name*) const [pure virtual]

Gets a boolean property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException (p. ***979***) if the property does not exist.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.405.4.6 virtual unsigned char cms::Message::getByteProperty (const std::string & *name*) const [pure virtual]

Gets a byte property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException (p. ***979***) if the property does not exist.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.405.4.7 virtual std::string cms::Message::getCMSCorrelationID () const [pure virtual]

Gets the correlation ID for the message. This method is used to return correlation ID values that are either provider-specific message IDs or application-specific String values.

Returns:

string representation of the correlation Id

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.405.4.8 virtual int cms::Message::getCMSDeliveryMode () const [pure virtual]

Gets the **DeliveryMode** (p. 1364) for this message.

Returns:

DeliveryMode (p. 1364) enumerated value.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.405.4.9 virtual const Destination* cms::Message::getCMSDestination () const [pure virtual]

Gets the **Destination** (p. 1377) object for this message. The CMSDestination header field contains the destination to which the message is being sent.

When a message is sent, this field is ignored. After completion of the send or publish method, the field holds the destination specified by the method.

When a message is received, its CMSDestination value must be equivalent to the value assigned when it was sent.

Returns:

Destination (p. 1377) object

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.405.4.10 virtual long long cms::Message::getCMSExpiration () const [pure virtual]

Gets the message's expiration value. When a message is sent, the CMSExpiration header field is left unassigned. After completion of the send or publish method, it holds the expiration time of the message. This is the sum of the time-to-live value specified by the client and the GMT at the time of the send or publish.

If the time-to-live is specified as zero, CMSExpiration is set to zero to indicate that the message does not expire.

When a message's expiration time is reached, a provider should discard it. The CMS API does not define any form of notification of message expiration.

Clients should not receive messages that have expired; however, the CMS API does not guarantee that this will not happen.

Returns:

the time the message expires, which is the sum of the time-to-live value specified by the client and the GMT at the time of the send

Exceptions:

CMSException *(*p. ***979***)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.405.4.11 virtual std::string cms::Message::getCMSMessageID () const [pure virtual]

The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider. When a message is sent, CMSMessageID can be ignored. When the send or publish method returns, it contains a provider-assigned value.

A CMSMessageID is a String value that should function as a unique key for identifying messages in a historical repository. The exact scope of uniqueness is provider-defined. It should at least cover all messages for a specific installation of a provider, where an installation is some connected set of message routers.

All CMSMessageID values must start with the prefix 'ID:'. Uniqueness of message ID values across different providers is not required.

Since message IDs take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the message ID is not used by an application. By calling the **MessageProducer.setDisableMessageID** (p. 2201) method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value.

Returns:

provider-assigned message id

Exceptions:

CMSException *(*p. ***979***)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<**

cms::MapMessage > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 379), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 379).

6.405.4.12 virtual int cms::Message::getCMSPriority () const [pure virtual]

Gets the message priority level. The CMS API defines ten levels of priority value, with 0 as the lowest priority and 9 as the highest. In addition, clients should consider priorities 0-4 as gradations of normal priority and priorities 5-9 as gradations of expedited priority.

The CMS API does not require that a provider strictly implement priority ordering of messages; however, it should do its best to deliver expedited messages ahead of normal messages.

Returns:

priority value

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 379), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 379).

6.405.4.13 virtual bool cms::Message::getCMSRedelivered () const [pure virtual]

Gets an indication of whether this message is being redelivered. If a client receives a message with the CMSRedelivered field set, it is likely, but not guaranteed, that this message was delivered earlier but that its receipt was not acknowledged at that time.

Returns:

true if this message is being redelivered

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 379), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 379).

6.405.4.14 virtual const cms::Destination* cms::Message::getCMSReplyTo () const [pure virtual]

Gets the **Destination** (p. 1377) object to which a reply to this message should be sent.

Returns:

Destination (p. 1377) to which to send a response to this message

Exceptions:

CMSException *(p. **979**)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.405.4.15 virtual long long cms::Message::getCMSTimestamp () const [pure virtual]

Gets the message timestamp. The CMSTimestamp header field contains the time a message was handed off to a provider to be sent. It is not the time the message was actually transmitted, because the actual send may occur later due to transactions or other client-side queuing of messages.

When a message is sent, CMSTimestamp is ignored. When the send or publish method returns, it contains a time value somewhere in the interval between the call and the return. The value is in the format of a normal millis time value in the Java programming language.

Since timestamps take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the timestamp is not used by an application. By calling the MessageProducer.setDisableMessageTimestamp method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint, the timestamp must be set to its normal value.

Returns:

the message timestamp

Exceptions:

CMSException *(p. **979**)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.405.4.16 virtual std::string cms::Message::getCMSType () const [pure virtual]

Gets the message type identifier supplied by the client when the message was sent.

Returns:

the message type

See also:

setCMSType (p. 2111)

Exceptions:

CMSException *(*p. ***979)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 379).

6.405.4.17 virtual double cms::Message::getDoubleProperty (const std::string & *name*) const [pure virtual]

Gets a double property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***979)*** if the property does not exist.

MessageFormatException *(*p. ***2172)*** - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 379).

6.405.4.18 virtual float cms::Message::getFloatProperty (const std::string & *name*) const [pure virtual]

Gets a float property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***979****)* if the property does not exist.

MessageFormatException *(*p. ***2172****)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 379), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 379).

6.405.4.19 virtual int cms::Message::getIntProperty (const std::string & *name*) const [pure virtual]

Gets a int property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***979****)* if the property does not exist.

MessageFormatException *(*p. ***2172****)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 379), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 379).

6.405.4.20 virtual long long cms::Message::getLongProperty (const std::string & *name*) const [pure virtual]

Gets a long property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***979***) if the property does not exist.

MessageFormatException *(*p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 379).

6.405.4.21 virtual std::vector<std::string> cms::Message::getPropertyNames () const [pure virtual]

Retrieves the property names.

Returns:

The complete set of property names currently in this message.

Exceptions:

CMSException *(*p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 379).

6.405.4.22 virtual ValueType cms::Message::getPropertyValueType (const std::string & *name*) const [pure virtual]

Returns the value type for the given property key. The CMS provider should translate all internal type identifiers into the CMS Value types returning UNKNOWN_TYPE for any specialized types not directly supported in the CMS API.

Parameters:

name The string property name key used to look up the value type.

Returns:

The ValueType contained in the given property.

Exceptions:

CMSException *(*p. ***979***) if no property exists that matches the requested key.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>** (p. 379).

6.405.4.23 virtual short cms::Message::getShortProperty (const std::string & *name*) const [pure virtual]

Gets a short property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException (p. ***979***) if the property does not exist.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>** (p. 379).

6.405.4.24 virtual std::string cms::Message::getStringProperty (const std::string & *name*) const [pure virtual]

Gets a string property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException (p. ***979***) if the property does not exist.

MessageFormatException (p. ***2172***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 379), **activemq::commands::ActiveMQMessageTemplate<**

cms::MapMessage > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 379), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 379).

6.405.4.25 virtual bool cms::Message::propertyExists (const std::string & *name*) const [pure virtual]

Indicates whether or not a given property exists.

Parameters:

name The name of the property to look up.

Returns:

True if the property exists in this message.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.26 virtual void cms::Message::setBooleanProperty (const std::string & *name*, bool *value*) [pure virtual]

Sets a boolean property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. ***979***) - if the name is an empty string.

MessageNotWriteableException (p. ***2190***) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.27 virtual void cms::Message::setByteProperty (const std::string & *name*, unsigned char *value*) [pure virtual]

Sets a byte property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(*p. ***979****)* - if the name is an empty string.

MessageNotWriteableException *(*p. ***2190****)* - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 381), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 381).

6.405.4.28 virtual void cms::Message::setCMSCorrelationID (const std::string & *correlationId*) [pure virtual]

Sets the correlation ID for the message. A client can use the CMSCorrelationID header field to link one message with another. A typical use is to link a response message with its request message.

CMSCorrelationID can hold one of the following:

- A provider-specific message ID
- An application-specific String
- A provider-native byte[] value

Since each message sent by a CMS provider is assigned a message ID value, it is convenient to link messages via message ID. All message ID values must start with the 'ID:' prefix.

In some cases, an application (made up of several clients) needs to use an application-specific value for linking messages. For instance, an application may use CMSCorrelationID to hold a value referencing some external information. Application-specified values must not start with the 'ID:' prefix; this is reserved for provider-generated message ID values.

If a provider supports the native concept of correlation ID, a CMS client may need to assign specific CMSCorrelationID values to match those expected by clients that do not use the CMS API. A byte[] value is used for this purpose. CMS providers without native correlation ID values are not required to support byte[] values. The use of a byte[] value for CMSCorrelationID is non-portable.

Parameters:

correlationId The message ID of a message being referred to.

Exceptions:

CMSException *(*p. ***979****)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.29 virtual void cms::Message::setCMSDeliveryMode (int *mode*) [pure virtual]

Sets the **DeliveryMode** (p. 1364) for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

mode **DeliveryMode** (p. 1364) enumerated value.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.30 virtual void cms::Message::setCMSDestination (const Destination * *destination*) [pure virtual]

Sets the **Destination** (p. 1377) object for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

destination **Destination** (p. 1377) Object

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.31 virtual void cms::Message::setCMSExpiration (long long *expireTime*) [pure virtual]

Sets the message's expiration value. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

expireTime the message's expiration time

Exceptions:

CMSException *(*p. ***979****)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.32 virtual void cms::Message::setCMSMessageID (const std::string & *id*) [pure virtual]

Sets the message ID. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

id the ID of the message

Exceptions:

CMSException *(*p. ***979****)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.33 virtual void cms::Message::setCMSPriority (int *priority*) [pure virtual]

Sets the Priority Value for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

priority priority value for this message

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.34 virtual void cms::Message::setCMSRedelivered (bool *redelivered*) [pure virtual]

Specifies whether this message is being redelivered. This field is set at the time the message is delivered. This method can be used to change the value for a message that has been received.

Parameters:

redelivered boolean redelivered value

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.35 virtual void cms::Message::setCMSReplyTo (const cms::Destination * *destination*) [pure virtual]

Sets the **Destination** (p. 1377) object to which a reply to this message should be sent. The CMSReplyTo header field contains the destination where a reply to the current message should be sent. If it is null, no reply is expected. The destination may be either a **Queue** (p. 2514) object or a **Topic** (p. 3096) object.

Messages sent with a null CMSReplyTo value may be a notification of some event, or they may just be some data the sender thinks is of interest.

Messages with a CMSReplyTo value typically expect a response. A response is optional; it is up to the client to decide. These messages are called requests. A message sent in response to a request is called a reply.

In some cases a client may wish to match a request it sent earlier with a reply it has just received. The client can use the CMSCorrelationID header field for this purpose.

Parameters:

destination **Destination** (p. 1377) to which to send a response to this message

Exceptions:

CMSException *(*p. ***979)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.36 virtual void cms::Message::setCMSTimestamp (long long *timeStamp*) [pure virtual]

Sets the message timestamp. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

timeStamp integer time stamp value

Exceptions:

CMSException *(*p. ***979)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.37 virtual void cms::Message::setCMSType (const std::string & *type*) [pure virtual]

Sets the message type. Some CMS providers use a message repository that contains the definitions of messages sent by applications. The CMSType header field may reference a message's definition in the provider's repository.

The CMS API does not define a standard message definition repository, nor does it define a naming policy for the definitions it contains.

Some messaging systems require that a message type definition for each application message be created and that each message specify its type. In order to work with such CMS providers, CMS clients should assign a value to CMSType, whether the application makes use of it or not. This ensures that the field is properly set for those providers that require it.

To ensure portability, CMS clients should use symbolic values for CMSType that can be configured at installation time to the values defined in the current provider's message repository. If string literals are used, they may not be valid type names for some CMS providers.

Parameters:

type the message type

See also:

getCMSType (p. 2102)

Exceptions:

CMSException *(p. **979**)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 381), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 381).

6.405.4.38 virtual void cms::Message::setDoubleProperty (const std::string & *name*, double *value*) [pure virtual]

Sets a double property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(p. **979**)* - if the name is an empty string.

MessageNotWriteableException *(p. **2190**)* - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 381), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 381), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 381).

6.405.4.39 virtual void cms::Message::setFloatProperty (const std::string & *name*, float *value*) [pure virtual]

Sets a float property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(p. **979**)* - if the name is an empty string.

MessageNotWriteableException *(p. **2190**)* - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.40 virtual void cms::Message::setIntProperty (const std::string & *name*, int *value*) [pure virtual]

Sets a int property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. ***979***) - if the name is an empty string.

MessageNotWriteableException (p. ***2190***) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.41 virtual void cms::Message::setLongProperty (const std::string & *name*, long long *value*) [pure virtual]

Sets a long property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. ***979***) - if the name is an empty string.

MessageNotWriteableException (p. ***2190***) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.42 virtual void cms::Message::setShortProperty (const std::string & *name*, short *value*) [pure virtual]

Sets a short property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. ***979***) - if the name is an empty string.

MessageNotWriteableException (p. ***2190***) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.4.43 virtual void cms::Message::setStringProperty (const std::string & *name*, const std::string & *value*) [pure virtual]

Sets a string property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. ***979***) - if the name is an empty string.

MessageNotWriteableException (p. ***2190***) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.405.5 Field Documentation

6.405.5.1 const int cms::Message::DEFAULT_DELIVERY_MODE [static]

The Default delivery mode for **Message** (p. 2090) Producers is PERSISTENT.

6.405.5.2 const int cms::Message::DEFAULT_MSG_PRIORITY [static]

The Default priority assigned to a **Message** (p. 2090) is 4.

6.405.5.3 const long long cms::Message::DEFAULT_TIME_TO_LIVE [static]

The Default Time to Live for a **Message** (p. 2090) Producer is unlimited, the message will never expire.

The documentation for this class was generated from the following file:

6.406.1 Constructor & Destructor Documentation

6.406.1.1 activemq::commands::MessageAck::MessageAck ()

6.406.1.2 activemq::commands::MessageAck::MessageAck (const Pointer< Message > & *message*, int *ackType*, int *messageCount*)

6.406.1.3 activemq::commands::MessageAck::MessageAck (const Pointer< MessageDispatch > & *dispatch*, int *ackType*, int *messageCount*)

6.406.1.4 virtual activemq::commands::MessageAck::~MessageAck () [virtual]

6.406.2 Member Function Documentation

6.406.2.1 virtual MessageAck* activemq::commands::MessageAck::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.406.2.2 virtual void activemq::commands::MessageAck::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.406.2.3 virtual bool activemq::commands::MessageAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.406.2.4 virtual unsigned char activemq::commands::MessageAck::getAckType () const [virtual]

6.406.2.5 virtual Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId () [virtual]

6.406.2.6 virtual const Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId () const [virtual]

6.406.2.7 virtual unsigned char activemq::commands::MessageAck::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.406.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination () [virtual]

6.406.2.9 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination () const [virtual]

6.406.2.10 virtual Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId () [virtual]

6.406.2.11 virtual const Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId () const [virtual]

6.406.2.12 virtual Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId () [virtual]

6.406.2.13 virtual const Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId () const [virtual]

6.406.2.14 virtual int activemq::commands::MessageAck::getMessageCount () const [virtual]

6.406.2.15 virtual Pointer<BrokerError>& activemq::commands::MessageAck::getPoisonCause () [virtual]

6.406.2.16 virtual const Pointer<BrokerError>& activemq::commands::MessageAck::getPoisonCause () const [virtual]

6.406.2.17 virtual Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () [virtual]

6.406.2.18 virtual const Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () const [virtual]

6.406.2.19 virtual bool activemq::commands::MessageAck::isMessageAck () const [inline, virtual]

Returns:

an answer of true to the **isMessageAck()** (p. 2119) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 638).

6.406.2.20 virtual void activemq::commands::MessageAck::setAckType (unsigned char *ackType*) [virtual]

6.406.2.21 virtual void activemq::commands::MessageAck::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.406.2.22 virtual void activemq::commands::MessageAck::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.406.2.23 virtual void activemq::commands::MessageAck::setFirstMessageId (const Pointer< MessageId > & *firstMessageId*) [virtual]

6.406.2.24 virtual void activemq::commands::MessageAck::setLastMessageId (const Pointer< MessageId > & *lastMessageId*) [virtual]

6.406.2.25 virtual void activemq::commands::MessageAck::setMessageCount (int *messageCount*) [virtual]

6.406.2.26 virtual void activemq::commands::MessageAck::setPoisonCause (const Pointer< BrokerError > & *poisonCause*) [virtual]

6.406.2.27 virtual void activemq::commands::MessageAck::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.406.2.28 virtual std::string activemq::commands::MessageAck::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.406.2.29 virtual Pointer<Command> activemq::commands::MessageAck::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.407 activemq::wireformat::openwire::marshal::generated::MessageAckM Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **MessageAckMarshaller** (p. 2122).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/MessageAckMarshaller.h>`Inherita
diagram for activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller:

Public Member Functions

- **MessageAckMarshaller** ()
- virtual ~**MessageAckMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.407.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **MessageAckMarshaller** (p. 2122). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.407.2 Constructor & Destructor Documentation

6.407.2.1 activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::MessageAckM () [inline]

6.407.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::~MessageAc () [inline, virtual]

6.407.3 Member Function Documentation

6.407.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.407.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::getDataStructu () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.407.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.407.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::looseUnmarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.407.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.407.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.407.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::tightUnmarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**MessageAckMarshaller.h**

6.408 cms::MessageAvailableListener Class Reference

A listener interface similar to the **MessageListener** (p. 2183) interface.

`#include <src/main/cms/MessageAvailableListener.h>`

Public Member Functions

- virtual ~**MessageAvailableListener** ()
- virtual void **onMessageAvailable** (**cms::MessageConsumer** *consumer)=0

  *Indicates that a new **Message** (p. 2090) has become available for consumption from the provided consumer, a call to receiveNoWait should return the message immediately.*

6.408.1 Detailed Description

A listener interface similar to the **MessageListener** (p. 2183) interface. This listener is notified by its associated **MessageConsumer** (p. 2127) that a new **Message** (p. 2090) is available for processing when the consumer is in sync consumption mode. A consumer with a registered **MessageListener** (p. 2183) will not use this listener.

6.408.2 Constructor & Destructor Documentation

6.408.2.1 virtual cms::MessageAvailableListener::~MessageAvailableListener () [virtual]

6.408.3 Member Function Documentation

6.408.3.1 virtual void cms::MessageAvailableListener::onMessageAvailable (**cms::MessageConsumer** * *consumer*) [pure virtual]

Indicates that a new **Message** (p. 2090) has become available for consumption from the provided consumer, a call to receiveNoWait should return the message immediately.

Parameters:

consumer The consumer that now has a message queued for consumption.

The documentation for this class was generated from the following file:

- src/main/cms/**MessageAvailableListener.h**

6.409 cms::MessageConsumer Class Reference

A client uses a `MessageConsumer` (p. 2127) to received messages from a destination.

`#include <src/main/cms/MessageConsumer.h>`Inheritance diagram for cms::MessageConsumer:

Public Member Functions

- virtual ~**MessageConsumer** ()
- virtual **Message** * **receive** ()=0

  *Synchronously Receive a **Message** (p. 2090).*

- virtual **Message** * **receive** (int millisecs)=0

  *Synchronously Receive a **Message** (p. 2090), time out after defined interval.*

- virtual **Message** * **receiveNoWait** ()=0

  *Receive a **Message** (p. 2090), does not wait if there isn't a new message to read, returns NULL if nothing read.*

- virtual void **setMessageListener** (**MessageListener** *listener)=0

  *Sets the **MessageListener** (p. 2183) that this class will send notifs on.*

- virtual **MessageListener** * **getMessageListener** () const =0

  *Gets the **MessageListener** (p. 2183) that this class will send mew **Message** (p. 2090) notification events to.*

- virtual std::string **getMessageSelector** () const =0

  Gets this message consumer's message selector expression.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)=0

  *Set an **MessageTransformer** (p. 2219) instance that is applied to all **cms::Message** (p. 2090) objects before they are dispatched to client **code** (p. 1005).*

  *Gets the currently configured **MessageTransformer** (p. 2219) for this **MessageConsumer** (p. 2127).*

- virtual void **setMessageAvailableListener** (**cms::MessageAvailableListener** *listener)=0

  *Sets the **MessageAvailableListener** (p. 2126) that this class will send events to if the consumer is in synchronous consumption mode and a new **Message** (p. 2090) has arrived.*

- virtual **cms::MessageAvailableListener** * **getMessageAvailableListener** () const =0

  *Gets the **MessageAvailableListener** (p. 2126) that this class will send mew **Message** (p. 2090) notification events to.*

6.409.1 Detailed Description

A client uses a `MessageConsumer` (p. 2127) to received messages from a destination. A client may either synchronously receive a message consumer's messages or have the consumer asynchronously deliver them as they arrive.

For synchronous receipt, a client can request the next message from a message consumer using one of its `receive` methods. There are several variations of `receive` that allow a client to poll or wait for the next message.

For asynchronous delivery, a client can register a `MessageListener` (p. 2183) object with a message consumer. As messages arrive at the message consumer, it delivers them by calling the `MessageListener` (p. 2183)'s `onMessage` method.

When the MessageConsumer's close method is called the method can block while an asynchronous message delivery is in progress or until a `receive` operation completes. A blocked consumer in a `receive` call will return a Null when the close method is called.

While the **MessageConsumer** (p. 2127) implements the **Startable** (p. 2852) and **Stoppable** (p. 2919) interfaces it is not required to implement these methods and can throw an UnsupportedOperation exception if they are not available for the given CMS provider.

6.409.2 Constructor & Destructor Documentation

6.409.2.1 virtual cms::MessageConsumer::~MessageConsumer () [virtual]

6.409.3 Member Function Documentation

6.409.3.1 virtual cms::MessageAvailableListener* cms::MessageConsumer::getMessageAvailableListener () const [pure virtual]

Gets the **MessageAvailableListener** (p. 2126) that this class will send mew **Message** (p. 2090) notification events to.

Returns:

The listener of message events received by this consumer.

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 872), **activemq::core::ActiveMQConsumer** (p. 298), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 310).

Referenced by activemq::cmsutil::CachedConsumer::getMessageAvailableListener().

6.409.3.2 virtual MessageListener* cms::MessageConsumer::getMessageListener () const [pure virtual]

Gets the **MessageListener** (p. 2183) that this class will send mew **Message** (p. 2090) notification events to.

Returns:

The listener of messages received by this consumer

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 872), **activemq::core::ActiveMQConsumer** (p. 298), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 311).

Referenced by activemq::cmsutil::CachedConsumer::getMessageListener().

6.409.3.3 virtual std::string cms::MessageConsumer::getMessageSelector () const [pure virtual]

Gets this message consumer's message selector expression.

Returns:

This Consumer's selector expression or "".

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 873), **activemq::core::ActiveMQConsumer** (p. 298), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 311).

Referenced by activemq::cmsutil::CachedConsumer::getMessageSelector().

6.409.3.4 virtual cms::MessageTransformer* cms::MessageConsumer::getMessageTransformer () const [pure virtual]

Gets the currently configured **MessageTransformer** (p. 2219) for this **MessageConsumer** (p. 2127).

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implemented in **activemq::cmsutil::CachedConsumer** (p. 873), **activemq::core::ActiveMQConsumer** (p. 298), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 311).

Referenced by activemq::cmsutil::CachedConsumer::getMessageTransformer().

6.409.3.5 virtual Message* cms::MessageConsumer::receive (int *millisecs*) [pure virtual]

Synchronously Receive a **Message** (p. 2090), time out after defined interval. Returns null if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 873), **activemq::core::ActiveMQConsumer** (p. 299), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 313).

6.409.3.6 virtual Message* cms::MessageConsumer::receive () [pure virtual]

Synchronously Receive a **Message** (p. 2090).

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 874), **activemq::core::ActiveMQConsumer** (p. 300), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 313).

Referenced by activemq::cmsutil::CachedConsumer::receive().

6.409.3.7 virtual Message* cms::MessageConsumer::receiveNoWait () [pure virtual]

Receive a **Message** (p. 2090), does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException *(p. **979**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 874), **activemq::core::ActiveMQConsumer** (p. 300), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 313).

Referenced by activemq::cmsutil::CachedConsumer::receiveNoWait().

6.409.3.8 virtual void cms::MessageConsumer::setMessageAvailableListener (cms::MessageAvailableListener * *listener*) [pure virtual]

Sets the **MessageAvailableListener** (p. 2126) that this class will send events to if the consumer is in synchronous consumption mode and a new **Message** (p. 2090) has arrived.

Parameters:

listener The listener of new message events fired by this consumer.

Exceptions:

CMSException (p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 874), **activemq::core::ActiveMQConsumer** (p. 300), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 315).

Referenced by activemq::cmsutil::CachedConsumer::setMessageAvailableListener().

6.409.3.9 virtual void cms::MessageConsumer::setMessageListener (MessageListener * *listener*) [pure virtual]

Sets the **MessageListener** (p. 2183) that this class will send notifs on.

Parameters:

listener The listener of messages received by this consumer.

Exceptions:

CMSException (p. ***979***) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 875), **activemq::core::ActiveMQConsumer** (p. 300), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 315).

Referenced by activemq::cmsutil::CachedConsumer::setMessageListener().

6.409.3.10 virtual void cms::MessageConsumer::setMessageTransformer (cms::MessageTransformer * *transformer*) [pure virtual]

Set an **MessageTransformer** (p. 2219) instance that is applied to all **cms::Message** (p. 2090) objects before they are dispatched to client **code** (p. 1005). The CMS **code** (p. 1005) never takes ownership of the **MessageTransformer** (p. 2219) pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the **MessageTransformer** (p. 2219) has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to apply on each **cms** (p. 91)::;**Message** (p. 2090) dispatch.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 875), **activemq::core::ActiveMQConsumer** (p. 301), and **activemq::core::kernels::ActiveMQConsumerKernel** (p. 315).

Referenced by activemq::cmsutil::CachedConsumer::setMessageTransformer().

Public Member Functions

- virtual ~**MessageDigest** ()
- std::vector< unsigned char > **digest** ()

  Completes the hash computation by performing final operations such as padding.

- int **digest** (unsigned char *input, int size, int offset, int length)

  Completes the hash computation by performing final operations such as padding.

- std::vector< unsigned char > **digest** (const unsigned char *input, int size)

  Performs a final update on the digest using the specified array of bytes, then completes the digest computation.

- std::vector< unsigned char > **digest** (const std::vector< unsigned char > &input)

  Performs a final update on the digest using the specified array of bytes, then completes the digest computation.

- std::string **getAlgorithmName** () const

  Returns a string that identifies the algorithm, independent of implementation details.

- const **Provider** * **getProvider** () const

  *Returns the **Provider** (p. 2500) associated with this **MessageDigest** (p. 2134).*

- int **getDigestLength** () const

  Returns the length of the digest in bytes, or 0 if this operation is not supported by the provider and the implementation is not cloneable.

- **MessageDigest** * **clone** ()

  *Returns a clone of this MessageDisgest instance if the **MessageDigestSpi** (p. 2140) in use is cloneable.*

- void **reset** ()

  Resets the digest for further use.

- std::string **toString** () const

  Returns a string representation of this message digest object.

- void **update** (unsigned char input)

  Updates the digest using the specified byte.

- void **update** (unsigned char *input, int size, int offset, int len)

  Updates the digest using the specified array of bytes, starting at the specified offset.

- void **update** (const std::vector< unsigned char > &input)

Updates the digest using the specified array of bytes.

- void **update** (**nio::ByteBuffer** &input)

  Update the digest using the specified ByteBuffer.

Static Public Member Functions

- static **MessageDigest** * **getInstance** (const std::string &algorithm)

  *Returns a **MessageDigest** (p. 2134) object that implements the specified digest algorithm.*

- static bool **isEqual** (const std::vector< unsigned char > &digesta, const std::vector< unsigned char > &digestb)

  Compares two digests for equality.

Protected Member Functions

- **MessageDigest** (const std::string &name)

6.411.1 Detailed Description

This **MessageDigest** (p. 2134) class provides applications the functionality of a message digest algorithm, such as MD5 or SHA. Message digests are secure one-way hash functions that take arbitrary-sized data and output a fixed-length hash value.

A **MessageDigest** (p. 2134) object starts out initialized. The data is processed through it using the update methods. At any point reset can be called to reset the digest. Once all the data to be updated has been updated, one of the digest methods should be called to complete the hash computation.

The digest method can be called once for a given number of updates. After digest has been called, the **MessageDigest** (p. 2134) object is reset to its initialized state.

Implementations are free to implement the clone method. Client applications can test cloneability by attempting cloning and catching the CloneNotSupportedException:

MessageDigest* md = **MessageDigest::getInstance** (p. 2137)("SHA");

try { md->update(toChapter1); MessageDigest* tc1 = md.clone(); byte[] toChapter1Digest = tc1.digest(); md.update(toChapter2); ...etc. } catch (CloneNotSupportedException& ex) { throw **DigestException** (p. 1398)("couldn't make digest of partial content"); }

Note that if a given implementation is not cloneable, it is still possible to compute intermediate digests by instantiating several instances, if the number of digests is known in advance.

6.411.2 Constructor & Destructor Documentation

6.411.2.1 decaf::security::MessageDigest::MessageDigest (const std::string & *name*) [protected]

6.411.2.2 virtual decaf::security::MessageDigest::~MessageDigest () [virtual]

6.411.3 Member Function Documentation

6.411.3.1 MessageDigest* decaf::security::MessageDigest::clone ()

Returns a clone of this MessageDisgest instance if the **MessageDigestSpi** (p. 2140) in use is cloneable.

Returns:

a clone of this **MessageDigest** (p. 2134) if possible.

Exceptions:

CloneNotSupportedException if the SPI in use cannot be cloned.

6.411.3.2 std::vector<unsigned char> decaf::security::MessageDigest::digest (const std::vector< unsigned char > & *input*)

Performs a final update on the digest using the specified array of bytes, then completes the digest computation. That is, this method first calls update(input), passing the input array to the update method, then calls **digest()** (p. 2137).

Parameters:

input The input to be updated before the digest is completed.

Returns:

the array of bytes for the resulting hash value.

6.411.3.3 std::vector<unsigned char> decaf::security::MessageDigest::digest (const unsigned char * *input*, int *size*)

Performs a final update on the digest using the specified array of bytes, then completes the digest computation. That is, this method first calls update(input), passing the input array to the update method, then calls **digest()** (p. 2137).

Parameters:

input The input to be updated before the digest is completed.

size The length in bytes of the input buffer.

Returns:

the array of bytes for the resulting hash value.

6.411.3.4 int decaf::security::MessageDigest::digest (unsigned char * *input*, int *size*, int *offset*, int *length*)

Completes the hash computation by performing final operations such as padding. The digest is reset after this call is made.

Parameters:

input The output buffer for the computed digest.

size The size of the given input buffer.

offset The offset into the output buffer to begin storing the digest.

length The number of bytes within buf allotted for the digest.

Returns:

the number of bytes placed into buffer.

Exceptions:

DigestException *(*p. ***1398***) if an error occurs.

6.411.3.5 std::vector<unsigned char> decaf::security::MessageDigest::digest ()

Completes the hash computation by performing final operations such as padding. The digest is reset after this call is made.

6.411.3.6 std::string decaf::security::MessageDigest::getAlgorithmName () const [inline]

Returns a string that identifies the algorithm, independent of implementation details. The name should be a standard name (such as "SHA", "MD5", etc).

Returns:

the algorithm name.

6.411.3.7 int decaf::security::MessageDigest::getDigestLength () const

Returns the length of the digest in bytes, or 0 if this operation is not supported by the provider and the implementation is not cloneable.

Returns:

the digest length in bytes, or 0 if this operation is not supported by the provider and the implementation is not cloneable.

6.411.3.8 static MessageDigest* decaf::security::MessageDigest::getInstance (const std::string & *algorithm*) [static]

Returns a **MessageDigest** (p. 2134) object that implements the specified digest algorithm. This method traverses the list of registered **security** (p. 121) Providers, starting with the most preferred

Provider (p. 2500). A new **MessageDigest** (p. 2134) object encapsulating the **MessageDigestSpi** (p. 2140) implementation from the first **Provider** (p. 2500) that supports the specified algorithm is returned.

Note that the list of registered providers may be retrieved via the Security.getProviders() method.

Parameters:

algorithm The name of the algorithm requested. (MD5, SHA-1, etc)

Returns:

a Message Digest object that implements the specified algorithm.

Exceptions:

NoSuchAlgorithmException *(p. 2257)* if no **Provider** (p. 2500) supports a **MessageDigestSpi** (p. 2140) implementation for the specified algorithm.

6.411.3.9 const Provider* decaf::security::MessageDigest::getProvider () const [inline]

Returns the **Provider** (p. 2500) associated with this **MessageDigest** (p. 2134). The pointer returned by this method remains the property of the **Security** (p. 2643) framework and should be deleted by the calling application at any time.

Returns:

the provider associated with this **MessageDigest** (p. 2134).

6.411.3.10 static bool decaf::security::MessageDigest::isEqual (const std::vector< unsigned char > & *digesta*, const std::vector< unsigned char > & *digestb*) [static]

Compares two digests for equality. Does a simple byte compare.

Parameters:

digesta The first digest for comparison.

digesta The second digest for comparison.

Returns:

true if the two digests are equal.

6.411.3.11 void decaf::security::MessageDigest::reset ()

Resets the digest for further use.

6.411.3.12 std::string decaf::security::MessageDigest::toString () const

Returns a string representation of this message digest object.

Returns:

a string representation of this message digest object.

6.411.3.13 void decaf::security::MessageDigest::update (nio::ByteBuffer & *input*)

Update the digest using the specified ByteBuffer. The digest is updated using the input.remaining() bytes starting at input.position(). Upon return, the buffer's position will be equal to its limit; its limit will not have changed.

Parameters:

input The input ByteBuffer to use for the update.

6.411.3.14 void decaf::security::MessageDigest::update (const std::vector< unsigned char > & *input*)

Updates the digest using the specified array of bytes.

Parameters:

input The array of bytes to use for the update.

6.411.3.15 void decaf::security::MessageDigest::update (unsigned char * *input*, int *size*, int *offset*, int *len*)

Updates the digest using the specified array of bytes, starting at the specified offset.

Parameters:

input The array of bytes.

input The size of the given input buffer.

offset The offset to start from in the array of bytes.

length The number of bytes to use, starting at offset.

6.411.3.16 void decaf::security::MessageDigest::update (unsigned char *input*)

Updates the digest using the specified byte.

Parameters:

input The byte with which to update the digest.

6.412 decaf::security::MessageDigestSpi Class Reference

This class defines the Service **Provider** (p. 2500) Interface (SPI) for the **MessageDigest** (p. 2134) class, which provides the functionality of a message digest algorithm, such as MD5 or SHA.

`#include <src/main/decaf/security/MessageDigestSpi.h>`Inheritance diagram for decaf::security::MessageDigestSpi:

Public Member Functions

- **MessageDigestSpi** ()
- virtual ~**MessageDigestSpi** ()
- virtual bool **isCloneable** () const

  Queries the SPI implementation and returns true if the SPI can be cloned.

- virtual **MessageDigestSpi** * **clone** ()

  Returns a clone if the implementation supports being cloned.

Protected Member Functions

- virtual int **engineGetDigestLength** ()=0

  Returns the digest length in bytes.

- virtual void **engineUpdate** (unsigned char input)=0

  Updates the digest using the specified byte.

- virtual void **engineUpdate** (const unsigned char *input, int size, int offset, int length)=0

  Updates the digest using the specified array of bytes, starting at the specified offset.

- virtual void **engineReset** ()=0

  Resets the digest for further use.

- virtual void **engineUpdate** (const std::vector< unsigned char > &input)=0

  Update the digest using the specified Vector of Bytes.

- virtual void **engineUpdate** (**decaf::nio::ByteBuffer** &input)=0

  Update the digest using the specified ByteBuffer.

- virtual std::vector< unsigned char > **engineDigest** ()=0

  Completes the hash computation by performing final operations such as padding.

- virtual int **engineDigest** (unsigned char *buffer, int size, int offset, int length)=0

  Completes the hash computation by performing final operations such as padding.

Friends

- class **MessageDigest**

6.412.1 Detailed Description

This class defines the Service **Provider** (p. 2500) Interface (SPI) for the **MessageDigest** (p. 2134) class, which provides the functionality of a message digest algorithm, such as MD5 or SHA. Message digests are secure one-way hash functions that take arbitrary-sized data and output a fixed-length hash value.

All the pure virtual methods in this class must be implemented by a cryptographic service provider who wishes to supply the implementation of a particular message digest algorithm.

Implementations are free to implement clone method or throw a CloneNotSupportedException..

Since:

1.0

6.412.2 Constructor & Destructor Documentation

6.412.2.1 decaf::security::MessageDigestSpi::MessageDigestSpi ()

6.412.2.2 virtual decaf::security::MessageDigestSpi::~MessageDigestSpi () [virtual]

6.412.3 Member Function Documentation

6.412.3.1 virtual MessageDigestSpi* decaf::security::MessageDigestSpi::clone () [virtual]

Returns a clone if the implementation supports being cloned.

Returns:

a new pointer that is a copy of this object.

Exceptions:

CloneNotSupportedException if this is called on an implementation that does not support cloning.

Reimplemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2059), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2064), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2717).

6.412.3.2 virtual int decaf::security::MessageDigestSpi::engineDigest (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, pure virtual]

Completes the hash computation by performing final operations such as padding. Once engineDigest has been called, the engine should be reset (see engineReset). Resetting is the responsibility of the engine implementor.

Parameters:

buffer The output buffer in which to store the digest

size The size of the given input buffer

offset The offset to start from in the output buffer

length The number of bytes within buffer allotted for the digest. Both this default implementation and the SUN provider do not return partial digests. The presence of this parameter is solely for consistency in our API's. If the value of this parameter is less than the actual digest length, the method will throw a **DigestException** (p. 1398). This parameter is ignored if its value is greater than or equal to the actual digest length.

Returns:

the length of the digest stored in the output buffer.

Exceptions:

DigestException *(*p. ***1398****)* if an error occurs.

NullPointerException if the buffer pointer is NULL.

Implemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2059), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2064), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2717).

6.412.3.3 virtual std::vector<unsigned char> decaf::security::MessageDigestSpi::engineDigest () [protected, pure virtual]

Completes the hash computation by performing final operations such as padding. Once engineDigest has been called, the engine should be reset (see engineReset). Resetting is the responsibility of the engine implementor.

Returns:

an STL vector of bytes containing the resulting hash value.

Implemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2060), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2065), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2718).

6.412.3.4 virtual int decaf::security::MessageDigestSpi::engineGetDigestLength () [protected, pure virtual]

Returns the digest length in bytes.

Returns:

The digest length in bytes.

Implemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2060), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2065), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2718).

6.412.3.5 virtual void decaf::security::MessageDigestSpi::engineReset () [protected, pure virtual]

Resets the digest for further use.

Implemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2060), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2065), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2718).

6.412.3.6 virtual void decaf::security::MessageDigestSpi::engineUpdate (decaf::nio::ByteBuffer & *input*) [protected, pure virtual]

Update the digest using the specified ByteBuffer. The digest is updated using the input.remaining() bytes starting at input.position(). Upon return, the buffer's position will be equal to its limit; its limit will not have changed.

Parameters:

input The ByteBuffer instance that will be used to update the digest.

Implemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2060), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2065), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2718).

6.412.3.7 virtual void decaf::security::MessageDigestSpi::engineUpdate (const std::vector< unsigned char > & *input*) [protected, pure virtual]

Update the digest using the specified Vector of Bytes.

Parameters:

input The vector of bytes that will be used to update the digest.

Implemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2061), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2066), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2719).

6.412.3.8 virtual void decaf::security::MessageDigestSpi::engineUpdate (const unsigned char * *input*, int *size*, int *offset*, int *length*) [protected, pure virtual]

Updates the digest using the specified array of bytes, starting at the specified offset.

Parameters:

input The array of bytes to use for the update.

size The size of the given input buffer..

offset The offset to start from in the array of bytes.

length The number of bytes to use, starting at offset.

Exceptions:

NullPointerException if the input array pointer is NULL.

Implemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2061), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2066), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2719).

6.412.3.9 virtual void decaf::security::MessageDigestSpi::engineUpdate (unsigned char *input*) [protected, pure virtual]

Updates the digest using the specified byte.

Parameters:

input The byte to use for the update.

Implemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2061), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2066), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2719).

6.412.3.10 virtual bool decaf::security::MessageDigestSpi::isCloneable () const [virtual]

Queries the SPI implementation and returns true if the SPI can be cloned.

Returns:

true if the SPI is clonable.

Reimplemented in **decaf::internal::security::provider::crypto::MD4MessageDigestSpi** (p. 2061), **decaf::internal::security::provider::crypto::MD5MessageDigestSpi** (p. 2066), and **decaf::internal::security::provider::crypto::SHA1MessageDigestSpi** (p. 2719).

6.413.1 Constructor & Destructor Documentation

6.413.1.1 activemq::commands::MessageDispatch::MessageDispatch ()

6.413.1.2 virtual activemq::commands::MessageDispatch::~MessageDispatch () [virtual]

6.413.2 Member Function Documentation

6.413.2.1 virtual MessageDispatch* activemq::commands::MessageDispatch::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.413.2.2 virtual void activemq::commands::MessageDispatch::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.413.2.3 virtual bool activemq::commands::MessageDispatch::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.413.2.4 virtual Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId () [virtual]

6.413.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId () const [virtual]

6.413.2.6 virtual unsigned char activemq::commands::MessageDispatch::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.413.2.7 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () [virtual]

6.413.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () const [virtual]

6.413.2.9 virtual Pointer<Message>& activemq::commands::MessageDispatch::getMessage () [virtual]

6.413.2.10 virtual const Pointer<Message>& activemq::commands::MessageDispatch::getMessage () const [virtual]

6.413.2.11 virtual int activemq::commands::MessageDispatch::getRedeliveryCounter () const [virtual]

6.413.2.12 decaf::lang::Exception activemq::commands::MessageDispatch::getRollbackCause () const

6.413.2.13 virtual bool activemq::commands::MessageDispatch::isMessageDispatch () const [inline, virtual]

Returns:

an answer of true to the **isMessageDispatch()** (p. 2147) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 638).

6.413.2.14 virtual void activemq::commands::MessageDispatch::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.413.2.15 virtual void activemq::commands::MessageDispatch::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.413.2.16 virtual void activemq::commands::MessageDispatch::setMessage (const Pointer< Message > & *message*) [virtual]

6.413.2.17 virtual void activemq::commands::MessageDispatch::setRedeliveryCounter (int *redeliveryCounter*) [virtual]

6.413.2.18 void activemq::commands::MessageDispatch::setRollbackCause (const decaf::lang::Exception & *cause*)

6.413.2.19 virtual std::string activemq::commands::MessageDispatch::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.413.2.20 virtual Pointer<Command> activemq::commands::MessageDispatch::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.413.3 Field Documentation

6.414 activemq::core::MessageDispatchChannel Class Reference

`#include <src/main/activemq/core/MessageDispatchChannel.h>`Inheritance diagram for activemq::core::MessageDispatchChannel:

Public Member Functions

- virtual ~**MessageDispatchChannel** ()
- virtual void **enqueue** (const **Pointer**< **MessageDispatch** > &message)=0

  Add a Message to the Channel behind all pending message.

- virtual void **enqueueFirst** (const **Pointer**< **MessageDispatch** > &message)=0

  Add a message to the front of the Channel.

- virtual bool **isEmpty** () const =0
- virtual bool **isClosed** () const =0
- virtual bool **isRunning** () const =0
- virtual **Pointer**< **MessageDispatch** > **dequeue** (long long timeout)=0

  Used to get an enqueued message.

- virtual **Pointer**< **MessageDispatch** > **dequeueNoWait** ()=0

  Used to get an enqueued message if there is one queued right now.

- virtual **Pointer**< **MessageDispatch** > **peek** () const =0

  Peek in the Queue and return the first message in the Channel without removing it from the channel.

- virtual void **start** ()=0

  Starts dispatch of messages from the Channel.

- virtual void **stop** ()=0

  Stops dispatch of message from the Channel.

- virtual void **close** ()=0

  Close this channel no messages will be dispatched after this method is called.

- virtual void **clear** ()=0

  Clear the Channel, all pending messages are removed.

- virtual int **size** () const =0
- virtual std::vector< **Pointer**< **MessageDispatch** > > **removeAll** ()=0

  Remove all messages that are currently in the Channel and return them as a list of Messages.

6.414.1 Constructor & Destructor Documentation

6.414.1.1 virtual activemq::core::MessageDispatchChannel::~MessageDispatchChannel () [virtual]

6.414.2 Member Function Documentation

6.414.2.1 virtual void activemq::core::MessageDispatchChannel::clear () [pure virtual]

Clear the Channel, all pending messages are removed.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1512), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2763).

6.414.2.2 virtual void activemq::core::MessageDispatchChannel::close () [pure virtual]

Close this channel no messages will be dispatched after this method is called.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1512), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2763).

6.414.2.3 virtual Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeue (long long *timeout*) [pure virtual]

Used to get an enqueued message. The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will consumed by this method.

Returns:

null if we timeout or if the consumer is closed.

Exceptions:

ActiveMQException

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1513), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2764).

6.414.2.4 virtual Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeueNoWait () [pure virtual]

Used to get an enqueued message if there is one queued right now. If there is no waiting message than this method returns Null.

Returns:

a message if there is one in the queue.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1513), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2764).

6.414.2.5 virtual void activemq::core::MessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & *message*) [pure virtual]

Add a Message to the Channel behind all pending message.

Parameters:

message - The message to add to the Channel.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1513), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2764).

6.414.2.6 virtual void activemq::core::MessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & *message*) [pure virtual]

Add a message to the front of the Channel.

Parameters:

message - The Message to add to the front of the Channel.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1513), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2764).

6.414.2.7 virtual bool activemq::core::MessageDispatchChannel::isClosed () const [pure virtual]

Returns:

has the Queue been closed.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1514), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2765).

6.414.2.8 virtual bool activemq::core::MessageDispatchChannel::isEmpty () const [pure virtual]

Returns:

true if there are no messages in the Channel.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1514), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2765).

6.414.2.9 virtual bool activemq::core::MessageDispatchChannel::isRunning () const [pure virtual]

Returns:

true if the Channel currently running and will dequeue message.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1514), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2765).

6.414.2.10 virtual Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::peek () const [pure virtual]

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns:

a message if there is one in the queue.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1515), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2766).

6.414.2.11 virtual std::vector<Pointer<MessageDispatch> > activemq::core::MessageDispatchChannel::removeAll () [pure virtual]

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns:

a list of Messages that was previously in the Channel.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1515), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2766).

6.414.2.12 virtual int activemq::core::MessageDispatchChannel::size () const [pure virtual]

Returns:

the number of Messages currently in the Channel.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1515), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2766).

6.414.2.13 virtual void activemq::core::MessageDispatchChannel::start () [pure virtual]

Starts dispatch of messages from the Channel.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1515), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2767).

6.414.2.14 virtual void activemq::core::MessageDispatchChannel::stop () [pure virtual]

Stops dispatch of message from the Channel.

Implemented in **activemq::core::FifoMessageDispatchChannel** (p. 1516), and **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2767).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**MessageDispatchChannel.h**

6.415 activemq::wireformat::openwire::marshal::generated::MessageDisp Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **MessageDispatchMarshaller** (p. 2155).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/MessageDispatchMarshaller.h>`In diagram for activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller:

Public Member Functions

- **MessageDispatchMarshaller** ()
- virtual ~**MessageDispatchMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.415.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **MessageDispatchMarshaller** (p. 2155). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.415.2 Constructor & Destructor Documentation

6.415.2.1 activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::Message() [inline]

6.415.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::~Messa() [inline, virtual]

6.415.3 Member Function Documentation

6.415.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::createObj() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.415.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::getDataSt() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.415.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::looseMars(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.415.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::looseUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.415.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.415.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.415.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::tightUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.416.1.2 virtual activemq::commands::MessageDispatchNotification::~MessageDispatchNotification () [virtual]

6.416.2 Member Function Documentation

6.416.2.1 virtual MessageDispatchNotification* activemq::commands::MessageDispatchNotification::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.416.2.2 virtual void activemq::commands::MessageDispatchNotification::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.416.2.3 virtual bool activemq::commands::MessageDispatchNotification::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.416.2.4 virtual Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId () [virtual]

6.416.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId () const [virtual]

6.416.2.6 virtual unsigned char activemq::commands::MessageDispatchNotification::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.416.2.7 virtual long long activemq::commands::MessageDispatchNotification::getDeliverySequenceId () const [virtual]

6.416.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination () [virtual]

6.416.2.9 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination () const [virtual]

6.416.2.12 virtual bool activemq::commands::MessageDispatchNotification::isMessageDispatchNotification () const [inline, virtual]

Returns:

an answer of true to the **isMessageDispatchNotification()** (p. 2161) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 638).

6.416.2.13 virtual void activemq::commands::MessageDispatchNotification::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.416.2.14 virtual void activemq::commands::MessageDispatchNotification::setDeliverySequenceId (long long *deliverySequenceId*) [virtual]

6.416.2.15 virtual void activemq::commands::MessageDispatchNotification::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.416.2.16 virtual void activemq::commands::MessageDispatchNotification::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]

6.416.2.17 virtual std::string activemq::commands::MessageDispatchNotification::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.416.2.18 virtual Pointer<Command> activemq::commands::MessageDispatchNotification::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.417 activemq::wireformat::openwire::marshal::generated::MessageDisp Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **MessageDispatchNotificationMarshaller** (p. 2164).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/MessageDispatchNotificationMar`
diagram for activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller:

Public Member Functions

- **MessageDispatchNotificationMarshaller** ()
- virtual ~**MessageDispatchNotificationMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.417.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **MessageDispatchNotificationMarshaller** (p. 2164). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.417.2 Constructor & Destructor Documentation

6.417.2.1 activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshal () [inline]

6.417.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshal () [inline, virtual]

6.417.3 Member Function Documentation

6.417.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshalle () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.417.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshalle () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.417.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshalle (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.417.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.417.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.417.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.417.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**MessageDispatchNotificationMarshaller.h**

6.418 cms::MessageEnumeration Class Reference

Defines an object that enumerates a collection of Messages.

`#include <src/main/cms/MessageEnumeration.h>`Inheritance diagram for cms::MessageEnumeration:

Public Member Functions

- virtual ~**MessageEnumeration** ()
- virtual bool **hasMoreMessages** ()=0

  *Returns true if there are more **Message** (p. 2090) in the Browser that can be retrieved via the `nextMessage` method.*

- virtual **cms::Message** * **nextMessage** ()=0

  *Returns the Next **Message** (p. 2090) in the **Queue** (p. 2514) if one is present, if no more Message's are available then an Exception is thrown.*

6.418.1 Detailed Description

Defines an object that enumerates a collection of Messages. The client calls the hasMoreMessages method to determine if a **Message** (p. 2090) is available. If a **Message** (p. 2090) is available the client calls the nextMessage method to retrieve that **Message** (p. 2090), calling nextMessage when a **Message** (p. 2090) is not available results in an exception.

Since:

2.1

6.418.2 Constructor & Destructor Documentation

6.418.2.1 virtual cms::MessageEnumeration::~MessageEnumeration () [virtual]

6.418.3 Member Function Documentation

6.418.3.1 virtual bool cms::MessageEnumeration::hasMoreMessages () [pure virtual]

Returns true if there are more **Message** (p. 2090) in the Browser that can be retrieved via the `nextMessage` method. If this method returns false and the `nextMessage` method is called then an Exception will be thrown.

Returns:

true if more Message's are available in the Browser.

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 427).

6.418.3.2 virtual cms::Message* cms::MessageEnumeration::nextMessage () [pure virtual]

Returns the Next **Message** (p. 2090) in the **Queue** (p. 2514) if one is present, if no more Message's are available then an Exception is thrown. If a **Message** (p. 2090) object pointer is returned then that object becomes the property of the caller and must be deleted by the caller when finished.

Returns:

The next **Message** (p. 2090) in the **Queue** (p. 2514).

Exceptions:

CMSException *(p. **979**)* if no more Message's currently in the **Queue** (p. 2514).

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 427).

The documentation for this class was generated from the following file:

- src/main/cms/**MessageEnumeration.h**

6.419 cms::MessageEOFException Class Reference

This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2923) or **BytesMessage** (p. 857) is being read.

`#include <src/main/cms/MessageEOFException.h>`Inheritance diagram for cms::MessageEOFException:

Public Member Functions

- **MessageEOFException** ()
- **MessageEOFException** (const **MessageEOFException** &ex)
- **MessageEOFException** (const std::string &message)
- **MessageEOFException** (const std::string &message, const std::exception *cause)
- **MessageEOFException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**MessageEOFException** () throw ()
- virtual **MessageEOFException** * **clone** ()

  *Creates a cloned version of this **CMSException** (p. 979) instance.*

6.419.1 Detailed Description

This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2923) or **BytesMessage** (p. 857) is being read.

Since:

1.3

6.419.2 Constructor & Destructor Documentation

6.419.2.1 cms::MessageEOFException::MessageEOFException ()

6.419.2.2 cms::MessageEOFException::MessageEOFException (const MessageEOFException & *ex*)

6.419.2.3 cms::MessageEOFException::MessageEOFException (const std::string & *message*)

6.419.2.4 cms::MessageEOFException::MessageEOFException (const std::string & *message*, const std::exception * *cause*)

6.419.2.5 cms::MessageEOFException::MessageEOFException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.419.2.6 virtual cms::MessageEOFException::~MessageEOFException () throw () [virtual]

6.419.3 Member Function Documentation

6.419.3.1 virtual MessageEOFException* cms::MessageEOFException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

The documentation for this class was generated from the following file:

- src/main/cms/**MessageEOFException.h**

6.420 cms::MessageFormatException Class Reference

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

`#include <src/main/cms/MessageFormatException.h>`Inheritance diagram for cms::MessageFormatException:

Public Member Functions

- **MessageFormatException** ()
- **MessageFormatException** (const **MessageFormatException** &ex)
- **MessageFormatException** (const std::string &message)
- **MessageFormatException** (const std::string &message, const std::exception *cause)
- **MessageFormatException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**MessageFormatException** () throw ()
- virtual **MessageFormatException** * **clone** ()

  *Creates a cloned version of this **CMSException** (p. 979) instance.*

6.420.1 Detailed Description

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type. It must also be thrown when equivalent type errors are made with message property values. For example, this exception must be thrown if **StreamMessage.readShort** (p. 2929) is used to read a boolean value.

Since:

1.3

6.420.2 Constructor & Destructor Documentation

6.420.2.1 cms::MessageFormatException::MessageFormatException ()

6.420.2.2 cms::MessageFormatException::MessageFormatException (const MessageFormatException & *ex*)

6.420.2.3 cms::MessageFormatException::MessageFormatException (const std::string & *message*)

6.420.2.4 cms::MessageFormatException::MessageFormatException (const std::string & *message*, const std::exception * *cause*)

6.420.2.5 cms::MessageFormatException::MessageFormatException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.420.2.6 virtual cms::MessageFormatException::~MessageFormatException () throw () [virtual]

6.420.3 Member Function Documentation

6.420.3.1 virtual MessageFormatException* cms::MessageFormatException::clone () [virtual]

Creates a cloned version of this **CMSException** (p. 979) instance. This method passes on ownership of the contained cause exception pointer to the clone. This method is mainly useful to the CMS provider.

Returns:

new pointer that is a clone of this Exception, caller owns.

Reimplemented from **cms::CMSException** (p. 980).

The documentation for this class was generated from the following file:

- src/main/cms/**MessageFormatException.h**

6.422.3 Member Function Documentation

6.422.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.422.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::getDataStructur () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.422.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.422.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.422.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.422.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.422.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

6.423 cms::MessageListener Class Reference

A `MessageListener` (p. 2183) object is used to receive asynchronously delivered messages.

`#include <src/main/cms/MessageListener.h>`

Public Member Functions

- virtual ~**MessageListener** ()
- virtual void **onMessage** (const **Message** *message)=0

  *Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 2090) types.*

6.423.1 Detailed Description

A `MessageListener` (p. 2183) object is used to receive asynchronously delivered messages.

Since:

1.0

6.423.2 Constructor & Destructor Documentation

6.423.2.1 virtual cms::MessageListener::~MessageListener () [virtual]

6.423.3 Member Function Documentation

6.423.3.1 virtual void cms::MessageListener::onMessage (const Message * *message*) [pure virtual]

Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 2090) types. a dynamic cast is used to find out what type of message this is. The lifetime of this object is only guaranteed to be for life of the onMessage function after this call-back returns the message may no longer exists. Users should copy the data or clone the message if they wish to retain information that was contained in this **Message** (p. 2090).

It is considered a programming error for this method to throw an exception. The method has been tagged with the 'throw()' qualifier, this implies that you application will segfault if you throw an error from an implementation of this method.

Parameters:

message **Message** (p. 2090) object {const} pointer recipient does not own.

The documentation for this class was generated from the following file:

- src/main/cms/**MessageListener.h**

6.424 activemq::wireformat::openwire::marshal::generated::MessageMars Class Reference

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.424.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **MessageMarshaller** (p. 2184). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.424.2 Constructor & Destructor Documentation

6.424.2.1 activemq::wireformat::openwire::marshal::generated::MessageMarshaller::MessageMarshal () [inline]

6.424.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessageMarshaller::~MessageMarsh () [inline, virtual]

6.424.3 Member Function Documentation

6.424.3.1 virtual void activemq::wireformat::openwire::marshal::generated::MessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshall** (p. 210), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 229), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 362), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 373), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 390), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 490), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 524).

6.424.3.2 virtual void activemq::wireformat::openwire::marshal::generated::MessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshall** (p. 211), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 230), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 363), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 374), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 391), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 491), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 525).

6.424.3.3 virtual int activemq::wireformat::openwire::marshal::generated::MessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshall** (p. 211), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 230), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 363), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 374), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 391), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 491), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 525).

6.424.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshall** (p. 211), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 230), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 363), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 374), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 391), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 491), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 525).

6.424.3.5 virtual void activemq::wireformat::openwire::marshal::generated::MessageMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshall** (p. 212), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 231), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 364), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 375), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 492), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 526).

  Sets the Time to Live that this Producers sends messages with.

- virtual long long **getTimeToLive** () const =0

  Gets the Time to Live that this producer sends messages with.

- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)=0

  *Set an **MessageTransformer** (p. 2219) instance that is applied to all **cms::Message** (p. 2090) objects before they are sent on to the CMS bus.*

- virtual **cms::MessageTransformer** * **getMessageTransformer** () const =0

  *Gets the currently configured **MessageTransformer** (p. 2219) for this **MessageProducer** (p. 2192).*

6.427.1 Detailed Description

A client uses a `MessageProducer (p. 2192)` object to send messages to a **Destination** (p. 1377). A `MessageProducer (p. 2192)` object is created by passing a `Destination (p. 1377)` object to a message-producer creation method supplied by a session.

A client also has the option of creating a message producer without supplying a destination. In this case, a **Destination** (p. 1377) must be provided with every send operation. A typical use for this kind of message producer is to send replies to requests using the request's CMSReplyTo destination.

A client can specify a default delivery mode, priority, and time to live for messages sent by a message producer. It can also specify the delivery mode, priority, and time to live for an individual message.

A client can specify a time-to-live value in milliseconds for each message it sends. This value defines a message expiration time that is the sum of the message's time-to-live and the GMT

when it is sent (for transacted sends, this is the time the client sends the message, not the time the transaction is committed).

Since:

1.0

6.427.2 Constructor & Destructor Documentation

6.427.2.1 virtual cms::MessageProducer::~MessageProducer () [virtual]

6.427.3 Member Function Documentation

6.427.3.1 virtual int cms::MessageProducer::getDeliveryMode () const [pure virtual]

Gets the delivery mode for this Producer.

Returns:

The **DeliveryMode** (p. 1364)

Exceptions:

CMSException *(p. **979**)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 879), **activemq::core::ActiveMQProducer** (p. 395), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 407).

Referenced by activemq::cmsutil::CachedProducer::getDeliveryMode().

6.427.3.2 virtual bool cms::MessageProducer::getDisableMessageID () const [pure virtual]

Gets if **Message** (p. 2090) Ids are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSException *(p. **979**)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 879), **activemq::core::ActiveMQProducer** (p. 395), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 407).

Referenced by activemq::cmsutil::CachedProducer::getDisableMessageID().

6.427.3.3 virtual bool cms::MessageProducer::getDisableMessageTimeStamp () const [pure virtual]

Gets if **Message** (p. 2090) Time Stamps are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSException *(*p. ***979***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 879), **activemq::core::ActiveMQProducer** (p. 396), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 407).

Referenced by activemq::cmsutil::CachedProducer::getDisableMessageTimeStamp().

6.427.3.4 virtual cms::MessageTransformer* cms::MessageProducer::getMessageTransformer () const [pure virtual]

Gets the currently configured **MessageTransformer** (p. 2219) for this **MessageProducer** (p. 2192).

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implemented in **activemq::cmsutil::CachedProducer** (p. 880), **activemq::core::ActiveMQProducer** (p. 396), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 407).

Referenced by activemq::cmsutil::CachedProducer::getMessageTransformer().

6.427.3.5 virtual int cms::MessageProducer::getPriority () const [pure virtual]

Gets the Priority level that this producer sends messages at.

Returns:

int based priority level

Exceptions:

CMSException *(*p. ***979***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 880), **activemq::core::ActiveMQProducer** (p. 396), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 408).

Referenced by activemq::cmsutil::CachedProducer::getPriority().

6.427.3.6 virtual long long cms::MessageProducer::getTimeToLive () const [pure virtual]

Gets the Time to Live that this producer sends messages with.

Returns:

Time to live value in milliseconds

Exceptions:

CMSException *(*p. ***979***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 880), **activemq::core::ActiveMQProducer** (p. 397), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 409).

Referenced by activemq::cmsutil::CachedProducer::getTimeToLive().

6.427.3.7 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, AsyncCallback * *onComplete*) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. If the **AsyncCallback** (p. 609) parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the **Message** (p. 2090) or an Error occurs.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

onComplete The **AsyncCallback** (p. 609) instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException *(*p. ***979***) - if an internal error occurs while sending the message.

MessageFormatException *(*p. ***2172***) - if an Invalid **Message** (p. 2090) is given.

InvalidDestinationException *(*p. ***1774***) - if a client uses this method with a **MessageProducer** (p. 2192) with an invalid destination.

UnsupportedOperationException *(*p. ***3166***) - if a client uses this method with a **MessageProducer** (p. 2192) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 881), **activemq::core::ActiveMQProducer** (p. 397), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 409).

6.427.3.8 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException *(*p. ***979***) - if an internal error occurs while sending the message.

MessageFormatException *(*p. ***2172***) - if an Invalid **Message** (p. 2090) is given.

InvalidDestinationException *(*p. ***1774***) - if a client uses this method with a **MessageProducer** (p. 2192) with an invalid destination.

UnsupportedOperationException *(*p. ***3166***) - if a client uses this method with a **MessageProducer** (p. 2192) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 881), **activemq::core::ActiveMQProducer** (p. 398), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 410).

6.427.3.9 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*, AsyncCallback * *onComplete*) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live. If the **AsyncCallback** (p. 609) parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the **Message** (p. 2090) or an Error occurs.

Parameters:

destination The destination on which to send the message

message the message to be sent.

onComplete The **AsyncCallback** (p. 609) instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException *(*p. ***979***) - if an internal error occurs while sending the message.

MessageFormatException *(*p. ***2172***) - if an Invalid **Message** (p. 2090) is given.

InvalidDestinationException *(*p. ***1774***) - if a client uses this method with a **MessageProducer** (p. 2192) with an invalid destination.

UnsupportedOperationException *(*p. ***3166***) - if a client uses this method with a **MessageProducer** (p. 2192) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 882), **activemq::core::ActiveMQProducer** (p. 398), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 410).

6.427.3.10 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

destination The destination on which to send the message

message the message to be sent.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs while sending the message.

MessageFormatException (p. ***2172***) - if an Invalid **Message** (p. 2090) is given.

InvalidDestinationException (p. ***1774***) - if a client uses this method with a **MessageProducer** (p. 2192) with an invalid destination.

UnsupportedOperationException (p. ***3166***) - if a client uses this method with a **MessageProducer** (p. 2192) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 882), **activemq::core::ActiveMQProducer** (p. 399), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 411).

6.427.3.11 virtual void cms::MessageProducer::send (Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*, AsyncCallback * *onComplete*) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. If the **AsyncCallback** (p. 609) parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the **Message** (p. 2090) or an Error occurs.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

onComplete The **AsyncCallback** (p. 609) instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs while sending the message.

MessageFormatException (p. ***2172***) - if an Invalid **Message** (p. 2090) is given.

InvalidDestinationException (p. ***1774***) - if a client uses this method with a **MessageProducer** (p. 2192) with an invalid destination.

UnsupportedOperationException (p. ***3166***) - if a client uses this method with a **MessageProducer** (p. 2192) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 883), **activemq::core::ActiveMQProducer** (p. 399), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 411).

6.427.3.12 virtual void cms::MessageProducer::send (Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs while sending the message.

MessageFormatException (p. ***2172***) - if an Invalid **Message** (p. 2090) is given.

InvalidDestinationException (p. ***1774***) - if a client uses this method with a **MessageProducer** (p. 2192) with an invalid destination.

UnsupportedOperationException (p. ***3166***) - if a client uses this method with a **MessageProducer** (p. 2192) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 883), **activemq::core::ActiveMQProducer** (p. 400), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 412).

6.427.3.13 virtual void cms::MessageProducer::send (Message * *message*, AsyncCallback * *onComplete*) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live. If the **AsyncCallback** (p. 609) parameter is set this method will return immediately and the call-back will be notified once the CMS Provider as acknowledge receipt of the **Message** (p. 2090) or an Error occurs.

Parameters:

message The message to be sent.

onComplete The **AsyncCallback** (p. 609) instance to notify on send complete or error, caller retains ownership of this pointer and must destroy it only after the send completes or the connection is closed.

Exceptions:

CMSException (p. ***979***) - if an internal error occurs while sending the message.

MessageFormatException (p. ***2172***) - if an Invalid **Message** (p. 2090) is given.

InvalidDestinationException (p. ***1774***) - if a client uses this method with a **MessageProducer** (p. 2192) with an invalid destination.

UnsupportedOperationException *(p. 3166)* - if a client uses this method with a **MessageProducer** (p. 2192) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 884), **activemq::core::ActiveMQProducer** (p. 400), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 412).

6.427.3.14 virtual void cms::MessageProducer::send (Message * *message*) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

message The message to be sent.

Exceptions:

CMSException *(p. 979)* - if an internal error occurs while sending the message.

MessageFormatException *(p. 2172)* - if an Invalid **Message** (p. 2090) is given.

InvalidDestinationException *(p. 1774)* - if a client uses this method with a **MessageProducer** (p. 2192) with an invalid destination.

UnsupportedOperationException *(p. 3166)* - if a client uses this method with a **MessageProducer** (p. 2192) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 884), **activemq::core::ActiveMQProducer** (p. 401), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 413).

Referenced by activemq::cmsutil::CachedProducer::send().

6.427.3.15 virtual void cms::MessageProducer::setDeliveryMode (int *mode*) [pure virtual]

Sets the delivery mode for this Producer.

Parameters:

mode The **DeliveryMode** (p. 1364)

Exceptions:

CMSException *(p. 979)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 885), **activemq::core::ActiveMQProducer** (p. 401), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 413).

Referenced by activemq::cmsutil::CachedProducer::setDeliveryMode().

6.427.3.16 virtual void cms::MessageProducer::setDisableMessageID (bool *value*) [pure virtual]

Sets if **Message** (p. 2090) Ids are disabled for this Producer.

Parameters:

value boolean indicating enable / disable (true / false)

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 885), **activemq::core::ActiveMQProducer** (p. 401), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 414).

Referenced by activemq::cmsutil::CachedProducer::setDisableMessageID().

6.427.3.17 virtual void cms::MessageProducer::setDisableMessageTimeStamp (bool *value*) [pure virtual]

Sets if **Message** (p. 2090) Time Stamps are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Exceptions:

CMSException (p. ***979***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 885), **activemq::core::ActiveMQProducer** (p. 402), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 414).

Referenced by activemq::cmsutil::CachedProducer::setDisableMessageTimeStamp().

6.427.3.18 virtual void cms::MessageProducer::setMessageTransformer (cms::MessageTransformer * *transformer*) [pure virtual]

Set an **MessageTransformer** (p. 2219) instance that is applied to all **cms::Message** (p. 2090) objects before they are sent on to the CMS bus. The CMS **code** (p. 1005) never takes ownership of the **MessageTransformer** (p. 2219) pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the **MessageTransformer** (p. 2219) has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to apply on each **cms** (p. 91)::MessageSend.

Implemented in **activemq::cmsutil::CachedProducer** (p. 886), **activemq::core::ActiveMQProducer** (p. 402), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 414).

Referenced by activemq::cmsutil::CachedProducer::setMessageTransformer().

6.427.3.19 virtual void cms::MessageProducer::setPriority (int *priority*) [pure virtual]

Sets the Priority that this Producers sends messages at.

Parameters:

priority int value for Priority level

Exceptions:

CMSException *(*p. ***979****)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 886), **activemq::core::ActiveMQProducer** (p. 402), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 414).

Referenced by activemq::cmsutil::CachedProducer::setPriority().

6.427.3.20 virtual void cms::MessageProducer::setTimeToLive (long long *time*) [pure virtual]

Sets the Time to Live that this Producers sends messages with. This value will be used if the time to live is not specified via the send method.

Parameters:

time default time to live value in milliseconds

Exceptions:

CMSException *(*p. ***979****)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 886), **activemq::core::ActiveMQProducer** (p. 402), and **activemq::core::kernels::ActiveMQProducerKernel** (p. 415).

Referenced by activemq::cmsutil::CachedProducer::setTimeToLive().

6.428 activemq::wireformat::openwire::utils::MessagePropertyIntercepto Class Reference

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

`#include <src/main/activemq/wireformat/openwire/utils/MessagePropertyInterceptor.h>`

Public Member Functions

- **MessagePropertyInterceptor** (**commands::Message** *message, **util::PrimitiveMap** *properties)

  Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

- virtual ~**MessagePropertyInterceptor** ()
- virtual bool **getBooleanProperty** (const std::string &name) const

  Gets a boolean property.

- virtual unsigned char **getByteProperty** (const std::string &name) const

  Gets a byte property.

- virtual double **getDoubleProperty** (const std::string &name) const

  Gets a double property.

- virtual float **getFloatProperty** (const std::string &name) const

  Gets a float property.

- virtual int **getIntProperty** (const std::string &name) const

  Gets a int property.

- virtual long long **getLongProperty** (const std::string &name) const

  Gets a long property.

- virtual short **getShortProperty** (const std::string &name) const

  Gets a short property.

- virtual std::string **getStringProperty** (const std::string &name) const

  Gets a string property.

- virtual void **setBooleanProperty** (const std::string &name, bool value)

  Sets a boolean property.

- virtual void **setByteProperty** (const std::string &name, unsigned char value)

  Sets a byte property.

- virtual void **setDoubleProperty** (const std::string &name, double value)

  Sets a double property.

- virtual void **setFloatProperty** (const std::string &name, float value)

  Sets a float property.

- virtual void **setIntProperty** (const std::string &name, int value)

  Sets a int property.

- virtual void **setLongProperty** (const std::string &name, long long value)

  Sets a long property.

- virtual void **setShortProperty** (const std::string &name, short value)

  Sets a short property.

- virtual void **setStringProperty** (const std::string &name, const std::string &value)

  Sets a string property.

6.428.1 Detailed Description

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties. Currently the only properties that are intercepted and handled are:

Name | Conversion Supported ---------- JMSXDeliveryCount | Int, Long, String JMSXGroupID | String JMSXGroupSeq | Int, Long, String

6.428.2 Constructor & Destructor Documentation

6.428.2.1 activemq::wireformat::openwire::utils::MessagePropertyInterceptor::MessagePropertyInte (commands::Message * *message*, util::PrimitiveMap * *properties*)

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

Parameters:

message - The Message to store reserved property data in

properties - The PrimitiveMap to store the rest of the properties in.

Exceptions:

NullPointerException if either param is NULL

6.428.2.2 virtual activemq::wireformat::openwire::utils::MessagePropertyInterceptor::~MessagePropertyInt () [virtual]

6.428.3 Member Function Documentation

6.428.3.1 virtual bool activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getBooleanProperty (const std::string & *name*) const [virtual]

Gets a boolean property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.428.3.2 virtual unsigned char activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getByteProperty (const std::string & *name*) const [virtual]

Gets a byte property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.428.3.3 virtual double activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getDoubleProperty (const std::string & *name*) const [virtual]

Gets a double property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.428.3.4 virtual float activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getFloatProperty (const std::string & *name*) const [virtual]

Gets a float property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.428.3.5 virtual int activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getIntProperty (const std::string & *name*) const [virtual]

Gets a int property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.428.3.6 virtual long long activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getLongProperty (const std::string & *name*) const [virtual]

Gets a long property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.428.3.7 virtual short activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getShortProperty (const std::string & *name*) const [virtual]

Gets a short property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.428.3.8 virtual std::string activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getStringProperty (const std::string & *name*) const [virtual]

Gets a string property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.428.3.9 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setBooleanProperty (const std::string & *name*, bool *value*) [virtual]

Sets a boolean property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.428.3.10 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setByteProperty (const std::string & *name*, unsigned char *value*) [virtual]

Sets a byte property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.428.3.11 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setDoubleProperty (const std::string & *name*, double *value*) [virtual]

Sets a double property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.428.3.12 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setFloatProperty (const std::string & *name*, float *value*) [virtual]

Sets a float property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.428.3.13 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setIntProperty (const std::string & *name*, int *value*) [virtual]

Sets a int property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.428.3.14 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setLongProperty (const std::string & *name*, long long *value*) [virtual]

Sets a long property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.428.3.15 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setShortProperty (const std::string & *name*, short *value*) [virtual]

Sets a short property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.428.3.16 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setStringProperty (const std::string & *name*, const std::string & *value*) [virtual]

Sets a string property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.429.1 Constructor & Destructor Documentation

6.429.1.1 activemq::commands::MessagePull::MessagePull ()

6.429.1.2 virtual activemq::commands::MessagePull::~MessagePull () [virtual]

6.429.2 Member Function Documentation

6.429.2.1 virtual MessagePull* activemq::commands::MessagePull::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.429.2.2 virtual void activemq::commands::MessagePull::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.429.2.3 virtual bool activemq::commands::MessagePull::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.429.2.4 virtual Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId () [virtual]

6.429.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId () const [virtual]

6.429.2.6 virtual std::string& activemq::commands::MessagePull::getCorrelationId () [virtual]

6.429.2.7 virtual const std::string& activemq::commands::MessagePull::getCorrelationId () const [virtual]

6.429.2.8 virtual unsigned char activemq::commands::MessagePull::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.429.2.9 virtual Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () [virtual]

6.429.2.10 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () const [virtual]

6.429.2.11 virtual Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () [virtual]

6.429.2.12 virtual const Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () const [virtual]

6.429.2.13 virtual long long activemq::commands::MessagePull::getTimeout () const [virtual]

6.429.2.14 virtual bool activemq::commands::MessagePull::isMessagePull () const [inline, virtual]

Returns:

an answer of true to the **isMessagePull()** (p. 2212) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 638).

6.429.2.15 virtual void activemq::commands::MessagePull::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.429.2.16 virtual void activemq::commands::MessagePull::setCorrelationId (const std::string & *correlationId*) [virtual]

6.429.2.17 virtual void activemq::commands::MessagePull::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.429.2.18 virtual void activemq::commands::MessagePull::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]

6.429.2.19 virtual void activemq::commands::MessagePull::setTimeout (long long *timeout*) [virtual]

6.429.2.20 virtual std::string activemq::commands::MessagePull::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.429.2.21 virtual Pointer<Command> activemq::commands::MessagePull::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

Public Member Functions

- **MessagePullMarshaller** ()
- virtual ~**MessagePullMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.430.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **MessagePullMarshaller** (p. 2215). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.430.2 Constructor & Destructor Documentation

6.430.2.1 activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::MessagePull () [inline]

6.430.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::~MessagePu () [inline, virtual]

6.430.3 Member Function Documentation

6.430.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.430.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::getDataStructu () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.430.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.430.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::looseUnmarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.430.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.430.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.430.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::tightUnmarsha (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.431 cms::MessageTransformer Class Reference

Provides an interface for clients to transform **cms::Message** (p. 2090) objects inside the CMS **MessageProducer** (p. 2192) and **MessageConsumer** (p. 2127) objects before the message's are sent or received.

`#include <src/main/cms/MessageTransformer.h>`

Public Member Functions

- virtual ~**MessageTransformer** ()
- virtual bool **producerTransform** (**cms::Session** *session, **cms::MessageProducer** *producer, **cms::Message** *message, **cms::Message** **transformed)=0

  Transforms the given message inside the producer before it is sent to the CMS bus.

- virtual bool **consumerTransform** (**cms::Session** *session, **cms::MessageConsumer** *consumer, **cms::Message** *message, **cms::Message** **transformed)=0

  Transforms the given message inside the consumer before it is dispatched to the client ***code*** *(p. 1005).*

6.431.1 Detailed Description

Provides an interface for clients to transform **cms::Message** (p. 2090) objects inside the CMS **MessageProducer** (p. 2192) and **MessageConsumer** (p. 2127) objects before the message's are sent or received.

Since:

3.0

6.431.2 Constructor & Destructor Documentation

6.431.2.1 virtual cms::MessageTransformer::~MessageTransformer () [virtual]

6.431.3 Member Function Documentation

6.431.3.1 virtual bool cms::MessageTransformer::consumerTransform (cms::Session * *session*, cms::MessageConsumer * *consumer*, cms::Message * *message*, cms::Message ** *transformed*) [pure virtual]

Transforms the given message inside the consumer before it is dispatched to the client **code** (p. 1005). The contract of this method is that the resulting transformed message pointer is set if and only if the method actually creates a new **cms::Message** (p. 2090) object, otherwise it must always be set to NULL. The return value indicates whether a transformation took place and indicates that the resulting transformed **cms::Message** (p. 2090) pointer will need to be deleted once the consumer completed message dispatch.

Parameters:

session The **Session** (p. 2680) used to create the target **MessageConsumer** (p. 2127) for this transformation.

consumer The **MessageConsumer** (p. 2127) instance that is going to handle dispatching the transformed **Message** (p. 2090).

message The CMS **Message** (p. 2090) object that is to be transformed by this method.

transformed A pointer to the location in memory where the newly transformed **Message** (p. 2090) has been allocated.

Returns:

true if the **MessageConsumer** (p. 2127) should handle deleting the transformed **Message** (p. 2090) once sent.

Exceptions:

cms::CMSException *(*p. ***979)*** if an error occurs during the transform operation.

6.431.3.2 virtual bool cms::MessageTransformer::producerTransform (cms::Session * *session*, cms::MessageProducer * *producer*, cms::Message * *message*, cms::Message ** *transformed*) [pure virtual]

Transforms the given message inside the producer before it is sent to the CMS bus. The contract of this method is that the resulting transformed message pointer is set if and only if the method actually creates a new **cms::Message** (p. 2090) object, otherwise it must always be set to NULL. The return value indicates whether a transformation took place and indicates that the resulting transformed **cms::Message** (p. 2090) pointer will need to be deleted once the producer has sent the **cms::Message** (p. 2090) on to the CMS bus.

Parameters:

session The **Session** (p. 2680) used to create the target **MessageProducer** (p. 2192) for this transformation.

producer The **MessageProducer** (p. 2192) instance that is going to handle sending the transformed **Message** (p. 2090).

message The CMS **Message** (p. 2090) object that is to be transformed by this method.

transformed A pointer to the location in memory where the newly transformed **Message** (p. 2090) has been allocated.

Returns:

true if the **MessageProducer** (p. 2192) should handle deleting the transformed **Message** (p. 2090) once sent.

Exceptions:

cms::CMSException *(*p. ***979)*** if an error occurs during the transform operation.

The documentation for this class was generated from the following file:

6.432.1 Detailed Description

The **MockTransport** (p. 2221) defines a base level **Transport** (p. 3125) class that is intended to be used in place of an a regular protocol **Transport** (p. 3125) suck as TCP. This **Transport** (p. 3125) assumes that it is the base **Transport** (p. 3125) in the Transports stack, and destroys any Transports that are passed to it in its constructor.

This **Transport** (p. 3125) defines an Interface **ResponseBuilder** (p. 2610) which must be implemented by any protocol for which the **Transport** (p. 3125) is used to Emulate. The **Transport** (p. 3125) hands off all outbound **commands** (p. 61) to the **ResponseBuilder** (p. 2610) for processing, it is up to the builder to create appropriate responses and schedule any asynchronous messages that might result from a message sent to the Broker.

6.432.2 Constructor & Destructor Documentation

6.432.2.1 activemq::transport::mock::MockTransport::MockTransport (const Pointer< wireformat::WireFormat > *wireFormat*, const Pointer< ResponseBuilder > *responseBuilder*)

6.432.2.2 virtual activemq::transport::mock::MockTransport::~MockTransport () [inline, virtual]

6.432.3 Member Function Documentation

6.432.3.1 virtual Pointer<FutureResponse> activemq::transport::mock::MockTransport::asyncRequest (const Pointer< Command > *command*, const Pointer< ResponseCallback > *responseCallback*) [virtual]

Sends a **commands** (p. 61) asynchronously, returning a **FutureResponse** (p. 1573) object that the caller can use to check to find out the response from the broker.

Parameters:

command The Command object that is to sent out.

responseCallback A callback object that will be notified once a response to the command is received.

Returns:

A **FutureResponse** (p. 1573) instance that can be queried for the Response to the Command.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3126).

6.432.3.2 virtual void activemq::transport::mock::MockTransport::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

IOException if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 967).

6.432.3.3 virtual void activemq::transport::mock::MockTransport::fireCommand (const Pointer< Command > *command*) [inline, virtual]

Fires a Command back through this **transport** (p. 72) to its registered CommandListener if there is one.

Parameters:

command - Command to send to the Listener.

References NULL.

6.432.3.4 virtual void activemq::transport::mock::MockTransport::fireException (const exceptions::ActiveMQException & *ex*) [inline, virtual]

Fires a Exception back through this **transport** (p. 72) to its registered ExceptionListener if there is one.

Parameters:

ex The Exception that will be passed on the the **Transport** (p. 3125) listener.

References NULL.

6.432.3.5 static MockTransport* activemq::transport::mock::MockTransport::getInstance () [inline, static]

6.432.3.6 std::string activemq::transport::mock::MockTransport::getName () const [inline]

6.432.3.7 int activemq::transport::mock::MockTransport::getNumReceivedMessageBeforeFail () const [inline]

6.432.3.8 int activemq::transport::mock::MockTransport::getNumReceivedMessages () const [inline]

6.432.3.9 int activemq::transport::mock::MockTransport::getNumSentKeepAlives () const [inline]

6.432.3.10 int activemq::transport::mock::MockTransport::getNumSentKeepAlivesBeforeFail () const [inline]

6.432.3.11 int activemq::transport::mock::MockTransport::getNumSentMessageBeforeFail () const [inline]

6.432.3.12 int activemq::transport::mock::MockTransport::getNumSentMessages () const [inline]

6.432.3.13 virtual std::string activemq::transport::mock::MockTransport::getRemoteAddress () const [inline, virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3127).

6.432.3.14 virtual TransportListener* activemq::transport::mock::MockTransport::getTransportListener () const [inline, virtual]

Gets the observer of asynchronous events from this **transport** (p. 72).

Returns:

the listener of **transport** (p. 72) events.

Implements **activemq::transport::Transport** (p. 3127).

6.432.3.15 Pointer<wireformat::WireFormat> activemq::transport::mock::MockTransport::getWireFormat () const [inline, virtual]

Gets the currently set WireFormat.

Returns:

the current WireFormat object.

Implements **activemq::transport::Transport** (p. 3127).

6.432.3.16 virtual bool activemq::transport::mock::MockTransport::isClosed () const [inline, virtual]

Has the **Transport** (p. 3125) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3125)

Implements **activemq::transport::Transport** (p. 3128).

6.432.3.17 virtual bool activemq::transport::mock::MockTransport::isConnected () const [inline, virtual]

Is the **Transport** (p. 3125) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3128).

6.432.3.18 bool activemq::transport::mock::MockTransport::isFailOnClose () const [inline]

6.432.3.19 bool activemq::transport::mock::MockTransport::isFailOnKeepAliveSends () const [inline]

6.432.3.20 bool activemq::transport::mock::MockTransport::isFailOnReceiveMessage () const [inline]

6.432.3.21 bool activemq::transport::mock::MockTransport::isFailOnSendMessage () const [inline]

6.432.3.22 bool activemq::transport::mock::MockTransport::isFailOnStart () const [inline]

6.432.3.23 bool activemq::transport::mock::MockTransport::isFailOnStop () const [inline]

6.432.3.24 virtual bool activemq::transport::mock::MockTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3125) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3125) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3128).

6.432.3.25 virtual bool activemq::transport::mock::MockTransport::isReconnectSupported () const [inline, virtual]

Returns:

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 3128).

6.432.3.26 virtual bool activemq::transport::mock::MockTransport::isUpdateURIsSupported () const [inline, virtual]

Returns:

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 3129).

6.432.3.27 virtual Transport* activemq::transport::mock::MockTransport::narrow (const std::type_info & *typeId*) [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3125) to allow a higher level **transport** (p. 72) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3129).

References NULL.

6.432.3.28 virtual void activemq::transport::mock::MockTransport::oneway (const Pointer< Command > *command*) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3129).

6.432.3.29 virtual void activemq::transport::mock::MockTransport::reconnect (const decaf::net::URI &uri *AMQCPP_UNUSED*) [inline, virtual]

6.432.3.30 virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > *command*, unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command The command to be sent.

timeout The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3130).

6.432.3.31 virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3130).

6.432.3.32 void activemq::transport::mock::MockTransport::setFailOnClose (bool *value*) [inline]

6.432.3.33 void activemq::transport::mock::MockTransport::setFailOnKeepAliveSends (bool *value*) [inline]

6.432.3.34 void activemq::transport::mock::MockTransport::setFailOnReceiveMessage (bool *value*) [inline]

6.432.3.35 void activemq::transport::mock::MockTransport::setFailOnSendMessage (bool *value*) [inline]

6.432.3.36 void activemq::transport::mock::MockTransport::setFailOnStart (bool *value*) [inline]

6.432.3.37 void activemq::transport::mock::MockTransport::setFailOnStop (bool *value*) [inline]

6.432.3.38 void activemq::transport::mock::MockTransport::setName (const std::string & *name*) [inline]

6.432.3.39 void activemq::transport::mock::MockTransport::setNumReceivedMessageBeforeFail (int *value*) [inline]

6.432.3.40 void activemq::transport::mock::MockTransport::setNumReceivedMessages (int *value*) [inline]

6.432.3.41 void activemq::transport::mock::MockTransport::setNumSentKeepAlives (int *value*) [inline]

6.432.3.42 void activemq::transport::mock::MockTransport::setNumSentKeepAlivesBeforeFail (int *value*) [inline]

6.432.3.43 void activemq::transport::mock::MockTransport::setNumSentMessageBeforeFail (int *value*) [inline]

6.432.3.44 void activemq::transport::mock::MockTransport::setNumSentMessages (int *value*) [inline]

6.432.3.45 virtual void activemq::transport::mock::MockTransport::setOutgoingListener (TransportListener * *listener*) [inline, virtual]

Sets a Listener that gets notified for every command that would have been sent by this **transport** (p. 72) to the Broker, this allows a client to verify that its messages are making it to the wire.

Parameters:

listener - The CommandListener to notify for each message

6.432.3.46 void activemq::transport::mock::MockTransport::setResponseBuilder (const Pointer< ResponseBuilder > *responseBuilder*) [inline]

Sets the **ResponseBuilder** (p. 2610) that this class uses to create Responses to Commands sent. These are either real Response Objects, or Commands that would have been sent Asynchronously be the Broker.

Parameters:

responseBuilder - The **ResponseBuilder** (p. 2610) to use from now on.

6.432.3.47 virtual void activemq::transport::mock::MockTransport::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous events from this **transport** (p. 72).

Parameters:

listener the listener of **transport** (p. 72) events.

Implements **activemq::transport::Transport** (p. 3131).

6.432.3.48 virtual void activemq::transport::mock::MockTransport::setWireFormat (const Pointer< wireformat::WireFormat > wireFormat *wireFormat*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 61).

Implements **activemq::transport::Transport** (p. 3131).

6.432.3.49 virtual void activemq::transport::mock::MockTransport::start () [virtual]

Starts the **Transport** (p. 3125), the send methods of a **Transport** (p. 3125) will throw an exception if used before the **Transport** (p. 3125) is started.

Exceptions:

IOException if and error occurs while starting the **Transport** (p. 3125).

Implements **activemq::transport::Transport** (p. 3131).

6.432.3.50 virtual void activemq::transport::mock::MockTransport::stop () [virtual]

Stops the **Transport** (p. 3125).

Exceptions:

IOException if an error occurs while stopping the **transport** (p. 72).

Implements **activemq::transport::Transport** (p. 3132).

6.432.3.51 virtual void activemq::transport::mock::MockTransport::updateURIs (bool rebalance *AMQCPP_UNUSED*, const decaf::util::List< decaf::net::URI > &uris *AMQCPP_UNUSED*) [inline, virtual]

6.433.1 Detailed Description

Manufactures MockTransports, which are objects that read from input streams and write to output streams.

6.433.2 Constructor & Destructor Documentation

6.433.2.1 virtual activemq::transport::mock::MockTransportFactory::~MockTransportFactory () [inline, virtual]

6.433.3 Member Function Documentation

6.433.3.1 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::create (const decaf::net::URI & *location*) [virtual]

Creates a fully configured **Transport** (p. 3125) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3133).

6.433.3.2 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::createComposite (const decaf::net::URI & *location*) [virtual]

Creates a slimed down **Transport** (p. 3125) instance which can be used in composite **transport** (p. 72) instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3134).

6.433.3.3 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::doCreateComposite (const decaf::net::URI & *location*, const Pointer< wireformat::WireFormat > *wireFormat*, const decaf::util::Properties & *properties*) [protected, virtual]

Creates a slimed down **Transport** (p. 3125) instance which can be used in composite **transport** (p. 72) instances.

Parameters:

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 3125).

properties - Properties to apply to the **transport** (p. 72).

Returns:

Pointer to a new **Transport** (p. 3125) instance.

Exceptions:

ActiveMQexception if an error occurs

- std::string **getName** () const
- std::string **toString** () const
- bool **isLocked** () const
- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  *Attempts to **Lock** (p. 1924) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.435.1 Detailed Description

Mutex (p. 2236) object that offers recursive support on all platforms as well as providing the ability to use the standard wait / notify pattern used in languages like Java.

Since:

1.0

6.435.2 Constructor & Destructor Documentation

6.435.2.1 decaf::util::concurrent::Mutex::Mutex ()

6.435.2.2 decaf::util::concurrent::Mutex::Mutex (const std::string & *name*)

6.435.2.3 virtual decaf::util::concurrent::Mutex::~Mutex () [virtual]

6.435.3 Member Function Documentation

6.435.3.1 std::string decaf::util::concurrent::Mutex::getName () const

6.435.3.2 bool decaf::util::concurrent::Mutex::isLocked () const

6.435.3.3 virtual void decaf::util::concurrent::Mutex::lock () [virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

Referenced by decaf::util::StlQueue< T >::lock(), decaf::util::StlMap< std::string, cms::Topic * >::lock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::lock(), decaf::util::AbstractMap< E, Set< E > * >::lock(), and decaf::util::AbstractCollection< K >::lock().

6.435.3.4 virtual void decaf::util::concurrent::Mutex::notify () [virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

Referenced by decaf::util::StlQueue< T >::notify(), decaf::util::StlMap< std::string, cms::Topic * >::notify(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notify(), decaf::util::AbstractMap< E, Set< E > * >::notify(), and decaf::util::AbstractCollection< K >::notify().

6.435.3.5 virtual void decaf::util::concurrent::Mutex::notifyAll () [virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

Referenced by decaf::util::StlQueue< T >::notifyAll(), decaf::util::StlMap< std::string, cms::Topic * >::notifyAll(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notifyAll(), decaf::util::AbstractMap< E, Set< E > * >::notifyAll(), and decaf::util::AbstractCollection< K >::notifyAll().

6.435.3.6 std::string decaf::util::concurrent::Mutex::toString () const

6.435.3.7 virtual bool decaf::util::concurrent::Mutex::tryLock () [virtual]

Attempts to **Lock** (p. 1924) the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

Referenced by decaf::util::StlQueue< T >::tryLock(), decaf::util::StlMap< std::string, cms::Topic * >::tryLock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::tryLock(), decaf::util::AbstractMap< E, Set< E > * >::tryLock(), and decaf::util::AbstractCollection< K >::tryLock().

6.435.3.8 virtual void decaf::util::concurrent::Mutex::unlock () [virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

Referenced by decaf::util::StlQueue< T >::unlock(), decaf::util::StlMap< std::string, cms::Topic * >::unlock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::unlock(), decaf::util::AbstractMap< E, Set< E > * >::unlock(), and decaf::util::AbstractCollection< K >::unlock().

6.435.3.9 virtual void decaf::util::concurrent::Mutex::wait (long long *millisecs*, int *nanos*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is

similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.435.3.10 virtual void decaf::util::concurrent::Mutex::wait (long long *millisecs*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.435.3.11 virtual void decaf::util::concurrent::Mutex::wait () [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2954) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

Referenced by decaf::util::StlQueue< T >::wait(), decaf::util::StlMap< std::string, cms::Topic * >::wait(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::wait(), decaf::util::AbstractMap< E, Set< E > * >::wait(), and decaf::util::AbstractCollection< K >::wait().

The documentation for this class was generated from the following file:

6.436 decaf::lang::exceptions::NegativeArraySizeException Class Reference

`#include <src/main/decaf/lang/exceptions/NegativeArraySizeException.h>`Inheritance diagram for decaf::lang::exceptions::NegativeArraySizeException:

Public Member Functions

- **NegativeArraySizeException** ()
  Default Constructor.
- **NegativeArraySizeException** (const **Exception** &ex)
  *Conversion Constructor from some other Decaf **Exception** (p. 1458).*
- **NegativeArraySizeException** (const **NegativeArraySizeException** &ex)
  Copy Constructor.
- **NegativeArraySizeException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- **NegativeArraySizeException** (const std::exception *cause)
  Constructor.
- **NegativeArraySizeException** (const char *file, const int lineNumber, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **NegativeArraySizeException** * **clone** () const
  Clones this exception.
- virtual ~**NegativeArraySizeException** () throw ()

6.436.1 Constructor & Destructor Documentation

6.436.1.1 decaf::lang::exceptions::NegativeArraySizeException::NegativeArraySizeException ()

Default Constructor.

6.436.1.2 decaf::lang::exceptions::NegativeArraySizeException::NegativeArraySizeException (const Exception & *ex*)

Conversion Constructor from some other Decaf **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.436.1.3 decaf::lang::exceptions::NegativeArraySizeException::NegativeArraySizeException (const NegativeArraySizeException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.436.1.4 decaf::lang::exceptions::NegativeArraySizeException::NegativeArraySizeException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.436.1.5 decaf::lang::exceptions::NegativeArraySizeException::NegativeArraySizeException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.436.1.6 decaf::lang::exceptions::NegativeArraySizeException::NegativeArraySizeException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.436.1.7 virtual decaf::lang::exceptions::NegativeArraySizeException::~NegativeArraySizeException () throw () [virtual]

6.436.2 Member Function Documentation

6.436.2.1 virtual NegativeArraySizeException* decaf::lang::exceptions::NegativeArraySizeException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) that is a copy of this one.

Reimplemented from **decaf::lang::exceptions::RuntimeException** (p. 2628).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**NegativeArraySizeException.h**

6.437 decaf::internal::net::Network Class Reference

Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.

`#include <src/main/decaf/internal/net/Network.h>`

Public Member Functions

- virtual ~**Network** ()
- **decaf::util::concurrent::Mutex** * **getRuntimeLock** ()

  *Gets a pointer to the **Network** (p. 2244) Runtime's Lock object, this can be used by **Network** (p. 2244) layer APIs to synchronize around certain actions such as adding a resource to the **Network** (p. 2244) layer, etc.*

- void **addNetworkResource** (**decaf::internal::util::Resource** *value)

  *Adds a Resource to the **Network** (p. 2244) Runtime, this resource will be held by the runtime until the Library shutdown method is called at which time all the Resources held by the **Network** (p. 2244) Runtime are destroyed.*

- template<typename T >
  void **addAsResource** (T *value)
- void **addShutdownTask** (**decaf::lang::Runnable** *task)

  *Register a Runnable to be called when the **Network** (p. 2244) Runtime is shutdown to provide a chance to cleanup any data or references that could cause problems should the **Network** (p. 2244) Runtime be re-initialized.*

Static Public Member Functions

- static **Network** * **getNetworkRuntime** ()

  *Gets the one and only instance of the **Network** (p. 2244) class, if this is called before the **Network** (p. 2244) layer has been initialized or after it has been shutdown then an IllegalStateException is thrown.*

- static void **initializeNetworking** ()

  Initialize the Networking layer.

- static void **shutdownNetworking** ()

  *Shutdown the **Network** (p. 2244) layer and free any associated resources, classes in the Decaf library that use the networking layer will now fail if used after calling the shutdown method.*

Protected Member Functions

- **Network** ()

6.437.1 Detailed Description

Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.

Since:

1.0

6.437.2 Constructor & Destructor Documentation

6.437.2.1 decaf::internal::net::Network::Network () [protected]

6.437.2.2 virtual decaf::internal::net::Network::~Network () [virtual]

6.437.3 Member Function Documentation

6.437.3.1 template<typename T > void decaf::internal::net::Network::addAsResource (T * *value*) [inline]

6.437.3.2 void decaf::internal::net::Network::addNetworkResource (decaf::internal::util::Resource * *value*)

Adds a Resource to the **Network** (p. 2244) Runtime, this resource will be held by the runtime until the Library shutdown method is called at which time all the Resources held by the **Network** (p. 2244) Runtime are destroyed.

Parameters:

value The Resource to add to the **Network** (p. 2244) Runtime.

Exceptions:

NullPointerException if the Resource value passed is null.

6.437.3.3 void decaf::internal::net::Network::addShutdownTask (decaf::lang::Runnable * *task*)

Register a Runnable to be called when the **Network** (p. 2244) Runtime is shutdown to provide a chance to cleanup any data or references that could cause problems should the **Network** (p. 2244) Runtime be re-initialized. The Runnable pointer ownership is transfered to the NetworkRuntime to guarantee the timing of resource cleanup.

The cleanup tasks are run at a critical time in the Shutdown process and should be as simple as possible and make every attempt to not throw any exceptions. If an exception is thrown it is ignored and processing of the next task is started.

The tasks should not assume that any **Network** (p. 2244) resources are still available and should execute as quickly as possible.

Parameters:

task Pointer to a Runnable object that will now be owned by the **Network** (p. 2244) Runtime.

6.437.3.4 static Network* decaf::internal::net::Network::getNetworkRuntime () [static]

Gets the one and only instance of the **Network** (p. 2244) class, if this is called before the **Network** (p. 2244) layer has been initialized or after it has been shutdown then an IllegalStateException is thrown.

Returns:

pointer to the **Network** (p. 2244) runtime for the Decaf library.

6.437.3.5 decaf::util::concurrent::Mutex* decaf::internal::net::Network::getRuntimeLock ()

Gets a pointer to the **Network** (p. 2244) Runtime's Lock object, this can be used by **Network** (p. 2244) layer APIs to synchronize around certain actions such as adding a resource to the **Network** (p. 2244) layer, etc. The pointer returned is owned by the **Network** (p. 2244) runtime and should not be deleted or copied by the caller.

Returns:

a pointer to the **Network** (p. 2244) Runtime's single Lock instance.

6.437.3.6 static void decaf::internal::net::Network::initializeNetworking () [static]

Initialize the Networking layer.

6.437.3.7 static void decaf::internal::net::Network::shutdownNetworking () [static]

Shutdown the **Network** (p. 2244) layer and free any associated resources, classes in the Decaf library that use the networking layer will now fail if used after calling the shutdown method.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**Network.h**

6.438 activemq::commands::NetworkBridgeFilter Class Reference

`#include <src/main/activemq/commands/NetworkBridgeFilter.h>`Inheritance diagram for activemq::commands::NetworkBridgeFilter:

Public Member Functions

- **NetworkBridgeFilter** ()
- virtual ~**NetworkBridgeFilter** ()
- virtual unsigned char **getDataStructureType** () const

  *Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.*

- virtual **NetworkBridgeFilter** * **cloneDataStructure** () const

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const
- virtual int **getNetworkTTL** () const

- static const unsigned char **ID_NETWORKBRIDGEFILTER** = 91

Protected Attributes

- int **networkTTL**
- **Pointer**< **BrokerId** > **networkBrokerId**

6.438.1 Constructor & Destructor Documentation

6.438.1.1 activemq::commands::NetworkBridgeFilter::NetworkBridgeFilter ()

6.438.1.2 virtual activemq::commands::NetworkBridgeFilter::~NetworkBridgeFilter () [virtual]

6.438.2 Member Function Documentation

6.438.2.1 virtual NetworkBridgeFilter* activemq::commands::NetworkBridgeFilter::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.438.2.2 virtual void activemq::commands::NetworkBridgeFilter::copyDataStructure (const DataStructure * *src*) [virtual]

6.438.2.3 virtual bool activemq::commands::NetworkBridgeFilter::equals (const DataStructure * *value*) const [virtual]

6.438.2.4 virtual unsigned char activemq::commands::NetworkBridgeFilter::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.438.2.5 virtual Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId () [virtual]

6.438.2.6 virtual const Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId () const [virtual]

6.438.2.7 virtual int activemq::commands::NetworkBridgeFilter::getNetworkTTL () const [virtual]

6.438.2.8 virtual void activemq::commands::NetworkBridgeFilter::setNetworkBrokerId (const Pointer< BrokerId > & *networkBrokerId*) [virtual]

6.438.2.9 virtual void activemq::commands::NetworkBridgeFilter::setNetworkTTL (int *networkTTL*) [virtual]

6.438.2.10 virtual std::string activemq::commands::NetworkBridgeFilter::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

6.438.3 Field Documentation

6.438.3.1 const unsigned char activemq::commands::NetworkBridgeFilter::ID_NETWORKBRIDGEFILTER = 91 [static]

() [inline, virtual]

6.439.3 Member Function Documentation

6.439.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::create
() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.439.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::getDa
() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.439.3.3 virtual void activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::looseM
(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.439.3.4 virtual void activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::looseU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.439.3.5 virtual int activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.439.3.6 virtual void activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::tightM (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.439.3.7 virtual void activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::tightU (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**NetworkBridgeFilterMarshaller.h**

6.440.1.1 decaf::net::NoRouteToHostException::NoRouteToHostException ()

Default Constructor.

6.440.1.2 decaf::net::NoRouteToHostException::NoRouteToHostException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.440.1.3 decaf::net::NoRouteToHostException::NoRouteToHostException (const NoRouteToHostException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.440.1.4 decaf::net::NoRouteToHostException::NoRouteToHostException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.440.1.5 decaf::net::NoRouteToHostException::NoRouteToHostException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.440.1.6 decaf::net::NoRouteToHostException::NoRouteToHostException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.440.1.7 virtual decaf::net::NoRouteToHostException::~NoRouteToHostException () throw () [virtual]

6.440.2 Member Function Documentation

6.440.2.1 virtual NoRouteToHostException* decaf::net::NoRouteToHostException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2788).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**NoRouteToHostException.h**

6.441 decaf::security::NoSuchAlgorithmException Class Reference

`#include <src/main/decaf/security/NoSuchAlgorithmException.h>`Inheritance diagram for decaf::security::NoSuchAlgorithmException:

Public Member Functions

- **NoSuchAlgorithmException** ()
  Default Constructor.
- **NoSuchAlgorithmException** (const Exception &ex)
  Conversion Constructor from some other Exception.
- **NoSuchAlgorithmException** (const **NoSuchAlgorithmException** &ex)
  Copy Constructor.
- **NoSuchAlgorithmException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchAlgorithmException** (const std::exception *cause)
  Constructor.
- **NoSuchAlgorithmException** (const char *file, const int lineNumber, const char *msg,...)
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoSuchAlgorithmException** * **clone** () const
  Clones this exception.
- virtual ~**NoSuchAlgorithmException** () throw ()

6.441.1 Constructor & Destructor Documentation

6.441.1.1 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException ()

Default Constructor.

6.441.1.2 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.441.1.3 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const NoSuchAlgorithmException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.441.1.4 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.441.1.5 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.441.1.6 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.441.1.7 virtual decaf::security::NoSuchAlgorithmException::~NoSuchAlgorithmException () throw () [virtual]

6.441.2 Member Function Documentation

6.441.2.1 virtual NoSuchAlgorithmException* decaf::security::NoSuchAlgorithmException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1585).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**NoSuchAlgorithmException.h**

  Copy Constructor.

- **NoSuchElementException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **NoSuchElementException** (const std::exception *cause)

  Constructor.

- **NoSuchElementException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occured.

- virtual **NoSuchElementException** * **clone** () const

  Clones this exception.

- virtual ~**NoSuchElementException** () throw ()

6.442.1 Constructor & Destructor Documentation

6.442.1.1 decaf::util::NoSuchElementException::NoSuchElementException ()

Default Constructor.

6.442.1.2 decaf::util::NoSuchElementException::NoSuchElementException (const decaf::lang::exceptions::RuntimeException & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex The Exception whose data is to be copied into this one.

6.442.1.3 decaf::util::NoSuchElementException::NoSuchElementException (const NoSuchElementException & *ex*)

Copy Constructor.

Parameters:

ex The Exception whose data is to be copied into this one.

6.442.1.4 decaf::util::NoSuchElementException::NoSuchElementException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.442.1.5 decaf::util::NoSuchElementException::NoSuchElementException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.442.1.6 decaf::util::NoSuchElementException::NoSuchElementException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.442.1.7 virtual decaf::util::NoSuchElementException::~NoSuchElementException () throw () [virtual]

6.442.2 Member Function Documentation

6.442.2.1 virtual NoSuchElementException* decaf::util::NoSuchElementException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new Exception instance that is a copy of this one.

Reimplemented from **decaf::lang::exceptions::RuntimeException** (p. 2628).

The documentation for this class was generated from the following file:

6.443.1.1 decaf::security::NoSuchProviderException::NoSuchProviderException ()

Default Constructor.

6.443.1.2 decaf::security::NoSuchProviderException::NoSuchProviderException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.443.1.3 decaf::security::NoSuchProviderException::NoSuchProviderException (const NoSuchProviderException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.443.1.4 decaf::security::NoSuchProviderException::NoSuchProviderException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.443.1.5 decaf::security::NoSuchProviderException::NoSuchProviderException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.443.1.6 decaf::security::NoSuchProviderException::NoSuchProviderException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.443.1.7 virtual decaf::security::NoSuchProviderException::~NoSuchProviderException () throw () [virtual]

6.443.2 Member Function Documentation

6.443.2.1 virtual NoSuchProviderException* decaf::security::NoSuchProviderException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1585).

  Constructor.

- **NullPointerException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occured.

- virtual **NullPointerException** * **clone** () const

  Clones this exception.

- virtual ~**NullPointerException** () throw ()

6.444.1 Constructor & Destructor Documentation

6.444.1.1 decaf::lang::exceptions::NullPointerException::NullPointerException ()

Default Constructor.

6.444.1.2 decaf::lang::exceptions::NullPointerException::NullPointerException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.444.1.3 decaf::lang::exceptions::NullPointerException::NullPointerException (const NullPointerException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.444.1.4 decaf::lang::exceptions::NullPointerException::NullPointerException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.444.1.5 decaf::lang::exceptions::NullPointerException::NullPointerException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.444.1.6 decaf::lang::exceptions::NullPointerException::NullPointerException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.444.1.7 virtual decaf::lang::exceptions::NullPointerException::~NullPointerException () throw () [virtual]

6.444.2 Member Function Documentation

6.444.2.1 virtual NullPointerException* decaf::lang::exceptions::NullPointerException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**NullPointerException.h**

6.445 decaf::lang::Number Class Reference

The abstract class **Number** (p. 2269) is the superclass of classes **Byte** (p. 766), **Double** (p. 1414), **Float** (p. 1531), **Integer** (p. 1738), **Long** (p. 1967), and **Short** (p. 2721).

`#include <src/main/decaf/lang/Number.h>`Inheritance diagram for decaf::lang::Number:

Public Member Functions

- virtual ~**Number** ()
- virtual unsigned char **byteValue** () const
  Answers the byte value which the receiver represents.
- virtual double **doubleValue** () const =0
  Answers the double value which the receiver represents.
- virtual float **floatValue** () const =0
  Answers the float value which the receiver represents.
- virtual int **intValue** () const =0
  Answers the int value which the receiver represents.
- virtual long long **longValue** () const =0
  Answers the long value which the receiver represents.
- virtual short **shortValue** () const
  Answers the short value which the receiver represents.

6.445.1 Detailed Description

The abstract class **Number** (p. 2269) is the superclass of classes **Byte** (p. 766), **Double** (p. 1414), **Float** (p. 1531), **Integer** (p. 1738), **Long** (p. 1967), and **Short** (p. 2721). Subclasses of **Number** (p. 2269) must provide methods to convert the represented numeric value to byte, double, float, int, long, and short.

Since:

1.0

6.445.2 Constructor & Destructor Documentation

6.445.2.1 virtual decaf::lang::Number::~Number () [inline, virtual]

6.445.3 Member Function Documentation

6.445.3.1 virtual unsigned char decaf::lang::Number::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented in **decaf::lang::Byte** (p. 768), **decaf::lang::Character** (p. 916), **decaf::lang::Double** (p. 1416), **decaf::lang::Float** (p. 1533), **decaf::lang::Integer** (p. 1741), **decaf::lang::Long** (p. 1970), and **decaf::lang::Short** (p. 2723).

6.445.3.2 virtual double decaf::lang::Number::doubleValue () const [pure virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 769), **decaf::lang::Character** (p. 917), **decaf::lang::Double** (p. 1418), **decaf::lang::Float** (p. 1534), **decaf::lang::Integer** (p. 1742), **decaf::lang::Long** (p. 1971), **decaf::lang::Short** (p. 2724), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 615).

6.445.3.3 virtual float decaf::lang::Number::floatValue () const [pure virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 770), **decaf::lang::Character** (p. 918), **decaf::lang::Double** (p. 1419), **decaf::lang::Float** (p. 1536), **decaf::lang::Integer** (p. 1743), **decaf::lang::Long** (p. 1972), **decaf::lang::Short** (p. 2724), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 615).

6.445.3.4 virtual int decaf::lang::Number::intValue () const [pure virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 770), **decaf::lang::Character** (p. 918), **decaf::lang::Double** (p. 1419), **decaf::lang::Float** (p. 1536), **decaf::lang::Integer** (p. 1743), **decaf::lang::Long** (p. 1972), **decaf::lang::Short** (p. 2725), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 617).

6.445.3.5 virtual long long decaf::lang::Number::longValue () const [pure virtual]

Answers the long value which the receiver represents.

Returns:

long long the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 770), **decaf::lang::Character** (p. 919), **decaf::lang::Double** (p. 1421), **decaf::lang::Float** (p. 1537), **decaf::lang::Integer** (p. 1744), **decaf::lang::Long** (p. 1973), **decaf::lang::Short** (p. 2725), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 617).

6.445.3.6 virtual short decaf::lang::Number::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented in **decaf::lang::Byte** (p. 772), **decaf::lang::Character** (p. 920), **decaf::lang::Double** (p. 1422), **decaf::lang::Float** (p. 1539), **decaf::lang::Integer** (p. 1748), **decaf::lang::Long** (p. 1977), and **decaf::lang::Short** (p. 2727).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Number.h**

- virtual **NumberFormatException** * **clone** () const
  Clones this exception.
- virtual ~**NumberFormatException** () throw ()

6.446.1 Constructor & Destructor Documentation

6.446.1.1 decaf::lang::exceptions::NumberFormatException::NumberFormatException ()

Default Constructor.

Referenced by clone().

6.446.1.2 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.446.1.3 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const NumberFormatException & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.446.1.4 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.446.1.5 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.446.1.6 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.446.1.7 virtual decaf::lang::exceptions::NumberFormatException::~NumberFormatException () throw () [virtual]

6.446.2 Member Function Documentation

6.446.2.1 virtual NumberFormatException* decaf::lang::exceptions::NumberFormatException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

References NumberFormatException().

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**NumberFormatException.h**

6.447 cms::ObjectMessage Class Reference

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

`#include <src/main/cms/ObjectMessage.h>`Inheritance diagram for cms::ObjectMessage:

Public Member Functions

- virtual ~**ObjectMessage** ()
- virtual void **setObjectBytes** (const std::vector< unsigned char > &bytes)=0

  Sets the payload bytes the represent the Object being transmitted.

- virtual std::vector< unsigned char > **getObjectBytes** () const =0

  Returns the byte array containing the serialized form of the transmitted Object.

6.447.1 Detailed Description

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object. The Object can be accessed in its serialized form as a vector of bytes which allows for bridging of message systems.

serialized `ObjectMessage (p. 2275)`s.

Since:

1.0

6.447.2 Constructor & Destructor Documentation

6.447.2.1 virtual cms::ObjectMessage::~ObjectMessage () [virtual]

6.447.3 Member Function Documentation

6.447.3.1 virtual std::vector<unsigned char> cms::ObjectMessage::getObjectBytes () const [pure virtual]

Returns the byte array containing the serialized form of the transmitted Object.

Returns:

a byte vector containing the serialized Object.

Exceptions:

CMSException *(*p. ***979****)* - if the operation fails due to an internal error.

MessageNotReadableException *(*p. ***2188****)* - if the message is in write only mode.

Implemented in **activemq::commands::ActiveMQObjectMessage** (p. 387).

6.447.3.2 virtual void cms::ObjectMessage::setObjectBytes (const std::vector< unsigned char > & *bytes*) [pure virtual]

Sets the payload bytes the represent the Object being transmitted.

Parameters:

bytes The byte array that contains the serialized object.

Exceptions:

CMSException (p. ***979***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2190***) - if the **Message** (p. 2090) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQObjectMessage** (p. 387).

The documentation for this class was generated from the following file:

- src/main/cms/**ObjectMessage.h**

6.448 decaf::internal::net::ssl::openssl::OpenSSLContextSpi Class Reference

Provides an SSLContext that wraps the OpenSSL API.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLContextSpi.h>`Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLContextSpi:

Public Member Functions

- **OpenSSLContextSpi** ()
- virtual ~**OpenSSLContextSpi** ()
- virtual void **providerInit** (**security::SecureRandom** *random)

  Perform the initialization of this Context.
  Parameters:

  random *Pointer to an instance of a secure random number generator.*
  Exceptions:

  NullPointerException *if the SecureRandom instance is NULL.*
  KeyManagementException *if an error occurs while initializing the context.*

- virtual **decaf::net::SocketFactory** * **providerGetSocketFactory** ()

  *Returns a **SocketFactory** (p. 2789) instance that can be used to create new **SSLSocket** (p. 2829) objects.*
  *The **SocketFactory** (p. 2789) is owned by the Service Provider and should not be destroyed by the caller.*
  Returns:

  SocketFactory *(p. 2789) instance that can be used to create new SSLSockets.*
  Exceptions:

  IllegalStateException *if the **SSLContextSpi** (p. 2813) object requires initialization but has not been initialized yet.*

- virtual **decaf::net::ServerSocketFactory** * **providerGetServerSocketFactory** ()

  *Returns a **ServerSocketFactory** (p. 2668) instance that can be used to create new **SSLServerSocket** (p. 2820) objects.*
  *The **ServerSocketFactory** (p. 2668) is owned by the Service Provider and should not be destroyed by the caller.*
  Returns:

  SocketFactory *(p. 2789) instance that can be used to create new SSLServerSockets.*
  Exceptions:

  IllegalStateException *if the **SSLContextSpi** (p. 2813) object requires initialization but has not been initialized yet.*

- class **OpenSSLSocket**
- class **OpenSSLSocketFactory**

6.448.1 Detailed Description

Provides an SSLContext that wraps the OpenSSL API.

Since:

1.0

6.448.2 Constructor & Destructor Documentation

6.448.2.1 decaf::internal::net::ssl::openssl::OpenSSLContextSpi::OpenSSLContextSpi ()

6.448.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLContextSpi::~OpenSSLContextSpi () [virtual]

6.448.3 Member Function Documentation

6.448.3.1 virtual decaf::net::ServerSocketFactory* decaf::internal::net::ssl::openssl::OpenSSLContextSpi::providerGetServerSocketFactory () [virtual]

Returns a **ServerSocketFactory** (p. 2668) instance that can be used to create new **SSLServerSocket** (p. 2820) objects.

The **ServerSocketFactory** (p. 2668) is owned by the Service Provider and should not be destroyed by the caller.

Returns:

SocketFactory (p. 2789) instance that can be used to create new SSLServerSockets.

Exceptions:

IllegalStateException if the **SSLContextSpi** (p. 2813) object requires initialization but has not been initialized yet.

Implements **decaf::net::ssl::SSLContextSpi** (p. 2814).

6.448.3.2 virtual decaf::net::SocketFactory* decaf::internal::net::ssl::openssl::OpenSSLContextSpi::providerGetSocketFactory () [virtual]

Returns a **SocketFactory** (p. 2789) instance that can be used to create new **SSLSocket** (p. 2829) objects.

The **SocketFactory** (p. 2789) is owned by the Service Provider and should not be destroyed by the caller.

Returns:

SocketFactory (p. 2789) instance that can be used to create new SSLSockets.

Exceptions:

IllegalStateException if the **SSLContextSpi** (p. 2813) object requires initialization but has not been initialized yet.

Implements **decaf::net::ssl::SSLContextSpi** (p. 2814).

6.448.3.3 virtual void decaf::internal::net::ssl::openssl::OpenSSLContextSpi::providerInit (security::SecureRandom * *random*) [virtual]

Perform the initialization of this Context.

Parameters:

random Pointer to an instance of a secure random number generator.

Exceptions:

NullPointerException if the SecureRandom instance is NULL.

KeyManagementException if an error occurs while initializing the context.

Implements **decaf::net::ssl::SSLContextSpi** (p. 2815).

6.448.4 Friends And Related Function Documentation

Public Member Functions

- **OpenSSLServerSocket** (**OpenSSLParameters** *parameters)
- virtual ~**OpenSSLServerSocket** ()
- virtual std::vector< std::string > **getSupportedCipherSuites** () const

  *Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 2820).*
  *Normally not all of these cipher suites will be enabled on the **Socket** (p. 2770).*

  Returns:

  a vector containing the names of all the supported cipher suites.

- virtual std::vector< std::string > **getSupportedProtocols** () const

  *Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 2820) instance.*

  Returns:

  a vector containing the names of all the supported protocols.

- virtual std::vector< std::string > **getEnabledCipherSuites** () const

  *Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 2820).*

  Returns:

  vector of the names of all enabled Cipher Suites.

- virtual void **setEnabledCipherSuites** (const std::vector< std::string > &suites)

  *Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 2820) connection. Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.*

  Parameters:

  suites *An Vector of names for all the Cipher Suites that are to be enabled.*

  Exceptions:

  IllegalArgumentException *if the vector is empty or one of the names is invalid.*

- virtual std::vector< std::string > **getEnabledProtocols** () const

  *Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 2820).*

  Returns:

  vector of the names of all enabled Protocols.

- virtual void **setEnabledProtocols** (const std::vector< std::string > &protocols)

  *Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 2820) connection.*
  Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.
  Parameters:

  protocols *An Vector of names for all the Protocols that are to be enabled.*
  Exceptions:

  IllegalArgumentException *if the vector is empty or one of the names is invalid.*

- virtual bool **getWantClientAuth** () const

  Returns:

  *true if the **Socket** (p. 2770) request client Authentication.*

- virtual void **setWantClientAuth** (bool value)

  *Sets whether or not this **Socket** (p. 2770) will request Client Authentication.*
  *If set to true the **Socket** (p. 2770) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.*
  Parameters:

  value *Whether the server socket should request client authentication.*

- virtual bool **getNeedClientAuth** () const

  Returns:

  *true if the **Socket** (p. 2770) requires client Authentication.*

- virtual void **setNeedClientAuth** (bool value)

  *Sets whether or not this **Socket** (p. 2770) will require Client Authentication.*
  *If set to true the **Socket** (p. 2770) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.*
  Parameters:

  value *Whether the server socket should require client authentication.*

- virtual **decaf::net::Socket** * **accept** ()

  *Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 2659), the caller blocks until a connection is made.*
  *If the SO_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 2807) if the operation times out.*
  Returns:

  *a new **Socket** (p. 2770) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.*
  Exceptions:

  IOException *if an I/O error occurs while binding the socket.*
  SocketException *(p. 2787) if an error occurs while blocking on the accept call.*
  SocketTimeoutException *(p. 2807) if the SO_TIMEOUT option was used and the accept timed out.*

6.450.1 Detailed Description

SSLServerSocket based on OpenSSL library **code** (p. 1005).

Since:

1.0

6.450.2 Constructor & Destructor Documentation

6.450.2.1 decaf::internal::net::ssl::openssl::OpenSSLServerSocket::OpenSSLServerSocket (OpenSSLParameters * *parameters*)

6.450.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLServerSocket::~OpenSSLServerSocket () [virtual]

6.450.3 Member Function Documentation

6.450.3.1 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLServerSocket::accept () [virtual]

Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 2659), the caller blocks until a connection is made.

If the SO_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 2807) if the operation times out.

Returns:

a new **Socket** (p. 2770) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.

Exceptions:

IOException if an I/O error occurs while binding the socket.

SocketException *(*p. *2787)* if an error occurs while blocking on the accept call.

SocketTimeoutException *(*p. *2807)* if the SO_TIMEOUT option was used and the accept timed out.

Reimplemented from **decaf::net::ServerSocket** (p. 2662).

6.450.3.2 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getEnabledCipherSuites () const [virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 2820).

Returns:

vector of the names of all enabled Cipher Suites.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2822).

6.450.3.3 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getEnabledProtocols () const [virtual]

Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 2820).

Returns:

vector of the names of all enabled Protocols.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2823).

6.450.3.4 virtual bool decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getNeedClientAuth () const [virtual]

Returns:

true if the **Socket** (p. 2770) requires client Authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2823).

6.450.3.5 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getSupportedCipherSuites () const [virtual]

Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 2820).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 2770).

Returns:

a vector containing the names of all the supported cipher suites.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2823).

6.450.3.6 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getSupportedProtocols () const [virtual]

Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 2820) instance.

Returns:

a vector containing the names of all the supported protocols.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2823).

6.450.3.7 virtual bool decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getWantClientAuth () const [virtual]

Returns:

true if the **Socket** (p. 2770) request client Authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2824).

6.450.3.8 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [virtual]

Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 2820) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters:

suites An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions:

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2824).

6.450.3.9 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [virtual]

Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 2820) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters:

protocols An Vector of names for all the Protocols that are to be enabled.

Exceptions:

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2824).

6.450.3.10 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setNeedClientAuth (bool *value*) [virtual]

Sets whether or not this **Socket** (p. 2770) will require Client Authentication.

If set to true the **Socket** (p. 2770) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.

Parameters:

value Whether the server socket should require client authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2824).

6.450.3.11 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setWantClientAuth (bool *value*) [virtual]

Sets whether or not this **Socket** (p. 2770) will request Client Authentication.

If set to true the **Socket** (p. 2770) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.

Parameters:

value Whether the server socket should request client authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 2825).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLServerSocket.h**

6.451 decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory Class Reference

SSLServerSocketFactory that creates Server Sockets that use OpenSSL.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLServerSocketFactory.h>`Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory:

Public Member Functions

- **OpenSSLServerSocketFactory** (**OpenSSLContextSpi** *parent)
- virtual ~**OpenSSLServerSocketFactory** ()
- virtual **decaf::net::ServerSocket** * **createServerSocket** ()

  *Create a new **ServerSocket** (p. 2659) that is unbound.*
  *The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.*

  Returns:

  *new **ServerSocket** (p. 2659) pointer that is owned by the caller.*

  Exceptions:

  ***IOException** if the **ServerSocket** (p. 2659) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** * **createServerSocket** (int port)

  *Create a new **ServerSocket** (p. 2659) that is bound to the given port.*
  *The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.*

  Parameters:

  ***port** The port to bind the **ServerSocket** (p. 2659) to.*

  Returns:

  *new **ServerSocket** (p. 2659) pointer that is owned by the caller.*

  Exceptions:

  ***IOException** if the **ServerSocket** (p. 2659) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** * **createServerSocket** (int port, int backlog)

  *Create a new **ServerSocket** (p. 2659) that is bound to the given port.*
  *The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will use the specified connection backlog setting.*

  Parameters:

  ***port** The port to bind the **ServerSocket** (p. 2659) to.*
  ***backlog** The number of pending connect request the **ServerSocket** (p. 2659) can queue.*

  Returns:

  *new **ServerSocket** (p. 2659) pointer that is owned by the caller.*

  Exceptions:

  ***IOException** if the **ServerSocket** (p. 2659) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** * **createServerSocket** (int port, int backlog, const **decaf::net::InetAddress** *address)

Create a new ***ServerSocket*** *(p. 2659) that is bound to the given port.*
The ***ServerSocket*** *(p. 2659) will have been configured with the defaults from the factory. The* ***ServerSocket*** *(p. 2659) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the* ***ServerSocket*** *(p. 2659) will listen on all interfaces.*

Parameters:

port *The port to bind the* ***ServerSocket*** *(p. 2659) to.*
backlog *The number of pending connect request the* ***ServerSocket*** *(p. 2659) can queue.*
address *The address of the interface on the local machine to bind to.*

Returns:

new ***ServerSocket*** *(p. 2659) pointer that is owned by the caller.*

Exceptions:

IOException *if the* ***ServerSocket*** *(p. 2659) cannot be created for some reason.*

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

Returns the list of cipher suites which are enabled by default.
Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns:

an STL vector containing the list of cipher suites enabled by default.

See also:

getSupportedCipherSuites() *(p. 2827)*

- virtual std::vector< std::string > **getSupportedCipherSuites** ()

Returns the names of the cipher suites which could be enabled for use on an SSL connection. Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns:

an STL vector containing the list of supported cipher suites.

See also:

getDefaultCipherSuites() *(p. 2827)*

6.451.1 Detailed Description

SSLServerSocketFactory that creates Server Sockets that use OpenSSL.

Since:

1.0

6.451.2 Constructor & Destructor Documentation

6.451.2.1 decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::OpenSSLServerSocketFact (OpenSSLContextSpi * *parent*)

6.451.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::~OpenSSLServerSocketFac () [virtual]

6.451.3 Member Function Documentation

6.451.3.1 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int *port*, int *backlog*, const decaf::net::InetAddress * *address*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 2659) will listen on all interfaces.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The number of pending connect request the **ServerSocket** (p. 2659) can queue.

address The address of the interface on the local machine to bind to.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2669).

6.451.3.2 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int *port*, int *backlog*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2659) will use the specified connection backlog setting.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

backlog The number of pending connect request the **ServerSocket** (p. 2659) can queue.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2669).

6.451.3.3 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int *port*) [virtual]

Create a new **ServerSocket** (p. 2659) that is bound to the given port.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.

Parameters:

port The port to bind the **ServerSocket** (p. 2659) to.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 2670).

6.451.3.4 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket () [virtual]

Create a new **ServerSocket** (p. 2659) that is unbound.

The **ServerSocket** (p. 2659) will have been configured with the defaults from the factory.

Returns:

new **ServerSocket** (p. 2659) pointer that is owned by the caller.

Exceptions:

IOException if the **ServerSocket** (p. 2659) cannot be created for some reason.

Reimplemented from **decaf::net::ServerSocketFactory** (p. 2670).

6.451.3.5 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::getDefaultCipherSuites () [virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns:

an STL vector containing the list of cipher suites enabled by default.

See also:

getSupportedCipherSuites() (p. 2827)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 2827).

6.451.3.6 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::getSupportedCipherSuites () [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns:

an STL vector containing the list of supported cipher suites.

See also:

getDefaultCipherSuites() (p. 2827)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 2827).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLServerSocketFactory.h**

6.452 decaf::internal::net::ssl::openssl::OpenSSLSocket Class Reference

Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocket.h>`Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocket:

Public Member Functions

- **OpenSSLSocket** (**OpenSSLParameters** *parameters)
- **OpenSSLSocket** (**OpenSSLParameters** *parameters, const **decaf::net::InetAddress** *address, int port)
- **OpenSSLSocket** (**OpenSSLParameters** *parameters, const **decaf::net::InetAddress** *address, int port, const **decaf::net::InetAddress** *localAddress, int localPort)
- **OpenSSLSocket** (**OpenSSLParameters** *parameters, const std::string &host, int port)
- **OpenSSLSocket** (**OpenSSLParameters** *parameters, const std::string &host, int port, const **decaf::net::InetAddress** *localAddress, int localPort)
- virtual ~**OpenSSLSocket** ()
- virtual void **connect** (const std::string &host, int port, int timeout)

  Connects to the specified destination, with a specified timeout value.
  *If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 2807) is thrown. A timeout value of zero is treated as an inifinite timeout.*

  Parameters:

  host *The host name or IP address of the remote host to connect to.*
  port *The port on the remote host to connect to.*
  timeout *The number of Milliseconds to wait before treating the connection as failed.*

  Exceptions:

  IOException *Thrown if a failure occurred in the connect.*
  SocketTimeoutException *(p. 2807) if the timeout for connection is exceeded.*
  IllegalArguementException *if the timeout value is negative or the endpoint is invalid.*

- virtual void **close** ()

  *Closes the **Socket** (p. 2770).*
  *Once closed a **Socket** (p. 2770) cannot be connected or otherwise operated upon, a new **Socket** (p. 2770) instance must be created.*

  Exceptions:

  IOException *if an I/O error occurs while closing the **Socket** (p. 2770).*

- virtual **decaf::io::InputStream** * **getInputStream** ()

  Gets the InputStream for this socket if its connected.
  *The pointer returned is the property of the associated **Socket** (p. 2770) and should not be deleted by the caller.*
  When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broker the read calls will normally throw an exception to indicate the failure.
  *Closing the InputStream will also close the underlying **Socket** (p. 2770).*

  Returns:

  The InputStream for this socket.

Exceptions:

IOException *if an error occurs during creation of the InputStream, also if the* ***Socket*** *(p. 2770) is not connected or the input has been shutdown previously.*

- virtual **decaf::io::OutputStream** * **getOutputStream** ()

  Gets the OutputStream for this socket if it is connected.
  The pointer returned is the property of the ***Socket*** *(p. 2770) instance and should not be deleted by the caller.*
  Closing the returned ***Socket*** *(p. 2770) will also close the underlying* ***Socket*** *(p. 2770).*
  Returns:

  the OutputStream for this socket.
  Exceptions:

  IOException *if an error occurs during the creation of this OutputStream, or if the* ***Socket*** *(p. 2770) is closed or the output has been shutdown previously.*

- virtual void **shutdownInput** ()

  Shuts down the InputStream for this socket essentially marking it as EOF.
  The stream returns EOF for any calls to read after this method has been called.
  Exceptions:

  IOException *if an I/O error occurs while performing this operation.*

- virtual void **shutdownOutput** ()

  Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.
  Exceptions:

  IOException *if an I/O error occurs while performing this operation.*

- virtual void **setOOBInline** (bool value)

  Sets the value of the OOBINLINE for this socket, by default this option is disabled.
  If enabled the urgent data is read inline on the Socket's InputStream, no notification is give.
  Returns:

  true if OOBINLINE is enabled, false otherwise.
  Exceptions:

  SocketException *(p. 2787) if an error is encountered while performing this operation.*

- virtual void **sendUrgentData** (int data)

  Sends on byte of urgent data to the ***Socket*** *(p. 2770).*
  Parameters:

  data *The value to write as urgent data, only the lower eight bits are sent.*
  Exceptions:

  IOException *if an I/O error occurs while performing this operation.*

- virtual **decaf::net::ssl::SSLParameters getSSLParameters** () const

  Returns an ***SSLParameters*** *(p. 2816) object for this* ***SSLSocket*** *(p. 2829) instance.*
  The cipherSuites and protocols vectors in the returned ***SSLParameters*** *(p. 2816) reference will never be empty.*
  Returns:

  an ***SSLParameters*** *(p. 2816) object with the settings in use for the* ***SSLSocket*** *(p. 2829).*

- virtual void **setSSLParameters** (const **decaf::net::ssl::SSLParameters** &value)

  *Sets the **SSLParameters** (p. 2816) for this **SSLSocket** (p. 2829) using the supplied **SSLParameters** (p. 2816) instance.*
  *If the cipherSutes vector in the **SSLParameters** (p. 2816) instance is not empty them the setEnabledCipherSuites method is called with that vector, if the protocols vector in the **SSLParameters** (p. 2816) instance is not empty then the setEnabledProtocols method is called with that vector. If the needClientAuth value or the wantClientAuth value is true then the setNeedClientAuth and setWantClientAuth methods are called respectively with a value of true, otherwise the setWantClientAuth method is called with a value of false.*
  Parameters:

  ***value** The **SSLParameters** (p. 2816) instance that is used to update this SSLSocket's settings.*
  Exceptions:

  ***IllegalArgumentException** if an error occurs while calling setEnabledCipherSuites or setEnabledProtocols.*

- virtual std::vector< std::string > **getSupportedCipherSuites** () const

  *Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 2829).*
  *Normally not all of these cipher suites will be enabled on the **Socket** (p. 2770).*
  Returns:

  a vector containing the names of all the supported cipher suites.

- virtual std::vector< std::string > **getSupportedProtocols** () const

  *Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 2829) instance.*
  Returns:

  a vector containing the names of all the supported protocols.

- virtual std::vector< std::string > **getEnabledCipherSuites** () const

  *Returns a vector containing the names of all the currently enabled Cipher Suites for this SSL **Socket** (p. 2770).*
  Returns:

  vector of the names of all enabled Cipher Suites.

- virtual void **setEnabledCipherSuites** (const std::vector< std::string > &suites)

  *Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 2770) connection.*
  Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.
  Parameters:

  ***suites** An Vector of names for all the Cipher Suites that are to be enabled.*
  Exceptions:

  ***IllegalArgumentException** if the vector is empty or one of the names is invalid.*

- virtual std::vector< std::string > **getEnabledProtocols** () const

  *Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 2770).*
  Returns:

  vector of the names of all enabled Protocols.

- virtual void **setEnabledProtocols** (const std::vector< std::string > &protocols)

  *Sets the Protocols that are to be enabled on the SSL **Socket** (p. 2770) connection.*
  Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.
  Parameters:

  ***protocols** An Vector of names for all the Protocols that are to be enabled.*
  Exceptions:

  ***IllegalArgumentException** if the vector is empty or one of the names is invalid.*

- virtual void **startHandshake** ()

  Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.
  When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an IOException to indicate an error.
  Exceptions:

  ***IOException** if an I/O error occurs while performing the Handshake*

- virtual void **setUseClientMode** (bool value)

  Determines the mode that the socket uses when a handshake is initiated, client or server.
  *This method must be called prior to any handshake attempts on this **Socket** (p. 2770), once a handshake has be initiated this socket remains the the set mode; client or server, for the life of this object.*
  Parameters:

  ***value** The mode setting, true for client or false for server.*
  Exceptions:

  ***IllegalArguementException** if the handshake process has begun and mode is lcoked.*

- virtual bool **getUseClientMode** () const

  *Gets whether this **Socket** (p. 2770) is in Client or Server mode, true indicates that the mode is set to Client.*
  Returns:

  *true if the **Socket** (p. 2770) is in Client mode, false otherwise.*

- virtual void **setNeedClientAuth** (bool value)

  *Sets the **Socket** (p. 2770) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*
  This option only applies to sockets in the Server mode.
  If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.
  Parameters:

  ***value** The value indicating if a client is required to authenticate itself or not.*

- virtual bool **getNeedClientAuth** () const

  Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.
  This option is only useful when the socket is operating in server mode.

Returns:

true if client authentication is required.

- virtual void **setWantClientAuth** (bool value)

*Sets the **Socket** (p. 2770) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*
This option only applies to sockets in the Server mode.
If the option is enabled an the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

Parameters:

value *The value indicating if a client is requested to authenticate itself or not.*

- virtual bool **getWantClientAuth** () const

Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that cleints that do not send a certificate are not considered to have failed authentication.
This option is only useful when the socket is operating in server mode.

Returns:

true if client authentication is required.

- int **read** (unsigned char *buffer, int size, int offset, int length)

Reads the requested data from the Socket and write it into the passed in buffer.

- void **write** (const unsigned char *buffer, int size, int offset, int length)

Writes the specified data in the passed in buffer to the Socket.

- int **available** ()

Gets the number of bytes in the Socket buffer that can be read without blocking.

6.452.1 Detailed Description

Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

Since:

1.0

6.452.2 Constructor & Destructor Documentation

6.452.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * *parameters*)

6.452.2.2 decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * *parameters*, const decaf::net::InetAddress * *address*, int *port*)

6.452.2.3 decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * *parameters*, const decaf::net::InetAddress * *address*, int *port*, const decaf::net::InetAddress * *localAddress*, int *localPort*)

6.452.2.4 decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * *parameters*, const std::string & *host*, int *port*)

6.452.2.5 decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * *parameters*, const std::string & *host*, int *port*, const decaf::net::InetAddress * *localAddress*, int *localPort*)

6.452.2.6 virtual decaf::internal::net::ssl::openssl::OpenSSLSocket::~OpenSSLSocket () [virtual]

6.452.3 Member Function Documentation

6.452.3.1 int decaf::internal::net::ssl::openssl::OpenSSLSocket::available ()

Gets the number of bytes in the Socket buffer that can be read without blocking.

Returns:

the number of bytes that can be read from the Socket without blocking.

Exceptions:

IOException if an I/O error occurs while performing this operation.

6.452.3.2 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::close () [virtual]

Closes the **Socket** (p. 2770).

Once closed a **Socket** (p. 2770) cannot be connected or otherwise operated upon, a new **Socket** (p. 2770) instance must be created.

Exceptions:

IOException if an I/O error occurs while closing the **Socket** (p. 2770).

Reimplemented from **decaf::net::Socket** (p. 2775).

6.452.3.3 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::connect (const std::string & *host*, int *port*, int *timeout*) [virtual]

Connects to the specified destination, with a specified timeout value.

If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 2807) is thrown. A timeout value of zero is treated as an inifinite timeout.

Parameters:

host The host name or IP address of the remote host to connect to.

port The port on the remote host to connect to.

timeout The number of Milliseconds to wait before treating the connection as failed.

Exceptions:

IOException Thrown if a failure occurred in the connect.

SocketTimeoutException *(p. 2807)* if the timeout for connection is exceeded.

IllegalArguementException if the timeout value is negative or the endpoint is invalid.

Reimplemented from **decaf::net::Socket** (p. 2776).

6.452.3.4 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getEnabledCipherSuites () const [virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this SSL **Socket** (p. 2770).

Returns:

vector of the names of all enabled Cipher Suites.

Implements **decaf::net::ssl::SSLSocket** (p. 2832).

6.452.3.5 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getEnabledProtocols () const [virtual]

Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 2770).

Returns:

vector of the names of all enabled Protocols.

Implements **decaf::net::ssl::SSLSocket** (p. 2832).

6.452.3.6 virtual decaf::io::InputStream* decaf::internal::net::ssl::openssl::OpenSSLSocket::getInputStream () [virtual]

Gets the InputStream for this socket if its connected.

The pointer returned is the property of the associated **Socket** (p. 2770) and should not be deleted by the caller.

When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broker the read calls will normally throw an exception to indicate the failure.

Closing the InputStream will also close the underlying **Socket** (p. 2770).

Returns:

The InputStream for this socket.

Exceptions:

IOException if an error occurs during creation of the InputStream, also if the **Socket** (p. 2770) is not connected or the input has been shutdown previously.

Reimplemented from **decaf::net::Socket** (p. 2777).

6.452.3.7 virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getNeedClientAuth () const [virtual]

Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

Returns:

true if client authentication is required.

Implements **decaf::net::ssl::SSLSocket** (p. 2833).

6.452.3.8 virtual decaf::io::OutputStream* decaf::internal::net::ssl::openssl::OpenSSLSocket::getOutputStream () [virtual]

Gets the OutputStream for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 2770) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 2770) will also close the underlying **Socket** (p. 2770).

Returns:

the OutputStream for this socket.

Exceptions:

IOException if an error occurs during the creation of this OutputStream, or if the **Socket** (p. 2770) is closed or the output has been shutdown previously.

Reimplemented from **decaf::net::Socket** (p. 2778).

6.452.3.9 virtual decaf::net::ssl::SSLParameters decaf::internal::net::ssl::openssl::OpenSSLSocket::getSSLParameters () const [virtual]

Returns an **SSLParameters** (p. 2816) object for this **SSLSocket** (p. 2829) instance.

The cipherSuites and protocols vectors in the returned **SSLParameters** (p. 2816) reference will never be empty.

Returns:

an **SSLParameters** (p. 2816) object with the settings in use for the **SSLSocket** (p. 2829).

Reimplemented from **decaf::net::ssl::SSLSocket** (p. 2833).

6.452.3.10 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getSupportedCipherSuites () const [virtual]

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 2829).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 2770).

Returns:

a vector containing the names of all the supported cipher suites.

Implements **decaf::net::ssl::SSLSocket** (p. 2833).

6.452.3.11 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getSupportedProtocols () const [virtual]

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 2829) instance.

Returns:

a vector containing the names of all the supported protocols.

Implements **decaf::net::ssl::SSLSocket** (p. 2833).

6.452.3.12 virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getUseClientMode () const [virtual]

Gets whether this **Socket** (p. 2770) is in Client or Server mode, true indicates that the mode is set to Client.

Returns:

true if the **Socket** (p. 2770) is in Client mode, false otherwise.

Implements **decaf::net::ssl::SSLSocket** (p. 2834).

6.452.3.13 virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getWantClientAuth () const [virtual]

Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that cleints that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

Returns:

true if client authentication is required.

Implements **decaf::net::ssl::SSLSocket** (p. 2834).

6.452.3.14 int decaf::internal::net::ssl::openssl::OpenSSLSocket::read (unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Reads the requested data from the Socket and write it into the passed in buffer.

Parameters:

buffer The buffer to read into

size The size of the specified buffer

offset The offset into the buffer where reading should start filling.

length The number of bytes past offset to fill with data.

Returns:

the actual number of bytes read or -1 if at EOF.

Exceptions:

IOException if an I/O error occurs during the read.

NullPointerException if buffer is Null.

IndexOutOfBoundsException if offset + length is greater than buffer size.

6.452.3.15 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::sendUrgentData (int *data*) [virtual]

Sends on byte of urgent data to the **Socket** (p. 2770).

Parameters:

data The value to write as urgent data, only the lower eight bits are sent.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 2781).

6.452.3.16 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [virtual]

Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 2770) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters:

suites An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions:

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLSocket** (p. 2834).

6.452.3.17 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [virtual]

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 2770) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters:

protocols An Vector of names for all the Protocols that are to be enabled.

Exceptions:

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLSocket** (p. 2834).

6.452.3.18 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setNeedClientAuth (bool *value*) [virtual]

Sets the **Socket** (p. 2770) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

Parameters:

value The value indicating if a client is required to authenticate itself or not.

Implements **decaf::net::ssl::SSLSocket** (p. 2835).

6.452.3.19 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setOOBInline (bool *value*) [virtual]

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the Socket's InputStream, no notification is give.

Returns:

true if OOBINLINE is enabled, false otherwise.

Exceptions:

SocketException *(*p. *2787)* if an error is encountered while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 2781).

6.452.3.20 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setSSLParameters (const decaf::net::ssl::SSLParameters & *value*) [virtual]

Sets the **SSLParameters** (p. 2816) for this **SSLSocket** (p. 2829) using the supplied **SSLParameters** (p. 2816) instance.

If the cipherSutes vector in the **SSLParameters** (p. 2816) instance is not empty them the setEnabledCipherSuites method is called with that vector, if the protocols vector in the **SSLParameters** (p. 2816) instance is not empty then the setEnabledProtocols method is called with that vector. If the needClientAuth value or the wantClientAuth value is true then the setNeedClientAuth and setWantClientAuth methods are called respectively with a value of true, otherwise the setWantClientAuth method is called with a value of false.

Parameters:

value The **SSLParameters** (p. 2816) instance that is used to update this SSLSocket's settings.

Exceptions:

IllegalArgumentException if an error occurs while calling setEnabledCipherSuites or setEnabledProtocols.

Reimplemented from **decaf::net::ssl::SSLSocket** (p. 2835).

6.452.3.21 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setUseClientMode (bool *value*) [virtual]

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 2770), once a handshake has be initiated this socket remains the the set mode; client or server, for the life of this object.

Parameters:

value The mode setting, true for client or false for server.

Exceptions:

IllegalArguementException if the handshake process has begun and mode is lcoked.

Implements **decaf::net::ssl::SSLSocket** (p. 2835).

6.452.3.22 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setWantClientAuth (bool *value*) [virtual]

Sets the **Socket** (p. 2770) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

Parameters:

value The value indicating if a client is requested to authenticate itself or not.

Implements **decaf::net::ssl::SSLSocket** (p. 2836).

6.452.3.23 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::shutdownInput () [virtual]

Shuts down the InputStream for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 2784).

6.452.3.24 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::shutdownOutput () [virtual]

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.

Exceptions:

IOException if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 2784).

6.452.3.25 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::startHandshake () [virtual]

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an IOException to indicate an error.

Exceptions:

IOException if an I/O error occurs while performing the Handshake

Implements **decaf::net::ssl::SSLSocket** (p. 2836).

6.452.3.26 void decaf::internal::net::ssl::openssl::OpenSSLSocket::write (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Writes the specified data in the passed in buffer to the Socket.

Parameters:

buffer The buffer to write to the socket.

size The size of the specified buffer.

offset The offset into the buffer where the data to write starts at.

length The number of bytes past offset to write.

Exceptions:

IOException if an I/O error occurs during the write.

NullPointerException if buffer is Null.

IndexOutOfBoundsException if offset + length is greater than buffer size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocket.h**

6.453 decaf::internal::net::ssl::openssl::OpenSSLSocketException Class Reference

Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketException.h>`Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketException:

Public Member Functions

- **OpenSSLSocketException** ()

  *Creates an new **OpenSSLSocketException** (p. 2308) with default values.*

- **OpenSSLSocketException** (const Exception &ex)

  Conversion Constructor from some other Exception.

Protected Member Functions

- std::string **getErrorString** () const

  Gets and formats an error message string from the OpenSSL error stack.

6.453.1 Detailed Description

Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.

Since:

1.0

6.453.2 Constructor & Destructor Documentation

6.453.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException ()

Creates an new **OpenSSLSocketException** (p. 2308) with default values.

6.453.2.2 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An Exception object that should become this type of Exception.

6.453.2.3 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const OpenSSLSocketException & *ex*)

Copy Constructor.

Parameters:

ex The **OpenSSLSocketException** (p. 2308) whose values should be copied to this instance.

6.453.2.4 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Create a new **OpenSSLSocketException** (p. 2308) and initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown (can be null).

msg The error message to report.

... The list of primitives that are formatted into the message.

6.453.2.5 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const std::exception * *cause*)

Creates a new **OpenSSLSocketException** (p. 2308) with the passed exception set as the cause of this exception.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.453.2.6 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Create a new **OpenSSLSocketException** (p. 2308) and initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs.

lineNumber The line number where the exception occurred.

msg The error message to report.

... The list of primitives that are formatted into the message

6.453.2.7 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * *file*, const int *lineNumber*)

Create a new **OpenSSLSocketException** (p. 2308) and initializes the file name and line number where this message occurred. Sets the message to report by getting the complete set of error messages from the OpenSSL error stack and concatenating them into one string.

Parameters:

file The file name where exception occurs.

lineNumber The line number where the exception occurred.

6.453.2.8 virtual decaf::internal::net::ssl::openssl::OpenSSLSocketException::~OpenSSLSocketException () throw () [virtual]

6.453.3 Member Function Documentation

6.453.3.1 virtual OpenSSLSocketException* decaf::internal::net::ssl::openssl::OpenSSLSocketException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override this method.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2788).

6.453.3.2 std::string decaf::internal::net::ssl::openssl::OpenSSLSocketException::getErrorString () const [protected]

Gets and formats an error message string from the OpenSSL error stack.

Returns:

a string containing the complete OpenSSL error string.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketException.h**

6.454 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory Class Reference

Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketFactory.h>`Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketFactory:

Public Member Functions

- **OpenSSLSocketFactory** (**OpenSSLContextSpi** *parent)
- virtual ~**OpenSSLSocketFactory** ()
- virtual **decaf::net::Socket** * **createSocket** ()

  Creates an unconnected ***Socket*** *(p. 2770) object.*

  Returns:

  a new ***Socket*** *(p. 2770) object, caller must free this object when done.*

  Exceptions:

  IOException *if the* ***Socket*** *(p. 2770) cannot be created.*

- virtual **decaf::net::Socket** * **createSocket** (const **decaf::net::InetAddress** *host, int port)

  Creates a new ***Socket*** *(p. 2770) object and connects it to the specified remote host and port using the configuration of this* ***SocketFactory*** *(p. 2789).*

  Parameters:

  host *The host to connect the socket to.*
  port *The port on the remote host to connect to.*

  Returns:

  a new ***Socket*** *(p. 2770) object, caller must free this object when done.*

  Exceptions:

  IOException *if an I/O error occurs while creating the* ***Socket*** *(p. 2770) object.*
  UnknownHostException *(p. 3154) if the host name is not known.*

- virtual **decaf::net::Socket** * **createSocket** (const **decaf::net::InetAddress** *host, int port, const **decaf::net::InetAddress** *ifAddress, int localPort)

  Creates a new ***Socket*** *(p. 2770) object and connects it to the specified remote host and port using the configuration of this* ***SocketFactory*** *(p. 2789).*
  The ***Socket*** *(p. 2770) will be bound to the specified local address and port.*

  Parameters:

  host *The host to connect the socket to.*
  port *The port on the remote host to connect to.*
  ifAddress *The address on the local machine to bind the* ***Socket*** *(p. 2770) to.*
  localPort *The local port to bind the* ***Socket*** *(p. 2770) to.*

  Returns:

  IOException *if an I/O error occurs while creating the* ***Socket*** *(p. 2770) object.*
  UnknownHostException *(p. 3154) if the host name is not known.*

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

  Returns the list of cipher suites which are enabled by default.
  Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

  Returns:

  an STL vector containing the list of cipher suites enabled by default.

  See also:

  getSupportedCipherSuites() *(p. 2839)*

- virtual std::vector< std::string > **getSupportedCipherSuites** ()

  Returns the names of the cipher suites which could be enabled for use on an SSL connection.
  Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

  Returns:

  an STL vector containing the list of supported cipher suites.

  See also:

  getDefaultCipherSuites() *(p. 2839)*

- virtual **decaf::net::Socket** * **createSocket** (**decaf::net::Socket** *socket, std::string host, int port, bool autoClose)

  Returns a socket layered over an existing socket connected to the named host, at the given port. This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters:

socket *The existing socket to layer over.*
host *The server host the original* ***Socket*** *(p. 2770) is connected to.*
port *The server port the original* ***Socket*** *(p. 2770) is connected to.*
autoClose *Should the layered over* ***Socket*** *(p. 2770) be closed when the topmost socket is closed.*

Returns:

a new ***Socket*** *(p. 2770) instance that wraps the given* ***Socket*** *(p. 2770).*

Exceptions:

IOException *if an I/O exception occurs while performing this operation.*
UnknownHostException *(p. 3154) if the host is unknown.*

6.454.1 Detailed Description

Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

Since:

1.0

6.454.2 Constructor & Destructor Documentation

6.454.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::OpenSSLSocketFactory (OpenSSLContextSpi * *parent*)

6.454.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::~OpenSSLSocketFactory () [virtual]

6.454.3 Member Function Documentation

6.454.3.1 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (decaf::net::Socket * *socket*, std::string *host*, int *port*, bool *autoClose*) [virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters:

socket The existing socket to layer over.

host The server host the original **Socket** (p. 2770) is connected to.

port The server port the original **Socket** (p. 2770) is connected to.

autoClose Should the layered over **Socket** (p. 2770) be closed when the topmost socket is closed.

Returns:

a new **Socket** (p. 2770) instance that wraps the given **Socket** (p. 2770).

Exceptions:

IOException if an I/O exception occurs while performing this operation.

UnknownHostException *(p. 3154)* if the host is unknown.

Implements **decaf::net::ssl::SSLSocketFactory** (p. 2838).

6.454.3.2 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const std::string & *name*, int *port*, const decaf::net::InetAddress * *ifAddress*, int *localPort*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 2770) to.

localPort The local port to bind the **Socket** (p. 2770) to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2790).

6.454.3.3 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const std::string & *hostname*, int *port*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException *(p. 3154)* if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2790).

6.454.3.4 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host*, int *port*, const decaf::net::InetAddress * *ifAddress*, int *localPort*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

The **Socket** (p. 2770) will be bound to the specified local address and port.

Parameters:

host The host to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 2770) to.

localPort The local port to bind the **Socket** (p. 2770) to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException (p. *3154*) if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2791).

6.454.3.5 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host*, int *port*) [virtual]

Creates a new **Socket** (p. 2770) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2789).

Parameters:

host The host to connect the socket to.

port The port on the remote host to connect to.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if an I/O error occurs while creating the **Socket** (p. 2770) object.

UnknownHostException (p. *3154*) if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 2791).

6.454.3.6 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket () [virtual]

Creates an unconnected **Socket** (p. 2770) object.

Returns:

a new **Socket** (p. 2770) object, caller must free this object when done.

Exceptions:

IOException if the **Socket** (p. 2770) cannot be created.

Reimplemented from **decaf::net::SocketFactory** (p. 2792).

6.454.3.7 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::getDefaultCipherSuites () [virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns:

an STL vector containing the list of cipher suites enabled by default.

See also:

getSupportedCipherSuites() (p. 2839)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 2839).

6.454.3.8 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::getSupportedCipherSuites () [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns:

an STL vector containing the list of supported cipher suites.

See also:

getDefaultCipherSuites() (p. 2839)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 2839).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketFactory.h**

6.455 decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream Class Reference

An output stream for reading data from an OpenSSL Socket instance.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketInputStream.h>`Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream:

Public Member Functions

- **OpenSSLSocketInputStream** (**OpenSSLSocket** *socket)
- virtual ~**OpenSSLSocketInputStream** ()
- virtual int **available** () const

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns:

  the number of bytes available on this input stream.

  Exceptions:

  IOException *(p. **1787**) if an I/O error occurs.*

- virtual void **close** ()

  Close - does nothing.

- virtual long long **skip** (long long num)

  Not supported.

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.455.1 Detailed Description

An output stream for reading data from an OpenSSL Socket instance.

Since:

1.0

6.455.2 Constructor & Destructor Documentation

6.455.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::OpenSSLSocketInputStream (OpenSSLSocket * *socket*)

6.455.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::~OpenSSLSocketInputStream () [virtual]

6.455.3 Member Function Documentation

6.455.3.1 virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::available () const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(*p. ***1787***)* if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1708).

6.455.3.2 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::close () [virtual]

Close - does nothing. It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 1707) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions:

IOException *(*p. ***1787***)* if an I/O error occurs while closing the **InputStream** (p. 1707).

Reimplemented from **decaf::io::InputStream** (p. 1709).

6.455.3.3 virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1709).

6.455.3.4 virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::doReadByte () [protected, virtual]

Implements **decaf::io::InputStream** (p. 1710).

6.455.3.5 virtual long long decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::skip (long long *num*) [virtual]

Not supported. Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1713).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketInputStream.h**

6.456 decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream Class Reference

OutputStream implementation used to write data to an **OpenSSLSocket** (p. 2294) instance.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketOutputStream.h>`Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream:

Public Member Functions

- **OpenSSLSocketOutputStream** (**OpenSSLSocket** *socket)
- virtual ~**OpenSSLSocketOutputStream** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.

  Exceptions:

  IOException *(p. **1787**) if an error occurs while closing.*

  The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char c)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.456.1 Detailed Description

OutputStream implementation used to write data to an **OpenSSLSocket** (p. 2294) instance.

Since:

1.0

6.456.2 Constructor & Destructor Documentation

6.456.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::OpenSSLSocketOutputStr (OpenSSLSocket * *socket*)

6.456.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::~OpenSSLSocketOutputS () [virtual]

6.456.3 Member Function Documentation

6.456.3.1 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::close () [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions:

IOException *(*p. *1787)* if an error occurs while closing.

The default implementation of this method does nothing. The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2349).

6.456.3.2 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2350).

6.456.3.3 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::doWriteByte (unsigned char *c*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2350).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketOutputStream.h**

6.457 activemq::wireformat::openwire::OpenWireFormat Class Reference

`#include <src/main/activemq/wireformat/openwire/OpenWireFormat.h>`Inheritance diagram for activemq::wireformat::openwire::OpenWireFormat:

Public Member Functions

- **OpenWireFormat** (const **decaf::util::Properties** &properties)

  *Constructs a new **OpenWireFormat** (p. 2324) object.*

- virtual ~**OpenWireFormat** ()
- virtual bool **hasNegotiator** () const

  *Returns true if this **WireFormat** (p. 3227) has a Negotiator that needs to wrap the Transport that uses it.*
  Returns:

  *true if the **WireFormat** (p. 3227) provides a Negotiator.*

- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > transport)

  If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.
  Parameters:

  ***transport** (p. 72) The Transport to Wrap the Negotiator around.*
  Returns:

  *new instance of a **WireFormatNegotiator** (p. 3247) as a **Pointer**<**Transport**> (p. 2370).*
  Exceptions:

  ***UnsupportedOperationException** if the **WireFormat** (p. 3227) doesn't have a Negotiator.*

- void **addMarshaller** (**marshal::DataStreamMarshaller** *marshaler)

  Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.

- virtual void **marshal** (const **Pointer**< **commands::Command** > command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
  Parameters:

  ***command** The Command to Marshal*
  ***transport** (p. 72) The Transport that called this method.*
  ***out** The output stream to write the command to.*
  Exceptions:

  ***IOException** if an I/O error occurs.*

- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
Returns a Pointer to the newly unmarshaled Command.

Parameters:

transport *(p. 72) Pointer to the* ***transport*** *(p. 72) that is making this request.*
in *The input stream to read the command from.*

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException *if an I/O error occurs.*

- virtual int **tightMarshalNestedObject1** (**commands::DataStructure** *object, **utils::BooleanStream** *bs)

  Utility method for Tight Marshaling the given object to the boolean stream passed.

- void **tightMarshalNestedObject2** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *ds, **utils::BooleanStream** *bs)

  Utility method that will Tight ***marshal*** *(p. 83) some internally nested object that implements the DataStructure interface.*

- **commands::DataStructure** * **tightUnmarshalNestedObject** (**decaf::io::DataInputStream** *dis, **utils::BooleanStream** *bs)

  Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.

- **commands::DataStructure** * **looseUnmarshalNestedObject** (**decaf::io::DataInputStream** *dis)

  Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.

- void **looseMarshalNestedObject** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *dataOut)

  Utility method to loosely Marshal an object that is derived from the DataStrucutre interface.

- void **renegotiateWireFormat** (const **commands::WireFormatInfo** &info)

  Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

- void **setPreferedWireFormatInfo** (const **Pointer< commands::WireFormatInfo >** info)

  Configures this object using the provided WireformatInfo object.

- const **Pointer< commands::WireFormatInfo >** & **getPreferedWireFormatInfo** () const

  Gets the Preferred WireFormatInfo object that this class holds.

- bool **isStackTraceEnabled** () const

  Checks if the stackTraceEnabled flag is on.

- void **setStackTraceEnabled** (bool stackTraceEnabled)

  Sets if the stackTraceEnabled flag is on.

- bool **isTcpNoDelayEnabled** () const
  Checks if the tcpNoDelayEnabled flag is on.
- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)
  Sets if the tcpNoDelayEnabled flag is on.
- int **getVersion** () const
  Get the current Wireformat Version.
- void **setVersion** (int version)
  Set the current Wireformat Version.
- virtual bool **inReceive** () const
  Is there a Message being unmarshaled?
- bool **isCacheEnabled** () const
  Checks if the cacheEnabled flag is on.
- void **setCacheEnabled** (bool cacheEnabled)
  Sets if the cacheEnabled flag is on.
- int **getCacheSize** () const
  Returns the currently set Cache size.
- void **setCacheSize** (int value)
  Sets the current Cache size.
- bool **isTightEncodingEnabled** () const
  Checks if the tightEncodingEnabled flag is on.
- void **setTightEncodingEnabled** (bool tightEncodingEnabled)
  Sets if the tightEncodingEnabled flag is on.
- bool **isSizePrefixDisabled** () const
  Checks if the sizePrefixDisabled flag is on.
- void **setSizePrefixDisabled** (bool sizePrefixDisabled)
  Sets if the sizePrefixDisabled flag is on.
- long long **getMaxInactivityDuration** () const
  Gets the MaxInactivityDuration setting.
- void **setMaxInactivityDuration** (long long value)
  Sets the MaxInactivityDuration setting.
- long long **getMaxInactivityDurationInitialDelay** () const
  Gets the MaxInactivityDurationInitialDelay setting.
- void **setMaxInactivityDurationInitialDelay** (long long value)
  Sets the MaxInactivityDurationInitialDelay setting.

Protected Member Functions

- **commands::DataStructure** * **doUnmarshal** (**decaf::io::DataInputStream** *dis)

  Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.

- void **destroyMarshalers** ()

  Cleans up all registered Marshallers and empties the dataMarshallers vector.

Static Protected Attributes

- static const unsigned char **NULL_TYPE**
- static const int **DEFAULT_VERSION**
- static const int **MAX_SUPPORTED_VERSION**

6.457.1 Constructor & Destructor Documentation

6.457.1.1 activemq::wireformat::openwire::OpenWireFormat::OpenWireFormat (const decaf::util::Properties & *properties*)

Constructs a new **OpenWireFormat** (p. 2324) object.

Parameters:

properties - can contain optional config params.

6.457.1.2 virtual activemq::wireformat::openwire::OpenWireFormat::~OpenWireFormat () [virtual]

6.457.2 Member Function Documentation

6.457.2.1 void activemq::wireformat::openwire::OpenWireFormat::addMarshaller (marshal::DataStreamMarshaller * *marshaler*)

Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.

Parameters:

marshaler - the Marshaler to add to the collection.

6.457.2.2 virtual Pointer<transport::Transport> activemq::wireformat::openwire::OpenWireFormat::createNegotiator (const Pointer< transport::Transport > *transport*) [virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters:

transport *(p. 72)* The Transport to Wrap the Negotiator around.

Returns:

new instance of a **WireFormatNegotiator** (p. 3247) as a **Pointer<Transport>** (p. 2370).

Exceptions:

UnsupportedOperationException if the **WireFormat** (p. 3227) doesn't have a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3228).

6.457.2.3 void activemq::wireformat::openwire::OpenWireFormat::destroyMarshalers () [protected]

Cleans up all registered Marshallers and empties the dataMarshallers vector. This should be called before a reconfiguration of the version marshallers, or on destruction of this object

6.457.2.4 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::doUnmarshal (decaf::io::DataInputStream * *dis*) [protected]

Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object. This method can return null if the type of the object to unmarshal is NULL, empty data.

Parameters:

dis The DataInputStream to read from.

Returns:

new DataStructure* that the caller owns.

Exceptions:

IOException if an error occurs during the unmarshal.

6.457.2.5 int activemq::wireformat::openwire::OpenWireFormat::getCacheSize () const [inline]

Returns the currently set Cache size.

Returns:

the current value of the broker's cache size.

6.457.2.6 long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDuration () const [inline]

Gets the MaxInactivityDuration setting.

Returns:

maximum inactivity duration value in milliseconds.

6.457.2.7 long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDurationInitialDelay () const [inline]

Gets the MaxInactivityDurationInitialDelay setting.

Returns:

maximum inactivity duration initial delay value in milliseconds.

6.457.2.8 const Pointer<commands::WireFormatInfo>& activemq::wireformat::openwire::OpenWireFormat::getPreferedWireFormatInfo () const [inline]

Gets the Preferred WireFormatInfo object that this class holds.

Returns:

pointer to a preferred WireFormatInfo object

6.457.2.9 int activemq::wireformat::openwire::OpenWireFormat::getVersion () const [inline, virtual]

Get the current Wireformat Version.

Returns:

int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 3228).

6.457.2.10 virtual bool activemq::wireformat::openwire::OpenWireFormat::hasNegotiator () const [inline, virtual]

Returns true if this **WireFormat** (p. 3227) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 3227) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3228).

6.457.2.11 virtual bool activemq::wireformat::openwire::OpenWireFormat::inReceive () const [inline, virtual]

Is there a Message being unmarshaled?

Returns:

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 3229).

6.457.2.12 bool activemq::wireformat::openwire::OpenWireFormat::isCacheEnabled () const [inline]

Checks if the cacheEnabled flag is on.

Returns:

true if the flag is on.

6.457.2.13 bool activemq::wireformat::openwire::OpenWireFormat::isSizePrefixDisabled () const [inline]

Checks if the sizePrefixDisabled flag is on.

Returns:

true if the flag is on.

6.457.2.14 bool activemq::wireformat::openwire::OpenWireFormat::isStackTraceEnabled () const [inline]

Checks if the stackTraceEnabled flag is on.

Returns:

true if the flag is on.

6.457.2.15 bool activemq::wireformat::openwire::OpenWireFormat::isTcpNoDelayEnabled () const [inline]

Checks if the tcpNoDelayEnabled flag is on.

Returns:

true if the flag is on.

6.457.2.16 bool activemq::wireformat::openwire::OpenWireFormat::isTightEncodingEnabled () const [inline]

Checks if the tightEncodingEnabled flag is on.

Returns:

true if the flag is on.

6.457.2.17 void activemq::wireformat::openwire::OpenWireFormat::looseMarshalNestedObject (commands::DataStructure * *o*, decaf::io::DataOutputStream * *dataOut*)

Utility method to loosely Marshal an object that is derived from the DataStrucutre interface. The marshaled data is written to the passed in DataOutputStream.

Parameters:

o - DataStructure derived Object to Marshal

dataOut - DataOutputStream to write the data to

Exceptions:

IOException if an error occurs.

6.457.2.18 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::looseUnmarshalNestedObject (decaf::io::DataInputStream * *dis*)

Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format. Will read the Data and construct a new DataStructure based Object, the pointer to the Object returned is now owned by the caller.

Parameters:

dis - the DataInputStream to read the data from

Returns:

a new DataStructure derived Object pointer

Exceptions:

IOException if an error occurs.

6.457.2.19 virtual void activemq::wireformat::openwire::OpenWireFormat::marshal (const Pointer< commands::Command > *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal

transport *(p. 72)* The Transport that called this method.

out The output stream to write the command to.

Exceptions:

IOException if an I/O error occurs.

Implements **activemq::wireformat::WireFormat** (p. 3229).

6.457.2.20 void activemq::wireformat::openwire::OpenWireFormat::renegotiateWireFormat (const commands::WireFormatInfo & *info*)

Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

Parameters:

info The new Wireformat Info settings.

Exceptions:

IllegalStateException is wire format can't be negotiated.

6.457.2.21 void activemq::wireformat::openwire::OpenWireFormat::setCacheEnabled (bool *cacheEnabled*) [inline]

Sets if the cacheEnabled flag is on.

Parameters:

cacheEnabled - true to turn flag is on

6.457.2.22 void activemq::wireformat::openwire::OpenWireFormat::setCacheSize (int *value*) [inline]

Sets the current Cache size.

Parameters:

value - the value to send as the broker's cache size.

6.457.2.23 void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDuration (long long *value*) [inline]

Sets the MaxInactivityDuration setting.

Parameters:

value - the Max inactivity duration value in milliseconds.

6.457.2.24 void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDurationInitialDelay (long long *value*) [inline]

Sets the MaxInactivityDurationInitialDelay setting.

Parameters:

value - the Max inactivity Initial Delay duration value in milliseconds.

6.457.2.25 void activemq::wireformat::openwire::OpenWireFormat::setPreferedWireFormatInfo (const Pointer< commands::WireFormatInfo > *info*)

Configures this object using the provided WireformatInfo object.

Parameters:

info A WireFormatInfo object, takes ownership.

Exceptions:

IllegalStateException if the **WireFormat** (p. 3227) object has not been initialized.

6.457.2.26 void activemq::wireformat::openwire::OpenWireFormat::setSizePrefixDisabled (bool *sizePrefixDisabled*) [inline]

Sets if the sizePrefixDisabled flag is on.

Parameters:

sizePrefixDisabled - true to turn flag is on

6.457.2.27 void activemq::wireformat::openwire::OpenWireFormat::setStackTraceEnabled (bool *stackTraceEnabled*) [inline]

Sets if the stackTraceEnabled flag is on.

Parameters:

stackTraceEnabled - true to turn flag is on

6.457.2.28 void activemq::wireformat::openwire::OpenWireFormat::setTcpNoDelayEnabled (bool *tcpNoDelayEnabled*) [inline]

Sets if the tcpNoDelayEnabled flag is on.

Parameters:

tcpNoDelayEnabled - true to turn flag is on

6.457.2.29 void activemq::wireformat::openwire::OpenWireFormat::setTightEncodingEnabled (bool *tightEncodingEnabled*) [inline]

Sets if the tightEncodingEnabled flag is on.

Parameters:

tightEncodingEnabled - true to turn flag is on

6.457.2.30 void activemq::wireformat::openwire::OpenWireFormat::setVersion (int *version*) [virtual]

Set the current Wireformat Version.

Parameters:

version An int that identifies the version

Exceptions:

IllegalArgumentException if the version given is not supported.

Implements **activemq::wireformat::WireFormat** (p. 3229).

6.457.2.31 virtual int activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject1 (commands::DataStructure * *object*, utils::BooleanStream * *bs*) [virtual]

Utility method for Tight Marshaling the given object to the boolean stream passed.

Parameters:

object - The DataStructure to **marshal** (p. 83)

bs - the BooleanStream to write to

Returns:

size of the data returned.

6.457.2.32 void activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject2 (commands::DataStructure * *o*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*)

Utility method that will Tight **marshal** (p. 83) some internally nested object that implements the DataStructure interface. Writes the data to the Data Output Stream provided.

Parameters:

o - DataStructure object

ds - DataOuputStream for writing

bs - BooleanStream

Exceptions:

IOException if an error occurs.

6.457.2.33 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::tightUnmarshalNestedObject (decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*)

Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream. The DataStructure instance that is returned is now the property of the caller.

Parameters:

dis - DataInputStream to read from

bs - BooleanStream to read from

Returns:

Newly allocated DataStructure Object

Exceptions:

IOException if an error occurs.

6.457.2.34 virtual Pointer<commands::Command> activemq::wireformat::openwire::OpenWireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) [virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters:

transport *(p. 72)* Pointer to the **transport** (p. 72) that is making this request.

in The input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException if an I/O error occurs.

Implements **activemq::wireformat::WireFormat** (p. 3229).

6.457.3 Field Documentation

6.457.3.1 const int activemq::wireformat::openwire::OpenWireFormat::DEFAULT_VERSION [static, protected]

6.457.3.2 const int activemq::wireformat::openwire::OpenWireFormat::MAX_SUPPORTED_VERSION [static, protected]

6.458.2 Member Function Documentation

6.458.2.1 virtual Pointer<wireformat::WireFormat> activemq::wireformat::openwire::OpenWireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) `[virtual]`

Creates a new **WireFormat** (p. 3227) Object passing it a set of properties from which it can obtain any optional settings.

Parameters:

properties The Properties for this **WireFormat** (p. 3227).

Returns:

Pointer to a new instance of a **WireFormat** (p. 3227) object.

Exceptions:

IllegalStateException if the factory has not been initialized.

Implements **activemq::wireformat::WireFormatFactory** (p. 3231).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireFormatFactory.h**

6.459 activemq::wireformat::openwire::OpenWireFormatNegotiator Class Reference

`#include <src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h>`Inheritance diagram for activemq::wireformat::openwire::OpenWireFormatNegotiator:

Public Member Functions

- **OpenWireFormatNegotiator** (**OpenWireFormat** *wireFormat, const **Pointer**< **transport::Transport** > **next**)

  Constructor - Initializes this object around another Transport.

- virtual ~**OpenWireFormatNegotiator** ()
- virtual void **oneway** (const **Pointer**< **commands::Command** > command)

  Sends a one-way command.

- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > command)

  Sends the given command to the broker and then waits for the response.

- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > command, unsigned int timeout)

  Sends the given command to the broker and then waits for the response.

- virtual void **onCommand** (const **Pointer**< **commands::Command** > command)

  Event handler for the receipt of a command.

- virtual void **onException** (const **decaf::lang::Exception** &ex)

  *Event handler for an exception from a command **transport** (p. 72).*

Protected Member Functions

- virtual void **afterNextIsStarted** ()

  Subclasses can override this method to do their own post startup work.

- virtual void **afterNextIsStopped** ()

  Subclasses can override this method to do their own stop work.

6.459.1 Constructor & Destructor Documentation

6.459.1.1 activemq::wireformat::openwire::OpenWireFormatNegotiator::OpenWireFormatNegotiator (OpenWireFormat * *wireFormat*, const Pointer< transport::Transport > *next*)

Constructor - Initializes this object around another Transport.

Parameters:

wireFormat - The **WireFormat** (p. 3227) object we use to negotiate

next - The next **transport** (p. 72) in the chain

6.459.1.2 virtual activemq::wireformat::openwire::OpenWireFormatNegotiator::~OpenWireFormatNegotiat () [virtual]

6.459.2 Member Function Documentation

6.459.2.1 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::afterNextIsStarted () [protected, virtual]

Subclasses can override this method to do their own post startup work. This method will always be called after the doStart() method and the next transport's own **start()** (p. 3144) methods have been successfully run.

Reimplemented from **activemq::transport::TransportFilter** (p. 3137).

6.459.2.2 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::afterNextIsStopped () [protected, virtual]

Subclasses can override this method to do their own stop work. This method is always called after all the next transports have been stopped to prevent this **transport** (p. 72) for destroying resources needed by the lower level transports.

Reimplemented from **activemq::transport::TransportFilter** (p. 3138).

6.459.2.3 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onCommand (const Pointer< commands::Command > *command*) [virtual]

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Reimplemented from **activemq::transport::TransportFilter** (p. 3141).

6.459.2.4 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::oneway (const Pointer< commands::Command > *command*) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command The command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3141).

6.459.2.5 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 72).

Parameters:

ex The exception to handle.

Reimplemented from **activemq::transport::TransportFilter** (p. 3142).

6.459.2.6 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > *command*, unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command The command to be sent.

timeout The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3142).

6.459.2.7 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 72).

Reimplemented from **activemq::transport::TransportFilter** (p. 3143).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireFormatNegotiator.h**

6.460 activemq::wireformat::openwire::OpenWireResponseBuilder Class Reference

Used to allow a MockTransport to generate response **commands** (p. 61) to OpenWire Commands.

`#include <src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h>`Inheritance diagram for activemq::wireformat::openwire::OpenWireResponseBuilder:

Public Member Functions

- **OpenWireResponseBuilder** ()
- virtual ~**OpenWireResponseBuilder** ()
- virtual **Pointer**< **commands::Response** > **buildResponse** (const **Pointer**< **commands::Command** > command)

  Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

- virtual void **buildIncomingCommands** (const **Pointer**< **commands::Command** > command, **decaf::util::LinkedList**< **Pointer**< **commands::Command** > > &queue)

  *When called the ResponseBuilder must construct all the Responses or Asynchronous **commands** (p. 61) that would be sent to this client by the Broker upon receipt of the passed command.*

6.460.1 Detailed Description

Used to allow a MockTransport to generate response **commands** (p. 61) to OpenWire Commands.

6.460.2 Constructor & Destructor Documentation

6.460.2.1 activemq::wireformat::openwire::OpenWireResponseBuilder::OpenWireResponseBuilder () [inline]

6.460.2.2 virtual activemq::wireformat::openwire::OpenWireResponseBuilder::~OpenWireResponseBuilder () [inline, virtual]

6.460.3 Member Function Documentation

6.460.3.1 virtual void activemq::wireformat::openwire::OpenWireResponseBuilder::buildIncomingCommands (const Pointer< commands::Command > *command*, decaf::util::LinkedList< Pointer< commands::Command > > & *queue*) [virtual]

When called the ResponseBuilder must construct all the Responses or Asynchronous **commands** (p. 61) that would be sent to this client by the Broker upon receipt of the passed command.

Parameters:

command - The Command being sent to the Broker.

queue - Queue of Command sent back from the broker.

Implements **activemq::transport::mock::ResponseBuilder** (p. 2610).

6.460.3.2 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireResponseBuilder::buildResponse (const Pointer< commands::Command > *command*) [virtual]

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters:

command - The command to build a response for

Returns:

A Response object pointer, or NULL if no response.

Implements **activemq::transport::mock::ResponseBuilder** (p. 2611).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireResponseBuilder.h**

6.461 decaf::lang::exceptions::OutOfMemoryError Class Reference

`#include <src/main/decaf/lang/exceptions/OutOfMemoryError.h>`Inheritance diagram for decaf::lang::exceptions::OutOfMemoryError:

Public Member Functions

- **OutOfMemoryError** ()

  Default Constructor.

  Conversion Constructor from some other ***Exception*** *(*p. *1458**).*

- **OutOfMemoryError** (const **OutOfMemoryError** &ex)

  Copy Constructor.

- **OutOfMemoryError** (const std::exception *cause)

  Constructor.

- **OutOfMemoryError** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **OutOfMemoryError** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **OutOfMemoryError** * **clone** () const

  Clones this exception.

- virtual ~**OutOfMemoryError** () throw ()

6.461.1 Constructor & Destructor Documentation

6.461.1.1 decaf::lang::exceptions::OutOfMemoryError::OutOfMemoryError ()

Default Constructor.

6.461.1.2 decaf::lang::exceptions::OutOfMemoryError::OutOfMemoryError (const Exception & *ex*)

Conversion Constructor from some other **Exception** (p. 1458).

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.461.1.3 decaf::lang::exceptions::OutOfMemoryError::OutOfMemoryError (const OutOfMemoryError & *ex*)

Copy Constructor.

Parameters:

ex The **Exception** (p. 1458) whose data is to be copied into this one.

6.461.1.4 decaf::lang::exceptions::OutOfMemoryError::OutOfMemoryError (const std::exception * *cause*)

Constructor.

Parameters:

cause **Pointer** (p. 2370) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.461.1.5 decaf::lang::exceptions::OutOfMemoryError::OutOfMemoryError (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.461.1.6 decaf::lang::exceptions::OutOfMemoryError::OutOfMemoryError (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.461.1.7 virtual decaf::lang::exceptions::OutOfMemoryError::~OutOfMemoryError () throw () [virtual]

6.461.2 Member Function Documentation

6.461.2.1 virtual OutOfMemoryError* decaf::lang::exceptions::OutOfMemoryError::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1458) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1460).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**OutOfMemoryError.h**

6.462 decaf::io::OutputStream Class Reference

Base interface for any class that wants to represent an output stream of bytes.

`#include <src/main/decaf/io/OutputStream.h>`Inheritance diagram for decaf::io::OutputStream:

Public Member Functions

- **OutputStream** ()
- virtual ~**OutputStream** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.
  Exceptions:

  IOException *(*p. ***1787****) if an error occurs while closing.*

- virtual void **flush** ()

  Flushes this stream by writing any buffered output to the underlying stream.
  Exceptions:

  IOException *(*p. ***1787****) if an I/O error occurs.*

- virtual void **write** (unsigned char c)

  Writes a single byte to the output stream.

- virtual void **write** (const unsigned char *buffer, int size)

  Writes an array of bytes to the output stream.

- virtual void **write** (const unsigned char *buffer, int size, int offset, int length)

  Writes an array of bytes to the output stream in order starting at buffer[offset] and proceeding until the number of bytes specified by the length argument are written or an error occurs.

- virtual std::string **toString** () const

  Output a String representation of this object.

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)=0
- virtual void **doWriteArray** (const unsigned char *buffer, int size)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.462.1 Detailed Description

Base interface for any class that wants to represent an output stream of bytes.

Since:

1.0

6.462.2 Constructor & Destructor Documentation

6.462.2.1 decaf::io::OutputStream::OutputStream ()

6.462.2.2 virtual decaf::io::OutputStream::~OutputStream () [virtual]

6.462.3 Member Function Documentation

6.462.3.1 virtual void decaf::io::OutputStream::close () [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions:

IOException *(*p. *1787)* if an error occurs while closing.

The default implementation of this method does nothing.

Implements **decaf::io::Closeable** (p. 967).

Reimplemented in **decaf::internal::io::StandardErrorOutputStream** (p. 2846), **decaf::internal::io::StandardOutputStream** (p. 2850), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 2323),

decaf::internal::net::tcp::TcpSocketOutputStream (p. 3004), **decaf::io::FilterOutputStream** (p. 1528), and **decaf::util::zip::DeflaterOutputStream** (p. 1361).

6.462.3.2 virtual void decaf::io::OutputStream::doWriteArray (const unsigned char * *buffer*, int *size*) [protected, virtual]

Reimplemented in **decaf::io::BufferedOutputStream** (p. 748), and **decaf::io::FilterOutputStream** (p. 1528).

6.462.3.3 virtual void decaf::io::OutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented in **activemq::io::LoggingOutputStream** (p. 1949), **decaf::internal::io::StandardErrorOutputStream** (p. 2846), **decaf::internal::io::StandardOutputStream** (p. 2851), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 2323), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 3004), **decaf::io::BufferedOutputStream** (p. 748), **decaf::io::ByteArrayOutputStream** (p. 831), **decaf::io::DataOutputStream** (p. 1277), **decaf::io::FilterOutputStream** (p. 1529), **decaf::util::zip::CheckedOutputStream** (p. 955), and **decaf::util::zip::DeflaterOutputStream** (p. 1362).

6.462.3.4 virtual void decaf::io::OutputStream::doWriteByte (unsigned char *value*) [protected, pure virtual]

Implemented in **activemq::io::LoggingOutputStream** (p. 1950), **decaf::internal::io::StandardErrorOutputStream** (p. 2846), **decaf::internal::io::StandardOutputStream** (p. 2851), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 2323), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 3004), **decaf::io::BufferedOutputStream** (p. 748), **decaf::io::ByteArrayOutputStream** (p. 831), **decaf::io::DataOutputStream** (p. 1277), **decaf::io::FilterOutputStream** (p. 1529), **decaf::util::zip::CheckedOutputStream** (p. 955), and **decaf::util::zip::DeflaterOutputStream** (p. 1362).

6.462.3.5 virtual void decaf::io::OutputStream::flush () [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions:

IOException *(p. **1787**)* if an I/O error occurs.

The default implementation of this method does nothing.

Implements **decaf::io::Flushable** (p. 1561).

Reimplemented in **decaf::internal::io::StandardErrorOutputStream** (p. 2846), **decaf::internal::io::StandardOutputStream** (p. 2851), **decaf::io::BufferedOutputStream** (p. 748), and **decaf::io::FilterOutputStream** (p. 1529).

6.462.3.6 virtual void decaf::io::OutputStream::lock () [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2955).

6.462.3.7 virtual void decaf::io::OutputStream::notify () [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2956).

6.462.3.8 virtual void decaf::io::OutputStream::notifyAll () [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2957).

6.462.3.9 virtual std::string decaf::io::OutputStream::toString () const [virtual]

Output a String representation of this object. The default version of this method just prints the Class Name.

Returns:

a string representation of the object.

Reimplemented in **decaf::io::ByteArrayOutputStream** (p. 832), and **decaf::io::FilterOutputStream** (p. 1529).

6.462.3.10 virtual bool decaf::io::OutputStream::tryLock () [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2958).

6.462.3.11 virtual void decaf::io::OutputStream::unlock () [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2959).

6.462.3.12 virtual void decaf::io::OutputStream::wait (long long *millisecs*, int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2960).

6.462.3.13 virtual void decaf::io::OutputStream::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2961).

6.462.3.14 virtual void decaf::io::OutputStream::wait () [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2962).

6.462.3.15 virtual void decaf::io::OutputStream::write (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Writes an array of bytes to the output stream in order starting at buffer[offset] and proceeding until the number of bytes specified by the length argument are written or an error occurs. The default implementation of this method simply calls the doWriteArrayBounded method which writes the contents of the array using the doWriteByte method repeatedly. It is recommended that a subclass override doWriteArrayBounded to provide more performant means of writing the array.

Parameters:

buffer The array of bytes to write.

size The size of the buffer array passed.

offset The position to start writing in buffer.

length The number of bytes from the buffer to be written.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

NullPointerException thrown if buffer is Null.

IndexOutOfBoundsException if the offset + length > size. or one of the parameters is negative.

6.462.3.16 virtual void decaf::io::OutputStream::write (const unsigned char * *buffer*, int *size*) [virtual]

Writes an array of bytes to the output stream. The entire contents of the given vector are written to the output stream.

The default implementation of this method simply calls the doWriteArray which writes the contents of the array using the doWriteByte method repeatedly. It is recommended that a subclass override doWriteArray to provide more performant means of writing the array.

Parameters:

buffer The vector of bytes to write.

size The size of the buffer passed.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

NullPointerException thrown if buffer is Null.

IndexOutOfBoundsException if size value is negative.

6.462.3.17 virtual void decaf::io::OutputStream::write (unsigned char *c*) [virtual]

Writes a single byte to the output stream. The default implementation of this method calls the pure virtual method doWriteByte which must be implemented by any subclass of the **OutputStream** (p. 2348).

Parameters:

c The byte to write to the sink.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

The documentation for this class was generated from the following file:

- src/main/decaf/io/**OutputStream.h**

6.463 decaf::io::OutputStreamWriter Class Reference

A class for turning a character stream into a byte stream.

`#include <src/main/decaf/io/OutputStreamWriter.h>`Inheritance diagram for decaf::io::OutputStreamWriter:

Public Member Functions

- **OutputStreamWriter** (**OutputStream** *stream, bool own=false)

  *Creates a new **OutputStreamWriter** (p. 2355).*

- virtual ~**OutputStreamWriter** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.

- virtual void **flush** ()

  Flushes this stream by writing any buffered output to the underlying stream.

Protected Member Functions

- virtual void **doWriteArrayBounded** (const char *buffer, int size, int offset, int length)

  Override this method to customize the functionality of the method write(char buffer, int size, int offset, int length).*

- virtual void **checkClosed** () const

6.463.1 Detailed Description

A class for turning a character stream into a byte stream.

See also:

InputStreamReader (p. 1717)

Since:

1.0

6.463.2 Constructor & Destructor Documentation

6.463.2.1 decaf::io::OutputStreamWriter::OutputStreamWriter (OutputStream * *stream*, bool *own* = `false`)

Creates a new **OutputStreamWriter** (p. 2355).

Parameters:

stream The **OutputStream** (p. 2348) to wrap. (cannot be NULL).

own Indicates whether this instance own the given **OutputStream** (p. 2348). If true then the **OutputStream** (p. 2348) is destroyed when this class is.

Exceptions:

NullPointerException if the stream is NULL.

6.463.2.2 virtual decaf::io::OutputStreamWriter::~OutputStreamWriter () [virtual]

6.463.3 Member Function Documentation

6.463.3.1 virtual void decaf::io::OutputStreamWriter::checkClosed () const [protected, virtual]

6.463.3.2 virtual void decaf::io::OutputStreamWriter::close () [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

IOException *(*p. ***1787****)* if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 967).

6.463.3.3 virtual void decaf::io::OutputStreamWriter::doWriteArrayBounded (const char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Override this method to customize the functionality of the method write(char* buffer, int size, int offset, int length). All subclasses must override this method to provide the basic **Writer** (p. 3252) functionality.

Implements **decaf::io::Writer** (p. 3254).

6.463.3.4 virtual void decaf::io::OutputStreamWriter::flush () [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions:

IOException *(*p. ***1787****)* if an I/O error occurs.

Implements **decaf::io::Flushable** (p. 1561).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**OutputStreamWriter.h**

6.464 activemq::commands::PartialCommand Class Reference

- std::vector< unsigned char > **data**

6.464.1 Constructor & Destructor Documentation

6.464.1.1 activemq::commands::PartialCommand::PartialCommand ()

6.464.1.2 virtual activemq::commands::PartialCommand::~PartialCommand () [virtual]

6.464.2 Member Function Documentation

6.464.2.1 virtual PartialCommand* activemq::commands::PartialCommand::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1849).

6.464.2.2 virtual void activemq::commands::PartialCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1850).

6.464.2.3 virtual bool activemq::commands::PartialCommand::equals (const DataStructure * *value*) const [virtual]

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1850).

6.464.2.4 virtual int activemq::commands::PartialCommand::getCommandId () const [virtual]

6.464.2.5 virtual std::vector<unsigned char>& activemq::commands::PartialCommand::getData () [virtual]

6.464.2.6 virtual const std::vector<unsigned char>& activemq::commands::PartialCommand::getData () const [virtual]

6.464.2.7 virtual unsigned char activemq::commands::PartialCommand::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1850).

6.464.2.8 virtual void activemq::commands::PartialCommand::setCommandId (int *commandId*) [virtual]

6.464.2.9 virtual void activemq::commands::PartialCommand::setData (const std::vector< unsigned char > & *data*) [virtual]

6.464.2.10 virtual std::string activemq::commands::PartialCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 671).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1850).

6.464.3 Field Documentation

6.464.3.1 int activemq::commands::PartialCommand::commandId [protected]

6.464.3.2 std::vector<unsigned char> activemq::commands::PartialCommand::data [protected]

6.464.3.3 const unsigned char activemq::commands::PartialCommand::ID_PARTIALCOMMAND = 60 [static]

The documentation for this class was generated from the following file:

6.465 activemq::wireformat::openwire::marshal::generated::PartialComm Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **PartialCommandMarshaller** (p. 2360).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/PartialCommandMarshaller.h>`Inh
diagram for activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller:

Public Member Functions

- **PartialCommandMarshaller** ()
- virtual ~**PartialCommandMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.465.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **PartialCommandMarshaller** (p. 2360). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.465.2 Constructor & Destructor Documentation

6.465.2.1 activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::PartialC () [inline]

6.465.2.2 virtual activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::~Partia () [inline, virtual]

6.465.3 Member Function Documentation

6.465.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::createObj () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1852).

6.465.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::getDataSt () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1852).

6.465.3.3 virtual void activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::looseMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1852).

6.465.3.4 virtual void activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::looseUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1853).

6.465.3.5 virtual int activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1853).

6.465.3.6 virtual void activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::tightMars (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1853).

6.465.3.7 virtual void activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::tightUnm (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1854).

The documentation for this class was generated from the following file:

6.467.1 Detailed Description

template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> class decaf::lang::Pointer< T, REFCOUNTER >

Decaf's implementation of a Smart **Pointer** (p. 2370) that is a template on a Type and is **Thread** (p. 3016) Safe if the default Reference Counter is used. This **Pointer** (p. 2370) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of `ReferenceCounter`.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 2370) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 2370) in a STL container that requires it, **Pointer** (p. 2370) provides an implementation of std::less.

Since:

1.0

6.467.2.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef T* decaf::lang::Pointer< T, REFCOUNTER >::PointerType

6.467.2.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef T& decaf::lang::Pointer< T, REFCOUNTER >::ReferenceType

6.467.3 Constructor & Destructor Documentation

6.467.3.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer () [inline]

Default Constructor. Initialized the contained pointer to NULL, using the -> operator results in an exception unless reset to contain a real value.

Referenced by decaf::lang::Pointer< TransactionId >::reset().

6.467.3.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const PointerType *value*) [inline, explicit]

Explicit Constructor, creates a **Pointer** (p. 2370) that contains value with a single reference. This object now has ownership until a call to release.

Parameters:

value - The instance of the type we are containing here.

6.467.3.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T, REFCOUNTER > & *value*) [inline]

Copy constructor. Copies the value contained in the pointer to the new instance and increments the reference counter.

Parameters:

value Another instance of a Pointer<T> that this **Pointer** (p. 2370) will copy.

6.467.3.4 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value*) [inline]

Copy constructor. Copies the value contained in the pointer to the new instance and increments the reference counter.

Parameters:

value A different but compatible **Pointer** (p. 2370) instance that this **Pointer** (p. 2370) will copy.

6.467.3.5 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value*, const STATIC_CAST_TOKEN &) [inline]

Static Cast constructor. Copies the value contained in the pointer to the new instance and increments the reference counter performing a static cast on the value contained in the source **Pointer** (p. 2370) object.

Parameters:

value **Pointer** (p. 2370) instance to cast to this type using a static_cast.

6.467.3.6 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value*, const DYNAMIC_CAST_TOKEN &) [inline]

Dynamic Cast constructor. Copies the value contained in the pointer to the new instance and increments the reference counter performing a dynamic cast on the value contained in the source **Pointer** (p. 2370) object. If the cast fails and return NULL then this method throws a ClassCastException.

Parameters:

value **Pointer** (p. 2370) instance to cast to this type using a dynamic_cast.

Exceptions:

ClassCastException if the dynamic cast returns NULL

6.467.3.7 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> virtual decaf::lang::Pointer< T, REFCOUNTER >::~Pointer () [inline, virtual]

6.467.4 Member Function Documentation

6.467.4.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER >::dynamicCast () const [inline]

6.467.4.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::get () const [inline]

Gets the real pointer that is contained within this **Pointer** (p. 2370). This is not really safe since the caller could delete or alter the pointer but it mimics the STL auto_ptr and gives access in cases where the caller absolutely needs the real **Pointer** (p. 2370). Use at your own risk.

Returns:

the contained pointer.

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::equals(), activemq::state::ConnectionState::getTransactionState(), decaf::lang::operator!=(), decaf::lang::Pointer< TransactionId >::operator!=(), std::less< decaf::lang::Pointer< T > >::operator()(), decaf::lang::operator==(), decaf::lang::Pointer< TransactionId >::operator==(), decaf::util::concurrent::LinkedBlockingQueue< Pointer< Transport > >::peek(), and decaf::util::concurrent::ExecutorService::submit().

6.467.4.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> bool decaf::lang::Pointer< T, REFCOUNTER >::operator! () const [inline]

6.467.4.4 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator!= (const Pointer< T1, R1 > & *right*) const [inline]

6.467.4.5 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType decaf::lang::Pointer< T, REFCOUNTER >::operator* () const [inline]

6.467.4.6 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType decaf::lang::Pointer< T, REFCOUNTER >::operator* () [inline]

Dereference Operator, returns a reference to the Contained value. This method throws an NullPointerException if the contained value is NULL.

Returns:

reference to the contained pointer.

Exceptions:

NullPointerException if the contained value is Null

6.467.4.7 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::operator-> () const [inline]

6.467.4.8 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::operator-> () [inline]

Indirection Operator, returns a pointer to the Contained value. This method throws an NullPointerException if the contained value is NULL.

Returns:

reference to the contained pointer.

Exceptions:

NullPointerException if the contained value is Null

6.467.4.9 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T1, R1 > & *right*) [inline]

6.467.4.10 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T, REFCOUNTER > & *right*) [inline]

Assigns the value of right to this **Pointer** (p. 2370) and increments the reference Count.

Parameters:

right - **Pointer** (p. 2370) on the right hand side of an operator= call to this.

6.467.4.11 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator== (const Pointer< T1, R1 > & *right*) const [inline]

6.467.4.12 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> T* decaf::lang::Pointer< T, REFCOUNTER >::release () [inline]

Releases the **Pointer** (p. 2370) held and resets the **internal** (p. 97) pointer value to Null. This method is not guaranteed to be safe if the **Pointer** (p. 2370) is held by more than one object or this method is called from more than one thread.

Returns:

The pointer instance that was held by this **Pointer** (p. 2370) object, the pointer is no longer owned by this **Pointer** (p. 2370) and won't be freed when this **Pointer** (p. 2370) goes out of scope.

Referenced by decaf::lang::Pointer< TransactionId >::Pointer(), and decaf::util::concurrent::ExecutorService::submit().

6.467.4.13 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::Pointer< T, REFCOUNTER >::reset (T * *value* = NULL) [inline]

Resets the **Pointer** (p. 2370) to hold the new value. Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 2370) to a NULL pointer.

Parameters:

value The new value to contain or NULL to empty the pointer (default NULL if not set).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList(), decaf::util::StlMap< std::string, cms::Topic * >::entrySet(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::entrySet(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::entrySet(), decaf::util::StlMap< std::string, cms::Topic * >::keySet(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::keySet(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::keySet(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll(), decaf::util::StlMap< std::string, cms::Topic * >::values(), decaf::util::HashMap< E, Set< E > *, HASHCODE >::values(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::values(), decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::~ArrayListIterator(), and decaf::util::concurrent::CopyOnWriteArrayList< E >::~CopyOnWriteArrayList().

6.467.4.14 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER >::staticCast () const [inline]

6.467.4.15 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::Pointer< T, REFCOUNTER >::swap (Pointer< T, REFCOUNTER > & *value*) [inline]

Exception (p. 1458) Safe Swap Function.

Parameters:

value The value to swap with this **Pointer** (p. 2370).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< E >::add(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::addIfAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::clear(), decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList(), decaf::lang::Pointer< TransactionId >::operator=(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll(), decaf::util::concurrent::CopyOnWriteArrayList< E >::set(), and decaf::lang::Pointer< TransactionId >::swap().

- virtual int **compare** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const

6.468.1 Detailed Description

template<typename T, typename R = decaf::util::concurrent::atomic::AtomicRefCounter>
class decaf::lang::PointerComparator< T, R >

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2370) instance. This can be useful in the case where a series of values in a Collection is more efficiently accessed in the Objects Natural Order and not the underlying pointers location in memory.

Also this allows **Pointer** (p. 2370) objects that Point to different instances of the same type to be compared based on the comparison of the object itself and not just the value of the pointer.

6.468.2 Constructor & Destructor Documentation

6.468.2.1 template<typename T , typename R = decaf::util::concurrent::atomic::AtomicRefCounter> virtual decaf::lang::PointerComparator< T, R >::~PointerComparator () [inline, virtual]

6.469 activemq::cmsutil::PooledSession Class Reference

A pooled session object that wraps around a delegate session.

`#include <src/main/activemq/cmsutil/PooledSession.h>`Inheritance diagram for activemq::cmsutil::PooledSession:

Public Member Functions

- **PooledSession** (**SessionPool** *pool, **cms::Session** *session)
- virtual ~**PooledSession** ()

  Does nothing.

- virtual **cms::Session** * **getSession** ()

  Returns a non-constant reference to the internal session object.

- virtual const **cms::Session** * **getSession** () const

  Returns a constant reference to the internal session object.

- virtual void **close** ()

  Returns this session back to the pool, but does not close or destroy the internal session object.

- virtual void **start** ()

  Starts the service.

- virtual void **stop** ()

  Stops this service.

- virtual void **commit** ()

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual void **recover** ()

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination)

  Creates a MessageConsumer for the specified destination.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal)

Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createDurableConsumer** (const **cms::Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)

  Creates a durable subscriber to the specified topic, using a Message selector.

- virtual **cms::MessageConsumer** * **createCachedConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal)

  First checks the internal consumer cache and creates on if none exist for the given destination, selector, noLocal.

- virtual **cms::MessageProducer** * **createProducer** (const **cms::Destination** *destination)

  Creates a MessageProducer to send messages to the specified destination.

- virtual **cms::MessageProducer** * **createCachedProducer** (const **cms::Destination** *destination)

  First checks the internal producer cache and creates one if none exist for the given destination.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::Queue** * **createQueue** (const std::string &queueName)

  Creates a queue identity given a Queue name.

- virtual **cms::Topic** * **createTopic** (const std::string &topicName)

  Creates a topic identity given a Queue name.

- virtual **cms::TemporaryQueue** * **createTemporaryQueue** ()

  Creates a TemporaryQueue object.

- virtual **cms::TemporaryTopic** * **createTemporaryTopic** ()

  Creates a TemporaryTopic object.

- virtual **cms::Message** * **createMessage** ()

  Creates a new Message.

- virtual **cms::BytesMessage** * **createBytesMessage** ()

  Creates a BytesMessage.

- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, int bytesSize)

  Creates a BytesMessage and sets the payload to the passed value.

- virtual **cms::StreamMessage** * **createStreamMessage** ()

  Creates a new StreamMessage.

- virtual **cms::TextMessage** * **createTextMessage** ()
  Creates a new TextMessage.
- virtual **cms::TextMessage** * **createTextMessage** (const std::string &text)
  Creates a new TextMessage and set the text to the value given.
- virtual **cms::MapMessage** * **createMapMessage** ()
  Creates a new MapMessage.
- virtual **cms::Session::AcknowledgeMode getAcknowledgeMode** () const
  Returns the acknowledgment mode of the session.
- virtual bool **isTransacted** () const
  Gets if the Sessions is a Transacted Session.
- virtual void **unsubscribe** (const std::string &name)
  Unsubscribes a durable subscription that has been created by a client.
- virtual void **setMessageTransformer** (**cms::MessageTransformer** *transformer)
  Set an MessageTransformer instance that is passed on to all MessageProducer and MessageConsumer objects created from this Session.
- virtual **cms::MessageTransformer** * **getMessageTransformer** () const
  Gets the currently configured MessageTransformer for this Session.

6.469.1 Detailed Description

A pooled session object that wraps around a delegate session. Calls to close this session only result in giving the session back to the pool.

6.469.2 Constructor & Destructor Documentation

6.469.2.1 activemq::cmsutil::PooledSession::PooledSession (SessionPool * *pool*, cms::Session * *session*)

6.469.2.2 virtual activemq::cmsutil::PooledSession::~PooledSession () [virtual]

Does nothing.

6.469.3 Member Function Documentation

6.469.3.1 virtual void activemq::cmsutil::PooledSession::close () [virtual]

Returns this session back to the pool, but does not close or destroy the internal session object.

Exceptions:

CMSException if an error occurs while performing this operation.

Implements **cms::Session** (p. 2683).

6.469.3.2 virtual void activemq::cmsutil::PooledSession::commit () [inline, virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2684).

References cms::Session::commit().

6.469.3.3 virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * *queue*, const std::string & *selector*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

selector the Message selector to filter which messages are browsed.

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2684).

6.469.3.4 virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * *queue*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2684).

6.469.3.5 virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage (const unsigned char * *bytes*, int *bytesSize*) [inline, virtual]

Creates a BytesMessage and sets the payload to the passed value.

Parameters:

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2685).

References cms::Session::createBytesMessage().

6.469.3.6 virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage () [inline, virtual]

Creates a BytesMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2685).

References cms::Session::createBytesMessage().

6.469.3.7 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createCachedConsumer (const cms::Destination * *destination*, const std::string & *selector*, bool *noLocal*) [virtual]

First checks the internal consumer cache and creates on if none exist for the given destination, selector, noLocal. If created, the consumer is added to the pool's lifecycle manager.

Parameters:

destination the destination to receive on

selector the selector to use

noLocal whether or not to receive messages from the same connection

Returns:

the consumer resource

Exceptions:

cms::CMSException (p. ***979***) if something goes wrong.

6.469.3.8 virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createCachedProducer (const cms::Destination * *destination*) [virtual]

First checks the internal producer cache and creates one if none exist for the given destination. If created, the producer is added to the pool's lifecycle manager.

Parameters:

destination the destination to send on

Returns:

the producer resource

Exceptions:

cms::CMSException *(*p. ***979)*** if something goes wrong.

6.469.3.9 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*, bool *noLocal*) [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2685).

References cms::Session::createConsumer().

6.469.3.10 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*) [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2686).

References cms::Session::createConsumer().

6.469.3.11 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*) [inline, virtual]

Creates a MessageConsumer for the specified destination.

Parameters:

destination the Destination that this consumer receiving messages for.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2686).

References cms::Session::createConsumer().

6.469.3.12 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createDurableConsumer (const cms::Topic * *destination*, const std::string & *name*, const std::string & *selector*, bool *noLocal* = false) [inline, virtual]

Creates a durable subscriber to the specified topic, using a Message selector. Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters:

destination the topic to subscribe to

name The name used to identify the subscription

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2687).

References cms::Session::createDurableConsumer().

6.469.3.13 virtual cms::MapMessage* activemq::cmsutil::PooledSession::createMapMessage () [inline, virtual]

Creates a new MapMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2687).

References cms::Session::createMapMessage().

6.469.3.14 virtual cms::Message* activemq::cmsutil::PooledSession::createMessage () [inline, virtual]

Creates a new Message.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2688).

References cms::Session::createMessage().

6.469.3.15 virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createProducer (const cms::Destination * *destination*) [inline, virtual]

Creates a MessageProducer to send messages to the specified destination.

Parameters:

destination the Destination to send on

Returns:

New MessageProducer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2688).

References cms::Session::createProducer().

6.469.3.16 virtual cms::Queue* activemq::cmsutil::PooledSession::createQueue (const std::string & *queueName*) [inline, virtual]

Creates a queue identity given a Queue name.

Parameters:

queueName the name of the new Queue

Returns:

new Queue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2688).

References cms::Session::createQueue().

6.469.3.17 virtual cms::StreamMessage* activemq::cmsutil::PooledSession::createStreamMessage () [inline, virtual]

Creates a new StreamMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

References cms::Session::createStreamMessage().

6.469.3.18 virtual cms::TemporaryQueue* activemq::cmsutil::PooledSession::createTemporaryQueue () [inline, virtual]

Creates a TemporaryQueue object.

Returns:

new TemporaryQueue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

References cms::Session::createTemporaryQueue().

6.469.3.19 virtual cms::TemporaryTopic* activemq::cmsutil::PooledSession::createTemporaryTopic () [inline, virtual]

Creates a TemporaryTopic object.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2689).

References cms::Session::createTemporaryTopic().

6.469.3.20 virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage (const std::string & *text*) [inline, virtual]

Creates a new TextMessage and set the text to the value given.

Parameters:

text the initial text for the message

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

References cms::Session::createTextMessage().

6.469.3.21 virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage () [inline, virtual]

Creates a new TextMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

References cms::Session::createTextMessage().

6.469.3.22 virtual cms::Topic* activemq::cmsutil::PooledSession::createTopic (const std::string & *topicName*) [inline, virtual]

Creates a topic identity given a Queue name.

Parameters:

topicName the name of the new Topic

Returns:

new Topic pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2690).

References cms::Session::createTopic().

6.469.3.23 virtual cms::Session::AcknowledgeMode activemq::cmsutil::PooledSession::getAcknowledgeMode () const [inline, virtual]

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2691).

References cms::Session::getAcknowledgeMode().

6.469.3.24 virtual cms::MessageTransformer* activemq::cmsutil::PooledSession::getMessageTransformer () const [inline, virtual]

Gets the currently configured MessageTransformer for this Session.

Returns:

the pointer to the currently set **cms::MessageTransformer** (p. 2219).

Implements **cms::Session** (p. 2691).

References cms::Session::getMessageTransformer().

6.469.3.25 virtual const cms::Session* activemq::cmsutil::PooledSession::getSession () const [inline, virtual]

Returns a constant reference to the internal session object.

Returns:

the session object.

6.469.3.26 virtual cms::Session* activemq::cmsutil::PooledSession::getSession () [inline, virtual]

Returns a non-constant reference to the internal session object.

Returns:

the session object.

6.469.3.27 virtual bool activemq::cmsutil::PooledSession::isTransacted () const [inline, virtual]

Gets if the Sessions is a Transacted Session.

Returns:

transacted true - false.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2691).

References cms::Session::isTransacted().

6.469.3.28 virtual void activemq::cmsutil::PooledSession::recover () [inline, virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Implements **cms::Session** (p. 2692).

References cms::Session::recover().

6.469.3.29 virtual void activemq::cmsutil::PooledSession::rollback () [inline, virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2692).

References cms::Session::rollback().

6.469.3.30 virtual void activemq::cmsutil::PooledSession::setMessageTransformer (cms::MessageTransformer * *transformer*) [inline, virtual]

Set an MessageTransformer instance that is passed on to all MessageProducer and MessageConsumer objects created from this Session. The CMS **code** (p. 1005) never takes ownership of the MessageTransformer pointer which implies that the client **code** (p. 1005) must ensure that the object remains valid for the lifetime of the CMS object to which the MessageTransformer has been assigned.

Parameters:

transformer Pointer to the **cms::MessageTransformer** (p. 2219) to set on all MessageConsumers and MessageProducers.

Implements **cms::Session** (p. 2692).

References cms::Session::setMessageTransformer().

6.469.3.31 virtual void activemq::cmsutil::PooledSession::start () [inline, virtual]

Starts the service.

Exceptions:

CMSException if an internal error occurs while starting.

Implements **cms::Startable** (p. 2852).

References cms::Startable::start().

6.469.3.32 virtual void activemq::cmsutil::PooledSession::stop () [inline, virtual]

Stops this service.

Exceptions:

CMSException - if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2919).

References cms::Stoppable::stop().

6.469.3.33 virtual void activemq::cmsutil::PooledSession::unsubscribe (const std::string & *name*) [inline, virtual]

Unsubscribes a durable subscription that has been created by a client. This method deletes the **state** (p. 70) being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

name The name used to identify this subscription

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2693).

References cms::Session::unsubscribe().

6.470 decaf::net::PortUnreachableException Class Reference

`#include <src/main/decaf/net/PortUnreachableException.h>`Inheritance diagram for decaf::net::PortUnreachableException:

Public Member Functions

- **PortUnreachableException** ()

  Default Constructor.

- **PortUnreachableException** (const Exception &ex)

  Conversion Constructor from some other Exception.

- **PortUnreachableException** (const **PortUnreachableException** &ex)

  Copy Constructor.

- **PortUnreachableException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **PortUnreachableException** (const std::exception *cause)

  Constructor.

- **PortUnreachableException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **PortUnreachableException** * **clone** () const

  Clones this exception.

- virtual ~**PortUnreachableException** () throw ()

6.470.1 Constructor & Destructor Documentation

6.470.1.1 decaf::net::PortUnreachableException::PortUnreachableException ()

Default Constructor.

6.470.1.2 decaf::net::PortUnreachableException::PortUnreachableException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.470.1.3 decaf::net::PortUnreachableException::PortUnreachableException (const PortUnreachableException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.470.1.4 decaf::net::PortUnreachableException::PortUnreachableException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.470.1.5 decaf::net::PortUnreachableException::PortUnreachableException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.470.1.6 decaf::net::PortUnreachableException::PortUnreachableException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.470.1.7 virtual decaf::net::PortUnreachableException::~PortUnreachableException () throw () [virtual]

6.470.2 Member Function Documentation

6.470.2.1 virtual PortUnreachableException* decaf::net::PortUnreachableException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2788).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**PortUnreachableException.h**

6.471 activemq::core::PrefetchPolicy Class Reference

Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

`#include <src/main/activemq/core/PrefetchPolicy.h>`Inheritance diagram for activemq::core::PrefetchPolicy:

Public Member Functions

- virtual ~**PrefetchPolicy** ()
- virtual void **setDurableTopicPrefetch** (int value)=0

  Sets the amount of prefetched messages for a Durable Topic.

- virtual int **getDurableTopicPrefetch** () const =0

  Gets the amount of messages to prefetch for a Durable Topic.

- virtual void **setQueuePrefetch** (int value)=0

  Sets the amount of prefetched messages for a Queue.

- virtual int **getQueuePrefetch** () const =0

  Gets the amount of messages to prefetch for a Queue.

- virtual void **setQueueBrowserPrefetch** (int value)=0

  Sets the amount of prefetched messages for a Queue Browser.

- virtual int **getQueueBrowserPrefetch** () const =0

  Gets the amount of messages to prefetch for a Queue Browser.

- virtual void **setTopicPrefetch** (int value)=0

  Sets the amount of prefetched messages for a Topic.

- virtual int **getTopicPrefetch** () const =0

  Gets the amount of messages to prefetch for a Topic.

- virtual int **getMaxPrefetchLimit** (int value) const =0

  Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

- virtual **PrefetchPolicy** * **clone** () const =0

  Clone the Policy and return a new pointer to that clone.

- virtual void **configure** (const **decaf::util::Properties** &properties)

  Checks the supplied properties object for properties matching the configurable settings of this class.

Protected Member Functions

- **PrefetchPolicy** ()

6.471.1 Detailed Description

Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

Since:

3.2.0

6.471.2 Constructor & Destructor Documentation

6.471.2.1 activemq::core::PrefetchPolicy::PrefetchPolicy () [protected]

6.471.2.2 virtual activemq::core::PrefetchPolicy::~PrefetchPolicy () [virtual]

6.471.3 Member Function Documentation

6.471.3.1 virtual PrefetchPolicy* activemq::core::PrefetchPolicy::clone () const [pure virtual]

Clone the Policy and return a new pointer to that clone.

Returns:

pointer to a new **PrefetchPolicy** (p. 2397) instance that is a clone of this one.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1315).

6.471.3.2 virtual void activemq::core::PrefetchPolicy::configure (const decaf::util::Properties & *properties*) [virtual]

Checks the supplied properties object for properties matching the configurable settings of this class. The default implementation looks for properties named with the prefix cms.PrefetchPolicy.XXX where XXX is the name of a property with a public setter method. For instance cms.PrefetchPolicy.topicPrefetch will be used to set the value of the topic prefetch limit.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

Parameters:

properties The Properties object used to configure this object.

Exceptions:

NumberFormatException if a property that is numeric cannot be converted

IllegalArgumentException if a property can't be converted to the correct type.

6.471.3.3 virtual int activemq::core::PrefetchPolicy::getDurableTopicPrefetch () const [pure virtual]

Gets the amount of messages to prefetch for a Durable Topic.

Returns:

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1315).

6.471.3.4 virtual int activemq::core::PrefetchPolicy::getMaxPrefetchLimit (int *value*) const [pure virtual]

Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

Returns:

the allowable value for a prefetch limit, either requested or the max.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1315).

6.471.3.5 virtual int activemq::core::PrefetchPolicy::getQueueBrowserPrefetch () const [pure virtual]

Gets the amount of messages to prefetch for a Queue Browser.

Returns:

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1315).

6.471.3.6 virtual int activemq::core::PrefetchPolicy::getQueuePrefetch () const [pure virtual]

Gets the amount of messages to prefetch for a Queue.

Returns:

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1316).

6.471.3.7 virtual int activemq::core::PrefetchPolicy::getTopicPrefetch () const [pure virtual]

Gets the amount of messages to prefetch for a Topic.

Returns:

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1316).

6.471.3.8 virtual void activemq::core::PrefetchPolicy::setDurableTopicPrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Durable Topic.

Parameters:

value The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1316).

6.471.3.9 virtual void activemq::core::PrefetchPolicy::setQueueBrowserPrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Queue Browser.

Parameters:

value The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1316).

6.471.3.10 virtual void activemq::core::PrefetchPolicy::setQueuePrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Queue.

Parameters:

value The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1317).

6.471.3.11 virtual void activemq::core::PrefetchPolicy::setTopicPrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Topic.

Parameters:

value The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1317).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**PrefetchPolicy.h**

6.472 activemq::util::PrimitiveList Class Reference

List of primitives.

`#include <src/main/activemq/util/PrimitiveList.h>`Inheritance diagram for activemq::util::PrimitiveList:

Public Member Functions

- **PrimitiveList** ()

  Default Constructor, creates an Empty list.

- virtual ~**PrimitiveList** ()
- **PrimitiveList** (const **decaf::util::List**< **PrimitiveValueNode** > &src)

  Copy Constructor.

- **PrimitiveList** (const **PrimitiveList** &src)

  Copy Constructor.

- std::string **toString** () const

  Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

- virtual bool **getBool** (int index) const

  Gets the Boolean value at the specified index.

- virtual void **setBool** (int index, bool value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual unsigned char **getByte** (int index) const

  Gets the Byte value at the specified index.

- virtual void **setByte** (int index, unsigned char value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual char **getChar** (int index) const

  Gets the Character value at the specified index.

- virtual void **setChar** (int index, char value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual short **getShort** (int index) const

  Gets the Short value at the specified index.

- virtual void **setShort** (int index, short value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual int **getInt** (int index) const

  Gets the Integer value at the specified index.

- virtual void **setInt** (int index, int value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual long long **getLong** (int index) const

  Gets the Long value at the specified index.

- virtual void **setLong** (int index, long long value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual float **getFloat** (int index) const

  Gets the Float value at the specified index.

- virtual void **setFloat** (int index, float value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual double **getDouble** (int index) const

  Gets the Double value at the specified index.

- virtual void **setDouble** (int index, double value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::string **getString** (int index) const

  Gets the String value at the specified index.

- virtual void **setString** (int index, const std::string &value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::vector< unsigned char > **getByteArray** (int index) const

  Gets the Byte Array value at the specified index.

- virtual void **setByteArray** (int index, const std::vector< unsigned char > &value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

6.472.1 Detailed Description

List of primitives.

6.472.2 Constructor & Destructor Documentation

6.472.2.1 activemq::util::PrimitiveList::PrimitiveList ()

Default Constructor, creates an Empty list.

6.472.2.2 virtual activemq::util::PrimitiveList::~PrimitiveList () [virtual]

6.472.2.3 activemq::util::PrimitiveList::PrimitiveList (const decaf::util::List< PrimitiveValueNode > & *src*)

Copy Constructor.

Parameters:

src - the Decaf List of PrimtiveNodeValues to copy

6.472.2.4 activemq::util::PrimitiveList::PrimitiveList (const PrimitiveList & *src*)

Copy Constructor.

Parameters:

src - the **PrimitiveList** (p. 2401) to copy

6.472.3 Member Function Documentation

6.472.3.1 virtual bool activemq::util::PrimitiveList::getBool (int *index*) const [virtual]

Gets the Boolean value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.2 virtual unsigned char activemq::util::PrimitiveList::getByte (int *index*) const [virtual]

Gets the Byte value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.3 virtual std::vector<unsigned char> activemq::util::PrimitiveList::getByteArray (int *index*) const [virtual]

Gets the Byte Array value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.4 virtual char activemq::util::PrimitiveList::getChar (int *index*) const [virtual]

Gets the Character value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.5 virtual double activemq::util::PrimitiveList::getDouble (int *index*) const [virtual]

Gets the Double value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.6 virtual float activemq::util::PrimitiveList::getFloat (int *index*) const [virtual]

Gets the Float value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.7 virtual int activemq::util::PrimitiveList::getInt (int *index*) const [virtual]

Gets the Integer value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.8 virtual long long activemq::util::PrimitiveList::getLong (int *index*) const [virtual]

Gets the Long value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.9 virtual short activemq::util::PrimitiveList::getShort (int *index*) const [virtual]

Gets the Short value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.10 virtual std::string activemq::util::PrimitiveList::getString (int *index*) const [virtual]

Gets the String value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 1900)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.472.3.11 virtual void activemq::util::PrimitiveList::setBool (int *index*, bool *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.12 virtual void activemq::util::PrimitiveList::setByte (int *index*, unsigned char *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.13 virtual void activemq::util::PrimitiveList::setByteArray (int *index*, const std::vector< unsigned char > & *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.14 virtual void activemq::util::PrimitiveList::setChar (int *index*, char *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.15 virtual void activemq::util::PrimitiveList::setDouble (int *index*, double *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.16 virtual void activemq::util::PrimitiveList::setFloat (int *index*, float *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.17 virtual void activemq::util::PrimitiveList::setInt (int *index*, int *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.18 virtual void activemq::util::PrimitiveList::setLong (int *index*, long long *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.19 virtual void activemq::util::PrimitiveList::setShort (int *index*, short *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.20 virtual void activemq::util::PrimitiveList::setString (int *index*, const std::string & *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 1900).

6.472.3.21 std::string activemq::util::PrimitiveList::toString () const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns:

formatted String of all elements in the list.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveList.h**

6.473 activemq::util::PrimitiveMap Class Reference

Map of named primitives.

`#include <src/main/activemq/util/PrimitiveMap.h>`Inheritance diagram for activemq::util::PrimitiveMap:

Public Member Functions

- **PrimitiveMap** ()

  Default Constructor, creates an empty map.

- virtual ~**PrimitiveMap** ()
- **PrimitiveMap** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &source)

  Copy Constructor.

- **PrimitiveMap** (const **PrimitiveMap** &source)

  Copy Constructor.

- std::string **toString** () const

  Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

- virtual **PrimitiveValueNode::PrimitiveType getValueType** (const std::string &key) const
- virtual bool **getBool** (const std::string &key) const

  Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setBool** (const std::string &key, bool value)

  Sets the value at key to the specified type.

- virtual unsigned char **getByte** (const std::string &key) const

  Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setByte** (const std::string &key, unsigned char value)

  Sets the value at key to the specified type.

- virtual char **getChar** (const std::string &key) const

  Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setChar** (const std::string &key, char value)

  Sets the value at key to the specified type.

- virtual short **getShort** (const std::string &key) const

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setShort** (const std::string &key, short value)

  Sets the value at key to the specified type.

- virtual int **getInt** (const std::string &key) const

  Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setInt** (const std::string &key, int value)

  Sets the value at key to the specified type.

- virtual long long **getLong** (const std::string &key) const

  Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setLong** (const std::string &key, long long value)

  Sets the value at key to the specified type.

- virtual float **getFloat** (const std::string &key) const

  Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setFloat** (const std::string &key, float value)

  Sets the value at key to the specified type.

- virtual double **getDouble** (const std::string &key) const

  Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setDouble** (const std::string &key, double value)

  Sets the value at key to the specified type.

- virtual std::string **getString** (const std::string &key) const

  Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setString** (const std::string &key, const std::string &value)

  Sets the value at key to the specified type.

- virtual std::vector< unsigned char > **getByteArray** (const std::string &key) const

  Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setByteArray** (const std::string &key, const std::vector< unsigned char > &value)

  Sets the value at key to the specified type.

6.473.1 Detailed Description

Map of named primitives.

6.473.2 Constructor & Destructor Documentation

6.473.2.1 activemq::util::PrimitiveMap::PrimitiveMap ()

Default Constructor, creates an empty map.

6.473.2.2 virtual activemq::util::PrimitiveMap::~PrimitiveMap () [virtual]

6.473.2.3 activemq::util::PrimitiveMap::PrimitiveMap (const decaf::util::Map< std::string, PrimitiveValueNode > & *source*)

Copy Constructor.

Parameters:

source The Decaf Library Map instance whose elements will be copied into this Map.

6.473.2.4 activemq::util::PrimitiveMap::PrimitiveMap (const PrimitiveMap & *source*)

Copy Constructor.

Parameters:

source The **PrimitiveMap** (p. 2411) whose elements will be copied into this Map.

6.473.3 Member Function Documentation

6.473.3.1 virtual bool activemq::util::PrimitiveMap::getBool (const std::string & *key*) const [virtual]

Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.2 virtual unsigned char activemq::util::PrimitiveMap::getByte (const std::string & *key*) const [virtual]

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.3 virtual std::vector<unsigned char> activemq::util::PrimitiveMap::getByteArray (const std::string & *key*) const [virtual]

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.4 virtual char activemq::util::PrimitiveMap::getChar (const std::string & *key*) const [virtual]

Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.5 virtual double activemq::util::PrimitiveMap::getDouble (const std::string & *key*) const [virtual]

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.6 virtual float activemq::util::PrimitiveMap::getFloat (const std::string & *key*) const [virtual]

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.7 virtual int activemq::util::PrimitiveMap::getInt (const std::string & *key*) const [virtual]

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.8 virtual long long activemq::util::PrimitiveMap::getLong (const std::string & *key*) const [virtual]

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.9 virtual short activemq::util::PrimitiveMap::getShort (const std::string & *key*) const [virtual]

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.10 virtual std::string activemq::util::PrimitiveMap::getString (const std::string & *key*) const [virtual]

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.473.3.11 virtual PrimitiveValueNode::PrimitiveType activemq::util::PrimitiveMap::getValueType (const std::string & *key*) const [virtual]

Returns:

the numeric type value for the given key if it exists.

Exceptions:

NoSuchElementException if the key is not present in the map.

6.473.3.12 virtual void activemq::util::PrimitiveMap::setBool (const std::string & *key*, bool *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.13 virtual void activemq::util::PrimitiveMap::setByte (const std::string & *key*, unsigned char *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.14 virtual void activemq::util::PrimitiveMap::setByteArray (const std::string & *key*, const std::vector< unsigned char > & *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.15 virtual void activemq::util::PrimitiveMap::setChar (const std::string & *key*, char *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.16 virtual void activemq::util::PrimitiveMap::setDouble (const std::string & *key*, double *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.17 virtual void activemq::util::PrimitiveMap::setFloat (const std::string & *key*, float *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.18 virtual void activemq::util::PrimitiveMap::setInt (const std::string & *key*, int *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.19 virtual void activemq::util::PrimitiveMap::setLong (const std::string & *key*, long long *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.20 virtual void activemq::util::PrimitiveMap::setShort (const std::string & *key*, short *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.21 virtual void activemq::util::PrimitiveMap::setString (const std::string & *key*, const std::string & *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.473.3.22 std::string activemq::util::PrimitiveMap::toString () const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns:

formatted String of all elements in the map.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveMap.h**

6.474 activemq::wireformat::openwire::marshal::PrimitiveTypesMarshall Class Reference

This class wraps the functionality needed to **marshal** (p. 83) a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

`#include <src/main/activemq/wireformat/openwire/marshal/PrimitiveTypesMarshaller.h>`

Public Member Functions

- **PrimitiveTypesMarshaller** ()
- virtual ~**PrimitiveTypesMarshaller** ()

Static Public Member Functions

- static void **marshal** (const **util::PrimitiveMap** *map, std::vector< unsigned char > &buffer)

  Marshal a primitive map object to the given byte buffer.

- static void **unmarshal** (**util::PrimitiveMap** *map, const std::vector< unsigned char > &buffer)

  Unmarshal a PrimitiveMap from the provided Byte buffer.

- static void **marshal** (const **util::PrimitiveList** *list, std::vector< unsigned char > &buffer)

  Marshal a primitive list object to the given byte buffer.

- static void **unmarshal** (**util::PrimitiveList** *list, const std::vector< unsigned char > &buffer)

  Unmarshal a PrimitiveList from the provided byte buffer.

- static void **marshalMap** (const **util::PrimitiveMap** *map, **decaf::io::DataOutputStream** &dataOut)

  Marshal a primitive map object to the given DataOutputStream.

- static **util::PrimitiveMap** * **unmarshalMap** (**decaf::io::DataInputStream** &dataIn)

  Unmarshal a PrimitiveMap from the provided DataInputStream.

- static void **marshalList** (const **util::PrimitiveList** *list, **decaf::io::DataOutputStream** &dataOut)

  Marshal a PrimitiveList to the given DataOutputStream.

- static **util::PrimitiveList** * **unmarshalList** (**decaf::io::DataInputStream** &dataIn)

  Unmarshal a PrimitiveList from the given DataInputStream.

Static Protected Member Functions

- static void **marshalPrimitiveMap** (**decaf::io::DataOutputStream** &dataOut, const **decaf::util::Map**< std::string, **util::PrimitiveValueNode** > &map)

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

- static void **marshalPrimitiveList** (**decaf::io::DataOutputStream** &dataOut, const **decaf::util::List< util::PrimitiveValueNode >** &list)

  Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

- static void **marshalPrimitive** (**decaf::io::DataOutputStream** &dataOut, const **util::PrimitiveValueNode** &value)

  Used to Marshal the Primitive types out on the Wire.

- static void **unmarshalPrimitiveMap** (**decaf::io::DataInputStream** &dataIn, **util::PrimitiveMap** &map)

  Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

- static void **unmarshalPrimitiveList** (**decaf::io::DataInputStream** &dataIn, **decaf::util::LinkedList< util::PrimitiveValueNode >** &list)

  Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

- static **util::PrimitiveValueNode unmarshalPrimitive** (**decaf::io::DataInputStream** &dataIn)

  Unmarshals a Primitive Type from the stream, and returns it as a value Node.

6.474.1 Detailed Description

This class wraps the functionality needed to **marshal** (p. 83) a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

6.474.2 Constructor & Destructor Documentation

6.474.2.1 activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::PrimitiveTypesMars () [inline]

6.474.2.2 virtual activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::~PrimitiveTypesMa () [inline, virtual]

6.474.3 Member Function Documentation

6.474.3.1 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveList * *list*, std::vector< unsigned char > & *buffer*) [static]

Marshal a primitive list object to the given byte buffer.

Parameters:

map The PrimitiveList to Marshal.

buffer The byte buffer to write the marshaled data to.

Exceptions:

Exception if an error occurs during the marshaling process.

6.474.3.2 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveMap * *map*, std::vector< unsigned char > & *buffer*) [static]

Marshal a primitive map object to the given byte buffer.

Parameters:

map Map to Marshal.

buffer The byte buffer to write the marshaled data to.

Exceptions:

Exception if an error occurs during the marshaling process.

6.474.3.3 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalList (const util::PrimitiveList * *list*, decaf::io::DataOutputStream & *dataOut*) [static]

Marshal a PrimitiveList to the given DataOutputStream.

Parameters:

list The list object to Marshal

dataOut Reference to a DataOutputStream to write the marshaled data to.

Exceptions:

Exception if an error occurs during the marshaling process.

6.474.3.4 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalMap (const util::PrimitiveMap * *map*, decaf::io::DataOutputStream & *dataOut*) [static]

Marshal a primitive map object to the given DataOutputStream.

Parameters:

map Map to Marshal.

dataOut Reference to a DataOutputStream to write the marshaled data to.

Exceptions:

Exception if an error occurs during the marshaling process.

6.474.3.5 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitive (decaf::io::DataOutputStream & *dataOut*, const util::PrimitiveValueNode & *value*) [static, protected]

Used to Marshal the Primitive types out on the Wire.

Parameters:

dataOut - the DataOutputStream to write to

value - the ValueNode to write.

Exceptions:

IOException if an I/O error occurs during this operation.

6.474.3.6 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveList (decaf::io::DataOutputStream & *dataOut*, const decaf::util::List< util::PrimitiveValueNode > & *list*) [static, protected]

Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters:

dataOut - the DataOutputStream to write to

list - the ValueNode to write.

Exceptions:

IOException if an I/O error occurs during this operation.

6.474.3.7 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveMap (decaf::io::DataOutputStream & *dataOut*, const decaf::util::Map< std::string, util::PrimitiveValueNode > & *map*) [static, protected]

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters:

dataOut - the DataOutputStream to write to

map - the ValueNode to write.

Exceptions:

IOException if an I/O error occurs during this operation.

6.474.3.8 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveList * *list*, const std::vector< unsigned char > & *buffer*) [static]

Unmarshal a PrimitiveList from the provided byte buffer.

Parameters:

map The List to populate with values from the marshaled data.

buffer The byte buffer containing the marshaled Map.

Exceptions:

Exception if an error occurs during the unmarshal process.

6.474.3.9 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveMap * *map*, const std::vector< unsigned char > & *buffer*) [static]

Unmarshal a PrimitiveMap from the provided Byte buffer.

Parameters:

map The Map to populate with values from the marshaled data.

buffer The byte buffer containing the marshaled Map.

Exceptions:

Exception if an error occurs during the unmarshal process.

6.474.3.10 static util::PrimitiveList* activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalList (decaf::io::DataInputStream & *dataIn*) [static]

Unmarshal a PrimitiveList from the given DataInputStream.

Parameters:

dataIn The DataInputStream instance to read the marshaled PrimitiveList from.

Returns:

a pointer to a newly allocated PrimitiveList instnace.

Exceptions:

Exception if an error occurs during the unmarshal process.

6.474.3.11 static util::PrimitiveMap* activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalMap (decaf::io::DataInputStream & *dataIn*) [static]

Unmarshal a PrimitiveMap from the provided DataInputStream.

Parameters:

dataIn The DataInputStream instance to read the marshaled PrimitiveMap from.

Returns:

a pointer to a newly allocated PrimitiveMap instnace.

Exceptions:

Exception if an error occurs during the unmarshal process.

6.474.3.12 static util::PrimitiveValueNode activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitive (decaf::io::DataInputStream & *dataIn*) [static, protected]

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

Parameters:

dataIn - DataInputStream to read from.

Returns:

a PrimitiveValueNode containing the data.

Exceptions:

IOException if an I/O error occurs during this operation.

6.474.3.13 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveLi (decaf::io::DataInputStream & *dataIn*, decaf::util::LinkedList< util::PrimitiveValueNode > & *list*) [static, protected]

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters:

dataIn - DataInputStream to read from.

list - the ValueNode to write.

Exceptions:

IOException if an I/O error occurs during this operation.

6.474.3.14 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveM (decaf::io::DataInputStream & *dataIn*, util::PrimitiveMap & *map*) [static, protected]

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters:

dataIn - DataInputStream to read from.

map - the map to fill with data.

Exceptions:

IOException if an I/O error occurs during this operation.

6.476 activemq::util::PrimitiveValueConverter Class Reference

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2430) from one type to another.

`#include <src/main/activemq/util/PrimitiveValueConverter.h>`

Public Member Functions

- **PrimitiveValueConverter** ()
- virtual ~**PrimitiveValueConverter** ()
- template<typename TO >
  TO **convert** (const **PrimitiveValueNode** &value) const

6.476.1 Detailed Description

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2430) from one type to another. If the conversion is supported then calling the convert method will throw an UnsupportedOperationException to indicate that its not possible to perform the conversion.

This class is used to implement the rules of conversion on CMS Message properties, the following conversion table must be implemented. A value written as the row type can be read in the column type.

| | boolean byte short int long float double String |----------|-------|-------|-------|-------|-------|-------|-------- |boolean | X | | | | | | | | |byte | | X | X | X | X | | | X |short | | | X | X | X | | | X |int | | | | X | X | | | X |long | | | | | X | | | X |float | | | | | | X | X | X |double | | | | | | | X | X |String | | X | X | X | X | X | X | X |----------|-------|-------|-------|-------|-------|-------|--------

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveValueConverter.h**

6.477 activemq::util::PrimitiveValueNode Class Reference

Class that wraps around a single value of one of the many types.

`#include <src/main/activemq/util/PrimitiveValueNode.h>`

Data Structures

- union **PrimitiveValue**

  Define a union type comprised of the various types.

Public Types

- enum **PrimitiveType** {

  NULL_TYPE = 0, **BOOLEAN_TYPE** = 1, **BYTE_TYPE** = 2, **CHAR_TYPE** = 3,

  SHORT_TYPE = 4, **INTEGER_TYPE** = 5, **LONG_TYPE** = 6, **DOUBLE_TYPE** = 7,

  FLOAT_TYPE = 8, **STRING_TYPE** = 9, **BYTE_ARRAY_TYPE** = 10, **MAP_TYPE** = 11,

  LIST_TYPE = 12, **BIG_STRING_TYPE** = 13 }

  Enumeration for the various primitive types.

Public Member Functions

- **PrimitiveValueNode** ()

  Default Constructor, creates a value of the NULL_ TYPE.

- **PrimitiveValueNode** (bool value)

  Boolean Value Constructor.

- **PrimitiveValueNode** (unsigned char value)

  Byte Value Constructor.

- **PrimitiveValueNode** (char value)

  Char Value Constructor.

- **PrimitiveValueNode** (short value)

  Short Value Constructor.

- **PrimitiveValueNode** (int value)

  Int Value Constructor.

- **PrimitiveValueNode** (long long value)

  Long Value Constructor.

- **PrimitiveValueNode** (float value)

Float Value Constructor.

- **PrimitiveValueNode** (double value)

  Double Value Constructor.

- **PrimitiveValueNode** (const char *value)

  String Value Constructor.

- **PrimitiveValueNode** (const std::string &value)

  String Value Constructor.

- **PrimitiveValueNode** (const std::vector< unsigned char > &value)

  Byte Array Value Constructor.

- **PrimitiveValueNode** (const **decaf::util::List**< **PrimitiveValueNode** > &value)

  Primtive List Constructor.

- **PrimitiveValueNode** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &value)

  Primtive Map Value Constructor.

- **PrimitiveValueNode** (const **PrimitiveValueNode** &node)

  Copy constructor.

- ~**PrimitiveValueNode** ()
- **PrimitiveValueNode** & **operator**= (const **PrimitiveValueNode** &node)

  Assignment operator, copies the data from the other node.

- bool **operator**== (const **PrimitiveValueNode** &node) const

  Comparison Operator, compares this node to the other node.

- **PrimitiveType getType** () const

  Gets the Value Type of this type wrapper.

- **PrimitiveValue getValue** () const

  Gets the internal Primitive Value object from this wrapper.

- void **setValue** (const **PrimitiveValue** &value, **PrimitiveType** valueType)

  Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

- void **clear** ()

  Clears the value from this wrapper converting it back to a blank NULL_ TYPE value.

- void **setBool** (bool value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- bool **getBool** () const

  Gets the Boolean value of this Node.

- void **setByte** (unsigned char value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- unsigned char **getByte** () const

  Gets the Byte value of this Node.

- void **setChar** (char value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- char **getChar** () const

  Gets the Character value of this Node.

- void **setShort** (short value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- short **getShort** () const

  Gets the Short value of this Node.

- void **setInt** (int value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- int **getInt** () const

  Gets the Integer value of this Node.

- void **setLong** (long long value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- long long **getLong** () const

  Gets the Long value of this Node.

- void **setFloat** (float value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- float **getFloat** () const

  Gets the Float value of this Node.

- void **setDouble** (double value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- double **getDouble** () const

  Gets the Double value of this Node.

- void **setString** (const std::string &value)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- std::string **getString** () const

  Gets the String value of this Node.

- void **setByteArray** (const std::vector< unsigned char > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- std::vector< unsigned char > **getByteArray** () const

  Gets the Byte Array value of this Node.

- void **setList** (const **decaf::util::List**< **PrimitiveValueNode** > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- const **decaf::util::List**< **PrimitiveValueNode** > & **getList** () const

  Gets the Primitive List value of this Node.

- void **setMap** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- const **decaf::util::Map**< std::string, **PrimitiveValueNode** > & **getMap** () const

  Gets the Primitive Map value of this Node.

- std::string **toString** () const

  Creates a string representation of this value.

6.477.1 Detailed Description

Class that wraps around a single value of one of the many types. Manages memory for complex types, such as strings. Note: the destructor was left non-virtual so no virtual table will be created. This probably isn't necessary, but will avoid needless memory allocation. Since we'll never extend this class, not having a virtual destructor isn't a concern.

6.477.2 Member Enumeration Documentation

6.477.2.1 enum activemq::util::PrimitiveValueNode::PrimitiveType

Enumeration for the various primitive types.

Enumerator:

NULL_TYPE
BOOLEAN_TYPE
BYTE_TYPE
CHAR_TYPE

SHORT_TYPE
INTEGER_TYPE
LONG_TYPE
DOUBLE_TYPE
FLOAT_TYPE
STRING_TYPE
BYTE_ARRAY_TYPE
MAP_TYPE
LIST_TYPE
BIG_STRING_TYPE

6.477.3 Constructor & Destructor Documentation

6.477.3.1 activemq::util::PrimitiveValueNode::PrimitiveValueNode ()

Default Constructor, creates a value of the NULL_TYPE.

6.477.3.2 activemq::util::PrimitiveValueNode::PrimitiveValueNode (bool *value*)

Boolean Value Constructor.

Parameters:

value - the new value to store.

6.477.3.3 activemq::util::PrimitiveValueNode::PrimitiveValueNode (unsigned char *value*)

Byte Value Constructor.

Parameters:

value - the new value to store.

6.477.3.4 activemq::util::PrimitiveValueNode::PrimitiveValueNode (char *value*)

Char Value Constructor.

Parameters:

value - the new value to store.

6.477.3.5 activemq::util::PrimitiveValueNode::PrimitiveValueNode (short *value*)

Short Value Constructor.

Parameters:

value - the new value to store.

6.477.3.6 activemq::util::PrimitiveValueNode::PrimitiveValueNode (int *value*)

Int Value Constructor.

Parameters:

value - the new value to store.

6.477.3.7 activemq::util::PrimitiveValueNode::PrimitiveValueNode (long long *value*)

Long Value Constructor.

Parameters:

value - the new value to store.

6.477.3.8 activemq::util::PrimitiveValueNode::PrimitiveValueNode (float *value*)

Float Value Constructor.

Parameters:

value - the new value to store.

6.477.3.9 activemq::util::PrimitiveValueNode::PrimitiveValueNode (double *value*)

Double Value Constructor.

Parameters:

value - the new value to store.

6.477.3.10 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const char * *value*)

String Value Constructor.

Parameters:

value - the new value to store.

6.477.3.11 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::string & *value*)

String Value Constructor.

Parameters:

value - the new value to store.

6.477.3.12 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::vector< unsigned char > & *value*)

Byte Array Value Constructor.

Parameters:

value - the new value to store.

6.477.3.13 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::List< PrimitiveValueNode > & *value*)

Primtive List Constructor.

Parameters:

value - the new value to store.

6.477.3.14 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Primtive Map Value Constructor.

Parameters:

value - the new value to store.

6.477.3.15 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const PrimitiveValueNode & *node*)

Copy constructor.

Parameters:

node The instance of another node to copy to this one.

6.477.3.16 activemq::util::PrimitiveValueNode::~PrimitiveValueNode () [inline]

6.477.4 Member Function Documentation

6.477.4.1 void activemq::util::PrimitiveValueNode::clear ()

Clears the value from this wrapper converting it back to a blank NULL_TYPE value.

6.477.4.2 bool activemq::util::PrimitiveValueNode::getBool () const

Gets the Boolean value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.3 unsigned char activemq::util::PrimitiveValueNode::getByte () const

Gets the Byte value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.4 std::vector<unsigned char> activemq::util::PrimitiveValueNode::getByteArray () const

Gets the Byte Array value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.5 char activemq::util::PrimitiveValueNode::getChar () const

Gets the Character value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.6 double activemq::util::PrimitiveValueNode::getDouble () const

Gets the Double value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.7 float activemq::util::PrimitiveValueNode::getFloat () const

Gets the Float value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.8 int activemq::util::PrimitiveValueNode::getInt () const

Gets the Integer value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.9 const decaf::util::List<PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getList () const

Gets the Primitive List value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.10 long long activemq::util::PrimitiveValueNode::getLong () const

Gets the Long value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.11 const decaf::util::Map<std::string, PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getMap () const

Gets the Primitive Map value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.12 short activemq::util::PrimitiveValueNode::getShort () const

Gets the Short value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.13 std::string activemq::util::PrimitiveValueNode::getString () const

Gets the String value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.477.4.14 PrimitiveType activemq::util::PrimitiveValueNode::getType () const [inline]

Gets the Value Type of this type wrapper.

Returns:

the PrimitiveType value for this wrapper.

6.477.4.15 PrimitiveValue activemq::util::PrimitiveValueNode::getValue () const [inline]

Gets the internal Primitive Value object from this wrapper.

Returns:

a copy of the contained **PrimitiveValue** (p. 2427)

6.477.4.16 PrimitiveValueNode& activemq::util::PrimitiveValueNode::operator= (const PrimitiveValueNode & *node*)

Assignment operator, copies the data from the other node.

Parameters:

node The instance of another node to copy to this one.

6.477.4.17 bool activemq::util::PrimitiveValueNode::operator== (const PrimitiveValueNode & *node*) const

Comparison Operator, compares this node to the other node.

Returns:

true if the values are the same false otherwise.

6.477.4.18 void activemq::util::PrimitiveValueNode::setBool (bool *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.19 void activemq::util::PrimitiveValueNode::setByte (unsigned char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.20 void activemq::util::PrimitiveValueNode::setByteArray (const std::vector< unsigned char > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.21 void activemq::util::PrimitiveValueNode::setChar (char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.22 void activemq::util::PrimitiveValueNode::setDouble (double *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.23 void activemq::util::PrimitiveValueNode::setFloat (float *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.24 void activemq::util::PrimitiveValueNode::setInt (int *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.25 void activemq::util::PrimitiveValueNode::setList (const decaf::util::List< PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.26 void activemq::util::PrimitiveValueNode::setLong (long long *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.27 void activemq::util::PrimitiveValueNode::setMap (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.28 void activemq::util::PrimitiveValueNode::setShort (short *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.29 void activemq::util::PrimitiveValueNode::setString (const std::string & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.477.4.30 void activemq::util::PrimitiveValueNode::setValue (const PrimitiveValue & *value*, PrimitiveType *valueType*)

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

Parameters:

value The value to set as the value contained in this Node.

valueType The type of the value being set into this one.

6.477.4.31 std::string activemq::util::PrimitiveValueNode::toString () const

Creates a string representation of this value.

Returns:

string value of this type wrapper.

6.478 decaf::security::Principal Class Reference

Base interface for a principal, which can represent an individual or organization.

`#include <src/main/decaf/security/Principal.h>`Inheritance diagram for decaf::security::Principal:

Public Member Functions

- virtual ~**Principal** ()
- virtual bool **equals** (const **Principal** &another) const =0

  Compares two principals to see if they are the same.

- virtual std::string **getName** () const =0

  Provides the name of this principal.

6.478.1 Detailed Description

Base interface for a principal, which can represent an individual or organization.

6.478.2 Constructor & Destructor Documentation

6.478.2.1 virtual decaf::security::Principal::~Principal () [virtual]

6.478.3 Member Function Documentation

6.478.3.1 virtual bool decaf::security::Principal::equals (const Principal & *another*) const [pure virtual]

Compares two principals to see if they are the same.

Parameters:

another A principal to be tested for equality to this one.

Returns:

true if the given principal is equivalent to this one.

6.478.3.2 virtual std::string decaf::security::Principal::getName () const [pure virtual]

Provides the name of this principal.

Returns:

the name of this principal.

Implemented in **decaf::security::auth::x500::X500Principal** (p. 3257).

The documentation for this class was generated from the following file:

- **PriorityQueue**< E > & **operator**= (const **Collection**< E > &source)

  *Assignment operator, assign another **Collection** (p. 1006) to this one.*

- **PriorityQueue**< E > & **operator**= (const **PriorityQueue**< E > &source)

  *Assignment operator, assign another **PriorityQueue** (p. 2445) to this one.*

- virtual **decaf::util::Iterator**< E > * **iterator** ()
- virtual **decaf::util::Iterator**< E > * **iterator** () const
- virtual int **size** () const

  Returns the number of elements in this collection.

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  *This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.*

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException *if the clear operation is not supported by this collection*

This implementation repeatedly invokes poll until it returns false.

- virtual bool **offer** (const E &value)

  Inserts the specified element into the queue provided that the condition allows such an operation.

- virtual bool **poll** (E &result)

  Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) const

  Gets but not removes the element in the head of the queue.

- virtual E **remove** ()

  Gets and removes the element in the head of the queue.
  Throws a ***NoSuchElementException*** *(p. 2260) if there is no element in the queue.*

  Returns:

  the element in the head of the queue.

  Exceptions:

  NoSuchElementException *(p. 2260) if there is no element in the queue.*

  This implementation returns the result of poll unless the queue is empty.

- virtual bool **remove** (const E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters:

  value *The reference to the element to remove from this* ***Collection*** *(p. 1006).*

  Returns:

  true if the collection was changed, false otherwise.

  Exceptions:

  UnsupportedOperationExceptio *if this is an unmodifiable collection.*
  NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual bool **add** (const E &value)

  Returns true if this collection changed as a result of the call.
  (Returns false if this collection does not permit duplicates and already contains the specified element.)
  Collections *(p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added.* ***Collection*** *(p. 1006)*

classes should clearly specify in their documentation any restrictions on what elements may be added.
If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.
For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value *The reference to the element to add to this* ***Collection*** *(p. 1006).*

Returns:

true if the element was added to this ***Collection*** *(p. 1006).*

Exceptions:

UnsupportedOperationExceptio *if this is an unmodifiable collection.*
NullPointerException *if the* ***Collection*** *(p. 1006) is a container of pointers and does not allow NULL values.*
IllegalArgumentException *if some property of the element prevents it from being added to this collection.*
IllegalStateException *if the element cannot be added at this time due to insertion restrictions.*

This implementation returns true if offer succeeds, else throws an IllegalStateException.

- **decaf::lang::Pointer< Comparator< E > > comparator** () const

  obtains a Copy of the Pointer instance that this ***PriorityQueue*** *(p. 2445) is using to compare the elements in the queue with.*

Friends

- class **PriorityQueueIterator**

6.479.1 Detailed Description

template<typename E> class decaf::util::PriorityQueue< E >

An unbounded priority queue based on a binary heap algorithm. The elements of the priority queue are ordered according to their natural ordering, or by a **Comparator** (p. 1040) provided to one of the constructors that accepts Comparators. A priority queue relying on natural ordering also does not permit insertion of non-comparable objects (doing so may result in a compiler error).

The head of this queue is the least element with respect to the specified ordering. If multiple elements are tied for least value, the head is one of those elements -- ties are broken arbitrarily. The queue retrieval operations poll, remove, peek, and element access the element at the head of the queue.

A priority queue is unbounded, but has an **internal** (p. 97) capacity governing the size of an array used to store the elements on the queue. It is always at least as large as the queue size. As elements are added to a priority queue, its capacity grows automatically. The details of the growth policy are not specified.

This class and its iterator implement all of the optional methods of the **Collection** (p. 1006) and **Iterator** (p. 1802) interfaces. The **Iterator** (p. 1802) provided in method **iterator()** (p. 2451) is not guaranteed to traverse the elements of the priority queue in any particular order. If you need ordered traversal, consider using `Arrays::sort( pq.toArray() )`.

Note that this implementation is not synchronized. Multiple threads should not access a **PriorityQueue** (p. 2445) instance concurrently if any of the threads modifies the queue. Instead, use the thread-safe PriorityBlockingQueue class.

Implementation note: this implementation provides O(log(n)) time for the enqueing and dequeing methods (offer, poll, **remove()** (p. 2453) and add); linear time for the remove(Object) and contains(Object) methods; and constant time for the retrieval methods (peek, element, and size).

Since:

1.0

6.479.2 Constructor & Destructor Documentation

6.479.2.1 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue () [inline]

Creates a Priority **Queue** (p. 2515) with the default initial capacity.

References decaf::util::PriorityQueueBase::DEFAULT_CAPACITY.

6.479.2.2 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (int *initialCapacity*) [inline]

Creates a Priority **Queue** (p. 2515) with the capacity value supplied.

Parameters:

initialCapacity The initial number of elements allocated to this **PriorityQueue** (p. 2445).

6.479.2.3 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (int *initialCapacity*, Comparator< E > * *comparator*) [inline]

Creates a Priority **Queue** (p. 2515) with the default initial capacity. This new **PriorityQueue** (p. 2445) takes ownership of the passed **Comparator** (p. 1040) instance and uses that to determine the ordering of the elements in the **Queue** (p. 2515).

Parameters:

initialCapacity The initial number of elements allocated to this **PriorityQueue** (p. 2445).

comparator The **Comparator** (p. 1040) instance to use in sorting the elements in the **Queue** (p. 2515).

Exceptions:

NullPointerException if the passed **Comparator** (p. 1040) is NULL.

References NULL.

6.479.2.4 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const Collection< E > & *source*) [inline]

Creates a **PriorityQueue** (p. 2445) containing the elements in the specified **Collection** (p. 1006).

Parameters:

source the **Collection** (p. 1006) whose elements are to be placed into this priority queue

6.479.2.5 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const PriorityQueue< E > & *source*) [inline]

Creates a **PriorityQueue** (p. 2445) containing the elements in the specified priority queue. This priority queue will be ordered according to the same ordering as the given priority queue.

Parameters:

source the priority queue whose elements are to be placed into this priority queue

6.479.2.6 template<typename E> virtual decaf::util::PriorityQueue< E >::~PriorityQueue () [inline, virtual]

6.479.3 Member Function Documentation

6.479.3.1 template<typename E> virtual bool decaf::util::PriorityQueue< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections (p. 1018) that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1006) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value The reference to the element to add to this **Collection** (p. 1006).

Returns:

true if the element was added to this **Collection** (p. 1006).

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions.

This implementation returns true if offer succeeds, else throws an IllegalStateException. This implementation returns true if offer succeeds, else throws an IllegalStateException.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 176).

References DECAF_CATCH_EXCEPTION_CONVERT, DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, and decaf::util::PriorityQueue< E >::offer().

6.479.3.2 template<typename E> virtual void decaf::util::PriorityQueue< E >::clear () [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1803) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

This implementation repeatedly invokes poll until it returns false. This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 177).

References decaf::util::PriorityQueueBase::DEFAULT_CAPACITY.

6.479.3.3 template<typename E> decaf::lang::Pointer< Comparator<E> > decaf::util::PriorityQueue< E >::comparator () const [inline]

obtains a Copy of the Pointer instance that this **PriorityQueue** (p. 2445) is using to compare the elements in the queue with. The returned value is a copy, the caller cannot change the value if the **internal** (p. 97) Pointer value.

Returns:

a copy of the **Comparator** (p. 1040) Pointer being used by this **Queue** (p. 2515).

6.479.3.4 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1799).

6.479.3.5 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1800).

References decaf::util::PriorityQueue< E >::PriorityQueueIterator.

6.479.3.6 template<typename E> virtual bool decaf::util::PriorityQueue< E >::offer (const E & *value*) [inline, virtual]

Inserts the specified element into the queue provided that the condition allows such an operation. The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters:

value the specified element to insert into the queue.

Returns:

true if the operation succeeds and false if it fails.

Exceptions:

NullPointerException if the **Queue** (p. 2515) implementation does not allow Null values to be inserted into the **Queue** (p. 2515).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2516).

Referenced by decaf::util::PriorityQueue< E >::add().

6.479.3.7 template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E >::operator= (const PriorityQueue< E > & *source*) [inline]

Assignment operator, assign another **PriorityQueue** (p. 2445) to this one.

Parameters:

source The **PriorityQueue** (p. 2445) to copy to this one.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 148).

6.479.3.8 template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E >::operator= (const Collection< E > & *source*) [inline]

Assignment operator, assign another **Collection** (p. 1006) to this one.

Parameters:

source The **Collection** (p. 1006) to copy to this one.

6.479.3.9 template<typename E> virtual bool decaf::util::PriorityQueue< E >::peek (E & *result*) const [inline, virtual]

Gets but not removes the element in the head of the queue. The result if successful is assigned to the result parameter.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2517).

References decaf::util::AbstractCollection< E >::isEmpty().

6.479.3.10 template<typename E> virtual bool decaf::util::PriorityQueue< E >::poll (E & *result*) [inline, virtual]

Gets and removes the element in the head of the queue. If the operation succeeds the value of the element at the head of the **Queue** (p. 2515) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2517).

References decaf::util::AbstractCollection< E >::isEmpty().

6.479.3.11 template<typename E> virtual bool decaf::util::PriorityQueue< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value The reference to the element to remove from this **Collection** (p. 1006).

Returns:

true if the collection was changed, false otherwise.

Exceptions:

UnsupportedOperationExceptio if this is an unmodifiable collection.

NullPointerException if the **Collection** (p. 1006) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object. This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 149).

6.479.3.12 template<typename E> virtual E decaf::util::PriorityQueue< E >::remove () [inline, virtual]

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 2260) if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260)* if there is no element in the queue.

This implementation returns the result of poll unless the queue is empty. This implementation returns the result of poll unless the queue is empty.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 178).

References decaf::util::AbstractCollection< E >::isEmpty().

6.479.3.13 template<typename E> virtual int decaf::util::PriorityQueue< E >::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1015).

6.481.2 Member Function Documentation

6.481.2.1 virtual ProducerAck* activemq::commands::ProducerAck::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.481.2.2 virtual void activemq::commands::ProducerAck::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.481.2.3 virtual bool activemq::commands::ProducerAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.481.2.4 virtual unsigned char activemq::commands::ProducerAck::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.481.2.5 virtual Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId ()

[virtual]

6.481.2.6 virtual const Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () const

6.481.2.7 virtual int activemq::commands::ProducerAck::getSize () const

[virtual]

6.481.2.8 virtual bool activemq::commands::ProducerAck::isProducerAck () const

[inline, virtual]

Returns:

an answer of true to the **isProducerAck()** (p. 2458) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 639).

6.481.2.9 virtual void activemq::commands::ProducerAck::setProducerId (const Pointer< ProducerId > & *producerId*)

[virtual]

6.481.2.10 virtual void activemq::commands::ProducerAck::setSize (int *size*)

[virtual]

6.481.2.11 virtual std::string activemq::commands::ProducerAck::toString () const

[virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.481.2.12 virtual Pointer<Command> activemq::commands::ProducerAck::visit (activemq::state::CommandVisitor * *visitor*)

[virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.481.3 Field Documentation

6.481.3.1 const unsigned char activemq::commands::ProducerAck::ID_PRODUCERACK = 19 [static]

6.482.3 Member Function Documentation

6.482.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.482.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::getDataStruct () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.482.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.482.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::looseUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.482.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.482.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.482.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.483 activemq::cmsutil::ProducerCallback Class Reference

Callback for sending a message to a CMS destination.

`#include <src/main/activemq/cmsutil/ProducerCallback.h>`Inheritance diagram for activemq::cmsutil::ProducerCallback:

Public Member Functions

- virtual ~**ProducerCallback** ()
- virtual void **doInCms** (**cms::Session** *session, **cms::MessageProducer** *producer)=0

  Execute an action given a session and producer.

6.483.1 Detailed Description

Callback for sending a message to a CMS destination.

6.483.2 Constructor & Destructor Documentation

6.483.2.1 virtual activemq::cmsutil::ProducerCallback::~ProducerCallback () [virtual]

6.483.3 Member Function Documentation

6.483.3.1 virtual void activemq::cmsutil::ProducerCallback::doInCms (cms::Session * *session*, cms::MessageProducer * *producer*) [pure virtual]

Execute an action given a session and producer.

Parameters:

session the CMS `Session`

producer the CMS `Producer`

Exceptions:

cms::CMSException *(*p. *979)* if thrown by CMS API methods

Implemented in **activemq::cmsutil::CmsTemplate::SendExecutor** (p. 2658).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**ProducerCallback.h**

6.484 activemq::cmsutil::CmsTemplate::ProducerExecutor Class Reference

6.486 activemq::wireformat::openwire::marshal::generated::ProducerIdM Class Reference

Marshaling **code** (p. 1005) for Open Wire Format for **ProducerIdMarshaller** (p. 2472).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ProducerIdMarshaller.h>`Inherita
diagram for activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller:

Public Member Functions

- **ProducerIdMarshaller** ()
- virtual ~**ProducerIdMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of the class that this class is a marshaling director for.

- virtual unsigned char **getDataStructureType** () const

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.486.1 Detailed Description

Marshaling **code** (p. 1005) for Open Wire Format for **ProducerIdMarshaller** (p. 2472). NOTE!: This file is auto **generated** (p. 84) - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.486.2 Constructor & Destructor Documentation

6.486.2.1 activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::ProducerIdM () [inline]

6.486.2.2 virtual activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::~ProducerId () [inline, virtual]

6.486.3 Member Function Documentation

6.486.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::createObject () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.486.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::getDataStructu () const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.486.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1290).

6.486.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1292).

6.486.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1293).

6.486.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1295).

6.486.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1296).

6.487.1 Constructor & Destructor Documentation

6.487.1.1 activemq::commands::ProducerInfo::ProducerInfo ()

6.487.1.2 virtual activemq::commands::ProducerInfo::~ProducerInfo () [virtual]

6.487.2 Member Function Documentation

6.487.2.1 virtual ProducerInfo* activemq::commands::ProducerInfo::cloneDataStructure () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1299).

6.487.2.2 virtual void activemq::commands::ProducerInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Reimplemented from **activemq::commands::BaseCommand** (p. 635).

6.487.2.3 Pointer<RemoveInfo> activemq::commands::ProducerInfo::createRemoveCommand () const

6.487.2.4 virtual bool activemq::commands::ProducerInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1299) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 636).

6.487.2.5 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () [virtual]

6.487.2.6 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () const [virtual]

6.487.2.7 virtual unsigned char activemq::commands::ProducerInfo::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1299) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1301).

6.487.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () [virtual]

6.487.2.9 virtual const Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () const [virtual]

6.487.2.10 virtual Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () [virtual]

6.487.2.11 virtual const Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () const [virtual]

6.487.2.12 virtual int activemq::commands::ProducerInfo::getWindowSize () const [virtual]

6.487.2.13 virtual bool activemq::commands::ProducerInfo::isDispatchAsync () const [virtual]

6.487.2.14 virtual bool activemq::commands::ProducerInfo::isProducerInfo () const [inline, virtual]

Returns:

an answer of true to the **isProducerInfo()** (p. 2478) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 639).

6.487.2.15 virtual void activemq::commands::ProducerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.487.2.16 virtual void activemq::commands::ProducerInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.487.2.17 virtual void activemq::commands::ProducerInfo::setDispatchAsync (bool *dispatchAsync*) [virtual]

6.487.2.18 virtual void activemq::commands::ProducerInfo::setProducerId (const Pointer< ProducerId > & *producerId*) [virtual]

6.487.2.19 virtual void activemq::commands::ProducerInfo::setWindowSize (int *windowSize*) [virtual]

6.487.2.20 virtual std::string activemq::commands::ProducerInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1299) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 641).

6.487.2.21 virtual Pointer<Command> activemq::commands::ProducerInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2606) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1024).

6.488.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::createObject() const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1288).

6.488.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::getDataStruct() const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1289).

6.488.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::looseMarshal(OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 83) to

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 643).

6.488.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::looseUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 644).

6.488.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format The OpenwireFormat properties

command The object to Marshal

bs The boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 645).

6.488.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to **marshal** (p. 83) to.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 646).

6.488.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightUnmarsh (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 647).

6.490 decaf::util::Properties Class Reference

Java-like properties class for mapping string names to string values.

`#include <src/main/decaf/util/Properties.h>`

Public Member Functions

- **Properties** ()
- **Properties** (const **Properties** &src)
- virtual ~**Properties** ()
- **Properties** & **operator**= (const **Properties** &src)

  Assignment Operator.

- bool **isEmpty** () const

  Returns true if the properties object is empty.

- int **size** () const
- const char * **getProperty** (const std::string &name) const

  Looks up the value for the given property.

- std::string **getProperty** (const std::string &name, const std::string &defaultValue) const

  Looks up the value for the given property.

- std::string **setProperty** (const std::string &name, const std::string &value)

  Sets the value for a given property.

- bool **hasProperty** (const std::string &name) const

  Check to see if the Property exists in the set.

- std::string **remove** (const std::string &name)

  Removes the property with the given name.

- std::vector< std::string > **propertyNames** () const

  Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.

- std::vector< std::pair< std::string, std::string > > **toArray** () const

  Method that serializes the contents of the property map to an array.

- void **copy** (const **Properties** &source)

  *Copies the contents of the given properties object to this one, if the given **Properties** (p. 2486) instance in NULL then this **List** (p. 1902) is not modified.*

- **Properties** * **clone** () const

  Clones this object.

- void **clear** ()

  Clears all properties from the map.

- bool **equals** (const **Properties** &source) const

  *Test whether two **Properties** (p. 2486) objects are equivalent.*

- std::string **toString** () const

  *Formats the contents of the **Properties** (p. 2486) Object into a string that can be logged, etc.*

- void **load** (**decaf::io::InputStream** *stream)

  Reads a property list (key and element pairs) from the input byte stream.

- void **load** (**decaf::io::Reader** *reader)

  Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

- void **store** (**decaf::io::OutputStream** *out, const std::string &comment)

  *Writes this property list (key and element pairs) in this **Properties** (p. 2486) table to the output stream in a format suitable for loading into a **Properties** (p. 2486) table using the load(InputStream) method.*

- void **store** (**decaf::io::Writer** *writer, const std::string &comments)

  *Writes this property list (key and element pairs) in this **Properties** (p. 2486) table to the output character stream in a format that can be read by the load(Reader) method.*

Protected Attributes

- **decaf::lang::Pointer< Properties > defaults**

  Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.490.1 Detailed Description

Java-like properties class for mapping string names to string values. The **Properties** (p. 2486) list contains a key value pair of properties that can be loaded and stored to a stream. Each **Properties** (p. 2486) instance can contain an **internal** (p. 97) **Properties** (p. 2486) list that contains default values for keys not found in the **Properties** (p. 2486) **List** (p. 1902).

The **Properties** (p. 2486) list if a Thread Safe class, it can be shared amongst objects in multiple threads without the need for additional synchronization.

Since:

1.0

6.490.2 Constructor & Destructor Documentation

6.490.2.1 decaf::util::Properties::Properties ()

6.490.2.2 decaf::util::Properties::Properties (const Properties & *src*)

6.490.2.3 virtual decaf::util::Properties::~Properties () [virtual]

6.490.3 Member Function Documentation

6.490.3.1 void decaf::util::Properties::clear ()

Clears all properties from the map.

6.490.3.2 Properties* decaf::util::Properties::clone () const

Clones this object.

Returns:

a replica of this object.

6.490.3.3 void decaf::util::Properties::copy (const Properties & *source*)

Copies the contents of the given properties object to this one, if the given **Properties** (p. 2486) instance in NULL then this **List** (p. 1902) is not modified.

Parameters:

source The source properties object.

6.490.3.4 bool decaf::util::Properties::equals (const Properties & *source*) const

Test whether two **Properties** (p. 2486) objects are equivalent. Two **Properties** (p. 2486) Objects are considered equivalent when they each contain the same number of elements and each key / value pair contained within the two are equal.

This comparison does not check the contents of the Defaults instance.

Parameters:

source The **Properties** (p. 2486) object to compare this instance to.

Returns:

true if the contents of the two **Properties** (p. 2486) objects are the same.

6.490.3.5 std::string decaf::util::Properties::getProperty (const std::string & *name*, const std::string & *defaultValue*) const

Looks up the value for the given property.

Parameters:

name The name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns:

The value of the property specified by `name`, if it exists, otherwise the `defaultValue`.

6.490.3.6 const char* decaf::util::Properties::getProperty (const std::string & *name*) const

Looks up the value for the given property.

Parameters:

name The name of the property to be looked up.

Returns:

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

6.490.3.7 bool decaf::util::Properties::hasProperty (const std::string & *name*) const

Check to see if the Property exists in the set.

Parameters:

name The property name to check for in this properties set.

Returns:

true if property exists, false otherwise.

6.490.3.8 bool decaf::util::Properties::isEmpty () const

Returns true if the properties object is empty.

Returns:

true if empty

6.490.3.9 void decaf::util::Properties::load (decaf::io::Reader * *reader*)

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format. **Properties** (p. 2486) are processed in terms of lines. There are two kinds of line, natural lines and logical lines. A natural line is defined as a line of characters that is terminated either by a set of line terminator characters (

or or

) or by the end of the stream. A natural line may be either a blank line, a comment line, or hold all or some of a key-element pair. A logical line holds all the data of a key-element pair, which

may be spread out across several adjacent natural lines by escaping the line terminator sequence with a backslash character \. Note that a comment line cannot be extended in this manner; every natural line that is a comment must have its own comment indicator, as described below. Lines are read from input until the end of the stream is reached.

A natural line that contains only white space characters is considered blank and is ignored. A comment line has an ASCII '#' or '!' as its first non-white space character; comment lines are also ignored and do not encode key-element information. In addition to line terminators, this format considers the characters space (' '), tab ('), and form feed (') to be white space.

If a logical line is spread across several natural lines, the backslash escaping the line terminator sequence, the line terminator sequence, and any white space at the start of the following line have no affect on the key or element values. The remainder of the discussion of key and element parsing (when loading) will assume all the characters constituting the key and element appear on a single natural line after line continuation characters have been removed. Note that it is not sufficient to only examine the character preceding a line terminator sequence to decide if the line terminator is escaped; there must be an odd number of contiguous backslashes for the line terminator to be escaped. Since the input is processed from left to right, a non-zero even number of 2n contiguous backslashes before a line terminator (or elsewhere) encodes n backslashes after escape processing.

The key contains all of the characters in the line starting with the first non-white space character and up to, but not including, the first unescaped '=', ':', or white space character other than a line terminator. All of these key termination characters may be included in the key by escaping them with a preceding backslash character; for example,

\:\=

would be the two-character key ":=". Line terminator characters can be included using and

escape sequences. Any white space after the key is skipped; if the first non-white space character after the key is '=' or ':', then it is ignored and any white space characters after it are also skipped. All remaining characters on the line become part of the associated element string; if there are no remaining characters, the element is the empty string "". Once the raw character sequences constituting the key and element are identified, escape processing is performed as described above.

As an example, each of the following three lines specifies the key "Truth" and the associated element value "Beauty":

Truth = Beauty Truth:Beauty Truth :Beauty

As another example, the following three lines specify a single property:

fruits apple, banana, pear, \ cantaloupe, watermelon, \ kiwi, mango

The key is "fruits" and the associated element is: "apple, banana, pear, cantaloupe, watermelon, kiwi, mango"

Note that a space appears before each \ so that a space will appear after each comma in the final result; the \, line terminator, and leading white space on the continuation line are merely discarded and are not replaced by one or more other characters.

As a third example, the line:

cheeses

specifies that the key is "cheeses" and the associated element is the empty string "".

Characters in keys and elements can be represented in escape sequences similar to those used for character and string literals (see §3.3 and §3.10.6 of the Java Language Specification). The differences from the character escape sequences and Unicode escapes used for characters and strings are:

- Octal escapes are not recognized.
- The character sequence **does** not represent a backspace character.
- The method does not treat a backslash character, \, before a non-valid escape character as an error; the backslash is silently dropped. For example, in a C++ string the sequence "\z" would cause a compile time error. In contrast, this method silently drops the backslash. Therefore, this method treats the two character sequence "\b" as equivalent to the single character 'b'.
- Escapes are not necessary for single and double quotes; however, by the rule above, single and double quote characters preceded by a backslash still yield single and double quote characters, respectively.

This method does not close the Reader upon its return.

Parameters:

reader The Reader that provides an character stream as input.

Exceptions:

IOException if there is an error while reading from the stream.
IllegalArgumentException if malformed data is found while reading the properties.
NullPointerException if the passed stream is Null.

6.490.3.10 void decaf::util::Properties::load (decaf::io::InputStream * *stream*)

Reads a property list (key and element pairs) from the input byte stream. The input stream is in a simple line-oriented format as specified in load(Reader) and is assumed to use the ISO 8859-1 character encoding.

This method does not close the stream upon its return.

Parameters:

stream The stream to read the properties data from.

Exceptions:

IOException if there is an error while reading from the stream.
IllegalArgumentException if malformed data is found while reading the properties.
NullPointerException if the passed stream is Null.

6.490.3.11 Properties& decaf::util::Properties::operator= (const Properties & *src*)

Assignment Operator.

Parameters:

src The **Properties** (p. 2486) list to copy to this **List** (p. 1902).

Returns:

a reference to this **List** (p. 1902) for use in chaining.

6.490.3.12 std::vector<std::string> decaf::util::Properties::propertyNames () const

Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.

Returns:

a set of keys in this property list where the key and its corresponding value are strings, including the keys in the default property list.

6.490.3.13 std::string decaf::util::Properties::remove (const std::string & *name*)

Removes the property with the given name.

Parameters:

name The name of the property to remove.

Returns:

the previous value of the property if set, or empty string.

6.490.3.14 std::string decaf::util::Properties::setProperty (const std::string & *name*, const std::string & *value*)

Sets the value for a given property. If the property already exists, overwrites the value.

Parameters:

name The name of the value to be written.

value The value to be written.

Returns:

the old value of the property or empty string if not set.

6.490.3.15 int decaf::util::Properties::size () const

Returns:

The number of **Properties** (p. 2486) in this **Properties** (p. 2486) Object.

6.490.3.16 void decaf::util::Properties::store (decaf::io::Writer * *writer*, const std::string & *comments*)

Writes this property list (key and element pairs) in this **Properties** (p. 2486) table to the output character stream in a format that can be read by the load(Reader) method. **Properties** (p. 2486) from the defaults table of this **Properties** (p. 2486) table (if any) are not written out by this method.

If the comments argument is not empty, then an ASCII # character, the comments string, and a line separator are first written to the output stream. Thus, the comments can serve as an identifying comment. Any one of a line feed ('

'), a carriage return (''), or a carriage return followed immediately by a line feed in comments is replaced by a line separator generated by the Writer and if the next character in comments is not character # or character ! then an ASCII # is written out after that line separator.

Next, a comment line is always written, consisting of an ASCII # character, the current date and time (as if produced by the toString method of **Date** (p. 1304) for the current time), and a line separator as generated by the Writer.

Then every entry in this **Properties** (p. 2486) table is written out, one per line. For each entry the key string is written, then an ASCII =, then the associated element string. For the key, all space characters are written with a preceding \ character. For the element, leading space characters, but not embedded or trailing space characters, are written with a preceding \ character. The key and element characters #, !, =, and : are written with a preceding backslash to ensure that they are properly loaded.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters:

writer The Writer instance to use to output the properties.

comments A description of these properties that is written before writing the properties.

Exceptions:

IOException if there is an error while writing from the stream.

NullPointerException if the passed stream is Null.

6.490.3.17 void decaf::util::Properties::store (decaf::io::OutputStream * *out*, const std::string & *comment*)

Writes this property list (key and element pairs) in this **Properties** (p. 2486) table to the output stream in a format suitable for loading into a **Properties** (p. 2486) table using the load(InputStream) method. **Properties** (p. 2486) from the defaults table of this **Properties** (p. 2486) table (if any) are not written out by this method.

This method outputs the comments, properties keys and values in the same format as specified in store(Writer), with the following differences:

- The stream is written using the ISO 8859-1 character encoding.
- Characters not in Latin-1 in the comments are written as for their appropriate unicode hexadecimal value xxxx.
- Characters less than and characters greater than in property keys or values are written as for the appropriate hexadecimal value xxxx.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters:

out The OutputStream instance to write the properties to.

comment A description of these properties that is written to the output stream.

Exceptions:

IOException if there is an error while writing from the stream.

NullPointerException if the passed stream is Null.

6.490.3.18 std::vector< std::pair< std::string, std::string > > decaf::util::Properties::toArray () const

Method that serializes the contents of the property map to an array.

Returns:

list of pairs where the first is the name and the second is the value.

6.490.3.19 std::string decaf::util::Properties::toString () const

Formats the contents of the **Properties** (p. 2486) Object into a string that can be logged, etc.

Returns:

string value of this object.

6.490.4 Field Documentation

6.490.4.1 decaf::lang::Pointer<Properties> decaf::util::Properties::defaults [protected]

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.492.1 Constructor & Destructor Documentation

6.492.1.1 decaf::net::ProtocolException::ProtocolException ()

Default Constructor.

6.492.1.2 decaf::net::ProtocolException::ProtocolException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.492.1.3 decaf::net::ProtocolException::ProtocolException (const ProtocolException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.492.1.4 decaf::net::ProtocolException::ProtocolException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.492.1.5 decaf::net::ProtocolException::ProtocolException (const std::exception * *cause*)

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.492.1.6 decaf::net::ProtocolException::ProtocolException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.492.1.7 virtual decaf::net::ProtocolException::~ProtocolException () throw () [virtual]

6.492.2 Member Function Documentation

6.492.2.1 virtual ProtocolException* decaf::net::ProtocolException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1788).

- **ProviderException** (const **ProviderException** &ex)

  Copy Constructor.

- **ProviderException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- **ProviderException** (const std::exception *cause)

  Convenience Constructor.

- **ProviderException** (const char *file, const int lineNumber, const char *msg,...)

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **ProviderException** * **clone** () const

  Clones this exception.

- virtual ~**ProviderException** () throw ()

6.494.1 Constructor & Destructor Documentation

6.494.1.1 decaf::security::ProviderException::ProviderException ()

Default Constructor.

6.494.1.2 decaf::security::ProviderException::ProviderException (const Exception & *ex*)

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.494.1.3 decaf::security::ProviderException::ProviderException (const ProviderException & *ex*)

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.494.1.4 decaf::security::ProviderException::ProviderException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.494.1.5 decaf::security::ProviderException::ProviderException (const std::exception * *cause*)

Convenience Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.494.1.6 decaf::security::ProviderException::ProviderException (const char * *file*, const int *lineNumber*, const char * *msg*, ...)

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.494.1.7 virtual decaf::security::ProviderException::~ProviderException () throw () [virtual]

6.494.2 Member Function Documentation

6.494.2.1 virtual ProviderException* decaf::security::ProviderException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::lang::exceptions::RuntimeException** (p. 2628).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**ProviderException.h**

6.495 decaf::security::ProviderService Class Reference

`#include <src/main/decaf/security/ProviderService.h>`Inheritance diagram for decaf::security::ProviderService:

Public Member Functions

- **ProviderService** (const **Provider** *provider, const std::string &type, const std::string &algorithm)
- virtual ~**ProviderService** ()
- std::string **getType** () const

  *Gets the type of service this **ProviderService** (p. 2505) instance supports.*

- std::string **getAlgorithm** () const

  *Gets the algorithm name that this **ProviderService** (p. 2505) supplies for its service type.*

- const **Provider** * **getProvider** () const

  *Returns a pointer to the **Provider** (p. 2500) that owns this **ProviderService** (p. 2505).*

- virtual **SecuritySpi** * **newInstance** ()=0

  Return a new instance of the implementation described by this service.

- std::string **toString** () const

  Return a String representation of this service.

6.495.1 Constructor & Destructor Documentation

6.495.1.1 decaf::security::ProviderService::ProviderService (const Provider * *provider*, const std::string & *type*, const std::string & *algorithm*)

6.495.1.2 virtual decaf::security::ProviderService::~ProviderService () `[virtual]`

6.495.2 Member Function Documentation

6.495.2.1 std::string decaf::security::ProviderService::getAlgorithm () const `[inline]`

Gets the algorithm name that this **ProviderService** (p. 2505) supplies for its service type.

Returns:

the algorithm this **ProviderService** (p. 2505) supports.

6.495.2.2 const Provider* decaf::security::ProviderService::getProvider () const [inline]

Returns a pointer to the **Provider** (p. 2500) that owns this **ProviderService** (p. 2505). The returned pointer is owned by the **Security** (p. 2643) framework an should not be deleted by the caller at any time.

Returns:

pointer to the **security** (p. 121) provider that owns this service.

6.495.2.3 std::string decaf::security::ProviderService::getType () const [inline]

Gets the type of service this **ProviderService** (p. 2505) instance supports.

Returns:

type name of the service this **ProviderService** (p. 2505) supports.

6.495.2.4 virtual SecuritySpi* decaf::security::ProviderService::newInstance () [pure virtual]

Return a new instance of the implementation described by this service. The **security** (p. 121) provider framework uses this method to construct implementations. Applications will typically not need to call it.

Returns:

a new instance of the **SecuritySpi** (p. 2647) provided by this **ProviderService** (p. 2505).

Implemented in **decaf::internal::security::provider::DefaultMessageDigestProviderService** (p. 1312), and **decaf::internal::security::provider::DefaultSecureRandomProviderService** (p. 1325).

6.495.2.5 std::string decaf::security::ProviderService::toString () const [inline]

Return a String representation of this service. The format of this string is always, "type.algorithm"

Returns:

string describing this **ProviderService** (p. 2505).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**ProviderService.h**

6.496 decaf::security::PublicKey Class Reference

A public key.

`#include <src/main/decaf/security/PublicKey.h>`Inheritance diagram for decaf::security::PublicKey:

Public Member Functions

- virtual ~**PublicKey** ()

6.496.1 Detailed Description

A public key. This interface contains no methods or constants. It merely serves to group (and provide type safety for) all public key interfaces.

6.496.2 Constructor & Destructor Documentation

6.496.2.1 virtual decaf::security::PublicKey::~PublicKey () `[virtual]`

6.497 decaf::io::PushbackInputStream Class Reference

A **PushbackInputStream** (p. 2508) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.

`#include <src/main/decaf/io/PushbackInputStream.h>`Inheritance diagram for decaf::io::PushbackInputStream:

Public Member Functions

- **PushbackInputStream** (**InputStream** *stream, bool **own**=false)

  *Creates a **PushbackInputStream** (p. 2508) and saves its argument, the input stream in, for later use.*

- **PushbackInputStream** (**InputStream** *stream, int bufSize, bool **own**=false)

  *Creates a **PushbackInputStream** (p. 2508) and saves its argument, the input stream in, for later use.*

- virtual ~**PushbackInputStream** ()
- void **unread** (unsigned char value)

  Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.

- void **unread** (const unsigned char *buffer, int size)

  Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

- void **unread** (const unsigned char *buffer, int size, int offset, int length)

  Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

- virtual int **available** () const

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.
  Returns:

  the number of bytes available on this input stream.
  Exceptions:

  ***IOException** (p. **1787**) if an I/O error occurs.*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  *The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters:

num *The number of bytes to skip.*

Returns:

total bytes skipped

Exceptions:

IOException *(p. 1787) if an I/O error occurs.*
UnsupportedOperationException *if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Does nothing except throw an ***IOException*** *(p. 1787).*

- virtual void **reset** ()

  Does nothing except throw an ***IOException*** *(p. 1787).*

- virtual bool **markSupported** () const

  Does nothing except throw an ***IOException*** *(p. 1787).*

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.497.1 Detailed Description

A **PushbackInputStream** (p. 2508) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte. This is useful in situations where it is convenient for a fragment of **code** (p. 1005) to read an indefinite number of data bytes that are delimited by a particular byte value; after reading the terminating byte, the **code** (p. 1005) fragment can "unread" it, so that the next read operation on the input stream will reread the byte that was pushed back. For example, bytes representing the characters constituting an identifier might be terminated by a byte representing an operator character; a method whose job is to read just an identifier can read until it sees the operator and then push the operator back to be re-read.

Since:

1.0

6.497.2 Constructor & Destructor Documentation

6.497.2.1 decaf::io::PushbackInputStream::PushbackInputStream (InputStream * *stream*, bool *own* = `false`)

Creates a **PushbackInputStream** (p. 2508) and saves its argument, the input stream in, for later use. Initially, there is no pushed-back byte.

Parameters:

stream The **InputStream** (p. 1707) instance to wrap.

Boolean value indicating if this **FilterInputStream** (p. 1521) owns the wrapped stream.

6.497.2.2 decaf::io::PushbackInputStream::PushbackInputStream (InputStream * *stream*, int *bufSize*, bool *own* = false)

Creates a **PushbackInputStream** (p. 2508) and saves its argument, the input stream in, for later use. Initially, there is no pushed-back byte.

Parameters:

stream The **InputStream** (p. 1707) instance to wrap.

bufSize The number of byte to allocate for pushback into this stream.

Boolean value indicating if this **FilterInputStream** (p. 1521) owns the wrapped stream.

Exceptions:

IllegalArgumentException if the bufSize argument is < zero.

6.497.2.3 virtual decaf::io::PushbackInputStream::~PushbackInputStream () [virtual]

6.497.3 Member Function Documentation

6.497.3.1 virtual int decaf::io::PushbackInputStream::available () const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(p. 1787)* if an I/O error occurs.

Returns the sum of the number of pushed back bytes if any and the amount of bytes available in the underlying stream via a call to available.

Reimplemented from **decaf::io::FilterInputStream** (p. 1523).

6.497.3.2 virtual int decaf::io::PushbackInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.497.3.3 virtual int decaf::io::PushbackInputStream::doReadByte () [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.497.3.4 virtual void decaf::io::PushbackInputStream::mark (int *readLimit*) [virtual]

Does nothing except throw an **IOException** (p. 1787). Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters:

readLimit The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::FilterInputStream** (p. 1524).

6.497.3.5 virtual bool decaf::io::PushbackInputStream::markSupported () const [inline, virtual]

Does nothing except throw an **IOException** (p. 1787). Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns:

true if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1525).

6.497.3.6 virtual void decaf::io::PushbackInputStream::reset () [virtual]

Does nothing except throw an **IOException** (p. 1787). Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1787) might be thrown. ∗ If such an **IOException** (p. 1787) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: ∗ The call to reset may throw an **IOException** (p. 1787). ∗ If an **IOException** (p. 1787) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1787).

Exceptions:

IOException *(*p. *1787**)* if an I/O error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1525).

6.497.3.7 virtual long long decaf::io::PushbackInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1707) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num The number of bytes to skip.

Returns:

total bytes skipped

Exceptions:

IOException *(*p. *1787**)* if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

This method first skips bytes in the local pushed back buffer before attempting to complete the request by calling the underlying stream skip method with the remainder of bytes that needs to be skipped.

Reimplemented from **decaf::io::FilterInputStream** (p. 1526).

6.497.3.8 void decaf::io::PushbackInputStream::unread (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

Parameters:

buffer The bytes to copy to the front of push back buffer.

size The size of the array to be copied.

offset The position in the buffer to start copying from.

length The number of bytes to push back from the passed buffer.

Exceptions:

NullPointerException if the buffer passed is NULL.

IndexOutOfBoundsException if the offset + length is greater than the buffer size.

IOException *(*p. ***1787****)* if there is not enough space in the pushback buffer or this stream has already been closed.

6.497.3.9 void decaf::io::PushbackInputStream::unread (const unsigned char * *buffer*, int *size*)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

Parameters:

buffer The bytes to copy to the front of push back buffer.

size The size of the array to be copied.

Exceptions:

NullPointerException if the buffer passed is NULL.

IndexOutOfBoundsException if the size value given is negative.

IOException *(*p. ***1787****)* if there is not enough space in the pushback buffer or this stream has already been closed.

6.497.3.10 void decaf::io::PushbackInputStream::unread (unsigned char *value*)

Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.

Parameters:

value The byte that is to be placed at the front of the push back buffer.

Exceptions:

IOException *(*p. ***1787****)* if there is not enough space in the pushback buffer or this stream has already been closed.

The documentation for this class was generated from the following file:

6.498 cms::Queue Class Reference

An interface encapsulating a provider-specific queue name.

`#include <src/main/cms/Queue.h>`Inheritance diagram for cms::Queue:

Public Member Functions

- virtual ~**Queue** ()
- virtual std::string **getQueueName** () const =0

  Gets the name of this queue.

6.498.1 Detailed Description

An interface encapsulating a provider-specific queue name. Messages sent to a **Queue** (p. 2514) are sent to a Single Subscriber on that **Queue** (p. 2514) **Destination** (p. 1377). This allows for Queues to be used as load balances implementing a SEDA based architecture. The length of time that a Provider will store a **Message** (p. 2090) in a **Queue** (p. 2514) is not defined by the CMS API, consult your Provider documentation for this information.

Since:

1.0

6.498.2 Constructor & Destructor Documentation

6.498.2.1 virtual cms::Queue::~Queue () [virtual]

6.498.3 Member Function Documentation

6.498.3.1 virtual std::string cms::Queue::getQueueName () const [pure virtual]

Gets the name of this queue.

Returns:

The queue name.

Exceptions:

CMSException *(*p. ***979***)* - If an internal error occurs.

Implemented in **activemq::commands::ActiveMQQueue** (p. 423), and **activemq::commands::ActiveMQTempQueue** (p. 505).

The documentation for this class was generated from the following file:

- src/main/cms/**Queue.h**

6.499 decaf::util::Queue< E > Class Template Reference

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

`#include <src/main/decaf/util/Queue.h>`Inheritance diagram for decaf::util::Queue< E >:

Public Member Functions

- virtual ~**Queue** ()
- virtual bool **offer** (const E &value)=0

  Inserts the specified element into the queue provided that the condition allows such an operation.

- virtual bool **poll** (E &result)=0

  Gets and removes the element in the head of the queue.

- virtual E **remove** ()=0

  Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) const =0

  Gets but not removes the element in the head of the queue.

- virtual E **element** () const =0

  Gets but not removes the element in the head of the queue.

6.499.1 Detailed Description

template<typename E> class decaf::util::Queue< E >

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection. Generally, a queue orders its elements by means of first-in-first-out. While priority queue orders its elements according to a comparator specified or the elements' natural order. Furthermore, a stack orders its elements last-in-first out.

Queue (p. 2515) does not provide blocking queue methods, which will block until the operation of the method is allowed. BlockingQueue interface defines such methods.

Unlike the Java **Queue** (p. 2515) interface the methods of this class cannot return null to indicate that a **Queue** (p. 2515) is empty since null has no meaning for elements such as classes, structs and primitive types and cannot be used in a meaningful way to check for an empty queue. Methods that would have returned null in the Java **Queue** (p. 2515) interface have been altered to return a boolean value indicating if the operation succeeded and take single argument that is a reference to the location where the returned value is to be assigned. This implies that elements in the **Queue** (p. 2515) must be *assignable* in order to utilize these methods.

Since:

1.0

6.499.2 Constructor & Destructor Documentation

6.499.2.1 template<typename E> virtual decaf::util::Queue< E >::~Queue () [inline, virtual]

6.499.3 Member Function Documentation

6.499.3.1 template<typename E> virtual E decaf::util::Queue< E >::element () const [pure virtual]

Gets but not removes the element in the head of the queue. Throws a **NoSuchElementException** (p. 2260) if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260)* if there is no element in the queue.

Implemented in **decaf::util::AbstractQueue< E >** (p. 177), **decaf::util::LinkedList< E >** (p. 1890), **decaf::util::AbstractQueue< Pointer< Transport > >** (p. 177), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1890), **decaf::util::LinkedList< CompositeTask * >** (p. 1890), **decaf::util::LinkedList< URI >** (p. 1890), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1890), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1890), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1890), **decaf::util::LinkedList< decaf::net::URI >** (p. 1890), **decaf::util::LinkedList< Pointer< Command > >** (p. 1890), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1890), **decaf::util::LinkedList< cms::Destination * >** (p. 1890), **decaf::util::LinkedList< cms::Session * >** (p. 1890), and **decaf::util::LinkedList< cms::Connection * >** (p. 1890).

6.499.3.2 template<typename E> virtual bool decaf::util::Queue< E >::offer (const E & *value*) [pure virtual]

Inserts the specified element into the queue provided that the condition allows such an operation. The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters:

value the specified element to insert into the queue.

Returns:

true if the operation succeeds and false if it fails.

Exceptions:

NullPointerException if the **Queue** (p. 2515) implementation does not allow Null values to be inserted into the **Queue** (p. 2515).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1869), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2974), **decaf::util::LinkedList< E >** (p. 1893), **decaf::util::PriorityQueue< E >** (p. 2451), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1893), **decaf::util::LinkedList< CompositeTask * >** (p. 1893), **decaf::util::LinkedList< URI >** (p. 1893), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1893), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1893), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1893), **decaf::util::LinkedList< decaf::net::URI >** (p. 1893), **decaf::util::LinkedList< Pointer< Command > >** (p. 1893), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1893), **decaf::util::LinkedList< cms::Destination * >** (p. 1893), **decaf::util::LinkedList< cms::Session * >** (p. 1893), and **decaf::util::LinkedList< cms::Connection * >** (p. 1893).

Referenced by decaf::util::AbstractQueue< Pointer< Transport > >::add().

6.499.3.3 template<typename E> virtual bool decaf::util::Queue< E >::peek (E & *result*) const [pure virtual]

Gets but not removes the element in the head of the queue. The result if successful is assigned to the result parameter.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1871), **decaf::util::LinkedList< E >** (p. 1895), **decaf::util::PriorityQueue< E >** (p. 2452), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1895), **decaf::util::LinkedList< CompositeTask * >** (p. 1895), **decaf::util::LinkedList< URI >** (p. 1895), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1895), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1895), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1895), **decaf::util::LinkedList< decaf::net::URI >** (p. 1895), **decaf::util::LinkedList< Pointer< Command > >** (p. 1895), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1895), **decaf::util::LinkedList< cms::Destination * >** (p. 1895), **decaf::util::LinkedList< cms::Session * >** (p. 1895), and **decaf::util::LinkedList< cms::Connection * >** (p. 1895).

Referenced by decaf::util::AbstractQueue< Pointer< Transport > >::element().

6.499.3.4 template<typename E> virtual bool decaf::util::Queue< E >::poll (E & *result*) [pure virtual]

Gets and removes the element in the head of the queue. If the operation succeeds the value of the element at the head of the **Queue** (p. 2515) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1871), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2975), **decaf::util::LinkedList< E >** (p. 1895), **decaf::util::PriorityQueue< E >** (p. 2452), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1895), **decaf::util::LinkedList< CompositeTask * >** (p. 1895), **decaf::util::LinkedList< URI >** (p. 1895), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1895), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1895), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1895), **decaf::util::LinkedList< decaf::net::URI >** (p. 1895), **decaf::util::LinkedList< Pointer< Command > >** (p. 1895), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1895), **decaf::util::LinkedList< cms::Destination * >** (p. 1895), **decaf::util::LinkedList< cms::Session * >** (p. 1895), and **decaf::util::LinkedList< cms::Connection * >** (p. 1895).

Referenced by decaf::util::AbstractQueue< Pointer< Transport > >::clear(), and decaf::util::AbstractQueue< Pointer< Transport > >::remove().

6.499.3.5 template<typename E> virtual E decaf::util::Queue< E >::remove () [pure virtual]

Gets and removes the element in the head of the queue. Throws a **NoSuchElementException** (p. 2260) if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException *(p. 2260)* if there is no element in the queue.

Implemented in **decaf::util::AbstractQueue< E >** (p. 178), **decaf::util::LinkedList< E >** (p. 1897), **decaf::util::PriorityQueue< E >** (p. 2453), **decaf::util::AbstractQueue< Pointer< Transport > >** (p. 178), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1897), **decaf::util::LinkedList< CompositeTask * >** (p. 1897), **decaf::util::LinkedList< URI >** (p. 1897), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1897), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1897), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1897), **decaf::util::LinkedList< decaf::net::URI >** (p. 1897), **decaf::util::LinkedList< Pointer< Command > >** (p. 1897), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1897), **decaf::util::LinkedList< cms::Destination * >** (p. 1897), **decaf::util::LinkedList< cms::Session * >** (p. 1897), and **decaf::util::LinkedList< cms::Connection * >** (p. 1897).

6.500 cms::QueueBrowser Class Reference

This class implements in interface for browsing the messages in a **Queue** (p. 2514) without removing them.

`#include <src/main/cms/QueueBrowser.h>`Inheritance diagram for cms::QueueBrowser:

Public Member Functions

- virtual ~**QueueBrowser** ()
- virtual const **Queue** * **getQueue** () const =0
- virtual std::string **getMessageSelector** () const =0
- virtual **cms::MessageEnumeration** * **getEnumeration** ()=0

  *Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 2514) in the order that a client would receive them.*

6.500.1 Detailed Description

This class implements in interface for browsing the messages in a **Queue** (p. 2514) without removing them. To browse the contents of the **Queue** (p. 2514) the client calls the `getEnumeration` method to retrieve a new instance of a **Queue** (p. 2514) Enumerator. The client then calls the hasMoreMessages method of the Enumeration, if it returns true the client can safely call the nextMessage method of the Enumeration instance.

Enumeration* enumeration = queueBrowser->**getEnumeration()** (p. 2519);

while(enumeration->hasMoreMessages()) { **cms::Message** (p. 2090)* message = enumeration->nextMessage();

// ... Do something with the **Message** (p. 2090).

delete message; }

Since:

1.1

6.500.2 Constructor & Destructor Documentation

6.500.2.1 virtual cms::QueueBrowser::~QueueBrowser () [virtual]

6.500.3 Member Function Documentation

6.500.3.1 virtual cms::MessageEnumeration* cms::QueueBrowser::getEnumeration () [pure virtual]

Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 2514) in the order that a client would receive them. The pointer returned is owned by the browser and should not be deleted by the client application.

Returns:

a pointer to a **Queue** (p. 2514) Enumeration, this Pointer is owned by the **QueueBrowser** (p. 2519) and should not be deleted by the client.

Exceptions:

CMSException *(p. **979**)* if an internal error occurs.

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 426).

6.500.3.2 virtual std::string cms::QueueBrowser::getMessageSelector () const [pure virtual]

Returns:

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions:

CMSException *(p. **979**)* if an internal error occurs.

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 426).

6.500.3.3 virtual const Queue* cms::QueueBrowser::getQueue () const [pure virtual]

Returns:

the **Queue** (p. 2514) that this browser is listening on.

Exceptions:

CMSException *(p. **979**)* if an internal error occurs.

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 427).

The documentation for this class was generated from the following file:

- src/main/cms/**QueueBrowser.h**

6.501 decaf::util::Random Class Reference

Random (p. 2521) Value Generator which is used to generate a stream of pseudorandom numbers.

`#include <src/main/decaf/util/Random.h>`Inheritance diagram for decaf::util::Random:

Public Member Functions

- **Random** ()

  Construct a random generator with the current time of day in milliseconds as the initial state.

- **Random** (unsigned long long seed)

  Construct a random generator with the given `seed` *as the initial state.*

- virtual ~**Random** ()
- bool **nextBoolean** ()

  Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

- double **nextDouble** ()

  Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

- float **nextFloat** ()

  Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

- double **nextGaussian** ()

  Pseudo-randomly generates (approximately) a normally distributed `double` *value with mean 0.0 and a standard deviation value of* `1.0` *using the polar method of G.*

- int **nextInt** ()

  Generates a uniformly distributed 32-bit `int` *value from the this random number sequence.*

- int **nextInt** (int n)

  Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` *(exclusively).*

- long long **nextLong** ()

  Generates a uniformly distributed 64-bit `int` *value from the this random number sequence.*

- virtual void **nextBytes** (std::vector< unsigned char > &buf)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.

- virtual void **nextBytes** (unsigned char *buf, int size)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.

- virtual void **setSeed** (unsigned long long seed)

  Modifies the seed using linear congruential formula presented in The Art of Computer Programming, Volume 2, Section 3.2.1.

Protected Member Functions

- virtual int **next** (int bits)

  Answers a pseudo-random uniformly distributed `int` *value of the number of bits specified by the argument* `bits` *as described by Donald E.*

6.501.1 Detailed Description

Random (p. 2521) Value Generator which is used to generate a stream of pseudorandom numbers. The algorithms implemented by class **Random** (p. 2521) use a protected utility method that on each invocation can supply up to 32 pseudorandomly generated bits.

Since:

1.0

6.501.2 Constructor & Destructor Documentation

6.501.2.1 decaf::util::Random::Random ()

Construct a random generator with the current time of day in milliseconds as the initial state.

See also:

setSeed (p. 2525)

6.501.2.2 decaf::util::Random::Random (unsigned long long *seed*)

Construct a random generator with the given `seed` as the initial state.

Parameters:

seed the seed that will determine the initial state of this random number generator

See also:

setSeed (p. 2525)

6.501.2.3 virtual decaf::util::Random::~Random () `[virtual]`

6.501.3 Member Function Documentation

6.501.3.1 virtual int decaf::util::Random::next (int *bits*) `[protected, virtual]`

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns:

int a pseudo-random generated int number

Parameters:

bits number of bits of the returned value

See also:

nextBytes (p. 2523)
nextDouble (p. 2524)
nextFloat (p. 2524)
nextInt() (p. 2525)
nextInt(int) (p. 2524)
nextGaussian (p. 2524)
nextLong (p. 2525)

Reimplemented in **decaf::security::SecureRandom** (p. 2635).

6.501.3.2 bool decaf::util::Random::nextBoolean ()

Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

Returns:

boolean a pseudo-random, uniformly distributed boolean value

6.501.3.3 virtual void decaf::util::Random::nextBytes (unsigned char * *buf*, int *size*) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters:

buf non-null array to contain the new random bytes

See also:

next (p. 2522)

Exceptions:

NullPointerException if buff is NULL
IllegalArgumentException if size is negative

Reimplemented in **decaf::security::SecureRandom** (p. 2636).

6.501.3.4 virtual void decaf::util::Random::nextBytes (std::vector< unsigned char > & *buf*) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters:

buf non-null array to contain the new random bytes

See also:

next (p. 2522)

Reimplemented in **decaf::security::SecureRandom** (p. 2636).

6.501.3.5 double decaf::util::Random::nextDouble ()

Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

Returns:

double

See also:

nextFloat (p. 2524)

6.501.3.6 float decaf::util::Random::nextFloat ()

Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

Returns:

float a random float number between 0.0 and 1.0

See also:

nextDouble (p. 2524)

6.501.3.7 double decaf::util::Random::nextGaussian ()

Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of `1.0` using the *polar method* of G. E. P. Box, M. E. Muller, and G. Marsaglia, as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.4.1, subsection C, algorithm P

Returns:

double

See also:

nextDouble (p. 2524)

6.501.3.8 int decaf::util::Random::nextInt (int *n*)

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).

Parameters:

n The int value that defines the max value of the return.

Returns:

the next pseudo random int value.

Exceptions:

IllegalArgumentException if n is less than or equal to zero.

6.501.3.9 int decaf::util::Random::nextInt ()

Generates a uniformly distributed 32-bit `int` value from the this random number sequence.

Returns:

int uniformly distributed `int` value

See also:

next (p. 2522)
nextLong (p. 2525)

6.501.3.10 long long decaf::util::Random::nextLong ()

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

Returns:

64-bit `int` random number

See also:

next (p. 2522)
nextInt() (p. 2525)
nextInt(int) (p. 2524)

6.501.3.11 virtual void decaf::util::Random::setSeed (unsigned long long *seed*) [virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters:

seed the seed that alters the state of the random number generator

See also:

next (p. 2522)
Random() (p. 2522)
Random(long)

Reimplemented in **decaf::security::SecureRandom** (p. 2637).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Random.h**

6.502 decaf::lang::Readable Class Reference

A **Readable** (p. 2526) is a source of characters.

`#include <src/main/decaf/lang/Readable.h>`Inheritance diagram for decaf::lang::Readable:

Public Member Functions

- virtual ~**Readable** ()
- virtual int **read** (**decaf::nio::CharBuffer** *charBuffer)=0

  Attempts to read characters into the specified character buffer.

6.502.1 Detailed Description

A **Readable** (p. 2526) is a source of characters. Characters from a **Readable** (p. 2526) are made available to callers of the read method via a CharBuffer.

Since:

1.0

6.502.2 Constructor & Destructor Documentation

6.502.2.1 virtual decaf::lang::Readable::~Readable () `[virtual]`

6.502.3 Member Function Documentation

6.502.3.1 virtual int decaf::lang::Readable::read (decaf::nio::CharBuffer * *charBuffer*) `[pure virtual]`

Attempts to read characters into the specified character buffer. The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters:

charBuffer The Buffer to read Characters into.

Returns:

The number of char values added to the buffer, or -1 if this source of characters is at its end

Exceptions:

IOException if an I/O error occurs.

NullPointerException if buffer is NULL.

ReadOnlyBufferException if charBuffer is a read only buffer.

Implemented in **decaf::io::Reader** (p. 2531).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Readable.h**

6.503 activemq::transport::inactivity::ReadChecker Class Reference

Runnable class that is used by the {.

`#include <src/main/activemq/transport/inactivity/ReadChecker.h>`Inheritance diagram for activemq::transport::inactivity::ReadChecker:

Public Member Functions

- **ReadChecker** (**InactivityMonitor** *parent)
- virtual ~**ReadChecker** ()
- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.

6.503.1 Detailed Description

Runnable class that is used by the {.

See also:

InactivityMonitor (p. 1666)} class the check for timeouts related to **transport** (p. 72) reads.

Since:

3.1

6.503.2 Constructor & Destructor Documentation

6.503.2.1 activemq::transport::inactivity::ReadChecker::ReadChecker (InactivityMonitor * *parent*)

6.503.2.2 virtual activemq::transport::inactivity::ReadChecker::~ReadChecker () [virtual]

6.503.3 Member Function Documentation

6.503.3.1 virtual void activemq::transport::inactivity::ReadChecker::run () [virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2622).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/inactivity/**ReadChecker.h**

6.504 decaf::io::Reader Class Reference

`#include <src/main/decaf/io/Reader.h>`Inheritance diagram for decaf::io::Reader:

Public Member Functions

- virtual ~**Reader** ()
- virtual void **mark** (int readAheadLimit)

  Marks the present position in the stream.

- virtual bool **markSupported** () const

  *Tells whether this stream supports the **mark()** (p. 2531) operation.*

- virtual bool **ready** () const

  Tells whether this stream is ready to be read.

- virtual void **reset** ()

  Resets the stream.

- virtual long long **skip** (long long count)

  Skips characters.

- virtual int **read** (std::vector< char > &buffer)

  Reads characters into an array.

- virtual int **read** (char *buffer, int size)

  Reads characters into an array, the method will attempt to read as much data as the size of the array.

- virtual int **read** (char *buffer, int size, int offset, int length)

  Reads characters into a portion of an array.

- virtual int **read** ()

  Reads a single character.

- virtual int **read** (**decaf::nio::CharBuffer** *charBuffer)

  Attempts to read characters into the specified character buffer.
